Conditional Syllogiſm, a ſyllogiſm where the major is a conditional propoſition. Thus,

If there is a God, he ought to be worſhipped.
But there is a God;
Therefore he ought to be worſhipped.

CONDIVICNUM, (anc. geog.), the capital of the Nannetes, in Armorica. Now Nants in Brittany, on the Loire, from its name *Civitas Nannetum*. W. Long. 1. 30. Lat. 47. 15

CONDOM, a town of Gaſcony in France, capital of the Condomois, with a biſhop's ſee. It is but a poor place, and the trade is very ſmall. It is ſeated on the river Geliſſe, in E. Long. 0. 22. N. Lat. 44.

CONDOR, or Contor, in ornithology. See Vultur.

CONDORMIENTES, in church-hiſtory, religious ſectaries, who take their name from lying all together, men and women, young and old. They aroſe in the 13th century, near Cologne; where they are ſaid to have worſhipped an image of Lucifer, and to have received anſwers and oracles from him.

CONDRIEU, a town of Lyonnois in France, remarkable for its excellent wines. It is ſeated at the foot of hill near the river Rhone, E. Long. 4. 33. N. Lat. 45. 28.

CONDRUSII, (anc. geog.), a people of Belgica, originally Germans, dwelling about the Maeſe. Their country is now called *Condrotz*, in the biſhopric of Liege, between Luxemburg and the Maeſe.

CONDUCTOR, in ſurgery, an inſtrument which ſerves to conduct the knife in the operation of cutting for the ſtone, and in laying up ſinuſes and fiſtulas.

Conductors, in electrical experiments, are thoſe bodies that receive and communicate electricity; and thoſe that repel it are called *non-conductors*. See Electricity.

CONDUIT, a canal or pipe for the conveyance of water, or other fluid.

There are ſeveral ſubterraneous conduits through which the waters paſs that form ſprings. Artificial conduits for water are made of lead, ſtone, caſt-iron, potter's earth, timber, &c.

CONDYLOID and Coronoid proceſſes. See Anatomy, nº 26.

CONDYLOMA, in medicine, a tubercle, or callous eminence, which ariſes in the folds of the anus, or rather a ſwelling or hardening of the wrinkles of that part.

CONDYLUS, a name given by anatomiſts to a knot in any of the joints, formed by the epiphyſis of a bone.

CONE, in geometry, a ſolid figure, having a circle for its baſe, and its top terminated in a point or vertex. See Conic Sections.

Melting Cone, in chemiſtry, is a hollow cone formed of copper or braſs, with a handle, and with a flat bottom adjoining to the apex of the cone, upon which it is intended to reſt. Its uſe is to receive a maſs of one or more metals melted together, and caſt into it. This maſs, when cold, may be eaſily ſhook out of the veſſel, from its figure. Alſo, if a melted maſs conſiſting of two or more metals, or other ſubſtances not combined together, be poured into this veſſel, the conical figure facilitates the ſeparation of theſe ſubſtances according to their reſpective denſities. The cone ought to be well heated before the melted maſs is thrown into it; that it may not contain any moiſture, which would occaſion a dangerous exploſion. It ought alſo to be greaſed internally with tallow, to prevent the adheſion of the fluid matter.

Cone of Rays, in optics, includes all the ſeveral rays which fall from any radiant point upon the ſurface of a glaſs.

Cone, in botany. See Conus.

CONESSI, a ſort of bark of a tree, which grows on the Coromandel coaſt in the Eaſt Indies. It is recommended in a letter to Dr Monro, in the Medical Eſſays, as a ſpecific in diarrhœas. It is to be finely pulverized, and made into an electuary with ſyrup of oranges. The bark ſhould be freſh, and the electuary ry new made every day, or ſecond day, otherwiſe it loſes its auſtere but grateful bitterneſs on the palate, and its proper effects on the inteſtines.

CONFARREATION, a ceremony among the ancient Romans, uſed in the marriage of perſons whoſe children were deſtined for the honour of the prieſt-hood.

Confarreation was the moſt ſacred of the three modes of contracting marriage among that people; and conſiſted, according to Servius, in this, that the *pontifex maximus* and *flamen dialis* joined and contracted the man and woman, by making them eat of the ſame cake of ſalted bread: whence the term, *far* ſignifying *meal* or *flour*.

Ulpian ſays, it conſiſted in the offering up of ſome pure wheaten bread; rehearſing, withal, a certain formula, in preſence of ten witneſſes. Dionyſius Halicarnaſſeus adds, that the huſband and wife did eat of the ſame wheaten bread, and threw part on the victims.

CONFECTION, in pharmacy, ſignifies, in general, any thing prepared with ſugar: in particular it imports ſomething preſerved, eſpecially dry ſubſtances. It alſo ſignifies a liquid or ſoft electuary, of which there are various ſorts directed in diſpenſatories. See PHARMACY.

CONFECTOR, among the ancient Romans, a ſort of gladiator, hired to fight in the amphitheatre againſt beaſts: thence alſo denominated *beſtiarius*.

The *confectores* were thus called *à conficiendis beſtiis*, from their diſpatching and killing beaſts.

The Greeks called them παραϐολοι, q. d. *daring, raſh, deſperate*; whence the Latins borrowed the appellations *parabolani* and *parabolarii*. The Chriſtans were ſometimes condemned to this ſort of combat.

CONFECTS, a denomination given to fruits, flowers, herbs, roots, &c. when boiled or prepared with ſugar or honey, to diſpoſe them to keep, and render them more agreeable to the taſte.

CONFEDERACY, in law, is when two or more perſons combine to do any damage to another, or to commit any unlawful act. Confederacy is puniſhable, though nothing be put in execution; but then it muſt have theſe four incidents: 1. That it be declared by ſome matter of proſecution, as by making of bonds or promiſes to one another; 2. That it be malicious, as for unjuſt revenge; 3. That it be falſe, *i. e.* againſt the innocent; and, laſtly, That it be out of court, voluntary.

CONFERVA, in botany: A genus belonging to the cryptogamia claſs of plants: and in the natural method ranking under the 57th order, *Algæ*. The tubercles are of different ſizes, on capillary, very long fibres. There are 21 ſpecies, moſt of them growing on ſtones in ſlow ſtreams, on the ſides of ciſterns, or in ponds.

CONFESSION, in a civil ſenſe, a declaration or acknowledgement of ſome truth, though againſt the intereſt of the party who makes it; whether it be in a court of juſtice or out of it. It is a maxim, that in civil matters, the confeſſion is never to be divided, but always taken entire. A criminal is never condemned on his ſimple confeſſion, without other collateral proofs: nor is a voluntary extrajudical confeſſion admitted as any proof. A perſon is not admitted to accuſe himſelf, according to that rule in law, *Non auditur perire volens*. See ARRAIGNMENT.

CONFESSION, among divines, the verbal acknowledgement which a Chriſtian makes of his ſins.

Among the Jews it was the cuſtom, on the annual feaſt of expiation, for the high-prieſt to make confeſſion of ſins to God in the name of the whole people: beſides this general confeſſion, the Jews were enjoined, if their ſins were a breach of the firſt table of the law, to make confeſſion of them to God; but violations of the ſecond table were to be acknowledged to their brethren. The confeſſion of the primitive Chriſtians were all voluntary, and not impoſed on them by any laws of the church; yet private confeſſion was not only allowed, but encouraged.

The Romiſh church requires confeſſion not only as a duty, but has advanced it to the dignity of a ſacrament: this confeſſion is made to the prieſt, and is private and auricular; and the prieſt is not to reveal them under pain of the higheſt puniſhment.

CONFESSION of Faith, a liſt of the ſeveral articles of belief in any church.

CONFESSIONAL, or CONFESSIONARY, a place in churches under the great altar, where the bodies of deceaſed ſaints, martyrs, and confeſſors, were depoſited.

This word is alſo uſed by the Romaniſts for a deſk in the church where the confeſſor takes the confeſſions of the penitents.

CONFESSOR, a Chriſtian who has made a ſolemn and reſolute profeſſion of the faith, and has endured torments in its defence. A mere ſaint is called a confeſſor, to diſtinguiſh him from the roll of dignified ſaints: ſuch as apoſtles, martyrs, &c. In eccleſiaſtical hiſtory, we frequently find the word confeſſors uſed for martyrs: in after-times, it was confined to thoſe who, after having been tormented by the tyrants, were permitted to live and die in peace. And at laſt it was alſo uſed for thoſe who, after having lived a good life, died under an opinion of ſanctity. According to St Cyprian, he who preſented himſelf to torture, or even to martyrdom, without being called to it, was not called a *confeſſor* but a *profeſſor*: and if any out of a want of courage abandoned his country, and became a voluntary exile for the ſake of the faith, he was called *exterris*.

CONFESSOR is alſo a prieſt, in the Romiſh church, who has a power to hear ſinners in the ſacrament of penance, and to give them abſolution. The church calls him in Latin *confeſſarius*, to diſtinguiſh him from confeſſor, which is a name conſecrated to ſaints. The confeſſors of the kings of France, from the time of Henry IV. have been conſtantly Jeſuits: before him the Dominicans and Cordeliers ſhared the office between them. The confeſſors of the houſe of Auſtria have alſo, ordinarily, been Dominicans and Cordeliers; but the latter emperors have all taken Jeſuits.

CONFIGURATION, the outward figure which bounds bodies, and gives them their external appearance: being that which, in a great meaſure, conſtitutes the ſpecific difference between bodies.

CONFIRMATION, in a general ſenſe, the act of ratifying or rendering a title, claim, report, or the like more ſure and indiſputable.

CONFIRMATION, in law, a conveyance of an eſtate, or right in *eſſe*, from one man to another, whereby a voidable eſtate is made ſure and unavoidable, or a particular eſtate is increaſed, or a poſſeſſion made perfect.

CONFIRMATION, in theology, the ceremony of laying on of hands, for the conveyance of the Holy Ghoſt.

The antiquity of this ceremony is, by all ancient writers, carried as high as the apoſtles, and founded upon their example and practice. In the primitive church, it uſed to be given to Chriſtians immediately after baptiſm, if the biſhop happened to be preſent at the ſolemnity. Among the Greeks, and throughout the Eaſt, it ſtill accompanies baptiſm: but the Romaniſts make it a diſtinct independent ſacrament. Seven years is the ſtated time for confirmation: however, they are ſometimes confirmed before, and ſometimes after, that age. The perſon to be confirmed has a god-father and god-mother appointed him, as in baptiſm. The order of confirmation in the church of England, does not determine the preciſe age of the perſons to be confirmed.

CONFISCATION, in law, the adjudication of goods or effects to the public treaſury; as the bodies and effects of criminals, traitors, &c.

CONFLAGRATION, the general burning of a city, or other conſiderable place.

This word is commonly applied to that grand period or cataſtrophe of our world, when the face of nature is to be changed by fire, as formerly it was by water. The ancient Pythagoreans, Platoniſts, Epicureans, and Stoics, appear to have had a notion of the conflagration: though whence they ſhould derive it, unleſs from the ſacred books, is difficult to conceive; except, perhaps, from the Phœnicians, who themſelves had it from the Jews. Seneca ſays expreſsly, *Tempus advenerit quo ſidera ſideribus incurrent, & omni flagrante materia uno igne, quicquid nunc ex depoſito lucet, ardebit.* This general diſſolution the Stoics call ἐκπυρωσις, *ecpyroſis*. Mention of the conflagration is alſo made in the books of the Sybils, Sophocles, Hyſtaſpes, Ovid, Lucan, *&c.* Dr Burnet, after F. Tachard and others, relates that the Siameſe believe that the earth will at laſt be parched up with heat; the mountains melted down; the earth's whole ſurface reduced to a level, and then conſumed with fire. And the Bramins of Siam do not only hold that the world ſhall be deſtroyed by fire; but alſo that a new earth ſhall be made out of the cinders of the old.

Various are the ſentiments of authors on the ſubject of the conflagration; the cauſe whence it is to ariſe, and the effects it is to produce. Divines ordinarily account for it metaphyſically; and will have it take its riſe from a miracle, as a fire from heaven. Philoſophers contend for its being produced from natural cauſes; and will have it effected according to the laws of mechanics. Some think an eruption of the central fire ſufficient for the purpoſe; and add, that this may be occaſioned ſeveral ways, *viz.* either by having its intenſion increaſed; which again, may be effected either by being driven into leſs ſpace by the encroachments of the ſuperficial cold, or by an increaſe of the inflammability of the fuel whereon it is fed; or by having the reſiſtance of the impriſoning earth weakened; which may happen, either from the diminution of its matter, by the conſumption of its central parts, or by weakening the coheſion of the conſtituent parts of the maſs by the exceſs of the defect of moiſture. Others look for the cauſe of the conflagration in the atmoſphere; and ſuppoſe, that ſome of the meteors there engendered in unuſual quantities, and exploded with unuſual vehemence, from the concurrence of various circumſtances, may effect it, without ſeeking any further. The aſtrologers account for it from a conjunction of all the planets in the ſign Cancer; as the deluge, ſay they, was occaſioned by their conjunction in Capricorn. Laſtly, others have recourſe to a ſtill more effectual and flaming machine, and conclude the world is to undergo its conflagration from the near approach of a comet in its return from the ſun.

CONFLUENT, among phyſicians, &c. an appellation given to that kind of SMALL-POX wherein the puſtules run into each other.

CONFLUENTES (anc. geog.), a place at the confluence of the Rhine and Moſelle, ſuppoſed to be one of the 50 forts erected by Druſus on the Rhine, in Gallia Belgica: Now *Coblentz*, a town of Triers. E. Long. 7. 15. Lat. 50. 30.

CONFORMATION, the particular conſiſtence and texture of the parts of any body, and their diſpoſition to compoſe a whole.

CONFORMATION, in medicine, that make and conſtruction of the human body which is peculiar to every individual. Hence, a *mala conformatio* ſignifies ſome fault in the firſt rudiments; whereby a perſon comes into the world crooked, or with ſome of the viſcera or cavities unduly framed or proportioned. Many are ſubject to incurable aſthmas, from a too ſmall capacity of the thorax, and the like vitious conformations.

CONFORMITY, in the ſchools, is the congruency, or relation of agreement between one thing and another; as between the meaſure and the thing meaſured, the object and the underſtanding, the thing and the diviſion thereof, &c.

CONFRONTATION, the act of bringing two perſons in preſence of each other, to diſcover the truth of ſome fact which they relate differently.

The word is chiefly uſed in criminal matters; where the witneſſes are confronted with the accuſed, the accuſed with one another, or the witneſſes with one another.

CONFUCIUS, a Chineſe philoſopher, who lived about 500 years before our Saviour's birth, in the kingdom of Lu, now called the province of *Xantung*. His wit and judgment got him a reputation from his very youth: and being a mandarin, and employed in the government of the kingdom of Lu, his profound knowledge of morals and politics made him be greatly admired. Notwithſtanding his care, his prince's court was much diſordered; and Confucius finding the king would not liſten to his advice, quitted the court, and taught moral philoſophy with ſuch applauſe that he ſoon had above 3000 ſcholars, whereof 72 ſurpaſſed the reſt in learning and virtue, for whom the Chineſe have ſtill a particular veneration. He divided his doctrine into four parts, and his ſcholars into four claſſes: the firſt order was of thoſe who ſtudied to acquire virtue; the 2d, thoſe who learned the art of reaſoning well; the 3d ſtudied the government of the ſtate and the duty of magiſtrates; the 4th were wholly taken up in noble diſcourſes of all that concerned morals. In ſpite of all his pains to eſtabliſh pure morality and religion, he was nevertheleſs the innocent cauſe of their corruption. It is ſaid, that when he was complimented upon the excellency of his philoſophy, he replied, that he fell greatly ſhort of the perfect degree of virtue; but that in the weſt the moſt holy was to be found. This made a ſtrong impreſſion on the learned; and in the 66th year after Chriſt's birth, the emperor Mon-ti ſent ambaſſadors toward the weſt to ſeek this holy man. They ſtopped at an iſland near the Red Sea, and found a famous idol named Fohi, repreſenting a philoſopher that lived 500 years before Confucius. They carried this idol back with them, with inſtructions concerning the worſhip rendered to it; and ſo introduced a ſuperſtition that aboliſhed in ſeveral places the maxims of Confucius. His tomb is in the academy where he taught, near the town Xio-fu, upon the banks of the river Xu. This philoſopher has been in great veneration in China above 2000 years; and is ſtill ſo eſteemed, that each town has a palace conſecrated to his memory. There was one of his deſcendants who was very conſiderable in the kingdom in 1646, whom Xanchi king of Tartary, who then conquered China, received with a great deal of honour. All thoſe of his family are mandarins by birth; and have a privilege common with the princes of the blood, not to pay any tribute.

CONFUSION, in a general ſenſe, is oppoſed to *order*, in a perturbation whereof confuſion conſiſts; *e. gr.* when things prior in nature do not precede, or poſterior do not follow, &c.

In a logical ſenſe, confuſion is oppoſed to diſtinctneſs or perſpicuity; and may happen either in words, as when miſcontrived or miſapplied; or in ideas, as when the idea of any thing preſents ſomething along with it, which does not properly belong to that thing. See IDEA and NOTION.

In a phyſical ſenſe, confuſion is a ſort of union or mixture by mere contiguity. Such is that between fluids of contrary nature, as oil and vinegar, &c.

CONFUSION, in Scots law, is a method of ſuſpending and extinguiſhing obligations. See LAW, Part III. N° clxxvi. 8.

CONFUSION of Tongues, in the hiſtory of mankind, is a memorable event, which happened in the one hundred and firſt year according to the Hebrew chronology, and the four hundred and firſt year by the Samaritan, after the flood, at the overthrow of Babel; and which was providentially brought about in order to facilitate the diſperſion of mankind and the population of the earth. Until this period there had been one common language, which formed a bond of union that prevented the ſeparation of mankind into diſtinct nations; and ſome have ſuppoſed, that the tower of Babel was erected as a kind of fortreſs, by which the people intended to defend themſelves againſt that ſeparation which Noah had projected.

There has been a conſiderable difference of opinion as to the nature of this confuſion, and the manner in which it was effected. Some learned men, prepoſſeſſed with the notion that all the different idioms now in the world did at firſt ariſe from one original language to which they may be reduced, and that the variety among them is no more than muſt naturally have happened in a long courſe of time by the mere ſeparation of the builders of Babel, have maintained, that there were no new languages formed at the confuſion; but that this event was accompliſhed by creating a miſunderſtanding and variance among the builders without any immediate influence on their language. But this opinion, advanced by Le Clerc, &c. ſeems to be directly contrary to the obvious meaning of the word שפה, *ſhapha*, "lip," uſed by the ſacred hiſtorian. Others have imagined, that this was brought about by a temporary confuſion of their ſpeech, or rather of their apprehenſions, cauſing them, whilſt they continued together and ſpoke the ſame language, to underſtand the words differently. Scaliger is of this opinion. Others, again, account for this event by the privation of all language, and by ſuppoſing that mankind were under a neceſſity of aſſociating together, and of impoſing new names on things by common conſent. Another opinion aſcribes the confuſion to ſuch an indiſtinct remembrance of the original language which they ſpoke before, as made them ſpeak it very differently; ſo that by the various inflections, terminations, and pronunciations of divers dialects, they could no more underſtand one another, than they who underſtand Latin can underſtand thoſe who ſpeak French, Italian, or Spaniſh, though all theſe languages ariſe out of it. This opinion is adopted by Cauſabon, and by Biſhop Patrick in his Commentary *in loc.* and is certainly much more probable than either of the former. And Mr Shuckford maintains, that the confuſion aroſe from ſmall beginnings, by the invention of new words in either of the three families of Shem, Ham, and Japhet, which might contribute to ſeparate them from one another; and that in each family new differences of ſpeech might gradually ariſe, ſo that each of theſe families went on to divide and ſubdivide among themſelves. Others again, as Mr Joſ. Mede and Dr Wotton, &c. not ſatisfied with either of the foregoing methods of accounting for the diverſity of languages among mankind, have recourſe to an extraordinary interpoſition of divine power, by which new languages were framed and communicated to different families by a ſupernatural infuſion or inſpiration; which languages have been the roots and originals from which the ſeveral dialects that are, or have been, or will be ſpoken, as long as this earth ſhall laſt, have ariſen, and to which they may with eaſe be reduced. As to the number of languages thus introduced, many opinions have been adopted. If there were no more than there were nations or heads of nations, then the number would be ſeven for Japhet, four for Ham, and five for Shem; but if there were as many as there were families, which is the more probable opinion, their number cannot be certainly aſſigned. However, the Hebrews fancy they were 70, becauſe the deſcendents from the ſons of Noah, enumerated Geneſis x. were juſt ſo many. Allowing, then, the languages of the chief families to have been fundamentally different from each other, the ſub-languages and dialects within each branch would probably have had a mutual affinity, greater or leſs as they ſettled nearer or farther from each other. But whichſoever of theſe hypotheſes is adopted, the primary object of the confuſion at Babel was the ſeparation and diſperſion of mankind.

Dr Bryant, in the third volume of his Analyſis of Ancient Mythology, has advanced a ſingular hypotheſis, both with reſpect to the confuſion of tongues and the diſperſion. He ſuppoſes that the confuſion of language was local and partial, and limited to Babel only.

By כל־הארץ, Gen. xi. 1. and 8, which our tranſlators render *the whole earth*, he underſtands *every region*; and by the ſame words in ver. 9. *the whole region* or province. This confuſion was occaſioned, as he ſuppoſes, by a labial failure; ſo that the people could not articulate. Thus their ſpeech was confounded, but not altered; for, as ſoon as they ſeparated, they recovered their true tenor of pronunciation, and the language of the earth continued for ſome ages nearly the ſame. The interviews between the Hebrews and other nations, recorded in Scripture, were conducted without an interpreter; and he farther obſerves, that the various languages which ſubſiſt at this day retain ſufficient relation to ſhow, that they were once dialects from the ſame matrix, and that their variety was the effect of time. See Dispersion.

CONFUTATION, in rhetoric, &c. a part of an oration, wherein the orator ſeconds his own arguments and ſtrengthens his cauſe, by refelling and deſtroying the oppoſite arguments of the antagoniſt. This is done by denying what is apparently falſe, by detecting ſome flaw in the reaſoning of the adverſe party, by granting their argument, and ſhowing its invalidity, or retorting it upon the adverſary.

CONGE, in the French law, a licence, or permiſſion, granted by a ſuperior to an inferior, which gives him a diſpenſation from ſome duty to which he was before obliged. A woman cannot obligate herſelf without the *conge* or licence of her huſband; a monk cannot go out of his convent, without the *conge* of his ſuperiors.

Conge' *d'Elire*, in eccleſiaſtical policy, the king's permiſſion royal to a dean and chapter in the time of a vacancy, to chooſe a biſhop; or to an abbey, or priory, of his own foundation, to chooſe their abbot or prior.

The king of England, as ſovereign patron of all archbiſhoprics, biſhoprics, and other eccleſiaſtical benefices, had of ancient time free appointment of all eccleſiaſtical dignities, whenſoever they chanced to be void; inveſting them firſt *per bacculum & annulum*, and afterwards by his letters-patent; and in courſe of time he made the election over to others, under certain forms and limitations, as that they ſhould at every vacation, before they chooſe, demand the king's congé d'elire, and after the election crave his royal aſſent, *&c.*

Conge', in architecture, a mould in form of a quarter round, or a cavetto, which ſerves to ſeparate two members from one another; ſuch as that which joins the ſhaft of the column to the cincture, called alſo *apophyge*.

Conges are alſo rings or ferrels formerly uſed in the extremities of wooden pillars, to keep them from ſplitting, afterwards imitated in ſtone-work.

Congelation.

1 Differs from cryſtallization.

CONGELATION, ſignifies the paſſing of any body from a fluid to a ſolid ſtate: ſo that the term is thus applicable to metals when they reſume their ſolid form after being heated, to water when it freezes, to wax, ſpermaceti, &c. when they become ſolid after having been rendered fluid by heat; and in general to all proceſſes, where the whole ſubſtance of the fluid is converted into ſolid: but it differs from cryſtallization; becauſe in the latter proceſs, though the ſalt paſſes from a fluid to a ſolid ſtate, a conſiderable quantity of liquid is always left, ſo that the term *congelation* is never applied in this caſe.

2 Is always attended with an emiſſion of heat.

The proceſs of congelation in all caſes depends upon, or at leaſt is accompanied with, the emiſſion of heat, as has been evinced by experiments made not only in water, but on ſpermaceti, wax, &c. for in all of theſe, tho' the thermometer immerſed in them while fluid continued to deſcend gradually till a certain period, yet it was as conſtantly obſerved to remain ſtationary, or even to aſcend while the congelation went on. The principle on which the phenomenon depends is thus aſcertained; but why this heat ſhould be emitted, is a queſtion which has not yet been thoroughly inveſtigated. Some conjectures relative to this are indeed mentioned in the article Chemistry, when treating of elementary fire, though experiments are ſtill to be wiſhed for on the ſubject.

3 Congelation of quickſilver.

It is not known whether all kinds of fluids are naturally capable of congelation or not; though we are certain that there are very great differences among them in this reſpect. The moſt difficult of all thoſe of which the congelation has been actually aſcertained is quickſilver. This was long thought capable of reſiſting any degree of cold whatever; and it is only within a few years that its congelation by artificial means was known, and ſtill more lately that ſome climates were found to be ſo ſevere as to congeal this fluid by the cold of the atmoſphere.

4 Experiments of Mr Braun.

The congelation of quickſilver was firſt aſcertained by M. Joſeph Adam Braun profeſſor of philoſophy at Peterſburg. He had been employed in making thermometrical experiments, not with a view to make the diſcovery he actually did, but to ſee how many degrees of cold he could produce. An excellent opportunity for this occurred on the 14th of December 1759, when the mercury ſtood naturally at —34, which is now known to be only five or ſix degrees above its point of congelation. Mr Braun having determined to avail himſelf of this great degree of natural cold, prepared a freezing mixture of aquafortis and pounded ice, by means of which his thermometer was reduced to —69. Part of the quickſilver had now really congealed; yet ſo far was M. Braun from entertaining any ſuſpicion of the truth, that he had almoſt deſiſted from further attempts, being ſatisfied with having ſo far exceeded all the philoſophers who went before him. Animated, however, by the hopes of producing a ſtill greater degree of cold, he renewed the experiment; but having expended all his pounded ice, he was obliged to ſubſtitute ſnow in its place. With this freſh mixture the mercury ſunk to —100, 240, and 352°. He then ſuppoſed that the thermometer was broken; but on taking it out to obſerve whether it was ſo or not, he found the quickſilver fixed, and continuing ſo for 12 minutes. On repeating the ſame experiment with another thermometer which had been graduated no lower than —220, all the mercury ſunk into the ball, and became ſolid as before, not beginning to reaſcend till after a ſtill longer interval of time. Hence the profeſſor concluded that the quickſilver was really frozen, and prepared for making a deciſive experiment. This was accompliſhed on the 25th of the ſame month, and the bulb of the thermometer broken as ſoon as the metal was congealed. The mercury was now converted into a ſolid and ſhining metallic maſs, which extended under the ſtrokes of a peſtle, in hardneſs rather inferior to lead, and yielding a dull ſound like that metal. Profeſſor Æpinus made ſimilar experiments at the ſame time, employing both thermometers and tubes of a larger bore; in which laſt he remarked, that the quickſilver fell ſenſibly on being frozen, aſſuming a concave ſurface, and likewiſe that the congealed pieces ſunk in fluid mercury.

The fact being thus eſtabliſhed, and fluidy no longer to be conſidered as an eſſential property of quickſilver, Mr Braun communicated an account of his experiments to the Peterſburg Academy, on the 6th of September 1760; of which a large extract was inſerted in the Philoſophical Tranſactions, vol. lii. p. 156. Five years afterwards he publiſhed another treatiſe on the ſame ſubject, under the title of Supplements to his former diſſertation. In theſe he declared, that, ſince his former publication, he had never ſuffered any winter to elapſe without repeating the experiment of congealing quickſilver, and never failed of ſucceſs when the natural cold was of a ſufficient ſtrength for the purpoſe. This degree of natural cold he ſuppoſes to be —10 of Fahrenheit, though ſome commencement of the congelation might be perceived when the temperature of the air was as high as +2. The reſults of all his experiments were, that with the abovementioned frigorific mixtures, and once with rectified ſpirits and ſnow, when the natural cold was at —28°, he congealed the quickſilver, and diſcovered that it is a real metal which melts with a very ſmall degree of heat. Not perceiving, however, the neceſſary conſequence of its great contraction in freezing, he, in this work, as well as in the former, confounded its point of congelation with that of its greateſt contraction in freezing, and thus marked the former a great deal too low; though the point of congelation was very uncertain according to him, various difficulties having occurred to his attempts of finding the greateſt point of contraction while freezing.

5 Of Mr Blumenbach. The experiments of M. Braun were not repeated by any perſon till the year 1774, when Mr John Frederic Blumenbach, then a ſtudent of phyſic at Gottingen, performed them to more advantage than it appears M. Braun had ever done. He was encouraged to make the attempt by the exceſſive cold of the winter that year. "I put (ſays he), at five in the evening of January 11th, three drachms of quickſilver into a ſmall ſugar-glaſs, and covered it with a mixture of ſnow and Egyptian ſal-ammoniac. This mixture was put looſe into the glaſs, ſo that the quickſilver lay perfectly free, being only covered with it as by pieces of ice: the whole, together with the glaſs, weighed ſomewhat above an ounce. It was hung out at a window in ſuch a poſition as to expoſe it freely to the northweſt; and two drachms more of ſal-ammoniac mixed with the ſnow on which it ſtood. The ſnow and ſal-ammoniac, in the open air ſoon froze into a maſs like ice: no ſenſible change, however, appeared in the quickſilver that evening: but at one in the morning it was found frozen ſolid. It had divided into two large and four ſmaller pieces: one of the former was hemiſpherical, the other cylindrical, each ſeemingly rather above a drachm in weight: the four ſmall bits might amount to half a ſcruple. They were all with their flat ſide frozen hard to the glaſs, and no where immediately touched by the mixture; their colour was a dull pale white with a bluiſh caſt, like zinc, very different from the natural appearance of quickſilver. Next morning about ſeven o'clock I found that the larger hemiſphere began to melt, perhaps becauſe it was moſt expoſed to the air, and not ſo near as the others to the ſal ammoniac mixture which lay beneath. In this ſtate it reſembled an amalgam, ſinking to that ſide on which the glaſs was inclined; but without quitting the ſurface of the glaſs, to which it was yet firmly congealed: the five other pieces had not yet undergone any alteration, but remained frozen hard. Toward eight o'clock the cylindrical piece began to ſoften in the ſame manner, and the other four ſoon followed. About eight they fell from the ſurface of the glaſs, and divided into many fluid ſhining globules, which were ſoon loſt in the interſtices of the frozen mixture, and reunited in part at the bottom, being now exactly like common quickſilver." At the time this experiment was made, the thermometer ſtood at —10° in the open air.

6 Remarks on this experiment. The circumſtances attending this experiment are ſtill unaccountable; for, in the firſt place, the natural cold was ſcarcely ſufficient, along with that of the artificial mixture, which produces 32° more, to have congealed the quickſilver; which yet appears to have been very effectually done by the length of time it continued ſolid. 2. It is not eaſy to account for the length of time required for congealing the quickſilver in this experiment, ſince other frigorific mixtures begin to act almoſt immediately; and, 3. There was not at laſt even the appearance of action, which conſiſts in a ſolution of the ſnow, and not in its freezing into a maſs. "The whole experiment (ſays Dr Blagden *) remains involved in ſuch obſcurity, that ſome perſons have ſuppoſed the quickſilver itſelf was not frozen, but only covered over with ice; to which opinion, however, there are great objections. It is worthy of remark, that Gottingen, though ſituated in the ſame latitude as London, and enjoying a temperate climate in general, becomes ſubject at times to a great ſeverity of cold. This of 11th of January 1774 is one inſtance; I find others there where the thermometer ſunk to —12°,—16°, or —19°; and at Cattlenburg, a ſmall town about two German miles diſtant, to —30°. By watching ſuch extraordinary occaſions, experiments on the freezing of quickſilver might eaſily be performed in many places, where the poſſibility of them is at preſent little ſuſpected. The cold obſerved at Glaſgow in 1780 would have been fully ſufficient for that purpoſe."

7 Experiments of Mr Hutchins, Dr Bicker, &c. In conſequence of the publication of Mr Braun's Experiments, the Royal Society deſired their late ſecretary Dr Maty to make the neceſſary application to the Hudſon's-bay company, in order to repeat the experiment in that country. Mr Hutchins, who was then at London, and going out with a commiſſion as governor of Albany Fort, offered to undertake the experiments, and executed them very completely, freezing quickſilver twice in the months of January and February 1775. The account of his ſucceſs was read before the Royal Society at the commencement of the ſevereſt winter that had been known for many years in Europe; and at this time the experiment was repeated by two gentlemen of different countries. One was Dr Lambert Bicker, ſecretary to the Batavian ſociety at Rotterdam; who on the 28th of January 1776, at eight

---

* *Phil. Tranſ.* vol. iii.

eight in the morning, made an experiment to try how low he could bring the thermometer by artificial cold, the temperature of the atmoſphere being then + 2°. He could not, however, bring it lower than —94°, at which point it ſtood immoveable: and on breaking the thermometer, part of the quickſilver was found to have loſt its fluidity, and was thickened to the conſiſtence of an amalgam. It fell out of the tube in little bits, which bore to be flattened by preſſure, without running into globules like the inner fluid part. The experiment was repeated next day, when the thermometer ſtood at +8°, but the mercury would not then deſcend below—80°; and as the thermometer was not broken, it could not be known whether the mercury had congealed or not. All that could be inferred from theſe experiments therefore was, that the congealing point of mercury was not below—94° of Fahrenheit's thermometer. The other who attempted the congelation of this fluid was the late Dr Anthony Fothergill; but it could not be determined whether he ſucceeded or not. An account of his experiment is inſerted in the Philoſophical Tranſactions, Vol. lxvi.

8
Point of congelation determined by Mr Hutchins.

No other attempts were made to congeal quickſilver until the year 1781, when Mr Hutchins reſumed the ſubject with great ſucceſs, inſomuch that from his experiment the freezing point of mercury is now almoſt as well ſettled as that of water. Preceding philoſophers, indeed, had not been altogether inattentive to this ſubject. Profeſſor Braun himſelf had taken great pains to inveſtigate it: but for want of paying the requiſite attention to the difference betwixt the contraction of the fluid mercury by cold and that of the congealing metal by freezing, he could determine nothing certain concerning it. Others declared it as their opinion, that nothing certain could be determined by merely freezing mercury in a thermometer filled with that fluid. Mr Cavendiſh and Dr Black firſt ſuggeſted the proper method of obviating the difficulties on this ſubject.

9
Dr Black's directions for making the experiment.

Dr Black, in a letter to Mr Hutchins, dated October 5. 1779, gave the following directions for making the experiment with accuracy: "Provide a few wide and ſhort tubes of thin glaſs, ſealed at one end and open at the other; the wideneſs of theſe tubes may be from half to three quarters of an inch, and the length of them about three inches. Put an inch or an inch and a half depth of mercury into one of theſe tubes, and plunging the bulb of the thermometer into the mercury, ſet the tube with the mercury and the thermometer in it into a freezing mixture, which ſhould be made for this purpoſe in a common tumbler or water-glaſs: and, *N. B.* in making a freezing mixture with ſnow and ſpirit of nitre, the quantity of the acid ſhould never be ſo great as to diſſolve the whole of the ſnow, but only enough to reduce it to the conſiſtence of panada. When the mercury in the wide tube is thus ſet in the freezing mixture, it muſt be ſtirred gently and frequently with the bulb of the thermometer; and if the cold be ſufficiently ſtrong, it will congeal by becoming thick and *broaſy* like an amalgam. As ſoon as this is obſerved, the thermometer ſhould be examined without lifting it out of the congealing mercury; and I have no doubt that in every experiment thus made with the ſame mercury, the inſtrument will always point to the ſame degree, provided it has been made and graduated with accuracy."

10
Apparatus recommended by Mr Cavendiſh.

The apparatus recommended by Mr Cavendiſh, and which Mr Hutchins made uſe of, conſiſted of a ſmall mercurial thermometer, the bulb of which reached about 1½ inches below the ſcale, and was incloſed in a glaſs cylinder ſwelled at the bottom into a ball, which when uſed was filled with quickſilver, ſo that the bulb of the thermometer was entirely covered with it. If this cylinder be immerſed in a freezing mixture till great part of the quickſilver in it is frozen, it is evident that the degree ſhown at that time by the incloſed thermometer is the preciſe point at which mercury freezes; for as in this caſe the ball of the thermometer muſt be ſurrounded for ſome time with quickſilver, part of which is actually frozen, it ſeems impoſſible that the thermometer ſhould be ſenſibly above that point; and while any of the quickſilver in the cylinder remains fluid, it is impoſſible that it ſhould ſink ſenſibly below it. The diameter of the bulb of the thermometer was rather leſs than a quarter of an inch, that of the ſwelled part of the cylinder two-thirds; and as it was eaſy to keep the thermometer conſtantly in the middle of the cylinder, the thickneſs of quickſilver betwixt it and the glaſs could never be much leſs than the ſixth part of an inch. The bulb of the thermometer was purpoſely made as ſmall as it conveniently could, in order to leave a ſufficient ſpace between it and the cylinder, without making the ſwelled part larger than neceſſary, which would have cauſed more difficulty in freezing the mercury in it.

11
Accounts of the experiments.

The firſt experiment with this apparatus was made on the 15th of December 1781; the thermometer had ſtood the evening before at —18°. A bottle of ſpiritus nitri fortus was put on the houſe-top, in order to cool it to the ſame temperature. The thermometers made uſe of had been hung up in the open air for three weeks to compare their ſcales. On the morning of the experiment they were about 23° below 0.—in making it, the thermometer of the apparatus was ſuſpended in the bulb of the cylinder by means of ſome red worſted wound about the upper part of its ſtem, to a ſufficient thickneſs to fill the upper part of its orifice; and a ſpace of near half an inch was left empty between the quickſilver and worſted.

The apparatus was placed in the open air, on the top of the fort, with only a few deer ſkins ſewed together for a ſhelter; the ſnow lay 18 inches deep on the works, and the apparatus was ſtuck into the ſnow in order to bring it the ſooner to the temperature of the air. The inſtruments were afterwards placed in three freſh freezing mixtures, in hopes of being able by their means to produce a greater degree of cold, but without effect; nor was any greater cold produced by adding more ſpirit of nitre. The mercury, however was very completely frozen, that in the thermometer deſcending to 448°. On plunging the mercury into the freezing mixture, is deſcended in leſs than one minute to 40° below 0.

The ſecond experiment was made the day following; and the ſame quantity of quickſilver employed that had been uſed in the former. As too ſmall a quantity of the freezing mixture, however, had been originally made, it was neceſſary to add more during the operation of congealation; by which means the ſpirit of nitre, in pouring it upon the ſnow, ſometimes touched the bulb of the thermometer, and inſtantly raiſed it much higher; nor did the mercury ever deſcend below 206°, which was not half ſo far as it had done the day before, though the temperature of the atmoſphere had been this day at — 43° before the commencement of the operation. That in the apparatus, however ſunk to —95°. The apparatus was taken out of the mixture for half a minute, in order to examine whether the mercury was perfectly congealed or not, and during that time it ſhowed no ſign of liquefaction.

The third experiment was made the ſame day, and with the freezing mixture uſed in the laſt. By it the point of congelation was determined to be not below 40°.

The fourth experiment was made January 7th 1782; and in it he obſerved, the the mercury in the apparatus thermometer, after ſtanding at 42 and 41¼ for a conſiderable time fell to 77, not gradually, but at once as a weight falls.

In the fifth experiment the weather was exceſſively ſevere, ſo that it ought to have frozen the metal in the open air; but this did not then happen.

At the time of making the ſixth experiment, the quickſilver in the open air ſtood at 44 below 0; and Mr Hutchins reſolved to make uſe of this opportunity to obſerve how far it was poſſible to make it deſcend by means of cold, obſerving the degrees at the ſame time with a ſpirit thermometer made by Nairne and Brount, with which he had been furniſhed by the royal ſociety in 1774. In this, however, he did not ſucceed; for the mercury never fell below 438, nor the ſtandard 48. It ſtood at 27¼ at the beginning of the experiment. The reaſon of this was ſuppoſed to be, that the atmoſphere was too cold for making this kind of experiments, by reaſon of its freezing the thread of quickſilver in the ſtem of the thermometer, ſo that it became incapable of contraction along with that in the bulb. In other experiments, though the metal in the bulb became ſolid, yet that in the ſtem always remained fluid; and thus was enabled to ſubſide to a great degree by the diminution of bulk in the ſolid mercury. That this was really the caſe, appeared from the quickſilver falling at once from —86 to — 434, when the cold of the freezing mixture diminiſhed, and the temperature of the air becoming about the ſame time ſomewhat milder, melted the congealed part in the ſtem, which thus had liberty to deſcend to that point.

In this experiment, alſo, the mixtures were made in double quantity to thoſe of the former: theſe being only in common tumblers, but the mixtures for this experiment in pint baſons. It was obſerved that they liquefied faſter than in other experiments. He had uſually made them of the conſiſtence of pap; but though he added ſnow at different times, it had very little effect in augmenting the cold, but rather decreaſed it. The congealed pieces of metal fell to the bottom as might naturally have been expected from its great contraction in becoming ſolid.

From this experiment Mr Hutchins concluded, that the nearer the temperature of the atmoſphere approached to the congealing point of mercury (ſo that a great degree of cold might be communicated to the bulb of a thermometer, and yet the quickſilver in the tube remain fluid), he might make the experiment of aſcertaining the greateſt contraction of mercury to more advantage. With this view, he made another experiment, when the temperature of ſome of his thermometers ſtood as low as—37°; and after an hour's attendance he perceived the mercury had fallen to 1367; but the thermometer unluckily was broken, and its bulb thrown away with the mixture. Profeſſor Braun had likewiſe obſerved, that his thermometers were always broken when the mercury deſcended below 600.

12
The thermometers broken by extreme cold.

The eighth experiment was made with a view to try whether quickſilver would congeal when in contact with the freezing mixture. For this purpoſe, he did not uſe the apparatus provided for other experiments, but filled a gallipot made of flint ſtone (as being thinner than the common ſort), containing about an ounce, half full of quickſilver, into which he inſerted a mercurial thermometer, employing another as an index. Thus he hoped to determine exactly when the quickſilver was congealed, as he had free acceſs to it at all times, which was not the caſe when it was incloſed in the cylindrical glaſs, the worſted wound round the tube of the thermometer to exclude the air being equally effectual in excluding any inſtrument from being introduced to touch the quickſilver. He then made a kind of ſkewer, with a flat blunt point, of dried cedar wood, on account of its lightneſs, which he found would remain in the gelatinous freezing mixture at any depth he choſe; but, when inſerted into the quickſilver, the great difference betwixt the ſpecific gravity of it and that ponderous fluid, made it always rebound upward; and by the degree of reſiſtance, he could always know whether it proceeded from fluid or ſolid metal. At this time, however, the experiment did not ſucceed; but, at another trial, having employed about ¾ths of a pound of metal, and let it remain a conſiderable time immerſed in the ſame mixture which had juſt now been ſuppoſed to fail, he found that part of it was congealed; and, on pouring off the fluid part, no leſs than two-thirds remained fixed at the bottom.

13
Mr Cavendiſh's experiments.

The laſt experiment which has been publiſhed concerning the congelation of quickſilver by means of ſnow is that of Mr Cavendiſh, and of which he gives an account in the Phil. Tranſact. Vol. lxxiii. p. 325. Here, ſpeaking of the cold of freezing mixtures, he ſays, "There is the utmoſt reaſon to think that Mr Hutchins would have obtained a greater degree of cold by uſing a weaker nitrous acid than he did. I found (ſays he) by adding ſnow gradually to ſome of this acid, that the addition of a ſmall quantity produced heat inſtead of cold; and it was not until ſo much was added as to increaſe the heat from 28 to 51°, that the addition of more ſnow began to produce cold; the quantity of ſnow required for this purpoſe being pretty exactly one quarter of the weight of the ſpirit of nitre, and the heat of the ſnow, and air of the room, as well as of the acid, being 28°, The reaſon of this is, that a great deal of heat is produced by mixing water with ſpirit of nitre; and the ſtronger the ſpirit is, the greater is the heat produced. Now it appears from this experiment, that before the acid was diluted,

14
Heat ſometimes produced by adding ſnow to ſpirit of nitre.

luted, the heat produced by its union with the water formed from the melting ſnow, was greater than the cold produced by the ſame; and it was not until it was diluted by the addition of one quarter of its weight of that ſubſtance, that the cold, generated by the latter cauſe, began to exceed the heat generated by the former. From what has been ſaid, it is evident, that a freezing mixture made with undiluted acid will not begin to generate cold until ſo much ſnow is diſſolved as to increaſe its heat from 28 to 51°; ſo that no greater cold will be produced than would be obtained by mixing the diluted acid heated to 51° with ſnow of the heat of 28°. This method of adding ſnow gradually is much the beſt way I know of finding what ſtrength it ought to be of, in order to produce the greateſt effect poſſible. By means of this acid diluted in the abovementioned proportion, I froze quickſilver in the thermometer called G (A) by Mr Hutchins, on the 26th of February 1782. I did not indeed break the thermometer to examine the ſtate of the quickſilver therein; for, as it ſunk to —110, it certainly muſt have been in part frozen; but immediately took it out, and put the ſpirit thermometer in its room, in order to find the cold of the mixture. It ſunk only to —30°; but by making allowance of the ſpirit in the tube being not ſo cold as that in the ball, it appears, that if it had not been for this cauſe, it would have ſunk to —35° (B); which is 6° below the point of freezing, and is within one degree of as great a cold as that produced by Mr Hutchins.

"In this experiment the thermometer G ſunk very rapidly; and, as far as I could perceive, without ſtopping at any intermediate point till it came to the abovementioned degree of —110°, where it ſtuck. The materials uſed in making the mixture were previouſly cooled, by means of ſalt and ſnow, to near nothing; the temperature of the air was between 20° and 25°; the quantity of acid uſed was 4½ oz.; and the glaſs in which the mixture was made, was ſurrounded with wool, and placed in a wooden box, to prevent its loſing its cold ſo faſt as it would otherwiſe have done. Some weeks before this I made a freezing mixture with ſome ſpirit of nitre much ſtronger than that uſed in the foregoing experiment, though not quite ſo ſtrong as the undiluted acid, in which the cold was leſs intenſe by 4½°. It is true the temper of the air was much leſs cold, namely 35°, but the ſpirit of nitre was at leaſt as cold, and the ſnow not much leſs ſo.

15
Of the cold produced by oil of vitriol and ſnow.

"The cold produced by mixing oil of vitriol, properly diluted with ſnow, is not ſo great as that produced by ſpirit of nitre, though it does not differ from it by ſo much as 8°; for a freezing mixture, prepared with diluted oil of vitriol, whoſe ſpecific gravity, at 60° of heat, was 1,5642, ſunk in the thermometer G to —37°, the experiment being tried at the ſame time, and with the ſame precautions, as the foregoing. It was previouſly found, by adding ſnow gradually to ſome of this acid, as was done by the nitrous acid, that it was a little, but not much ſtronger, than it ought to be, in order to produce the greateſt effect."

The experiment made by Mr Walker, in which he congealed quickſilver by means of ſpirit of nitre and Glauber's ſalt, without any ſnow, concludes the hiſtory of the artificial congelation of mercury. See the article COLD. It now remains that we ſay ſomething of the congelation of it by the natural cold of the atmoſphere.

16
Congelation of quickſilver by natural cold.

Dr Blagden, from whoſe paper in the Philoſophical Tranſactions, vol. lxxiii. this account is taken, obſerves, that it was not till near the year 1730 that thermometers were made with any degree of accuracy; and in four or five years after this, the firſt obſervations were made which prove the freezing of quickſilver. On the acceſſion of the Empreſs Anne Ivanouna to the throne of Ruſſia, three profeſſors of the Imperial academy were choſen to explore and deſcribe the different parts of her Aſiatic dominions, and to inquire into the communication betwixt Aſia and America. Theſe were Dr John George Gmelin, in the department of natural hiſtory and chemiſtry; M. Gerard Frederic Muller, as general hiſtoriographer; and M. Louis de l'Iſle de la Croyere, for the department of aſtronomy; draughtſmen and other proper aſſiſtants being appointed to attend them. They departed from Peterſburgh in 1733; and ſuch as ſurvived did not return till ten years after. The thermometrical obſervations were communicated by Profeſſor Gmelin, who firſt publiſhed them in his Flora Sibirica, and afterwards more fully in the Journal of his Travels. An abſtract of them was likewiſe inſerted in the Peterſburg Commentaries for the years 1756 and 1765, taken, after the profeſſor's death, from his original diſpatches in poſſeſſion of the imperial academy.

17
Exceſſive cold of Siberia.

In the winter of 1734 and 1735, Mr Gmelin being at Yeneſeiſk in 58½° N. Lat. and 92° E. Long. from Greenwich, firſt obſerved ſuch a deſcent of the mercury, as we know muſt have been attended with congelation. "Here (ſays he) we firſt experienced the truth of what various travellers have related with reſpect to the extreme cold of Siberia; for, about the middle of December, ſuch ſevere weather ſet in, as we were ſure had never been known in our time at Peterſburg. The air ſeemed as if it were frozen, with the appearance of a fog, which did not ſuffer the ſmoke to aſcend as it iſſued from the chimnies. Birds fell down out of the air as dead; and froze immediately, unleſs they were brought into a warm room. Whenever the door was opened, a fog ſuddenly formed round it. During the day, ſhort as it was, parhelia and haloes round the ſun were frequently ſeen; and in the night mock moons, and haloes about the moon. Finally, our thermometer, not ſubject to the ſame deception as the ſenſes, left us no doubt of the exceſſive cold; for the quickſilver in it was reduced, on the 5th of January O. S. to —120° of Fahrenheit's ſcale, lower than it had ever hitherto been obſerved in nature."

The next inſtance of congelation happened at Yakutſk, in N. Lat. 62. and E. Long. 130. The weather here was unuſually mild for the climate, yet the ther-

---

(A) This was a ſmall mercurial thermometer, made by Nairne and Blount, on an ivory ſcale, divided at every five degrees, and reaching from 215° above to 250° below the cypher.

(B) This is to be underſtood of a ſpirit thermometer, whoſe —29° = 40° of Fahrenheit's mercurial.

thermometer fell to —72°; and one perſon informed the profeſſor by a note, that the mercury in his barometer was frozen. He haſtened immediately to his houſe to behold ſuch a ſurpriſing phenomenon; but though he was witneſs to the fact, the prejudice he entertained againſt the poſſibility of the congelation, would not allow him to believe it. "Not feeling, (ſays he), by the way, the ſame effects of cold as I had experienced at other times in leſs diſtances, I began, before my arrival, to entertain ſuſpicions about the congelation of his quickſilver. In fact, I ſaw that it did not continue in one column, but was divided in different places as into little cylinders, which appeared frozen; and, in ſome of theſe diviſions between the quickſilver, I perceived like the appearance of frozen moiſture. It immediately occurred to me, that the mercury might have been cleaned with vinegar and ſalt, and not ſufficiently dried. The perſon acknowledged it had been purified in that manner. The ſame quickſilver, taken out of the barometer, and well dried, would not freeze again, though expoſed to a much greater degree of cold, as ſhown by the thermometer."

Another ſet of obſervations, in the courſe of which the mercury frequently congealed, were made by Profeſſor Gmelin at Kirenga fort, in 57½ N. Lat. 108. E. Long.; his thermometer, at different times, ſtanding at —108°, —86°, —100°, —113°, and many other intermediate degrees. This happened in the winter of 1737 and 1738. On the 27th of November, after the thermometer had been ſtanding for two days at —46°, he found it ſunk at noon to 108°. Suſpecting ſome miſtake, after he had noted down the obſervation, he inſtantly ran back, and found it at 102°; but aſcending with ſuch rapidity, that in the ſpace of half an hour it had riſen to —19°. This phenomenon, which appeared ſo ſurpriſing, undoubtedly depended on the expanſion of the mercury frozen in the bulb of the thermometer, and which now melting, forced upwards the ſmall thread in the ſtem.

A ſimilar appearance was obſerved at the ſame fort a few days after; and on the 29th of December, O S. he found the mercury, which had been ſtanding at —40° in the morning, ſunk to —100° at four in the afternoon. At this time, he ſays, he "ſaw ſome air in the thermometer ſeparating the quickſilver for the ſpace of about ſix degrees." He had taken notice of a ſimilar appearance the preceding evening, excepting that the *air*, as he ſuppoſed it to be, was not then collected into one place, but lay ſcattered in ſeveral.

Theſe appearances undoubtedly proceeded from a congelation of the mercury, though the prejudice entertained againſt the poſſibility of this phenomenon would not allow the profeſſor even to inquire into it at all. Several other obſervations were made; ſome of which were loſt, and the reſt contain no farther information.

The ſecond inſtance where a natural congelation of mercury has certainly been obſerved, is recorded in the tranſactions of the Royal Academy of Sciences at Stockholm. The weather, in January 1760, was remarkably cold in Lapland; ſo that, on the 5th of that month, the thermometers fell to —76°, —128°, or lower; on the 23d and following days they fell to —58°, —79°, —92°, and below —238° entirely into the ball. This was obſerved at Tornea, Sombio, Jakaſierf, and Utſioki, four places in Lapland, ſituated between the 65th and 78th degrees of N. Lat. and the 21ſt and 28th of E. Long. The perſon who obſerved them was M. Andrew Hellant, who makes the following remarks, of themſelves ſufficient to ſhow that the quickſilver was frozen. "During the cold weather at Sombio (ſays he), as it was clear ſun-ſhine, though ſcarcely the whole body of the ſun appeared above the low woods that covered our horizon, I took a thermometer which was hanging before in the ſhade, and expoſed it to the riſing ſun about eleven in the forenoon, to ſee whether, when that luminary was ſo low, it would have any effect upon the inſtrument. But to my great ſurpriſe, upon looking at it about noon, I found that the mercury had entirely ſubſided into the ball, though it was ſtanding as high as —61° at 11 o'clock, and the ſcale reached down to 238° below 0." On bringing the inſtrument near a fire, it preſently roſe to its uſual height; and the reaſon of its ſubſiding before was its being ſomewhat warmed by the rays of the ſun; which, feeble as they were, had yet ſufficient power to melt the ſmall thread of congealed mercury in the ſtem of the thermometer, and allow it to ſubſide along with the reſt. Mr Hellant, however, ſo little underſtood the reaſon of this phenomenon, that he frequently attempted to repeat it by bringing the thermometer near a fire, when the cold was only a few degrees below the freezing point of water, but could never ſucceed until it fell to —58°, or lower, that is, until the cold was ſufficiently intenſe to congeal the metal. The only ſeeming difficulty in his whole account, is, that when the mercury had ſubſided entirely into the ball of the thermometer, a vacuum or empty ſpot appeared, which run round the cavity like an air bubble, on turning the inſtrument: but this proceeded from a partial liquefaction of the mercury, which muſt neceſſarily melt firſt on the outſide, and thus exhibit the appearance juſt mentioned.

18
Remarkable experiments of Dr Pallas.

The moſt remarkable congelation of mercury, which has ever yet been obſerved, was that related by Dr Peter Simon Pallas, who had been ſent by the Empreſs of Ruſſia, with ſome other gentlemen, on an expedition ſimilar to that of Dr Gmelin. He did not, however, ſpend the winters in which he was in Siberia in the coldeſt parts of the country; that is about the middle of the northern part. Twice indeed he reſided at Kraſnoyarſk, in N. Lat. 56½°, E. Long. 93°, where, in the year 1772, he had an opportunity of obſerving the phenomenon we ſpeak of. "The winter (ſays he) ſet in early this year, and was felt with uncommon ſeverity in December. On the 6th and 7th of that month happened the greateſt cold I have ever experienced in Siberia; the air was calm at the time, and ſeemingly thickened; ſo that, though the ſky was in other reſpects clear, the ſun appeared as through a fog. I had only one ſmall thermometer left, in which the ſcale went no lower than—7°; and on the 6th in the morning, I remarked that the quickſilver in it ſunk into the ball, except ſome ſmall columns which ſtuck faſt in the tube.—When the ball of the thermometer, as it hung in the open air, was warmed by being touched with the finger, the quickſilver roſe; and it could plainly be ſeen, that the ſolid columns ſtuck and reſiſted a good while, and were at length puſhed upward with a ſort of violence. In the mean time I placed upon the gallery, on the north ſide of my houſe, about a quarter of a pound of clean and dry quickſilver in an open bowl. Within an hour I found the edges and ſurface of it frozen ſolid, and ſome minutes afterwards the whole was condenſed by the natural cold into a ſoft maſs very much like tin. While the inner part was ſtill fluid, the frozen ſurface exhibited a great variety of branched wrinkles; but in general it remained pretty ſmooth in freezing, as did alſo a larger quantity which I afterwards expoſed to the cold. The congealed mercury was more flexible than lead; but on being bent ſhort, it was found more brittle than tin; and when hammered out thin, it ſeemed ſomewhat granulated. If the hammer had not been perfectly cooled, the quickſilver melted away under it in drops; and the ſame thing happened when the metal was touched with the finger, by which alſo the finger was immediately benumbed. In our warm room it thawed on its ſurface gradually, by drops, like wax on the fire, and did not melt all at once. When the frozen maſs was broken to pieces in the cold, the fragments adhered to each other and to the bowl on which they lay. Although the froſt ſeemed to abate a little towards night, yet the congealed quickſilver remained unaltered, and the experiment with the thermometer could ſtill be repeated. On the 7th of December, I had an opportunity of making the ſame obſervations all day; but ſome hours after ſunſet, a northweſt wind ſprung up, which raiſed the thermometer to —46°, when the maſs of quickſilver began to melt.

19 Von Elterlein's experiment.

In the beginning of the year 1780, M. Von Elterlein, of Vytegra, a town of Ruſſia, in Lat. 61°. E Long. 36. froze quickſilver by natural cold; of which he gives the following account. "On the 4th of January 1780, the cold having encreaſed to—34° that evening at Vytegra, I expoſed to the open air three ounces of very pure quickſilver in a china tea-cup, covered with paper, pierced full of holes. Next day, at eight in the morning, I found it ſolid, and looking like a piece of caſt lead, with a conſiderable depreſſion in the middle. On attempting to looſen it in the cup, my knife raiſed ſhavings from it as if it had been lead, which remained ſticking up; and at length the metal ſeparated from the bottom of the cup in one maſs. I then took it in my hand to try if it would bend: it was ſtill like glue, and broke into two pieces; but my fingers immediately loſt all feeling, and could ſcarcely be reſtored in an hour and an half by rubbing with ſnow. At eight o'clock a thermometer, made by Mr Lexmann of the Academy, ſtood at—57°; by half after nine it was riſen to—40°; and then the two pieces of mercury which lay in the cup had loſt ſo much of their hardneſs, that they could no longer be broken, or cut into ſhavings, but reſembled a thick amalgam, which though it became fluid when preſſed by the fingers, immediately afterwards reſumed the conſiſtence of pap. With the thermometer at---29°, the quickſilver became fluid. The cold was never leſs on the 5th than ---28°, and by nine in the evening in had increaſed again to ---33°.

20 Experiment of Mr Hutchins.

An inſtance of the natural congelation of quickſilver alſo occured in Jemtland, one of the provinces of Sweden, on the 1ſt of January 1782; and, laſtly, on the 26th of the ſame month, Mr Hutchins obſerved the ſame effect of the cold at Hudſon's bay. "The ſubject of this curious phenomenon (ſays he), was quickſilver put into a common two-ounce vial, and corked. The vial was about a third part full, and had conſtantly been ſtanding by the thermometer for a month paſt. At eight o'clock this morning I obſerved it was frozen rather more than a quarter of an inch thick round the ſides and bottom of the vial, the middle part continuing fluid. As this was a certain method of finding the point of congelation, I introduced a mercurial and a ſpirit thermometer into the fluid part, after breaking off the top of the vial, and they roſe directly and became ſtationary; the former 40° or $40\frac{1}{2}$°, the latter at $29\frac{3}{4}$, both below the cypher. Having taken theſe out, I put in two others, G a mercurial one formerly deſcribed, and a ſpirit thermometer; the former of which became ſtationary at 40° and the latter at 30°. I then decanted the fluid quickſilver, to examine the internal ſurface of the frozen metal, which proved very uneven, with many radii going acroſs; ſome of which reſembled pin-heads, Urgent buſineſs called me away an hour. On my return I found a ſmall portion only had liquefied in my abſence. I then broke the vial entirely, and with a hammer repeatedly ſtruck the quickſilver. It beat out flat, yielded a deadiſh ſound, and became fluid in leſs than a minute afterwards.---It may be worth remarking, that the quickſilver in one of the thermometers, which had ſunk to very near 500, and was then at 444, very readily run up and down the tube by elevating either end of the inſtrument."

Theſe are all the well authenticated accounts of the congelation of mercury by the natural cold of the atmoſphere. Some others have been publiſhed; but being either leſs important, or not ſo well authenticated, we forbear to mention them. A very conſiderable confirmation is obtained from the above hiſtory, of the theory of congelation delivered by Dr Black, and which is fully explained under the article CHEMISTRY. On Mr Hutchin's experiments, and on congelation in general, Mr Cavendiſh makes many valuable remarks; the ſubſtance of which is as follows.

21 Mr Cavendiſh's remarks on congelation.

"If a veſſel of water, with a thermometer in it, be expoſed to the cold, the thermometer will ſink ſeveral degrees below the freezing point, eſpecially if the water be covered up ſo as to be defended from the wind, and care taken not to agitate it; and then on dropping in a bit of ice, or on mere agitation, ſpiculæ of ice ſhoot ſuddenly through the water, and the incloſed thermometer riſes quickly to the freezing point, where it remains ſtationary." In a note he ſays, that though in conformity to the common opinion he has allowed that "mere agitation may ſet the water a freezing, yet ſome experiments lately made by Dr Blagden ſeem to ſhow, that it has not much, if any, effect of that kind, otherwiſe than by bringing the water in contact with ſome ſubſtance colder than itſelf. Though in general alſo the ice ſhoots rapidly, and the incloſed thermometer riſes very quick; yet he once obſerved it to riſe very ſlowly, taking up not leſs than half a minute, before it aſcended to the freezing point; but in this experiment the water was cooled not more than one or two degrees below freezing; and it ſhould ſeem, that the more the water is cooled below the freezing point, the more rapidly the ice ſhoots and the encloſed thermometer riſes."

Mr Cavendiſh then obſerves, "that from the foregoing experiments we learn that water is capable of being cooled conſiderably below the freezing point, without any congelation taking place; and that, as ſoon as by any means a ſmall part of it is made to freeze, the ice ſpreads rapidly through the whole of the water. The cauſe of this riſe of the thermometer is, that all, or almoſt all bodies, by changing from a fluid to a ſolid ſtate, or from the ſtate of an elaſtic to that of an unelaſtic fluid, generate heat; and that cold is produced by the contrary proceſs. Thus all the circumſtances of the phenomenon may be perfectly well explained: for, as ſoon as any part of the water freezes, heat will be generated thereby in conſequence of the abovementioned law, ſo that the new formed ice and remaining water will be warmed, and muſt continue to receive heat by the freezing of freſh portions of water, till it is heated exactly to the freezing point, unleſs the water could become quite ſolid before a ſufficient quantity of heat was generated to raiſe it to that point, which is not the caſe: and it is evident, that it cannot be heated above the freezing point; for as ſoon as it comes thereto, no more water will freeze, and conſequently no more heat will be generated.---The reaſon why the ice ſpreads all over the water, inſtead of forming a ſolid lump in one part, is, that, as ſoon as any ſmall portion of ice is formed, the water in contact with it will be ſo much warmed as to be prevented from freezing, but the water at a little diſtance from it will ſtill be below the freezing point, and will conſequently begin to freeze.

"Were it not for this generation of heat, the whole of any quantity of water would freeze as ſoon as the proceſs of congelation began; and in like manner the cold is generated by the melting of ice; which is the cauſe of the long time required to thaw ice and ſnow. It was formerly found that, by adding ſnow to warm water, and ſtirring it about until all was melted, the water was as much cooled as it would have been by the addition of the ſame quantity of water rather more than 150° degrees colder than the ſnow; or, in other words, ſomewhat more than 150° of cold are generated by the thawing of the ſnow; and there is great reaſon to believe that juſt as much heat is produced by the freezing of water. The cold generated in the experiment juſt mentioned was the ſame whether ice or ſnow was uſed.

22 On metals when beginning to turn ſolid.

"A thermometer kept in melted tin or lead till they become ſolid, remains perfectly ſtationary from the time the metal begins to harden round the ſides of the pot till it is entirely ſolid; but it cannot be perceived at all to ſink below that point, and riſe up to it when the metal begins to harden. It is not unlikely, however, that the great difference of heat between the air and melted metal might prevent this effect from taking place; ſo that though it was not perceived in theſe experiments, it is not unlikely that thoſe metals, as well as water and quickſilver, may bear being cooled a little below the freezing or hardening point (for the hardening of melted metals, and freezing of water, ſeems exactly the ſame proceſs), without beginning to loſe their fluidity."

"The experiments of Mr Hutchins prove, that quickſilver contracts or diminiſhes in bulk by freezing; and that the very low degrees to which the thermometers have been made to ſink, is owing to this contraction, and not to the cold having been in any degree equal to that ſhown by the thermometer. In the fourth experiment, one of the thermometers ſunk to 450°, though it appeared, by the ſpirit thermometers that the cold of the mixture was not more than five or ſix degrees below the point of freezing quickſilver. In the firſt experiment alſo, it ſunk to 448, at a time when the cold of the mixture was only $2\frac{1}{4}$ below that point: ſo that it appears, that the contraction of quickſilver by freezing, muſt be at laſt equal to its expanſion by 404 degrees of heat. (A) This however, is not the whole contraction that it ſuffers; for it appears by an extract from a meteorological journal kept by Mr Hutchins at Albany fort, that his thermometer once ſunk to 490° below 0; though it was known by a ſpirit thermometer, that the cold ſcarcely exceeded the point of freezing quickſilver. There are two experiments alſo of Profeſſor Braun, in which the thermometer ſunk to 544 and 556° below nothing; which is the greateſt deſcent he ever obſerved without the ball being cracked. It is not indeed known how cold his mixtures were; but from Mr Hutchin's experiments, there is great reaſon to think they could not be many degrees below 40°. If ſo, the contraction which quickſilver ſuffers in freezing, is not much leſs than its expanſion by 500° or 510° of heat, that, is almoſt $\frac{1}{18}$ of its whole bulk; and in all probability is never much more than that, though it is probable that this contraction is not always determinate: for a conſiderable variation may frequently be obſerved in the ſpecific gravity of the ſame piece of metal caſt different times over; and almoſt all caſt metals become heavier by hammering.

23 Variation of the denſity of metals by frequent caſting.

Mr Cavendiſh obſerved, that on caſting the ſame piece of tin three times over, its denſity varied from 7.252 to 7.294, though there was great reaſon to think that no hollows were left in it, and that only a ſmall part of this difference could proceed from the error of the experiment. This variation of denſity is as much as is produced in quickſilver by an alteration of 66° of heat; and it is not unlikely, that the deſcent of a thermometer, on account of the contraction of the quickſilver in its ball by freezing, may vary as much in different trials, though the whole maſs of quickſilver is frozen without any vacuities.

24 Of freezing mixtures.

"The cold produced by mixing ſpirit of nitre with ſnow is entirely owing to the melting of the ſnow. Now, in all probability, there is a certain degree of cold in which the ſpirit of nitre, ſo far from diſſolving ſnow, will yield part of its own water, and ſuf-

---

(A) "The numbers here given are thoſe ſhown by the thermometer without any correction; but if a proper allowance is made for the error of that inſtrument, it will appear, that the true contraction was 25° leſs than here ſet down; and from the manner in which thermometers have been uſually adjuſted, it is likely that in the 5th experiment of Mr Hutchins, as well as in thoſe of Profeſſor Braun, the true contraction might equally fall ſhort of that by obſervation."

ſuffer that to freeze, as is the caſe with ſolutions of common ſalt; ſo that if the cold of the materials before mixing is equal to this, no additional cold can be produced. If the cold of the materials is leſs, ſome increaſe of cold will be produced; but the total cold will be leſs than in the former caſe, ſince the additional cold cannot be generated without ſome of the ſnow being diſſolved, and thereby weakening the acid, and making it leſs able to diſſolve more ſnow; but yet the leſs the cold of the materials is, the greater will be the additional cold produced. This is conformable to Mr Hutchins's experiments; for, in the fifth experiment, in which the cold of the materials was —40°, the additional cold produced was only 5°. In the firſt experiment, in which the cold of the materials was only —23°, an addition of at leaſt 19° of cold was obtained; and by mixing ſome of the ſame ſpirit of nitre with ſnow in this climate, when the heat of the materials was +26°, Mr Cavendiſh was able to ſink the thermometer to —29°, ſo that an addition of 55 degrees of cold was produced.

“ It is remarkable, that in none of Mr Hutchins's experiments the cold of the mixture was more than 6° of the ſpirit thermometer below the freezing point of quickſilver, which is ſo little, that it might incline one to think that the ſpirit of nitre uſed by him was weak. This, however, was not the caſe; as its ſpecific gravity at 58° of heat was 1,4923. It was able to diſſolve $\frac{1}{1.42}$ its weight of marble, and contained very little mixture of the vitriolic or marine acid: as well as could be judged from an examination of it, it was as little phlogiſticated as acid of that ſtrength uſually is.”

25 Congelation of oil of vitriol.

Acids, eſpecially thoſe of the mineral kind, powerfully reſiſt congelation. There is, however, a peculiarity with regard to that of vitriol. Mr Chaptal, a foreign chemiſt, obſerved that it condenſed by the cold of the atmoſphere, and the cryſtals began to melt only at +70° of his thermometer; which, if Reaumur's, correſponds to about 47° of Fahrenheit. The cryſtals were unctuous from the melting acid, and they felt warmer than the neighbouring bodies: the form was that of a priſm of ſix ſides, flatted and terminated by a pyramid of ſix ſides, but the pyramid appeared on one end only; on the other, the cryſtal was loſt in the general maſs. The pyramid reſulted from an aſſemblage of ſix iſoſceles triangles: the oil when the cryſtal was melted was of a yellowiſh black; on rediſtilling it in a proper apparatus, no peculiar gas came over. M. Chaptal repeated his experiments with the highly concentrated acid, but found that it did not freeze; that the denſity of the acid which he thought froze moſt eaſily was to the oil, of the uſual ſtrength for ſale, as from 63 and 65 to 66; and the neceſſary degree of cold about 19 of Fahrenheit. Oil of vitriol once melted will not cryſtallize again with the ſame degree of cold.

M. Moré, a conſiderable manufacturer of oil of vitriol at Hadimont near Vervier, in the duchy of Limbourg in Germany, attributes this congelation to the addition of nitrous air. The acid of vitriol is uſually ſeparated from ſulphur by burning it in cloſe veſſels; and the air is ſupplied by adding to the ſulphur a little nitre. He found, that by mixing the acid, capable of being congealed, with water, or employing it for other purpoſes, orange-coloured fumes, and the ſmell of the true nitrous acid, were very evident. When this gas was deſtroyed, no degree of cold would congeal the acid, whatever was its degree of concentration; and the congelation was generally obſerved immediately after the proceſs by which the acid was obtained.

Mr Macquer relates, in the ſecond edition of his Chemical Dictionary, article *Vitriolic Acid*, that the Duke d'Ayen had obſerved the congelation of concentrated vitriolic acid, which had been expoſed to a cold expreſſed by 13 or 14 degrees below 0 on Reaumur's thermometer; but that mixtures, conſiſting of one part of the abovementioned concentrated acid, with two or more parts of water, could not be frozen by the cold to which he expoſed them, till he had diluted the acid ſo much that its denſity was to that of water as 104½ to 96; in which latter caſe of congelation it is probable that the water only was frozen, as is the caſe in dilute ſolutions of ſalts. Similar experiments were made by M. de Morveau, and with equal ſucceſs. Having produced an intenſe cold by pouring ſpirit of nitre on pounded ice, he congealed a part of ſome vitriolic acid which had been previouſly concentrated; but he obſerved, that though a very intenſe cold had been made uſe of to congeal the acid at firſt, it nevertheleſs remained congealed in much ſmaller degrees of cold, and that it thawed very ſlowly. This coincides with the obſervations of M. Chaptal; though the latter obſerves, that there is ſome difference between ſtrong oil of vitriol lowered with water, and that produced of a given ſtrength by rectification. The latter always has ſome colour; and it will not diſſolve indigo in ſuch a manner as to carry the colour into the ſtuff, though the ſtronger oil, diluted to the ſame degree, ſucceeds very well. Some obſervations were alſo made by Mr M'Nab at Hudſon's Bay, an account of which is given in the Phil. Tranſ. for 1786 by Mr Cavendiſh, at whoſe deſire they had been made. From them it appears, that a vitriolic acid, whoſe ſpecific gravity was to that of water as 1843 to 1000, froze when expoſed to a cold of —15° of Fahrenheit's ſcale; that another more dilute vitriolic acid, conſiſting of 629 parts of the former concentrated acid, and 351 parts of water, congealed in a temperature of —36; and that, when farther diluted, it was capable of ſuſtaining a much greater degree of cold without freezing at all. In theſe experiments, as well as in thoſe of Mr Morveau, it appeared that the whole of the acid did not congeal, but that part of it retained its fluidity; and on examining the ſtrength of that which remained fluid, Mr Cavendiſh found that there was very little difference between it and the other; whence he was led to ſuppoſe, that the reaſon of this congelation does not ariſe from any difference in ſtrength, but on ſome leſs obvious quality, and ſuch as conſtitutes the difference between common and icy oil of vitriol.

In all the experiments hitherto made, however, Mr Cavendiſh had found ſome uncertainty in determining the point of eaſieſt freezing; neither could he determine whether the cold neceſſary for congelation does not increaſe without any limitation in proportion to the ſtrength of the acid. A new ſet of experiments were

were

20 Mr Kier's experiments.

were therefore made by Mr Kier to determine this point. He had obſerved, after a ſevere froſt at the end of the year 1784 and beginning of 1785, that ſome vitriolic acid, contained in a corked phial, had congealed, while other bottles containing the ſame, ſome ſtronger and ſome weaker, retained their fluidity. As the congelation was naturally imputed to the extremity of the cold, he was afterwards ſurpriſed to find, when the froſt ceaſed, that the acid remained congealed for many days, when the temperature of the atmoſphere was ſometimes above 40° of Fahrenheit; and when the congealed acid was brought into a warm room on purpoſe to thaw it, a thermometer placed in contact with it during its thawing continued ſtationary at 45°. Hence he concluded, that the freezing and thawing point of this acid was nearly at 45°; and accordingly, on expoſing the liquor which had been thawed to the air at the temperature of 30°, the congelation again took place in a few hours. From the circumſtance of other parcels of the ſame acid, but of different ſtrengths, remaining fluid, though they had been expoſed to a much greater degree of cold, he was led to believe that there muſt be ſome certain ſtrength at which the acid is more diſpoſed to congeal than at any other. The ſpecific gravity of the acid which had frozen was to that of water nearly as 1800 to 1000, and that of the ſtronger acid which had not frozen was as 1846 to 1000, which is the common denſity of that uſually ſold in England; and there was not the leaſt difference, excepting in point of ſtrength, between the acid which had frozen and that which had not; Mr Kier having taken the acid ſome weeks before with his own hands from the bottle which contained the latter, and diluted it with water, till it became of the ſpecific gravity of 1800.

To render the experiment complete, Mr Keir immerſed ſeveral acids of different ſtrengths in melting ſnow, inſtead of expoſing them to the air; the temperature of which was variable, whereas that of melting ſnow was certain and invariable. Thoſe which would not freeze in melting ſnow were afterwards immerſed in a mixture of common ſalt, ſnow, and water; the temperature of which, though not ſo conſtant and determinate as that of melting ſnow, generally remained for ſeveral hours at 18°, and was ſometimes ſeveral degrees lower. The intention of adding water to the ſnow and ſalt was to leſſen the intenſity of the cold of this mixture, and to render it more permanent than if the ſnow and ſalt alone were mixed. The acids which had frozen in melting ſnow were five in number; which being thawed and brought to the temperature of 60°, were found on examination to have the following ſpecific gravities, viz. 1786, 1784, 1780, 1778, 1775. Thoſe which had not congealed with the melting ſnow, but which did ſo with the mixture of ſnow, ſalt, and water, were found, when brought to the temperature of 60°, to be of the following ſpecific gravities, viz. 1814, 1810, 1804, 1794, 1790, 1770, 1759, 1750. Thoſe which remained, and would freeze neither in melting ſnow nor in the mixture of ſnow, ſalt, and water, were of the gravities 1846, 1839, 1815, 1745, 1720, 1700, 1610, 1551. From the firſt of theſe it appears, that the medium denſity of the acids which froze with the natural cold was 1780; and from the ſecond, that at the denſities of 1790 and 1770 the acid had been incapable of freezing with that degree of cold. Hence it follows, that 1780 is nearly the degree of ſtrength of eaſieſt freezing, and that an increaſe or diminution of that denſity equal to $\frac{1}{178}$th of the whole, renders the acid incapable of freezing with the cold of melting ſnow, though this cold is ſomething above the freezing point of the moſt congealable acid. From the ſecond it appears, that by applying a more intenſe cold, viz. that produced by a mixture of ſnow, ſalt, and water. the limits of the denſities of acids capable of congelation were extended to about $\frac{3}{178}$th above or below the point of eaſieſt freezing: and there ſeems little reaſon to doubt, that, by greater augmentations of cold, theſe limits may be further extended; but in what ratio theſe augmentations and extenſions proceed, cannot be determined without many obſervations made in different temperatures.

"But (ſays Mr Keir) though it is probable that the moſt concentrated acids may be frozen, provided the cold be ſufficiently intenſe, yet there ſeems reaſon to believe, that ſome of the congelations which have been obſerved in highly concentrated acids, have been effected in conſequence of the denſity of theſe acids being reduced nearly to the point of eaſy freezing by their having abſorbed moiſture from the air: for the Duke d'Ayen and M. de Morveau expoſed their acids to the air in cups or open veſſels; and the latter even acquaints us, that on examining the ſpecific gravity of the acid which had frozen, he found it to that of water as 129 to 74; which denſity being leſs than that of eaſieſt freezing, proves that the acid he employed, and which he had previouſly concentrated, had been actually weakened during the experiment. I have ſeveral times expoſed concentrated oil of vitriol in open veſſels in froſty weather; and I have ſometimes, but not always, obſerved a congelation to take place. Upon ſeparating the congealed part, and on examining the ſpecific gravity of the latter after it had thawed, I found that it had been reduced to the point of eaſieſt freezing. When the congealed acid was kept longer expoſed it gradually thawed, even when the cold of the air increaſed; the reaſon of which is not to be imputed to the heat produced by the moiſture of the air mixing with the acid, but principally to the diminution below the point of eaſieſt freezing, which was occaſioned by the continued abſorption of moiſture from the air, and which rendered the acid incapable of continuing frozen without a great increaſe of cold,

"It appears, then, that the concentration of M. de Morveau's acid, at the time of its congelation, from which circumſtance Mr Cavendiſh infers generally that the vitriolic acid freezes more eaſily as it is more denſe, is not a true premiſe; and that therefore the inference, though juſtly deduced, is invalid. On the contrary, there ſeems every reaſon to believe, that as the denſity of the acids increaſes beyond the point of eaſieſt freezing, the facility of the congelation diminiſhes; at leaſt to as great denſity as we have ever been able to obtain the vitriolic acid: for if it were poſſible to diveſt it entirely of water, it would probably aſſume a ſolid form in any temperature of the air.

" The cryſtallization of the vitriolic acid is more or leſs diſtinct, according to the ſlowneſs of the formation of the cryſtals and other favourable circumſtances. Sometimes they are very large, diſtinctly ſhaped, and hard. Their ſhape is like thoſe of the common mineral alkali and ſelenite ſpar, but with angles different in dimenſions from either of theſe. They are ſolid, conſiſting of ten faces; of which the two largeſt are equal, parallel, and oppoſite to each other; and are oblique-angled parallelograms or rhomboids, whoſe angles are, as near as could be meaſured, of 105 and 75 degrees. Between theſe two rhomboidal faces are placed eight of the form of trapeziums; and thus each cryſtal may be ſuppoſed to be compounded of two equal and ſimilar fruſtums of pyramids joined together by their rhomboidal baſes. They always ſunk in the fluid acid to the bottom of the veſſel, which ſhowed that their denſity was increaſed by congelation. It was attempted to determine their ſpecific gravity by adding to this fluid ſome concentrated acid, which ſhould make them float in the liquor, the examination of whoſe ſpecific gravity ſhould aſcertain that of the floating cryſtals; but they were found to ſink even in the moſt concentrated acid, and were conſequently denſer. Some of the congealable acid previouſly brought to the freezing temperature was then poured into a graduated narrow cylindrical glaſs, up to a certain mark, which indicated a ſpace equal to that occupied by 200 grains of water. The glaſs was placed in a mixture of ſnow, ſalt, and water; and when the acid was frozen, a mark was made on the part of the glaſs to which it had ſunk. Having thawed the acid and emptied the glaſs, it was filled with water to the mark to which it had ſunk by freezing; and it was then found that 15 grains more of water were required to raiſe it to the mark expreſſing 200 grains; which ſhows, that the diminution of bulk ſuſtained by the acid in freezing had been equal to $\frac{1}{13.3}$ of the whole. Computing from this datum, we ſhould eſtimate the ſpecific gravity of the congealed acid to have been 1924; but as it evidently contained a great number of bubbles, its real ſpecific gravity muſt have been conſiderably greater than the above calculation, and cannot eaſily be determined on account of theſe bubbles. By way of compariſon, Mr Keir obſerved the alteration of bulk which water contained in the ſame cylindrical veſſel would ſuffer by freezing; and found that its expanſion was equal to about $\frac{1}{8}$th of its bulk. The water had been previouſly boiled, but nevertheleſs contained a great number of air bubbles; ſo that in this reſpect there is a conſiderable difference between the congelations of water and the vitriolic acid; though perhaps it may ariſe principally from the bubbles of elaſtic fluid being in greater proportion in the one than the other.

" Greater cold is produced by mixing ſnow or pounded ice with the congealed than with the fluid vitriolic acid, though the quantity is not yet determined. The greateſt cold produced by Mr M'Nab at Hudſon's Bay, was effected by mixing ſnow with a vitriolic acid which had been previouſly congealed; and to this circumſtance Mr Cavendiſh imputes the intenſity of the cold, as the liquefaction both of the acid and the ſnow had concurred in producing the ſame effect; while in mixing fluid acids with ſnow, the thawing of the ſnow is probably the only productive cauſe.

" To compare the times requiſite for the liquefaction of ice and of congealed oil of vitriol, two equal and ſimilar glaſſes were filled, one with the congealable vitriolic acid, the other with water; and after having immerſed them in a freezing mixture till both were congealed and reduced to the temperature of 28°, the glaſſes were withdrawn, wiped dry, and placed in a room where the thermometer ſtood at 62°. The ice thawed in 40 minutes, and the acid in 95; at the end of which time the thermometer, which ſtood near the glaſſes, had riſen to 64°. Hence it appears that the congealed acid requires more than twice the time for its liquefaction that ice does, though it cannot thence be fairly inferred, that the cold generated by the liquefaction of the ice and of congealed acid are in the above proportions of the times, from the following conſiderations, *viz.* that as, during the liquefaction of the ice, its temperature remains ſtationary at 32°, and during the liquefaction of the acid, its temperature remains about 44 or 45°, it appears, that the ice being conſiderably colder than the acid, will take the heat from the contiguous air much faſter. By this experiment, however, we know that a conſiderable quantity of cold is generated by the liquefaction of the acid; and hence it appears probable, that in producing cold artificially, by mixing ſnow with acids in very cold temperatures, it would probably be uſeful to employ a vitriolic acid of the proper denſity for congelation, and to freeze it previouſly to its mixture with ſnow. It muſt not, however, be imagined, that the cold generated by the mixture of theſe two frozen ſubſtances is nearly equal to the ſums of the colds generated by the ſeparate liquefactions of the congealed acid and ice, when ſingly expoſed to a thawing temperature; for the mixture reſulting from the liquefaction, conſiſting of the vitriolic acid and the water of the ſnow, appears from the generation of heat which occurs from the mixture of theſe ingredients in a fluid ſtate, to be ſubject to different laws than thoſe which rule either of the ingredients ſeparately.

" The vitriolic acid, like water and other fluids, is capable of retaining its fluidity when cooled conſiderably below its freezing point. A phial containing ſome congealable vitriolic acid being placed in a mixture of ſalt, ſnow, and water, a thermometer was ſoon afterwards immerſed in it while the acid was yet fluid, on which it quickly ſunk from 50 to 29°. On moving the thermometer in the fluid, to make it acquire the exact temperature, the mercury was obſerved ſuddenly to riſe; and on looking at the acid, numberleſs ſmall cryſtals were obſerved floating in it, which had been ſuddenly formed. The degree to which the mercury then roſe was $46\frac{1}{4}$°; and at another time, while the acid was freezing, it ſtood at 45°."

From theſe experiments our author infers, " 1. That the vitriolic acid has a point of eaſieſt freezing, and that this is when its ſpecific gravity is to that of water as 1780 to 1000. 2. That the greater or leſs diſpoſition to congelation does not depend on any other circumſtance than the ſtrength of the acid. 3. That the freezing and thawing degree of the moſt congealable acid is about 45° of Fahrenheit's ſcale. It is, however, to be obſerved, that this degree is inferred from the temperature indicated by the thermometers immerſed in the freezing and thawing acids; but the congelation of the fluid acid could never be accompliſhed without expoſing it to a greater degree of cold, either by expoſing it to the air in froſty weather or to the cold of melting ſnow. 4. Like water, this acid poſſeſſes the property of retaining its fluidity when cooled ſeveral degrees below the freezing point; and of riſing ſuddenly to it when its congelation is promoted by agitation, or by contact even with a warmer thermometer. 5. That, like water and other congelable fluids, the vitriolic acid generates cold by its liquefaction, and heat during its congelation, though the quantity of this heat and cold remains to be determined by future experiments. 6. That the acid, by congelation, when the circumſtances for diſtinct cryſtallization are favourable, aſſumes a regular cryſtalline form, a conſiderable ſolidity and hardneſs, and a denſity much greater than it poſſeſſed in its fluid ſtate."

Beſides this ſpecies of congelation, the vitriolic acid is ſubject to another, probably the ſame deſcribed by Baſil Valentine and ſome of the older chemiſts. This is effected in the ordinary temperature of the air, even in ſummer; and, according to Mr Keir*, is peculiar to that ſpecies of oil of vitriol which is diſtilled from green vitriol, and which is poſſeſſed of a ſmoking quality in a high degree; "for not only the authors (ſays Mr Keir), by whom this congelation has been obſerved, have given this deſcription of the acid employed, but alſo the late experiments of Mr Dollfuſs, ſeem to ſhow that this ſmoking quality is eſſential to the phenomenon: for neither the acid obtained from vitriol, when deprived by rectification of its ſmoking quality, nor the Engliſh oil of vitriol, which is known to be obtained by burning ſulphur, and which does not ſmoke, were found by his trials to be ſuſceptible of this ſpecies of congelation. It may, however, be worth the attention of thoſe chemiſts who have an opportunity of ſeeing this *icy oil of vitriol*, as it is called, to obſerve more accurately than has yet been done, the freezing temperature and the denſity of the congealable acids; and to examine whether the denſity of this ſmoking acid alſo is connected with the glacial property. It ſeems alſo further deſerving of inveſtigation, whether there be not ſome analogy between the congelation of the ſmoking oil of vitriol and the very curious cryſtallization which Dr Prieſtley obſerved in a concentrated vitriolic acid ſaturated with nitrous acid vapours; and whether this ſmoking quality does not proceed from ſome marine or other volatile acid, which may be contained in the martial vitriol whence the vitriolic acid is obtained."

Mr Keir alſo obſerves, that M. Cornatter has effected the cryſtallization of vitriolic acid, by diſtilling it with nitrous acid and charcoal; and we can add from our own experience, that a cryſtallization inſtantly takes place on allowing the fumes of the nitrous and vitriolic acids to mix together; and this, whether the former be procured from martial vitriol or ſulphur, and whether it be in a phlogiſticated ſtate or not, concentration in both acids is here the only requiſite.

CONGER, in zoology. See **MURÆNA**.

CONGERIES, a Latin word, ſometimes uſed in our language for a collection or heap of ſeveral particles or bodies united into one maſs or aggregate.

CONGESTION, in medicine, a maſs or collection of humours, crowded together and hardened in any part of the body, and there forming a preternatural tumor.

Congeſtion is effected by little and little: in which it differs from *defluction*, which is more ſudden.

CONGIARIUM, **CONGIARY**, among medaliſts, a gift or donative repreſented on a medal. The word comes from the Latin *congius*; becauſe the firſt preſents made to the people of Rome conſiſted in wine and oil, which were meaſured out to them in *congii*. The congiary was properly a preſent made by the emperors to the people of Rome. Thoſe made to the ſoldiers were not called *congiaries* but *donatives*. The legend on medals repreſenting *congiaries*, is, *Congiarium* or *Liberalitas*. Tiberius gave a congiary of three hundred pieces of money to each citizen: Caligula twice gave three hundred ſeſterces a head: Nero, whoſe congiaries are the firſt that we find repreſented on medals, gave four hundred.

CONGIUS, a liquid meaſure of the ancient Romans, containing the eighth part of the amphora, or the fourth of the urna, or ſix ſextarii. The congius in Engliſh meaſure contains 2,070,676 ſolid inches; that is ſeven pints, 4,942 ſolid inches.

CONGLOBATE GLAND. See **ANATOMY**.

CONGLOMERATE GLAND. *Ibid.*

CONGLOMERATE Flowers, are thoſe growing on a branching foot-ſtalk, to which they are irregularly but cloſely connected. This mode of infloreſcence, as Linnæus terms it, is oppoſed to that in which the flowers are irregularly and looſely ſupported on their foot-ſtalks, hence termed a *diffuſe panicle**. The term is exemplified in ſeveral of the graſſes, particularly in ſome ſpecies of the *poa*, feſcue graſs, and agroſtis.

CONGLUTINATION, the gluing or faſtening any two bodies together by the intromiſſion of a third, whoſe parts are unctuous and tenacious, in the nature of glue. See **GLUE**.

1 Extent.

CONGO, a kingdom of Africa, bounded on the north by the river Zair, or Zarah, which divides it from Loanga; on the ſouth by the river Danda, which ſeparates it from Angola; on the eaſt by the kingdoms of Fungono and Metamba, and the burnt mountains of the ſun, thoſe of chryſtal or ſalt-petre and ſilver, or (according to Anthony Cavazzi, a late traveller into thoſe parts) by the moutains of Boanza, Berbela, and the great mountain of Chilandia or Aquilonda; and on the weſt by that part of the Atlantic ocean called the Ethiopic ſea, or the ſea of Congo. According to theſe limits, Congo Proper extends about three degrees from north to ſouth; lying between 6° and 9° S. Lat.; but widens in its breadth inland, by the courſe of the river Zair, which runs winding above two degrees more to the north. Its length from eaſt to weſt is very uncertain, as no obſervations have been taken of the exact ſituation of thoſe mountains which bound it.

2 Hiſtory uncertain and fabulous.

The hiſtory of this kingdom affords but few intereſting particulars. Before its diſcovery by the Portugueſe, the hiſtory is altogether uncertain and fabulous, as the inhabitants were totally unacquainted with

---

* Phil. Tranſ. vol. lxxvii. p. 267.

* See Panicle.

letters and learning. So little were they acquainted with chronology, that it is ſaid they did not even diſtinguiſh between day and night; much leſs could they compute their time by moons or years; and therefore could remember paſt tranſactions only by ſaying they happened in ſuch a king's reign.

3
The country diſcovered by the Portugueſe.

The country was diſcovered by the Portugueſe in 1484. The diſcoverer was named Diego Cam, an expert and bold ſailor. He was very well received by the natives, and ſent ſome of his men with preſents to the king; but they being detained by unexpected accidents beyond the promiſed time of their return, Cam was obliged to ſail away without them, and took with him four young Congoeſe, as hoſtages for the ſafety of his countrymen. Theſe he taught the Portugueſe language, in which they made ſuch progreſs that king John was highly pleaſed, and ſent them back next year to Congo with rich preſents; charging them to exhort their monarch, in his name, to become a convert to the Chriſtian religion, and to permit it to be propagated through his dominions. A firm alliance was concluded between the two monarchs, which continues to this day, though not without ſome interruptions, to which the Portugueſe themſelves have given occaſion more than the natives.

4
Cavazzi's account of Congo.

Any particular account we have of this kingdom, reſts almoſt entirely on the credit of Anthony Cavazzi, the traveller abovementioned. He was a capuchin-friar, a native of the duchy of Modena, and was ſent miſſionary into thoſe parts *de propaganda fide*, in the year 1654, and arrived at Congo the ſame year. During his ſtay there, his zeal to make converts made him travel through all theſe different kingdoms; and the credit he gained, as well as the great employments he was intruſted with, gave him an opportunity of informing himſelf of every thing relating to them with great exactneſs. The extent and ſituation, however, he could not poſſibly aſcertain, for want of inſtruments, nor hath this defect been ſince ſupplied. According to him, the dominions of Congo extended a great deal further eaſtward and ſouthward before the introduction of Chriſtianity than afterwards; a great number of the ſtates that were under the Congoeſe monarchs, either as ſubjects, or tributary, having withdrawn their allegiance out of diſlike to them on that account. Not content with oppoſing the officers and troops that came annually to raiſe the tribute impoſed by the king, they made ſuch frequent and powerful incurſions into his dominions, that they obliged him to draw his forces nearer the centre of Congo to prevent an invaſion; by which means the kingdom, from an extent of 600 leagues, was reduced to leſs than one half.

5
Extent leſſened ſince the introduction of Chriſtianity.

6
Account of the climate and ſeaſons.

Congo Proper being ſituated within the torrid zone, is liable to exceſſive heats: as it lies on the ſouthern ſide of the equinoctial, the ſeaſons are of courſe oppoſite to ours. They reckon only two principal ſeaſons, the ſummer and winter; the former begins in October, and continues till February or March; during which time the ſun's rays dart with ſuch force, that the atmoſphere appears to an European to be in a flame. The exceſſive heat, however, is mitigated by the equal length of the days and nights, as well as by the winds, breezes, rains, and dews. The winter takes up the other part of the year; and is ſaid by the natives to be proportionally cold, though to an European it would appear hot. Theſe two ſeaſons they divide into ſix leſſer ones, *viz*. Maſſanza, Neaſu, Ecundi, Quitombo, Quibiſo, and Quibangala.

Maſſanza begins with the month of October, which is the beginning of their ſpring. The rains begin to fall at that time, and continue during the next two, and ſometimes three, months. When they do ſo, the low lands are commonly overflowed by the extraordinary floods, and all their corn carried off. A diſaſter of this kind is commonly followed by a famine; for the lazy inhabitants take no care to lay up any proviſions, although ſuch misfortunes happen very frequently. This firſt ſeaſon they reckon commences at the time the plants begin to ſpring.

The ſecond ſeaſon, Neaſu, begins about the end of January, when the produce of their lands has arrived at its full height, and wants but a few days of being ripened for harveſt. This firſt crop is no ſooner gathered in, than they ſow their fields afreſh, their land commonly yielding them two harveſts.

The third and fourth ſeaſons, called *Ecundi* and *Quitombo*, are frequently blended together towards the middle of March, when the more gentle rains begin to fall, and continue to do ſo till the month of May. Theſe two ſeaſons are diſtinguiſhed by the greater or leſſer quantity of rain that falls during that interval. During the reſt of the time, the air is either very clear, hot, and dry; or the clouds being overcharged with electric matter, burſt out into the moſt terrible thunders and lightnings, without yielding the leaſt drop of rain, though they ſeem loaded with it.

The two laſt, *viz*. the Quibiſo and Quibangala, make up their ſhort winter, which conſiſts not in froſt or ſnow, but in dry, blaſting winds, which ſtrip the earth of all its verdure, till the next Maſſanza begins to reſtore them to their former bloom.

7
Natives exceſſively indolent.

They now divide their year into twelve lunar months, and begin it in September. They have alſo weeks conſiſting of four days only, the laſt of which is their ſabbath; and on it they religiouſly abſtain from every kind of work. This practice, the compilers of the Univerſal Hiſtory conjecture to have ariſen from the extreme lazineſs for which this people, and indeed all the African nations, are ſo remarkable. To this ſhameful indolence alſo is to be aſcribed the little produce they reap from their lands, while the Portugueſe ſettled among them, who are at more pains in the cultivation of theirs, enjoy all manner of plenty. The natives, however, had rather run the riſk of the moſt terrible famines, than be at the tenth part of the labour they ſee the Portugueſe take. They ſeem to think it below them to uſe any other exerciſes than thoſe of dancing, leaping, hunting, ſhooting, &c.; the reſt of their time they ſpend in ſmoking, and downright idleneſs, committing the laborious part of their houſehold affairs to their ſlaves, or, in want of them, to their wives. Nothing is more common than to ſee theſe poor creatures toiling in the fields and woods with a child tied to their backs, and fainting under their exceſſive labour and heavy burdens, or (which is ſtill worſe) hunger and thirſt. What is yet more ſurpriſingly ſhameful is, that though they have plenty of domeſtic animals which they might eaſily make uſe of for cultivating their grounds, and for other laborious ſervices, and though they ſee the Portugueſe do it every day to great advantage; yet they will rather ſee their tender females ſink under their toil and labour, than be at the trouble of breeding up any of theſe uſeful creatures to their aſſiſtance.

8 Vegetables produced in Congo. The ground produces variety of grain, but no corn or rice except what is cultivated by the Portugueſe. Their maize, or Indian wheat, grows very ſtrong, and is well laden. This, being well ground, they make into bread, or boil with water into a kind of pap. Of this they have four kinds; one of which reſembling what we call French wheat, is produced in plenty, and makes ſome amends for the want of induſtry in the people. They cultivate alſo a variety of the peaſe and bean kind: but what they chiefly live upon, as moſt ſuitable to their lazy diſpoſition, is a kind of nut, like our filberds, which fall to the ground of themſelves, and are to be found every where; every nut that falls to the ground producing a new ſhrub next year. They have ſcarcely any fruit-trees but what have been brought thither by the Portugueſe. They have various ſorts of palm-trees, uſeful both by their fruit, leaves, and their juice, which is eaſily converted into wine; alſo by affording a kind of oil with which they dreſs their victuals, though the Europeans uſe it only to burn in their lamps. They have alſo a vaſt number of plants and ſhrubs, which it would be impoſſible to deſcribe or enumerate. Wheat is the only thing that the ground will not produce. It puſhes forth, indeed, the ſtraw and the ear; the former of which grows high enough, we are told, to hide a man on horſeback, but the latter is empty, without one grain fit for uſe. Father Labat, however, who had lived a conſiderable time in ſome of the American iſlands, where he had obſerved the ſame thing, tells us, that he had the curioſity to examine thoſe ears more carefully and had found ſome few grains; and that, having ſowed them afreſh, they produced very long ears, full of large heavy grain. Whence he conjectures, that if the Portugueſe had tried the ſame experiment in their African ſettlements, it might perhaps have been attended with the ſame ſucceſs.

9 Hazardous travelling. In the low lands the graſs grows ſo high, rank, and thick, that it becomes one of the moſt dangerous receptacles for wild beaſts, ſerpents, and other venomous inſects: on this account travelling is exceedingly hazardous, as they have few beaten roads in the whole country, and travellers are obliged to march over it through vaſt plains, in continual danger of being devoured or ſtung to death; to ſay nothing of the manifold diſeaſes produced by the unwholeſome dews with which the graſs is covered during ſome part of the day. The only method of guarding againſt all theſe evils effectually, is by ſetting fire to the graſs in the hot weather, when it is quite parched by the heat of the ſun: but even this cannot be done without the greateſt danger; becauſe both the wild beaſts and venomous reptiles, being rouſed out of their places of retirement, will fly furiouſly at thoſe who happen to be in the way. In this caſe there is no poſſibility of eſcaping, but by climbing up the higheſt trees, or defending one's ſelf by fire-arms or other weapons. In ſuch emergencies, the natives have a much better chance than the Europeans; the former being able to climb trees with ſurpriſing ſwiftneſs; while the latter muſt be aſſiſted with rope-ladders, which they commonly cauſe their blacks to carry about with them, and to go up and faſten to one of the branches.

10 Great variety of flowers. The flowers are here exceedingly beautiful and numerous. Almoſt every field and grove yields a much nobler proſpect than the European gardens can boaſt of, notwithſtanding the pains beſtowed on their cultivation. The flowers are remarkable, not only for the prodigious variety of their colours, but the vaſt quantity of heads which grow upon one ſtalk. In the day-time, indeed, they ſeem to have loſt their natural fragrancy; that being in ſome meaſure exhaled by the heat of the ſun: but this is amply compenſated after its ſetting, and more eſpecially a little before its riſing, when their ſweetneſs is again condenſed, and revived by the coldneſs and dews of the night, after which they exhale their various refreſhing ſcents in a much higher degree than ours. The lilies, which there grow naturally in the fields, valleys, and woods, excel thoſe of our gardens, not only in their extreme whiteneſs, but much more in a delightful fragrancy, without offending the head, as the European lilies do by their faintiſh ſweetneſs. The tulips which there grow wild, though generally called *Perſic*, have ſomething ſo ſurpriſingly charming in the variety and combination of their colours, that they dazzle the eyes of an intenſe beholder: neither do their flowers grow ſingly as with us, but ten or twelve upon one ſtalk; and with this double advantage, that they diffuſe a very reviving and agreeable ſweetneſs, and continue much longer in their full bloom. Of the ſame nature are their tuberoſes, hyacinths, and other native flowers; which ſpring up in vaſt groups of 100 and 200 from one root, though ſomewhat ſmaller than ours; ſome of them finely variegated, and all of them yielding an agreeable ſmell. The roſes, jeſſamines, and other exotics brought thither from Europe or America, come up likewiſe in great perfection; but require a conſtant ſupply of water, and diligent attendance, to prevent them from degenerating. The American jeſſamine, in particular, inſtead of ſingle flowers, will grow up by dozens in a bunch: ſome of them of an exquiſite white, and others of the colour of the moſt vivid fire.

11 Animals of different kinds. A vaſt variety, of animals of different kinds are found in the kingdom of Congo; the chief of which are the elephant. This creature is moſtly found in the province of Bamba, which abounds with woods, paſture, and plenty of water; the elephants delighting much to bathe themſelves during the heat of the day. They commonly go in troops of an hundred or more; and ſome of them are of ſuch a monſtrous ſize, that we are told the print of their hoof hath meaſured four, nay *ſeven*, ſpans in diameter. From the hair of their tails, and that of ſome other animals, the natives, eſpecially the women, weave themſelves collars, bracelets, girdles, &c. with variety of devices and figures, which denote their quality; and are in ſuch eſteem, that the hair of two elephants tails is ſufficient to buy a ſlave. The reaſon of this is, that the natives have not the art of taming them, but are obliged to ſend ſome of their braveſt and ſtouteſt men to hunt them in the woods; which is not done without great labour and danger, they being here exceedingly fierce. The moſt common way of hunting

them is by digging deep holes in the ground, the top of which they cover with branches and leaves, as is practiſed in moſt parts of Aſia.

Lions, leopards, tigers, wolves, and other beaſts of prey, abound here in great plenty, and do much damage. Here are alſo a vaſt variety of monkeys of all ſizes and ſhapes. The zebra, well known for its extreme beauty and ſwiftneſs, is alſo met with in this country. They have alſo a variety of buffaloes and wild aſſes; but the *dante* ſeems to be an animal peculiar to this kingdom. It is ſhaped and coloured much like an ox, though not ſo large. Its ſkin is commonly bought by the Portugueſe, and ſent into Germany to be tanned and made into targets, which are then called *dantes*. The natives make uſe of their raw hide dried to make their ſhields; which are ſo tough that no arrow or dart can pierce them; and they are alſo large enough to cover the whole body. The creature is vaſtly ſwift; and when wounded, will follow the ſcent or ſmoke of the gunpowder with ſuch fury, that the hunter is obliged to climb up a tree with all poſſible ſpeed; and this retreat he always takes care to ſecure before he ventures to fire. The wounded beaſt finding its enemy out of its reach, ſtays for him at the foot of the tree, and will not ſtir from it; of which the hunter taking the advantage, diſpatches it with repeated ſhots. The foreſts of Congo alſo ſwarm with wild dogs, who, like the wolves, prey upon the tame cattle, and are ſo fierce that they will attack armed men. Their teeth are exceeding keen and ſharp; they never bark, but make a dreadful howling when famiſhed or in purſuit of their prey.

12 Birds.

This country alſo abounds with all the different kinds of birds that are to be found in other warm climates. One ſort, which they call *birds of muſic*, is greatly eſteemed, inſomuch that perſons of the higheſt rank have from time immemorial taken the greateſt delight in keeping them in cages and aviaries for the ſake of their ſurpriſing melody. On the other hand, as the Congoeſe are ſuperſtitious to the laſt degree, there are ſeveral kinds of birds which they look upon as ominous, and are ſo terrified at the ſight or hearing of them, that if they were going to enter upon ever ſo momentous an expedition, if they were met in council, or going to engage an enemy with ever ſo great an advantage, the flight or cry of ſuch birds would throw them into a general panic, and diſperſe them in the utmoſt haſte and confuſion. The moſt dreadful of the ominous kind are the crows, ravens, bats, and owls. The great owl is the moſt terrible of all, and to him they give the name of *kariem pemba*, by which words they likewiſe denote the devil.

Fiſh of different kinds abound on the coaſts of Congo in great numbers; but the inland parts are infeſted with ſuch numbers of ſerpents, ſcorpions, and other venomous inſects as are perhaps ſufficient to overbalance every natural advantage we have yet mentioned. 13 Ants very dangerous. The moſt pernicious and dangerous kind are the ants; of which they reckon no leſs than ſix ſeveral ſpecies of different colours and ſizes; all of them formidable on account of their prodigious numbers, and the miſchief they do not only to the fruits of the earth, but to men and beaſts; whom they will ſurround in the night time, and devour even to the very bone. It is a common practice, we are told, to condemn perſons guilty of ſome atrocious crimes to be ſtripped naked, tied hand and foot, and thrown into a hole where theſe inſects ſwarm; where they are ſure to be devoured by them in leſs than 24 hours to the very bones. But criminals are not the only perſons who are in danger from the jaws of theſe little devouring inſects. People may be attacked by them, as we have already hinted, in the night time, and while they are ſleeping in their beds. This obliges the natives to be careful where they lie down, and to kindle a ſmall fire, or at leaſt to have a circle of burning hot embers round their beds. This caution is ſtill more neceſſary in the country villages and hamlets, where perſons are otherwiſe in danger of being attacked by millions of them in the dead of the night. In ſuch a caſe, the only expedient to ſave one's ſelf is to jump up as ſoon as one feels the bite, to bruſh them off with all poſſible ſpeed, and then at once to ſet the houſe on fire. The danger is ſtill greater in travelling through the country where a perſon is often obliged to take up his lodging on the bare ground; and may be overtaken during the heat of the day with ſuch profound ſleep, as not to be wakened by theſe diminutive animals till they have made their way through the ſkin; and in ſuch a caſe nothing will prevent their devouring a man alive, though there were ever ſo many hands to aſſiſt him. In ſuch incredible quantities do theſe creatures abound, notwithſtanding the great numbers of monkeys who are continually ferreting the ants out of their retreats, and feed upon them with the utmoſt avidity. This can only be aſcribed to the natural lazineſs and indolence of the inhabitants; which is ſuch, that they not only neglect to rid their lands of them by proper cultivation, but will ſuffer their houſes, nay even their very churches, to be undermined by them. Another kind of theſe deſtructive vermin lie ſo thick upon the paths and highways, that a perſon cannot walk without treading upon, and having his legs and thighs almoſt devoured by them. A third ſort of a white and red colour, but very ſmall, will gnaw their way through the hardeſt wood, penetrate into a ſtrong cheſt, and in a little while devour all the cloths, linen, and every thing that is in it. A fourth ſort, ſmall and black, leave a moſt intolerable ſtench upon every thing they touch or crawl over, whether cloths or houſehold-ſtuff, which are not eaſily ſweetened again; or if they paſs over victuals, they are entirely ſpoiled. A fifth ſort harbour chiefly on the leaves and branches of trees; and if a man chance to climb up thither to ſave himſelf from a wild beaſt, he is ſo tormented by them, that nothing but the fear of the jaws of the one could make him endure the ſtings of the other. A ſixth ſort is of the flying kind; and is probably one of the former kinds, that live wholly under ground, till nature furniſhes them with wings. After this, they riſe in ſuch ſwarms as darken the air, and would make terrible havoc among all kinds of vegetables, did not the natives come out againſt them in whole companies, and by dint of flaps, and other flat weapons, knock them down by myriads, and then laying them in heaps, ſet fire to their wings, which half broils them for food. Amidſt all this variety of pernicious inſects, however, they have one ſpecies of a more friendly and profitable kind, *viz.* the induſtrious bee, which furniſhes the inhabitants with honey and wax in ſuch plenty, that there is ſcarce a hollow tree, clift of a rock, or chop of the earth, in which their combs are not found in great quantities.

14 Congo very populous

With reſpect to the populouſneſs of the kingdom of Congo, ſome authors, writing either from mere conjecture, or at beſt precarious inferences, have repreſented it as thinly peopled. The accounts of the miſſionaries and Portugueſe, however, are directly oppoſite to theſe. They found the country for the moſt part covered with towns and villages, and theſe ſwarming with inhabitants; the cities well filled with people, particularly the metropolis, which is ſaid to contain above 50,000 ſouls. The provinces, though not equally populous, yet in the whole make up ſuch an amount, as plainly proves, that what is wanting in the one is amply made up by the other. We are told, that the duchy of Bamba is ſtill able to raiſe 200,0 0 fighting men, and was formerly in a condition to raiſe double that number; and that the army of the king of Congo, in the year 1665, conſiſted of 900,000 fighting men, who were attended by an infinite number of women, children, and ſlaves. The numbers of the Congoeſe will appear the more credible, when we conſider the extreme fecundity of their women, the hardineſs with which they bring up their children, and the ſtoutneſs and healthineſs of their men. In ſome villages, if the miſſionaries are to be credited, the number of children is ſo great, that a father will part with one or two, for any commodity he wants, or even for ſome trifling bawble he fancies; ſo that the number of ſlaves they ſell abroad ſeldom amounts, *communibus annis*, to leſs than 15,000 or 16,000.

15 Congoeſe have a high opinion of themſelves.

There is ſcarce a nation on earth that have a higher opinion of themſelves or their country, than the Congoeſe, or that is more hardened againſt all conviction to the contrary, from reaſon, experience, or the moſt impartial compariſon with other countries in Europe or Aſia. Indeed, it is impoſſible they ſhould think otherwiſe, when it is one of the fundamentals of their belief, that the reſt of the world was the work of angels, but that the kingdom of Congo, in its full and ancient extent, was the handywork of the Supreme Architect; and muſt of courſe have vaſt prerogatives and advantages over all others. When told of the magnificence of the European and Aſiatic courts, their immenſe revenues, the grandeur of their palaces and edifices, the richneſs and happineſs of their ſubjects, the great progreſs they have made in the arts and ſciences, to which their country is wholly a ſtranger, they coolly anſwer, that all this comes vaſtly ſhort of the dignity and ſplendor of the kings and kingdom of Congo; and that there can be but one Congo in the world, to the happineſs of whoſe monarch and people all the reſt were created to contribute, and to whoſe treaſury the ſea and rivers pay their conſtant tribute of 'zimbis (or ſhells, which are their current coin); whilſt other princes muſt condeſcend to enrich themſelves by digging through rocks and mountains, to come at the excrements of the earth, ſo they ſtyle gold and ſilver which are in ſuch requeſt among other nations. Accordingly, they imagine, that the nations which come to traffic with them, are forced to that ſervile employment by their poverty and the badneſs of their country, rather than induced to it by luxury or avarice; whilſt they themſelves can indulge their natural indolence or ſloth, though attended with the moſt pinching poverty, rather than diſgrace the dignity of their blood by the leaſt effort of induſtry, which, how laudable and beneficial ſoever, is looked upon by them as only a leſſer degree of ſlavery. But though they generally eſteem it ſo much below their dignity to apply to any uſeful work, they think it no diſgrace to beg or ſteal. With reſpect to the firſt, they are ſaid to be the moſt ſhameleſs and importunate beggars in the world. They will take no denial, ſpare no crouching, lying, prayers, to obtain what they want, nor curſes and ill language when ſent away without it. With regard to the laſt, they deem no theft unlawful or ſcandalous, except it be committed in a private manner, without the knowledge of the perſon wronged. It is eſteemed a piece of bravery and gallantry to wrench any thing from another by violence; and this kind of theft is ſo common, not only among the vulgar, but alſo among the great ones, that they make no ſcruple, in their travels from place to place, to ſeize not only upon all the proviſions they meet with in towns and villages, but upon every thing elſe that falls in their way. Theſe violences oblige the poor people to conceal the few valuables they have, in ſome ſecret place out of the knowledge and reach of thoſe harpies; and they think themſelves well off if they can eſcape a ſevere baſtonading, or other cruel uſage frequently inflicted upon them, in order to make them diſcover the place of their concealment.

16 Their ſloth, pride, &c.

17 Complexion, character, cuſtoms, &c.

The complexion of the natives, both men and women, is black, though not in the ſame degree; ſome being of a much deeper black than others. Their hair is black and finely curled; ſome have it alſo of a dark ſandy colour: their eyes are moſtly of a fine lively black; but ſome are of a dark ſea colour. They have neither flat noſes nor thick lips like the Nubians and other negroes. Their ſtature is moſtly of the middle ſize; and, excepting their black complexion, they much reſemble the Portugueſe. In their temper they are miſtruſtful, envious, jealous, and treacherous; and where they once take a diſtaſte or affront, will ſpare no pains, nor ſtick at any means, however baſe, to be avenged of, and cruſh their enemy under their feet. There is no ſuch thing among them as natural affection. A huſband, if an heathen, may take as many wives as he pleaſes; and if a Chriſtian, may have any number of concubines, whom he may divorce at pleaſure, or even ſell them though with child. So little regard have they for their children, that there is ſcarce one among them who will not ſell a ſon or a daughter, or perhaps both, for a piece of cloth, a collar or girdle of coral or beads, and often for a bottle of wine or brandy.

18 Religion.

The religion of the Congoeſe in many parts is downright idolatry, accompanied with the moſt ridiculous ſuperſtitions, and the moſt abſurd and deteſtable rites invented by their gangas or prieſts; and even in thoſe parts where Chriſtianity is profeſſed, it is ſo darkened by ſuperſtitions of one kind or other, that we may juſtly queſtion whether the people are any gainers by the exchange.

19 Government.

The government of this kingdom is monarchical, and as deſpotic as any in Aſia or Africa. The kings are the ſole proprietors of all the lands within their dominions; and theſe they can diſpoſe of to whom they pleaſe, upon condition they pay a certain tribute out of them: upon failure of the payment of which, or any other neglect, they turn them out. Even the princes of the blood are ſubjected to the ſame law; ſo that there is no perſon of any rank or quality whatever that can bequeath a foot of land to his heirs or ſucceſſors; and when theſe owners under the crown die, the lands immediately return to it again, whether they were in their poſſeſſion, or had been left to ever ſo many tenants under them; ſo that it entirely depends on the prince whether theſe lands ſhall be continued in the ſame, or be diſpoſed into other hands. The Portugueſe, however, ſince their ſettling in theſe parts, have prevailed upon the monarchs to permit the heirs and ſucceſſors to continue in the quiet poſſeſſion of ſuch lands, in order to avoid the confuſions, or even rebellions, which the alienation and deprival of them frequently occaſioned, and to oblige the tenants of them to pay their tribute more exactly and readily than they did before.

20 **Commerce.** St Salvador is the chief place of traffic the Portugueſe and other Europeans have in this country. There are thought to be about 4000 of them ſettled here, who trade with moſt parts of the kingdom. The chief commodities they bring thither are either the product of Brazil or European manufactures. The former conſiſt chiefly of grains, fruits, plants, &c.; the latter of Turkey carpets, Engliſh cloth, and other ſtuffs; copper, braſs veſſels, ſome kinds of blue earthen-ware, rings, and ornaments of gold, ſilver, and other baſer metals; coral, glaſs beads, bugles, and other trinkets; light ſtuffs made of cotton, woollen, and linen for cloathing; and a great variety of tools and other utenſils. In return for theſe, they carry off a great number of ſlaves, amounting to 15,000 or 16,000 annually, as we have already obſerved. Formerly they uſed alſo to carry away elephants teeth, furs, and other commodities of the country; but theſe branches of commerce are now greatly decayed, and the ſlave-trade is what the Portugueſe merchants principally depend on.

Congo, a term applied to tea of the ſecond quality.

CONGREGATION, an aſſembly of ſeveral eccleſiaſtics, united ſo as to conſtitute a body.

The term is principally uſed for aſſemblies of cardinals appointed by the pope, and diſtributed into ſeveral chambers, for the diſcharge of certain functions and juriſdictions, after the manner of our offices and courts. The firſt is the congregation of the holy office, or the inquiſition: the ſecond, that of juriſdiction over biſhops and regulars: the third, that of councils; this has power to interpret the council of Trent: the fourth, that of cuſtoms, ceremonies, precedencies, canonizations called *the congregation of rites*: the fifth, that of St Peter's fabric, which takes cognizance of all cauſes relating to piety and charity, part whereof is due to the church of St Peter: the ſixth, that of waters, rivers, roads: the ſeventh, of fountains and ſtreets: the eighth, that of the index, which examines the books to be printed or corrected: the ninth, that of the council of ſtate, for the management of the territories belonging to the pope and church (ſee Camerlingo): the tenth, *de bono regimine*; of which two laſt the cardinal-nephew is chief; the eleventh, that of money: the twelfth, that of biſhops, wherein thoſe who are to be promoted to biſhoprics in Italy are examined; this is held before the pope: the thirteenth, that of conſiſtorial matters; the chief whereof is the cardinal-dean: the fourteenth, a congregation for propagating the faith (ſee College): and the fifteenth, that of eccleſiaſtical immunity, for ſettling ſuits againſt churchmen. There is alſo a congregation of alms, which takes care of every thing that relates to the ſubſiſtence of Rome and the ſtate of the church.

Congregation is alſo uſed for a company or ſociety of religious cantoned out of this or that order; and making, as it were, an inferior order, or a ſubdiviſion of the order itſelf. Such are the congregations of the oratory, and thoſe of Cluny, &c. among the Benedictines.

The word is alſo uſed for aſſemblies of pious perſons in manner of fraternities, frequent among the Jeſuits in honour of the Virgin, &c. It is likewiſe applied to the audience in a church, particularly as conſiſting of the inhabitants of the ſame pariſh.

CONGREGATIONALISTS, in church hiſtory, a ſect of Proteſtants who reject all church government, except that of a ſingle congregation under the direction of one paſtor.

CONGRESS, in political affairs, an aſſembly of commiſſioners, envoys, deputies, &c. from ſeveral courts meeting to concert matters for their common good.

Congreſs, in America, is the aſſembly of delegates from the United States. See America.

Congreſs, in a judicial ſenſe, the trial made by appointment of a judge before ſurgeons and matrons, in order to prove whether or no a man be impotent, before ſentence is paſſed for the diſſolution of a marriage ſolicited upon ſuch a complaint.

Neither the civil nor canon law makes any mention of the trial of virility by congreſs. It had its origin in France from the boldneſs of a young fellow, who, in open court, having been hard preſſed by his wife, demanded the congreſs. The judge, ſurpriſed with the novelty of the demand, found it could not be denied, as being the ſureſt evidence that the caſe could admit of. In time it became a branch in the French juriſprudence, and was authoriſed by decreets and arrets. It obtained for about 120 years; and was annulled by an arret of parliament in 1677, as being found precarious; ſome having failed under the experiment out of mere modeſty and ſhame, which is found to have the ſame effect with actual impotency.

CONGREVE (William), a younger brother of an ancient family in Staffordſhire. His father was employed in the ſtewardſhip of the great eſtate of the Earl of Burlington in Ireland, where he reſided many years; and our author was born there in 1672. Mr Congreve entered into the Middle-Temple when he came to England, and began to ſtudy the law; but his bias was toward polite literature and poetry. His firſt performance was a noval, intituled, *Incognita*, or *Love and Duty reconciled.* He ſoon after began his comedy of the *Old Bachelor*; which was the amuſement of ſome leiſure hours during a ſlow recovery from a fit of illneſs ſoon after his return to England; yet was in itſelf ſo perfect, that Mr Dryden, on its being ſhown to him, declared he had never in his life ſeen ſuch a firſt play.

When brought on the ſtage in 1693, it met with ſuch univerſal approbation, that Mr Congreve, though he was but 19 years old at the time of his writing it, became now conſidered as a prop to the declining ſtage, and a riſing genius in dramatic poetry. The next year he produced the *Double Dealer*; which, for what reaſon is not obvious, did not meet with ſo much ſucceſs as the former. The merit of his firſt play, however, had obtained him the favour and patronage of Lord Halifax, and ſome peculiar mark of diſtinction from Queen Mary; on whoſe death, which happened in the cloſe of this year, he wrote a very elegant elegiac paſtoral. In 1695, when Betterton opened the new houſe in Lincoln's-Inn Fields, Mr Congreve, joining with him, gave him his comedy of *Love for Love*, with which the company opened their campaign; and which met with ſuch ſucceſs, that they immediately offered the author a ſhare in the management of the houſe, on condition of his furniſhing them with one play yearly. This offer he accepted; but whether through indolence, or that correctneſs which he looked upon as neceſſary to his works, his *Mourning Bride* did not come out till 1697, nor his *Way of the World* till two years after that. The indifferent ſucceſs this laſt mentioned play, though an exceeding good one, met with from the public, completed that diſguſt to the theatre, which a long conteſt with Jeremy Collier, who had attacked the immoralities of the Engliſh ſtage, and more eſpecially ſome of his pieces, had begun, and he determined never more to write for the ſtage. However, though he quitted dramatic writing, he did not lay down the pen entirely; but occaſionally wrote many little pieces both in proſe and verſe, all of which ſtand on the records of literary fame. It is very poſſible, however, that he might not ſo ſoon have given way to this diſguſt, had not the eaſineſs of his circumſtances rendered any ſubſervience to the opinions and caprice of the town abſolutely unneceſſary to him. For his abilities having very early in life raiſed him to the acquaintance of the Earl of Halifax, who was then the Mæcenas of the age; that nobleman, deſirous of raiſing ſo promiſing a genius above the neceſſity of too haſty productions, made him one of the commiſſioners for licenſing hackney-coaches; or, according to Coxeter, a commiſſioner of the wine-licence. He ſoon after beſtowed on him a place in the pipe-office; and not long after gave him a poſt in the cuſtoms worth 600 l. *per annum.* In the year 1718, he was appointed ſecretary of Jamaica; ſo that, with all together, his income towards the later part of his life was upwards of 1200 l. a-year.

The greateſt part of the laſt 20 years of his life was ſpent in eaſe and retirement; and he either did not, or affected not to give himſelf any trouble about reputation. Yet ſome part of that conduct might proceed from a degree of pride; to which purpoſe, T. Cibber, in his lives of the poets, Vol. IV. p. 93. relates the following anecdote of him: "When the celebrated Voltaire was in England, he waited upon Mr Congreve, and paſſed ſome compliments upon the merit and reputation of his works. Congreve thanked him; but at the ſame time told that ingenious foreigner, that he did not chooſe to be conſidered as an author, but only as a private gentleman, and in that light expected to be viſited. Voltaire anſwered, that if he had never been any thing but a private gentleman, in all probability he had never been troubled with that viſit." He obſerves, in his own account of the tranſaction, that he was not a little diſguſted with ſo unſeaſonable a piece of vanity.

Towards the cloſe of his life he was much afflicted with the gout; and making a tower to Bath for the benefit of the waters, was unfortunately overturned in his chariot; by which, it is ſuppoſed, he got ſome inward bruiſe, as he ever after complained of a pain in his ſide; and, on his return to London, continued gradually declining in his health, till the 19th of January 1729, when he died, aged 57; and, on the 26th following, was buried in Weſtminſter Abbey, the pall being ſupported by perſons of the firſt diſtinction.

CONGRUITY, a ſuitableneſs or relation of agreement between things.

The terms *congruity* and *propriety* are not applicable to any ſingle object: they imply a plurality, and obviouſly ſignify a particular relation between different objects. Thus we currently ſay, that a decent garb is ſuitable or proper for a judge; modeſt behaviour for a young woman; and a lofty ſtyle for an epic poem: and, on the other hand, that it is unſuitable or incongruous to ſee a little woman ſunk into an overgrown farthingale, a coat richly embroidered covering coarſe and dirty linen, a mean ſubject in an elevated ſtyle, an elevated ſubject in a mean ſtyle, a firſt miniſter darning his wife's ſtocking, or a reverend prelate in lawn ſleeves dancing a hornpipe.

The perception we have of this relation, which ſeems peculiar to man, cannot proceed from any other cauſe, but from a *ſenſe* of congruity or propriety; for, ſuppoſing us deſtitute of that ſenſe, the terms would be to us unintelligible.

It is a matter of experience, that congruity or propriety, wherever perceived, is agreeable; and that incongruity or impropriety, wherever perceived, is diſagreeable. The only difficulty is, to aſcertain what are the particular objects that in conjunction ſuggeſt theſe relations; for there are many objects that do not: the ſea, for example, viewed in conjunction with a picture, or a man viewed in conjunction with a mountain, ſuggeſt not either congruity or incongruity. It ſeems natural to infer, what will be found true by induction, that we never perceive congruity nor incongruity but among things that are connected together by ſome relation; ſuch as a man and his actions, a principal and his acceſſories, a ſubject and its ornaments. We are indeed ſo framed by nature, as, among things ſo connected, to require a certain ſuitableneſs or correſpondence, termed *congruity* or *propriety*; and to be diſpleaſed when we find the oppoſite relation of *incongruity* or *impropriety*.

If things connected be the ſubject of congruity, it is reaſonable before-hand to expect, that a degree of congruity ſhould be required proportioned to the degree of the connection. And upon examination we find this to hold in fact: where the relation is intimate, as between a cauſe and its effect, a whole and its parts, we require the ſtricteſt congruity; but where the relation is ſlight, or accidental, as among things jumbled together in the ſame place, we require little or no congruity: the ſtricteſt propriety is required in behaviour and manner of living; becauſe a man is connected with theſe by the relation of cauſe and effect: the relation between an edifice and the ground it ſtands upon, is of the moſt intimate kind; and therefore the ſituation of a great houſe ought to be lofty; its relation to neighbouring hills, rivers, planes, being that of propinquity only, demands but a ſmall ſhare of congruity: among members of the ſame club, the congruity ought to be conſiderable, as well as among things placed for ſhow in the ſame niche: among paſſengers in a ſtage-coach, we require very little congruity: and leſs ſtill at a public ſpectacle.

Congruity is ſo nearly allied to beauty, as commonly to be held a ſpecies of it; and yet they differ ſo eſſentially as never to coincide: beauty, like colour, is placed upon a ſingle ſubject; congruity upon a plurality: further, a thing beautiful in itſelf, may, with relation to other things, produce the ſtrongeſt ſenſe of incongruity.

Congruity and propriety are commonly reckoned ſynonymous terms; but they are diſtinguiſhable; and the preciſe meaning of each muſt be aſcertained. Congruity is the genus of which propriety is a ſpecies; for we call nothing *propriety*, but that congruity or ſuitableneſs which ought to ſubſiſt between ſenſible beings and their thoughts, words, and actions.

In order to give a full view of theſe ſecondary relations, we ſhall trace them through ſome of the moſt conſiderable primary relations. The relation of a part to the whole, being extremely intimate, demands the utmoſt degree of congruity; even the ſlighteſt deviation is diſguſtful.

Examples of congruity and incongruity are furniſhed in plenty by the relation between a ſubject and its ornaments. A literary performance intended merely for amuſement, is ſuſceptible of much ornament, as well as a muſic-room or a play-houſe; for in gaiety, the mind hath a peculiar reliſh for ſhow and decoration. The moſt gorgeous apparel, however improper in tragedy, is not unſuitable to opera-actors: the truth is, an opera, in its preſent form, is a mighty fine thing; but as it deviates from nature in its capital circumſtances, we look not for nature nor propriety in thoſe which are acceſſory. On the other hand, a ſerious and important ſubject admits not much ornament; nor a ſubject that of itſelf is extremely beautiful: and a ſubject that fills the mind with its loftineſs and grandeur, appears beſt in a dreſs altogether plain.

To a perſon of a mean appearance, gorgeous apparel is unſuitable; which, beſides the incongruity, has a bad effect; for by contraſt it ſhows the meanneſs of appearance in the ſtrongeſt light. Sweetneſs of look and manner, requires ſimplicity of dreſs, joined with the greateſt elegance. A ſtately and majeſtic air requires ſumptuous apparel, which ought not to be gaudy, nor crowded with little ornaments. A woman of conſummate beauty can bear to be highly adorned, and yet ſhows beſt in a plain dreſs:

———— For lovelineſs
Needs not the foreign aid of ornament,
But is when unadorn'd, adorn'd the moſt.
Thomſon's Autumn, 208.

Congruity regulates not only the quantity of ornament, but alſo the kind. The ornaments that embelliſh a dancing-room ought to be all of them gay. No picture is proper for a church but what has religion for its ſubject. All the ornaments upon a ſhield ought to relate to war; and Virgil, with great judgment, confines the carvings upon the ſhield of Æneas to the military hiſtory of the Romans: but this beauty is overlooked by Homer; for the bulk of the ſculpture upon the ſhield of Achilles, is of the arts of peace in general, and of joy and feſtivity in particular: the author of Telemachus betrays the ſame inattention, in deſcribing the ſhield of that young hero.

In judging of propriety with regard to ornaments, we muſt attend, not only to the nature of the ſubject that is to be adorned, but alſo to the circumſtances in which it is placed: the ornaments that are proper for a ball, will appear not altogether ſo decent at public worſhip; and the ſame perſon ought to dreſs differently for a marriage-feaſt and for a burial.

Nothing is more intimately related to a man, than his ſentiments, words, and actions; and therefore we require here the ſtricteſt conformity. When we find what we thus require, we have a lively ſenſe of propriety: when we find the contrary, our ſenſe of impropriety is not leſs lively. Hence the univerſal diſtaſte of affectation, which conſiſts in making a ſhow of greater delicacy and refinement than is ſuited either to the character or circumſtance of the perſon.

Congruity and propriety, wherever perceived, appear agreeable; and every agreeable object produceth in the mind a pleaſant emotion: incongruity and impropriety, on the other hand, are diſagreeable; and of courſe produce painful emotions. Theſe emotions, whether pleaſant or painful, ſometimes vaniſh without any conſequence; but more frequently occaſion other emotions, which we proceed to exemplify.

When any ſlight incongruity is perceived in an accidental combination of perſons or things, as of paſſengers in a ſtage-coach, or of individuals dining at an ordinary; the painful emotion of incongruity, after a momentary exiſtence, vaniſheth without producing any effect. But this is not the caſe of propriety and impropriety: voluntary acts, whether words or deeds, are imputed to the author; when proper, we reward him with our eſteem; when improper, we puniſh him with our contempt. Let us ſuppoſe, for example, a generous action ſuited to the character of the author, which raiſes in him and in every ſpectator the pleaſant emotion of propriety: this emotion generates in the author both ſelf eſteem and joy; the former when he conſiders the relation to the action; and the latter when he conſiders the good opinion that others will entertain of him: the ſame emotion of propriety produceth in the ſpectators eſteem for the author of the action; and when they think of themſelves, it alſo produceth, by means of contraſt, an emotion of humility. To diſcover the effects of an unſuitable action, we muſt invert each of theſe circumſtances: the painful emotion of impropriety generates in the author of the action both humility and ſhame; the former when he conſiders his relation to the action, and the latter when he conſiders what others will think of him: the ſame emotion of impropriety produceth in the ſpectators contempt for the author of the action; and it alſo produceth, by means of contraſt, when they think of themſelves, an emotion of ſelf-eſteem. Here then are many different emotions, derived from the ſame action, conſidered in different views by different perſons; a machine provided with many ſprings, and not a little complicated. Propriety of action, it would ſeem, is a chief favourite of nature, when ſuch care and ſolicitude is beſtowed upon it. It is not left to our own choice; but, like juſtice, is required at our hands; and, like juſtice, is enforced by natural rewards and puniſhments: a man cannot, with impunity, do any thing unbecoming or improper; he ſuffers the chaſtiſement of contempt inflicted by others, and of ſhame inflicted by himſelf. An apparatus ſo complicated, and ſo ſingular, ought to rouſe our attention: for nature doth nothing in vain; and we may conclude with great certainty, that this curious branch of the human conſtitution is intended for ſome valuable purpoſe.

A groſs impropriety is puniſhed with contempt and indignation, which are vented againſt the offender by correſponding external expreſſions: nor is even the ſlighteſt impropriety ſuffered to paſs without ſome degree of contempt. But there are improprieties, of the ſlighter kind, that provoke laughter: of which we have examples without end, in the blunders and abſurdities of our own ſpecies: ſuch improprieties receive a different puniſhment, as will appear by what follows. The emotions of contempt and of laughter occaſioned by an impropriety of this kind, uniting intimately in the mind of the ſpectator, are expreſſed externally by a peculiar ſort of laugh, termed *a laugh of deriſion* or *ſcorn*. An impropriety that thus moves not only contempt, but laughter, is diſtinguiſhed by the epithet of *ridiculous*; and a laugh of deriſion or ſcorn is the puniſhment provided for it by nature. Nor ought it to eſcape obſervation, that we are ſo fond of inflicting this puniſhment, as ſometimes to exert it even againſt creatures of an inferior ſpecies: witneſs a turky cock ſwelling with pride, and ſtrutting with diſplayed feathers; a ridiculous object, which in a gay mood is apt to provoke a laugh of deriſion.

We muſt not expect, that theſe different improprieties are ſeparated by diſtinct boundaries: for of improprieties, from the ſlighteſt to the moſt groſs, from the moſt riſible to the moſt ſerious, there are degrees without end. Hence it is, that in viewing ſome unbecoming actions, too riſible for anger, and too ſerious for deriſion, the ſpectator feels a ſort of mixt emotion, partaking both of deriſion and of anger; which accounts for an expreſſion, common with reſpect to the impropriety of ſome actions, that we know not whether to laugh or be angry.

It cannot fail to be obſerved, that in the caſe of a riſible impropriety, which is always ſlight, the contempt we have for the offender is extremely faint, tho' deriſion, its gratification, is extremely pleaſant. This diſproportion between a paſſion and its gratification, ſeems not conformable to the analogy of nature. In looking about for a ſolution, we muſt reflect upon what is laid down above, that an improper action not only moves our contempt for the author, but alſo, by means of contraſt, ſwells the good opinion we have of ourſelves. This contributes, more than any other article, to the pleaſure we have in ridiculing follies and abſurdities; and accordingly, it is well known, that they who put the greateſt value upon themſelves are the moſt prone to laugh at others. Pride, which is a vivid paſſion, pleaſant in itſelf, and not leſs ſo in its gratification, would ſingly be ſufficient to account for the pleaſure of ridicule, without borrowing any aid from contempt. Hence appears the reaſon of a noted obſervation, That we are the moſt diſpoſed to ridicule the blunders and abſurdities of others, when we are in high ſpirits; for in high ſpirits, ſelf-conceit diſplays itſelf with more than ordinary vigour.

With regard to the final cauſes of congruity and impropriety; one, regarding congruity, is pretty obvious, that the ſenſe of congruity, as one principle of the fine arts, contributes in a remarkable degree to our entertainment. Congruity, indeed, with reſpect to quantity, coincides with proportion: when the parts of a building are nicely adjuſted to each other, it may be ſaid indifferently, that it is agreeable by the congruity of its parts, or by the proportion of its parts. But propriety, which regards voluntary agents only, can never be the ſame with proportion: a very long noſe is diſproportioned, but cannot be termed *improper*. In ſome inſtances, it is true, impropriety coincides with diſproportion in the ſame ſubject, but never in the ſame reſpect; for example, a very little man buckled to a long toledo: conſidering the man and the ſword with reſpect to ſize, we perceive a diſproportion; conſidering the ſword as the choice of the man, we perceive an impropriety.

The ſenſe of impropriety with reſpect to miſtakes, blunders, and abſurdities, is happily contrived for the good of mankind. In the ſpectators, it is productive of mirth and laughter, excellent recreation in an interval from buſineſs. But this is a trifle in reſpect of what follows. It is painful to be the ſubject of ridicule; and to puniſh with ridicule the man who is guilty of an abſurdity, tends to put him more upon his guard in time coming. Thus even the moſt innocent blunder is not committed with impunity; becauſe, were errors licenſed where they do no hurt, inattention would grow into a habit, and be the occaſion of much hurt.

The final cauſe of propriety as to moral duties, is of all the moſt illuſtrious. To have a juſt notion of it, the moral duties that reſpect others muſt be diſtinguiſhed from thoſe that reſpect ourſelves. Fidelity, gratitude, and the forbearing injury, are examples of the firſt ſort; temperance, modeſty, firmneſs of mind, are examples of the other: the former are made duties by the ſenſe of juſtice; the latter by the ſenſe of propriety. Here is a final cauſe of the ſenſe of propriety, that muſt rouſe our attention. It is undoubtedly the intereſt of every man, to ſuit his behaviour to the dignity of his nature, and to the ſtation allotted him by Providence; for ſuch rational conduct contributes in every reſpect to happineſs, by preſerving health, by procuring plenty, by gaining the eſteem of others, and, which of all is the greateſt bleſſing, by gaining a juſtly-founded ſelf-eſteem. But in a matter ſo eſſential to our well-being, even ſelf-intereſt is not relied on: the powerful authority of duty is ſuperadded to the motive of intereſt. The God of nature, in all things eſſential to our happineſs, hath obſerved one uniform method: to keep us ſteady in our conduct, he hath fortified us with natural laws and principles, which prevent many aberrations, that would daily happen were we totally ſurrendered to ſo fallible a guide as

Congruity.

human reaſon. Propriety cannot rightly be conſidered in another light, than as the natural law that regulates our conduct with reſpect to ourſelves; as juſtice is the natural law that regulates our conduct with reſpect to others. We call propriety a law, not leſs than juſtice; becauſe both are equally rules of conduct that ought to be obeyed: propriety includes this obligation; for to ſay an action is proper, is, in other words, to ſay, that it *ought* to be performed; and to ſay it is improper, is, in other words, to ſay that it *ought* to be forborne. It is this very character of *ought* and *ſhould* that makes juſtice a law to us; and the ſame character is applicable to propriety, though perhaps more faintly than to juſtice: but the difference is in degree only, not in kind; and we ought, without heſitation or reluctance, to ſubmit equally to the government of both.

But it muſt, in the next place, be obſerved, that to the ſenſe of propriety, as well as of juſtice, are annexed the ſanctions of rewards and puniſhments; which evidently prove the one to be a law as well as the other. The ſatisfaction a man hath in doing his duty, joined with the eſteem and good-will of others, is the reward that belongs to both equally. The puniſhments alſo, though not the ſame, are nearly allied; and differ in degree more than in quality. Diſobedience to the law of juſtice, is puniſhed with remorſe; diſobedience to the law of propriety, with ſhame, which is remorſe in a lower degree. Every tranſgreſſion of the law of juſtice raiſes indignation in the beholder; and ſo doth every flagrant tranſgreſſion of the law of propriety. Slighter improprieties receive a milder puniſhment: they are always rebuked with ſome degree of contempt, and frequently with deriſion. In general, it is true, that the rewards and puniſhments annexed to the ſenſe of propriety, are ſlighter in degree than thoſe annexed to the ſenſe of juſtice: which is wiſely ordered, becauſe duty to others is ſtill more eſſential to ſociety than duty to ourſelves; for ſociety could not ſubſiſt a moment were individuals not protected from the headſtrong and turbulent paſſion of their neighbours.

Congruity, Coni.

CONI, a ſtrong town of Italy in Piedmont, and capital of a territory of that name, with a good citadel. The town being divided into two factions, it ſurrendered to the French in 1641; but was reſtored to the Duke of Savoy ſoon after. It is ſeated at the confluence of the rivers Greſſe and Sture. E. Long. 7. 29. N. Lat. 44. 23.

CONIC SECTIONS

ARE curve lines formed by the interſections of a cone and plane.

If a cone be cut by a plane through the vertex, the ſection will be a triangle ABC, Plate CXLVI. fig. 1.

If a cone be cut by a plane parallel to its baſe, the ſection will be a circle. If it be cut by a plane DEF, fig. 1. in ſuch a direction, that the ſide AC of a triangle paſſing through the vertex, and having its baſe BC perpendicular to EF, may be parallel to DP, the ſection is a parabola; if it be cut by a plane DR, fig. 2. meeting AC, the ſection is an ellipſe; and if it be cut by a plane DMO, fig. 3. which ſhould meet AC extended beyond A, it is an hyperbola.

If any line HG, fig. 1. be drawn in a parabola perpendicular to DP, the ſquare of HG will be to the ſquare of EP, as DG to DP; for let LHK be a ſection parallel to the baſe, and therefore a circle, the rectangle LGK will be equal to the ſquare of HG, and the rectangle BPC equal to the ſquare of EP; therefore theſe ſquares will be to each other as their rectangles; that is, as BP to LG, that is DP to DG.

SECT. I. *Deſcription of Conic Sections on a Plane.*

1. PARABOLA.

“Let AB, fig. 4. be any right line, and C any point without it, and DKF a ruler, which let be placed in the ſame plane in which the right line and point are, in ſuch a manner that one ſide of it, as DK, be applied to the right line AB, and the other ſide KF coincide with the point C; and at F, the extremity of the ſide KF, let be fixed one end of the thread FNC, whoſe length is equal to KF, and the other extremity of it at the point C, and let part of the thread, as FG, be brought cloſe to the ſide KF by a ſmall pin G; then let the ſquare DKF be moved from B towards A, ſo that all the while its ſide DK be applied cloſe to the line BA, and in the mean time the thread being extended will always be applied to the ſide KF, being ſtopt from going from it by means of the ſmall pin; and by the motion of the ſmall pin N there will be deſcribed a certain curve, which is called a *ſemi-parabola*.

“And if the ſquare be brought to its firſt given poſition, and in the ſame manner be moved along the line AB, from B towards H, the other ſemi-parabola will be deſcribed.”

The line AB is called the *directrix*; C, the focus; any line perpendicular to AB, a diameter; the point where it meets the curve, its vertex; and four times the diſtance of the vertex from the directrix, its latus rectum or parameter.

2. ELLIPSE.

“If any two points, as A and B, fig. 5. be taken in any plane, and in them are fixed the extremities of a thread, whoſe length is greater than the diſtance between the points, and the thread extended by means of a ſmall pin C, and if the pin be moved round from any point until it return to the place from whence it began to move, the thread being extended during the whole time of the revolution, the figure which the ſmall pin by this revolution deſcribes is called an *ellipſe*.”

The points AB are called the *foci*; D, the *centre*; EF, the *tranſverſe axis*; GH, the *leſſer axis*; and any other line paſſing through D, a *diameter*.

3. HYPERBOLA.

“If to the point A, fig. 6. in any plane, one end of the rule AB be placed, in ſuch a manner, that about that point, as a centre, it may freely move;

"and if to the other end B, of the rule AB, be fixed the extremity of the thread BDC, whoſe length is ſmaller than the rule AB, and the other end of the thread, being fixed in the point C, coinciding with the ſide of the rule AB, which is in the ſame plane with the given point A; and let part of the thread, as BD, be brought cloſe to the ſide of the rule AB, by means of a ſmall pin D; then let the rule be moved about the point A, from C towards T, the thread all the while being extended, and the remaining part coinciding with the ſide of the rule being ſtopt from going from it by means of the ſmall pin, and by the motion of the ſmall pin D, a certain figure is deſcribed which is called the *ſemi-hyperbola*."

The other ſemi-hyperbola is deſcribed in the ſame way, and the oppoſite HKF, by fixing the ruler to C, and the thread to A, and deſcribing it in the ſame manner. A and C are called *foci*; the point G, which biſects AC, the centre; KE, the tranſverſe axis; a line drawn through the centre meeting the hyperbolas, a tranſverſe diameter; a line drawn through the centre, perpendicular to the tranſverſe axis, and cut off by the circle MN, whoſe centre is E, and radius equal to CG, is called the *ſecond axis*.

If a line be drawn through the vertex E, equal and parallel to the ſecond axis GP and GO be joined, they are called *aſſymptotes*. Any line drawn through the centre, not meeting the hyperbolas, and equal in length to the part of a tangent parallel to it, and intercepted betwixt the aſſymptotes, is called a *ſecond diameter*.

An ordinate to any ſection is a line biſected by a diameter and the abſciſſa, the part of the diameter cut off by the ordinate.

Conjugate diameters in the ellipſe and hyperbola are ſuch as mutually biſect lines parallel to the other; and a third proportional to two conjugate diameters is called the *latus rectum* of that diameter, which is the firſt in the proportion.

In the parabola, the lines drawn from any point to the focus are equal to perpendiculars to the directrix; being both equal to the part of the thread ſeparated from the ruler.

In the ellipſe, the two lines drawn from any point in the curve to the foci are equal to each other, being equal to the length of the thread; they are alſo equal to the tranſverſe axis. In the hyperbola the difference of the lines drawn from any point to the foci is equal, being equal to the difference of the lengths of the ruler and thread, and is equal to the tranſverſe axis.

From theſe fundamental properties all the others are derived.

The ellipſe returns into itſelf. The parabola and hyperbola may be extended without limit.

Every line perpendicular to the directrix of a parabola meets it in one point, and falls afterwards within it; and every line drawn from the focus meets it in one point, and falls afterwards without it. And every line that paſſes through a parabola, not perpendicular to the directrix, will meet it again, but only once.

Every line paſſing through the centre of an ellipſe is biſected by it; the tranſverſe axis is the greateſt of all theſe lines; the leſſer axis the leaſt; and theſe nearer the tranſverſe axis greater than thoſe more remote.

In the hyperbola, every line paſſing through the centre, is biſected by the oppoſite hyperbola, and the tranſverſe axis is the leaſt of all theſe lines; alſo the ſecond axis is the leaſt of all the ſecond diameters. Every line drawn from the centre within the angle contained by the aſſymptotes, meets at once, and falls afterwards within it; and every line drawn through the centre without that angle, never meets it; and a line which cuts one of the aſſymptotes, and cuts the other extended beyond the centre, will meet both the oppoſite hyperbolas in one point.

If a line GM, fig. 4. be drawn from a point in a parabola perpendicular to the axis, it will be an ordinate to the axis, and its ſquare will be equal to the rectangle under the abſciſſa MI and latus rectum; for, becauſe GMC is a right angle, GM^q is equal to the difference of GC^q and CM^q; but GC is equal to GE, which is equal to MB; therefore GM^q is equal to $BM^q - CM^q$; which, becauſe CI and IB are equal, is (8 *Euc.* 2.) equal to four times the rectangle under MI and IB, or equal to the rectangle under MI and the latus rectum.

Hence it follows, that if different ordinates be drawn to the axis, their ſquares being each equal to the rectangle under the abſciſſa and latus rectum, will be to each other in the proportion of the abſciſſas, which is the ſame property as was ſhown before to take place in the parabola cut from the cone, and proves thoſe curves to be the ſame.

This property is extended alſo to the ordinates of other diameters, whoſe ſquares are equal to the rectangle under the abſciſſas and parameters of their reſpective diameters.

In the ellipſe, the ſquare of the ordinate is to the rectangle under the ſegments of the diameter, as the ſquare of the diameter parallel to the ordinate to the ſquare of the diameter to which it is drawn, or as the firſt diameter to its latus rectum; that is, LK^q fig. 5. is to EKF as EF^q to GH^q.

In the hyperbola, the ſquare of the ordinate is to the rectangle contained under the ſegments of the diameters betwixt its vertices, as the ſquare of the diameter parallel to the ordinate to the ſquare of the diameter to which it is drawn, or as the firſt diameter to its latus rectum; that is, SX^q is to EXK as MN^q to KE^q.

Or if an ordinate be drawn to a ſecond diameter, its ſquare will be to the ſum of the ſquares of the ſecond diameter, and of the line intercepted betwixt the ordinate and centre, in the ſame proportion: that is, RZ^q fig. 6. is to ZG^q added to GM^q, as KE^q to MN^q. Theſe are the moſt important properties of the conic ſections; and, by means of theſe, it is demonſtrated, that the figures are the ſame deſcribed on a plane as cut from the cone; which we have demonſtrated in the caſe of the parabola.

SECT. II. *Equations of the Conic Sections*

ARE derived from the above properties. The equation of any curve, is an algebraic expreſſion, which denotes the relation betwixt the ordinate and abſciſſa; the abſciſſa being equal to x, and the ordinate equal to y.

If p be the parameter of a parabola, then $y^2=px$; which is an equation for all parabolas.

If a be the diameter of an ellipſe, p its parameter; then $y^2 : ax-xx :: p : a$; and $y^2=\frac{p}{a}\times\overline{ax-xx}$; an equation for all ellipſes.

If a be a tranſverſe diameter of a hyperbola, p its parameter; then $y^2 : a\,x+xx :: p : a$, and $y^2 = \frac{p}{a}\times\overline{ax+xx}$.

If a be a ſecond diameter of an hyperbola, then $y^2 = aa+xx :: p : a$; and $y^2=\frac{p}{a}\times\overline{aa+xx}$; which are equations for all hyperbolas.

As all theſe equations are expreſſed by the ſecond powers of x and y, all conic ſections are curves of the ſecond order; and converſely, the locus of every quadratic equation is a conic ſection, and is a parabola, ellipſe, or hyperbola, according as the form of the equation correſponds with the above ones, or with ſome other deduced from lines drawn in a different manner with reſpect to the ſection.

Sect. III. *General Properties of Conic Sections.*

A tangent to a parabola biſects the angle contained by the lines drawn to the focus and directrix; in an ellipſe and hyperbola, it biſects the angle contained by the lines drawn to the foci.

In all the ſections, lines parallel to the tangent are ordinates to the diameter paſſing through the point of contact; and in the ellipſe and hyperbola, the diameters parallel to the tangent, and thoſe paſſing through the points of contact, are mutually conjugate to each other. If an ordinate be drawn from a point to a diameter, and a tangent from the ſame point which meets the diameter produced; in the parabola, the part of the diameter betwixt the ordinate and tangent will be biſected in the vertex; and in the ellipſe and hyperbola, the ſemi-diameter will be a mean proportion betwixt the ſegments of the diameter betwixt the centre and ordinate, and betwixt the centre and tangent.

The parallelogram formed by tangents drawn thro' the vertices of any conjugate diameters, in the ſame ellipſe or hyperbola, will be equal to each other.

Sect. IV. *Properties peculiar to the Hyperbola.*

As the hyperbola has ſome curious properties ariſing from its aſſymptotes, which appear at firſt view almoſt incredible, we ſhall briefly demonſtrate them:

1. The hyperbola and its aſſymptotes never meet; if not, let them meet in S, fig. 6.; then by the property of the curve the rectangle KXE is to SX^q as GE^q to GM^q or EP^q; that is, as GX^q to SX^q; wherefore, KXE will be equal to the ſquare of GX; but the rectangle KXE, together with the ſquare of GE, is alſo equal to the ſquare of GX; which is abſurd.

2. If a line be drawn through a hyperbola parallel to its ſecond axis, the rectangle, by the ſegments of that line, betwixt the point in the hyperbola and the aſſymptotes, will be equal to the ſquare of the ſecond axis.

For if SZ, fig. 6. be drawn perpendicular to the ſecond axis, by the property of the curve, the ſquare of MG, that is, the ſquare of PE is to the ſquare of GE, as the ſquares ZG and the ſquare of MG together, to the ſquare of SZ or GX: and the ſquares of RX and GX are in the ſame proportion, becauſe the triangles RXG, PEG are equiangular; therefore the ſquares ZG and MG are equal to the ſquare of RX; from which, taking the equal ſquares of SX and ZG, there remains the rectangle RSV, equal to the ſquare of MG.

3. Hence, if right lines be drawn parallel to the ſecond axis, cutting an hyperbola and its aſſymptotes, the rectangles contained betwixt the hyberbola and points where the lines cut the aſſymptotes will be equal to each other; for they are ſeverally equal to the ſquare of the ſecond axis.

4. If from any points, *d* and S, in a hyperbola, there be drawn lines parallel to the aſſymptotes *da* SQ and S*b dc*, the rectangle under *d a* and *d c* will be equal to the rectangle under QS and S *b*; alſo the parallelograms *d a*, G *c*, and SQG *b*, which are equiangular, and conſequently proportional to the rectangles, are equal.

For draw YW RV parallel to the ſecond axis, the rectangle Y *d* W is equal to the rectangle RSV; wherefore, WD is to SV as RS is to *d* Y. But becauſe the triangles RQS, AYD, and GSV *c d* W, are equiangular, W *d* is to SV as *c d* to S *b*, and R S is to DY as SQ to *d a*; wherefore, *d c* is to S *b* as SQ to *d a*: and the rectangle *d c*, *d a*, is equal to the rectangle QS, S *b*.

5. The aſſymptotes always approach nearer the hyperbola.

For, becauſe the rectangle under SQ and S *b* or QG, is equal to the rectangle under *d a* and *d c*, or AG, and QG is greater than *a* G; therefore *a d* is greater than QS.

9. The aſſymptotes come nearer the hyperbola than any aſſignable diſtance.

Let X be any ſmall line. Take any point, as *d*, in the hyperbola, and draw *d a*, *d c*, parallel to the aſſymptotes; and as X is to *d a*, ſo let *a* G be to GQ. Draw QS parallel to *a d*, meeting the hyperbola in S, then QS will be equal to X. For the rectangle SQG will be equal to the rectangle *d a* G; and conſequently SQ is to *d a* as AG to GQ.

If any point be taken in the aſſymptote below Q, it can eaſily be ſhown that its diſtance is leſs than the line X.

Sect. V. *Areas contained by Conic Sections.*

The area of a parabola is equal to $\frac{2}{3}$ the area of a circumſcribed parallelogram.

The area of an ellipſe is equal to the area of a circle whoſe diameter is a mean proportional betwixt its greater and leſſer axes.

If two lines *a d* and QS, be drawn parallel to one of the aſſymptotes of an hyperbola, the ſpace *a* QS *d*, bounded by theſe parallel lines, the aſſymptotes and the hyperbola will be equal to the logarithm of *a* Q, whoſe module is *a d*, ſuppoſing *a* G equal to unity.

Sect. VI. *Curvature of Conic Sections.*

The curvature of any conic ſection, at the vertices of its axis is equal to the curvature of a circle whoſe diameter is equal to the parameter of its axis.

If a tangent be drawn from any other point of a conic ſection, the curvature of the ſection in that point will be equal to the curvature of a circle to which the ſame line is a tangent, and which cuts off from the diameter of the ſection, drawn through the point, a part equal to its parameter.

SECT. VII. *Uſes of Conic Sections.*

ANY body, projected from the ſurface of the earth, deſcribes a parabola, to which the direction wherein it is projected is a tangent: and the diſtance of the directrix is equal to the height from which a body muſt fall to acquire the velocity wherewith it is projected: hence the properties of the parabola are the foundation of gunnery.

All bodies acted on by a central force, which decreaſes as the ſquare of the diſtances increaſes, and impreſſed with any projectile motion, making any angle with the direction of the central force, muſt deſcribe conic ſections, having the central force in one of the foci, and will deſcribe parabolas, ellipſes, and hyperbolas, according to the proportion betwixt the central and projectile force. This is proved by direct demonſtration.

The great principle of gravitation acts in this manner; and all the heavenly bodies deſcribe conic ſections having the ſun in one of the foci; the orbits of the planets are ellipſes, whoſe tranſverſe and leſſer diameters are nearly equal: it is uncertain whether the comets deſcribe ellipſes with very unequal axes, and ſo return after a great number of years; or whether they deſcribe parabolas and hyperbolas, in which caſe they will never return.

SECT. VIII. *Uſes of Conic Sections in the Solution of Geometrical Problems.*

MANY problems can be ſolved by conic ſections that cannot be ſolved by right lines and circles. The following theorems, which follow from the ſimpler properties of the ſections, will give a ſpecimen of this.

A point equally diſtant from a given point and a given line, is ſituated in a given parabola.

A point, the ſum of whoſe diſtances from two given points is given, is ſituated in a given ellipſe.

A point, the difference of whoſe diſtances from two given points is given, is ſituated in a given hyperbola.

CONICHTHYODONTES, or PLECTRONITÆ, in natural hiſtory, one of the three names the foſſile teeth of fiſhes are known by.

CONIFERÆ, in botany, an order of plants in the *Fragmenta methodi naturalis* of Linnæus, containing the following genera, viz. cupreſſus, ephedra, equiſetum, juniperus, pinus, taxus, thuja.

CONIFEROUS TREES, ſuch as bear hard dry ſeed-veſſels of a conical figure; conſiſting of ſeveral woody parts, being moſtly ſcaly, adhering cloſely together, and ſeparating when ripe.

CONIMBRICA (anc. geog.), a town of Luſitania, on the ſouth ſide of the river Monda; from the ruins of which aroſe *Coimbra*, in its neigbourhood, a city of Portugal. W. Long. 9. 5. Lat. 40. 16.

CONINGSECK, a town of Suabia in Germany, and capital of a county of the ſame name. E. Long. 9. 23. N. Lat. 47. 50.

CONJOINT, in a general ſenſe, ſignifies united or connected.

CONJOINT Degrees, in muſic, two notes which follow each other immediately in the order of the ſcale, as *ut* and *re*.

CONJOINT Tetrachords, two tetrachords, or fourths, where the ſame chord is the higheſt of one and the loweſt of the other.

CONISSALÆ, in natural hiſtory, a claſs of foſſils naturally and eſſentially compounded, not inflammable, nor ſoluble in water, found in detached maſſes, and formed of cryſtalline matter debaſed by earth.

Of this claſs there are two orders, and of each of theſe only one genus. Coniſſalæ of the firſt order are found in form of a naturally regular and uniform powder; all the genuine particles of which are nearly of one determinate ſhape, appearing regularly concreted, and not fragments of others once larger. Coniſſalæ of the ſecond order are found in form of a rude, irregular, and ſhapeleſs powder, the particles of which are never of any determinate figure, but ſeem broken fragments of once larger maſſes.

To the former genus belong the different kinds of ſand; and to the latter the ſaburræ, or gritts.

CONJUGATE DIAMETER, or *Axis, of an Ellipſis*, the ſhorteſt of the two diameters, or that biſecting the axis.

CONJUGATION, in grammar, a regular diſtribution of the ſeveral inflexions of verbs in their different voices, moods, tenſes, numbers, and perſons, ſo as to diſtinguiſh them from one another. See GRAMMAR and LANGUAGE.

CONIUM, HEMLOCK: A genus of the digynia order, belonging to the pentandria claſs of plants; and in the natural method ranking under the 45th order, *Umbellatæ*. The partial involucra are halved, and moſtly triphyllous; the fruit ſubgloboſe and quinque-ſtriated, the ſtriæ crenated on each ſide. The ſpecies are three; 1. The *maculatum*, or *greater hemlock*, grows nanaturally on the ſides of banks and roads in many parts of Britain. It is a biennial plant which periſhes after it has ripened its ſeeds. It hath a long taper root like a parſnip, but ſmaller. The ſtalk is ſmooth, ſpotted with purple, and riſes from four to upwards of ſix feet high; branching out toward the top into ſeveral ſmaller ſtalks, garniſhed with decompounded leaves, whoſe lobes are cut at the top into three parts; theſe are of a lucid green, and have a diſagreeable ſmell. The ſtalks are terminated by umbels of white flowers, each being compoſed of about ten rays or ſmall umbels, and have a great number of flowers, which ſpread open, each ſitting upon a diſtinct footſtalk; the ſeeds are ſmall and channelled, and like thoſe of anniſeed. It flowers in June, and the ſeeds ripen in autumn.

2. The *tenuifolium*, with ſtriated ſeeds, differs from the firſt in having taller ſtalks, which are not ſo much ſpotted. The leaves are much narrower, and of a paler green; and this difference is conſtant. It is a biennial plant, and grows naturally in Germany. 3. The *africanum*, with prickly ſeeds, it a native of the Cape of Good Hope. The plant rarely grows above nine inches high: the lower leaves are divided like thoſe of the ſmall wild rue, and are of a greyiſh colour, thoſe upon the ſtock are narrower, but of the ſame colour; theſe are terminated by umbels of white flowers, each of the larger umbels being compoſed of three ſmall ones; the involucrum hath three narrow leaves ſituated under the umbel. This flowers in July and ripens ſeed in autumn, ſoon after which the plants decay.

Medicinal Uſes. The firſt ſpecies is ſometimes applied externally, in a form of decoction, infuſion, or poultice, as a diſcutient. Theſe are apt to excoriate, and their vapour is to ſome particularly diſagreeable and hurtful. The ſtalks are inſignificant, and the roots very virulent. With regard to its virtue when taken internally, it has been generally accounted poiſonous; which it doubtleſs is, in a high degree, when uſed in any conſiderable quantity. But Dr Stoerk has lately found, that in certain ſmall doſes it may be taken with great ſafety; and that, without at all diſordering the conſtitution, or even producing any ſenſible operation, it ſometimes proves a powerful reſolvent in many obſtinate diſorders. In ſcirrhus, the internal and external uſe of hemlock has been found uſeful, but then mercury has been generally uſed at the ſame time. In open cancer, it often abates the pains, and is free from the conſtipating effects of opium. It is likewiſe uſed in ſcrophulous tumours and ulcers, and in other ulcers that are only defined by the term ill-conditioned. It is alſo recommended by ſome in chin-cough, and various other diſeaſes. Its common, and perhaps beſt form, is that of the powdered leaves, in the doſe at firſt of two or three grains a-day, which in ſome caſes has been gradually increaſed to upwards of two ounces a-day, without producing giddineſs. An extract from the ſeeds is ſaid to produce giddineſs ſooner than that from the leaves. Hence, while both the London and Edinburgh colleges have given a place to the ſuccus ſpiſſatus cicutæ, into the pharmacopœia of the latter an extractum ſeminum cicutæ is alſo introduced.

CONJUNCT, in a general ſenſe, ſignifies conjoined, concurrent, or united.

CONJUNCT Rights, in Scots law. See LAW, Part III. nº clxxx. 15, &c.

CONJUNCT, or *Confident Perſons*, in Scots law. Ibid. nº clxxxiii. 8.

CONJUNCTION, in aſtronomy, the meeting of two or more ſtars or planets in the ſame degree of the zodiac.

CONJUNCTION, in grammar, an indeclinable word or particle, which ſerves to join words and ſentences together, and thereby ſhows their relation or dependence upon one another. See GRAMMAR.

CONJURATION, magic words, characters, or ceremonies, whereby evil ſpirits, tempeſts, &c. are ſuppoſed to be raiſed, or driven away. The Romiſh prieſts pretend to expel devils, by preparing holy water in a particular manner, and ſprinkling it over the poſſeſſed, with a number of conjurations and exorciſms.

Some authors make the difference between conjuration and witchcraft to conſiſt in this; that the former effects its end by prayers and invocation of God's name, &c. to compel the devil to do what is deſired, ſo that the conjurer is ſuppoſed to be at war with the devil, and that evil ſpirit to act merely out of conſtraint: whereas the latter attains its end by an immediate application to the devil himſelf; and the devil's complaiſance is ſuppoſed to be the conſequence of ſome compact between them, ſo that the devil and the witch have a good underſtanding together. Both theſe, again, differ from enchanting and ſorcery; in that theſe latter operate ſecretly and ſlowly by ſpells, charms, &c. without ever calling on the devil, or having any conference with him.

CONN See COND.

CONNAUGHT, one of the four provinces of Ireland, bounded on the eaſt by that of Leinſter, on the weſt by the ocean, on the north and north-weſt by part of the ocean and province of Ulſter, and on the ſouth and eaſt by Munſter. It is about 130 miles in length, and 84 in breadth. It has no rivers of any great note beſides the Shannon. It has ſeveral convenient bays and creeks, and is fertile in many places. It had ſeveral dangerous bogs, over-run with woods, which are now in ſome meaſure cleared away. This province produces abundance of cattle, ſheep, deer, hawks, and honey; but the inhabitants being lazy, it is the leaſt cultivated of all the four provinces. It contains 1 arbiſhopric, 5 biſhoprics, 6 counties, 7 market towns, 8 places of trade, 10 boroughs that ſend members to parliament, 47,256 houſes, 24 old caſtles, beſides fortreſſes that have been erected of late, and 330 pariſhes. The principal town is Galway.

CONNADUS, CEYLON SUMACH: A genus of the decandria order, belonging to the monodelphia claſs of plants; and in the natural method ranking with thoſe of which the order is doubtful. The ſtigma is ſimple, the capſule bivalved, unilocular, and monoſpermous. There is but one ſpecies, viz. The monocarpus. This is a native of India, and riſes with a ligneous ſtalk eight or ten feet high, which is hard, rigid, and covered with a black bark, and divides upward into two or three branches garniſhed with trifoliate leaves, having long footſtalks placed alternate. It is propagated by cutting, and is to be treated in the ſame manner with other tender exotics.

CONNECTICUT, a large river which gives name to one of the five ſtates of New England, (ſee the next article). It riſes in a ſwamp on the height of land, in Lat. 45. 10. Long. 4. E. After a ſleepy courſe of eight or ten miles, it tumbles over four ſeparate falls, and turning weſt keeps cloſe under the hills which form the northern boundary of the vale through which it runs. The Amonooſuck and Iſrael rivers, two principal branches of Connecticut river, fall into it from the eaſt, between the latitudes 44° and 45°. Between the towns of Walpole on the eaſt, and Weſtminiſter on the weſt, ſide of the river, are the great Falls. The whole river, compreſſed between two rocks ſcarcely 30 feet aſunder, ſhoots with amazing rapidity into a broad baſon below. Over theſe

Morſe's Geography.

Connecticut.

theſe falls, a bridge 160 feet in length, was built in 1734, under which the higheſt floods may paſs without detriment. This is the firſt bridge that was ever erected over this noble river. Above Deerfield in Maſſachuſets it receives Deerfield river from the weſt, and Miller's river from the eaſt, after which it turns weſterly in a ſinuous courſe to Fighting falls, and a little after tumbles over Deerfield falls, which are impaſſable by boats. At Windſor in Connecticut it receives Farmington river from the weſt; and at Hartford meets the tide. From Hartford it paſſes on in a crooked courſe, until it falls into Long Iſland ſound, between Saybrook and Lyme.

The length of this river, in a ſtraight line, is nearly 300 miles. Its general courſe is ſeveral degrees weſt of ſouth. It is from 80 to 100 roods wide, 130 miles from its mouth. At its mouth is a bar of ſand which conſiderably obſtructs the navigation. Ten feet water at full tides is found on this bar, and the ſame depth to Middleton. The diſtance of the bar from this place, as the river runs, is 36 miles. Above Middleton are ſeveral ſhoals which ſtretch quite acroſs the river. Only ſix feet water is found on the ſhoal at high tide, and here the tide ebbs and flows but about eight inches. About three miles below Middleton the river is contracted to about 40 roods in breadth by two high mountains. Almoſt every where elſe the banks are low, and ſpread into fine extenſive meadows. In the ſpring floods, which generally happen in May, theſe meadows are covered with water. At Hartford the water ſometimes riſes 20 feet above the common ſurface of the river, and having all to paſs through the abovementioned ſtrait, it is ſometimes two or three weeks before it returns to its uſual bed. Theſe floods add nothing to the depth of water on the bar at the mouth of the river; this bar lying too far off in the ſound to be affected by them.

On this beautiful river, whoſe banks are ſettled almoſt to its ſource, are many pleaſant, neat, well-built towns. On its weſtern bank, from its mouth northward, are the towns of Saybrook, Haddam, Middleton, Weathersfield, Hartford, Windſor, and Suffield, in Connecticut; Weſt Springfield, Northampton, Hatfield, and Deerfield, in Maſſachuſets; Guilford, Brattleborough, in which is Fort Dummer, Weſtminſter, Windſor, Hartford, Fairlee, Newbury, Brunſwick. and many others in Vermont. Croſſing the river into New Hampſhire, and travelling on the eaſtern bank, you paſs through Woodbury nearly oppoſite to Brunſwick, Northumberland, the Coos country, Lyman, Orford, Lyme, Hanover, in which is Dartmouth College, Lebanon, Corniſh, Clermont, Charleſton, or Nº 4, Cheſterfield, and many others in New Hampſhire, Sunderland, Hadley, Springfield, Long Meadow, in Maſſachuſets; and in Connecticut, Enfield, Eaſt Windſor, Eaſt Hartford, Glaſtenbury, Eaſt Haddam, and Lyme.

This river is navigable to Hartford, upwards of 50 miles from its mouth, and the produce of the country for 200 miles above is brought thither in boats. The boats which are uſed in this buſineſs are flat-bottomed, long, and narrow, for the convenience of going up ſtream, and of ſo light a make as to be portable in carts. They are taken out of the river at three different carrying places, all of which make 15 miles.

Connecticut.

Sturgeon, ſalmon, and ſhad, are caught in plenty in their ſeaſon, from the mouth of the river upwards, excepting ſturgeon, which do not aſcend the upper falls; beſides a variety of ſmall fiſh, ſuch as pike, carp, pearch, &c.

From this river are employed three brigs of 180 tons each, in the European trade; and about 60 ſail from 60 to 150 tons, in the Weſt India trade; beſides a few fiſhermen, and 40 or 50 coaſting veſſels.

CONNECTICUT, one of the five ſtates of New England in America; bounded on the north by Maſſachuſets; on the eaſt by Rhode Iſland; on the ſouth, by the ſound, which divides it from Long Iſland; and on the weſt, by the ſtate of New York.

The diviſional line between Connecticut and Maſſachuſets, as ſettled in 1713, was found to be about 72 miles in length. The line dividing Connecticut from Rhode Iſland was ſettled in 1728, and found to be about 45 miles. The ſea coaſt, from the mouth of Paukatuk river, which forms a part of the eaſtern boundary of Connecticut, in a direct ſouthweſtwardly line to the mouth of Byram river, is reckoned at about 90 miles. The line between Connecticut and New-York runs from latitude 41. 0. to latitude 42. 2.; 72 miles. Connecticut contains about 4674 ſquare miles; equal to about 2,960,000 acres.

1 Rivers.

This ſtate is watered by ſeveral fine rivers, the principal of which are, *Connecticut*, deſcribed in the preceding article, Houſatonik, and the Thames. One branch of the Houſatonik riſes in Laneſborough, the other in Windſor, both in Berkſhire county in Maſſachuſets. It paſſes through a number of pleaſant towns, and empties into the ſound between Stratford and Milford. It is navigable 12 miles, to Derby. A bar of ſhells, at its mouth, obſtructs its navigation for large veſſels. In this river, between Saliſbury and Canaan, is a cataract, where the water of the whole river, which is 150 yards wide, falls about ſixty feet perpendicularly, in a perfectly white ſheet. A copious miſt ariſes, in which floating rainbows are ſeen in various places at the ſame time, exhibiting a ſcene exceedingly grand and beautiful.

The Thames empties in Long Iſland ſound at New London. It is navigable 14 miles, to Norwich Landing. Here it loſes its name, an branches into Shetucket on the eaſt, and Norwich or Little river on the weſt. The city of Norwich ſtands on the tongue of land between theſe rivers. Little river, about a mile from its mouth, has a remarkable and very romantic cataract. A rock 10 or 12 feet in perpendicular height, extends quite acroſs the channel of the river. Over this the whole river pitches, in one entire ſheet, upon a bed of rocks below. Here the river is compreſſed into a very narrow channel between two craggy cliffs, one of which towers to a conſiderable height. The channel deſcends gradually, is very crooked, and covered with pointed rocks. Upon theſe the water ſwiftly tumbles, foaming with the moſt violent agitation, 15 or 20 rods, into a broad baſon which ſpreads before it. At the bottom of the perpendicular falls, the rocks are curiouſly excavated by the conſtant pouring of the water. Some of the cavities, which are all of a circular form, are five or ſix feet deep. The ſmoothneſs of the water above its deſcent—the regularity and beauty of the perpendicular fall—the tremendous roughneſs of the other, and the craggy, towering cliff which impends the whole, preſent to the view of the ſpectator a ſcene indeſcribably delightful and majeſtic. On this river are ſome of the fineſt mill ſeats in New England, and thoſe immediately below the falls, occupied by Lathrop's mills, are perhaps not exceeded by any in the world. Acroſs the mouth of this river is a broad, commodious bridge, in the form of a wharf, built at a great expence.

Shetucket river, the other branch of the Thames, four miles from its mouth, receives Quinnabog, which has its ſource in Brimfield in Maſſachuſets; thence paſſing through Sturbridge and Dudly in Maſſachuſets, it croſſes into Connecticut, and divides Pomfret from Killingly, Canterbury from Plainfield, and Liſbon from Preſton, and then mingles with Shetucket. In paſſing through this hilly country, it tumbles over many falls, and affords a vaſt number of mill ſeats. The ſource of the Shetucket is not far from that of Quinnabog. It has the name of Willamantik while paſſing through Stafford, and between Tolland and Willington, Coventry and Mansfield. Below Windham it takes the name of Shetucket, and empties as above. Theſe rivers are fed by numberleſs brooks from every part of the adjacent country. At the mouth of Shetucket is a bridge of timber 124 feet in length, ſupported at each end by pillars, and held up in the middle by braces on the top, in the nature of an arch.

2 Harbours.

The two principal harbours are at New London and New Haven. The former opens to the ſouth. From the light-houſe, which ſtands at the mouth of the harbour, to the town, is about three miles; the breadth is three quarters of a mile, and in ſome places more. The harbour has from five to ſix fathoms water—a clear bottom—tough ooze, and as far as one mile above the town is entirely ſecure and commodious for large ſhips. New Haven harbour is greatly inferior to that of New London. It is a bay which ſets up northerly from the ſound about four miles. Its entrance is about half a mile wide. It has very good anchorage, and two and an half fathoms at low water, and three fathoms and four feet at common tides. The whole of the ſea coaſt is indented with harbours, many of which are ſafe and commodious, but are not ſufficiently uſed to merit a deſcription.

3 Climate, ſoil, and productions.

Connecticut, though ſubject to the extremes of heat and cold in their ſeaſons, and to frequent ſudden changes, is very healthful. As many as one in 46 of the inhabitants of Connecticut, who were living in 1774, were upwards of 70 years old. From accurate calculation it is found, that about one in eight live to the age of 70 years and upwards; one in 13 to the age of 80 years, and one in about 30 to the age of 90.

In the maritime towns the weather is variable, according as the wind blows from the ſea or land. As you advance into the country, the ſea breezes have leſs effect upon the air, and conſequently the weather is leſs variable. The ſhorteſt day is 8 hours and 58 minutes, and the longeſt 15 hours. The northweſt winds, in the winter-ſeaſon, are often extremely ſevere and piercing, occaſioned by the great body of ſnow which lies concealed from the diſſolving influence of the ſun in the immenſe foreſts north and northweſt. The clear and ſerene temperature of the ſky, however, makes amends for the ſeverity of the weather, and is favourable to health and longevity. Connecticut is generally broken land, made up of mountains, hills, and valleys; and is exceedingly well watered. Some ſmall parts of it are thin and barren. It lies in the fifth and ſixth northern climates, and has a ſtrong fertile ſoil. Its principal productions are Indian corn, rye, wheat in many parts of the ſtate, oats and barley, which are heavy and good, and of late buck-wheat--flax in large quantities---ſome hemp, potatoes of ſeveral kinds, pumpkins, turnips, peas, beans, &c. &c. fruits of all kinds, which are common to the climate. The ſoil is very well calculated for paſture and mowing, which enables the farmers to feed large numbers of neat cattle and horſes. Actual calculation has evinced, that any given quantity of the beſt mowing land in Connecticut, produces about twice as much clear profit as the ſame quantity of the beſt wheat land in the ſtate of New York. Many farmers, in the eaſtern part of the ſtate, have lately found their advantage in raiſing mules, which are carried from the ports of Norwich and New London to the Weſt India iſlands, and yield a handſome profit. The beef, pork, butter, and cheeſe of Connecticut, are equal to any in the word.

4 Trade.

The trade of Connecticut is principally with the Weſt India iſlands, and is carried on in veſſels from 60 to 140 tons. The exports conſiſt of horſes, mules, oxen, oak ſtaves, hoops, pine boards, oak planks, beans, Indian corn, fiſh, beef, pork, &c. Horſes, live cattle, and lumber, are permitted in the Dutch, Daniſh, and French ports. Beef and fiſh are liable to ſuch heavy duties in the French iſlands, as that little profit ariſes to the merchant who ſends them to their ports. Pork and flour are prohibited. As the ordinance making free ports in the French Weſt India iſlands extends to all foreigners, the price of molaſſes and other articles, has been greatly enhanced by the Engliſh purchaſes for Canada and Nova Scotia; ſo that the trade of Connecticut with the French Weſt India iſlands is not profitable. Cotton, cocoa, indigo and ſugars, are not permitted to be brought away by Americans. The ſeverity with which theſe prohibitory laws are adminiſtered is ſuch, as that theſe articles cannot be ſmuggled.

Connecticut has a large number of coaſting veſſels employed in carrying the produce of the ſtate to other ſtates--- To Rhode Iſland, Maſſachuſets, and New Hampſhire, they carry pork, wheat, corn, and rye. To North and South Carolinas and Georgia, butter, cheeſe, ſalted beef, cyder, apples, potatoes, hay, &c. and receive in return rice, indigo, and money. But as New York is nearer, and the ſtate of the markets always well known, much of the produce of Connecticut, eſpecially of the weſtern parts, is carried there; particularly pot and pearl aſhes, flax-ſeed, beef, pork, cheeſe, and butter, in large quantities. Moſt of the produce of Connecticut river, from the parts of Maſſachuſets, New Hampſhire, and Vermont, as well as of Connecticut, which are adjacent, goes to the ſame market. Conſiderable quantities of the produce of the eaſtern parts of the ſtate are marketed at Boſton and Providence.

The value of the whole exported produce and commodities from this ſtate, before the year 1774, was then eſtimated at about L.200,000 lawful money annually,

nually. Since this time no accurate eſtimate has been made, ſo that it is impoſſible to tell whether the amount has ſince been increaſed or diminiſhed.

In 1774, the number of ſhipping in Connecticut was 180; their tonage 10,317; ſeafaring men 1162; beſides upwards of 20 ſail of coaſting veſſels, which employed about 90 ſeamen. This ſtate has not yet fully recovered the confuſion in which it was involved by the late war; ſo that the number of ſhipping, &c. has not, at any period ſince 1774, been aſcertained with accuracy. It is probable, however, conſidering the loſſes ſuſtained by the war, the decay of the ſhip building buſineſs, and the number of unfortunate ſhipwrecks, and loſſes by hurricanes in the Weſt Indies, that the ſhipping and ſeamen are not now ſo numerous as in 1774.

5 **Manufactures.** The number of ſhipping from the port of New London employed in 1788 in the European and Weſt India trade, was four ſhips, one ſnow, 54 brigantines, 32 ſchooners, and 45 ſloops. The number of horſes and cattle exported from the diſtrict round New London, from the 10th of January 1787 to the 10th of January 1788, was 6917; beſides jack-aſſes imported and exported, not included. From 1786 to 1787, the number was 6671; ſo that the laſt year exceeded the other 246. From March 1787 to January 1788, 1454 horſes, 700 oxen, and 23 cows, were exported from the port of Middleton.

The farmers in Connecticut and their families are moſtly clothed in plain, decent, homeſpun cloth. Their linens and woollens are manufactured in the family way; and although they are generally of a coarſer kind, they are of a ſtronger texture, and much more durable than thoſe imported from France and Great Britain. Many of their cloths are fine and handſome.

In New Haven is a linen manufactory which flouriſhes, and one for cotton is about to be eſtabliſhed. In Eaſt Hartford is a glaſs-work, a ſnuff and powder mill, and an iron-work and ſlitting-mill. Iron works are eſtabliſhed alſo at Saliſbury, Norwich, and other parts of the ſtate. At Stafford is a furnace at which is made large quantities of hollow ware and other ironmongery, ſufficient to ſupply the whole ſtate. Paper is manufactured at Norwich, Hartford, New Haven, and in Litchfield county. Nails of every ſize are made in almoſt every town and village in Connecticut; ſo that conſiderable quantities can be exported to the neighbouring ſtates, and at a better rate than they can be had from Europe. Ironmongery, hats of the beſt kinds, candles, leather, ſhoes, and boots, are manufactured in this ſtate. We muſt not omit to mention wooden diſhes and other wooden ware, which are made in vaſt quantities in Suffield and ſome few other places, and ſold in almoſt every part of the eaſtern ſtates. Oil-mills, of a new and very ingenious conſtruction, have been erected in ſeveral parts of the ſtate.

It appears from experiments made formerly in this ſtate, that a buſhel of ſun-flower ſeed yields a gallon of oil; and that an acre of ground planted with the ſeed at three feet a part, will yield between forty and fifty buſhels of the ſeed. This oil is as mild as ſweet oil, and is equally agreeable with ſallads, and as a medicine. It may, moreover, be uſed with advantage in paints, varniſhes, and ointments. From its being manufactured in our own country, it may always be procured and uſed in a freſh ſtate. The oil is preſſed from the ſeed in the ſame manner that cold drawn linſeed oil is obtained from flax-ſeed, and with as little trouble. Sweet olive oil ſells for ſix ſhillings a quart. Should the oil of the ſun-flower ſell for only two-thirds of that price, the produce of an acre of ground, ſuppoſing it to yield only 40 buſhels of the ſeed, will be L. 32, a ſum far beyond the product of an acre of ground in any kind of grain. The ſeed is raiſed with very little trouble, and grows in land of moderate fertility. It may be gathered and ſhelled, fit for the extraction of the oil, by women and children.

6 **Civil diviſions and population.** Connecticut is divided into eight counties, *viz.* Hartford, New Haven, New London, Fairfield, Windham, Litchfield, Middleſex, and Tolland. The counties are ſubdivided into upwards of 80 townſhips; each of which is a corporation, inveſted with power to hold lands, chooſe their own town-officers, to make prudential laws, the penalty of tranſgreſſion not to exceed 20s. and to chooſe their own repreſentatives to the general aſſembly. The townſhips are generally divided into two or more pariſhes, in each of which is one or more places for public worſhip.

Connecticut is the moſt populous, in proportion to its extent, of any of the thirteen ſtates. It is laid out in ſmall farms from 50 to 300 or 400 acres each, which are held by the farmers in fee ſimple; and are generally cultivated as well as the nature of the ſoil will admit. The ſtate is chequered with innumerable roads or highways, croſſing each other in every direction. A traveller in any of theſe roads, even in the moſt unſettled parts of the ſtate, will ſeldom paſs more than two or three miles without finding a houſe or cottage, and a farm under ſuch improvements as to afford the neceſſaries for the ſupport of a family. The whole ſtate reſembles a well-cultivated garden; which, with that degree of induſtry that is neceſſary to happineſs, produces the neceſſaries and conveniences of life in great plenty.

In 1756, the number of inhabitants in Connecticut was 130,611; in 1774, there were 167,856 ſouls. In 18 years, the increaſe was 67,245; from 1774 to 1782, the increaſe was but 11,294 perſons. This comparatively ſmall increaſe of inhabitants may be ſatisfactorily accounted for from the deſtruction of the war, and the numerous emigrations to Vermont, the weſtern parts of New Hampſhire, and other ſtates.

The inhabitants are almoſt entirely of Engliſh deſcent. There are no Dutch, French, or Germans, and very few Scotch or Iriſh people, in any part of New England.

7 **Character, manners, &c.** In addition to what has been already ſaid on theſe particulars under New England, it may be obſerved, that the people of Connecticut are remarkably fond of having all their diſputes, even thoſe of the moſt trivial kind, ſettled according to law. The prevalence of this litigious ſpirit affords employment and ſupport for a numerous body of lawyers. The number of actions entered annually upon the ſeveral dockets in the ſtate, juſtifies the above obſervations. That party ſpirit, however, which is the bane of political happineſs, has not raged with ſuch violence in this ſtate as in Maſſachuſets and Rhode-Iſland. Public proceedings have been conducted, generally, and eſpecially of

late, with much calmneſs and candour. The people are well informed in regard to their rights, and judicious in the methods they adopt to ſecure them.

The clergy, who are numerous, and, as a body, very reſpectable, have hitherto preſerved a kind of ariſtocratical balance in the very democratical government of the ſtate; which has happily operated as a check upon the overbearing ſpirit of republicaniſm. It has been lamented that the unhappy religious diſputes which have too much prevailed among ſome of the clergy, and the too great attention that others have paid to their temporal concerns, to the neglect of their flocks, and an inattention to the qualifications of thoſe who have been admitted to the ſacred office, have, heretofore, conſiderably diminiſhed their influence. It is a pleaſing circumſtance that the rage for theological diſputation is abating; and greater ſtrictneſs is obſerved in the admiſſion of candidates to the miniſtry. Their influence is on the increaſe; and it is no doubt to be attributed, in part, to their increaſing influence, that an evident reformation in the manners of the people of this ſtate has taken place ſince the peace. In regard to learning and abilities, the clergy, at the preſent day, are equal to their predeceſſors at any former period.

8 Religion. As to eccleſiaſtical government and diſcipline, each church is a ſeparate juriſdiction, and claims authority to chooſe their own miniſter, to exerciſe government, and to enjoy goſpel ordinances within itſelf. The churches, however, are not independent of each other; they are aſſociated for mutual benefit and convenience. The aſſociations have power to licence candidates for the miniſtry, to conſult for the general welfare, and to recommend meaſures to be adopted by the churches, but have no authority to enforce them. When diſputes ariſe in churches, councils are called, by the parties, to ſettle them; but their power is only adviſory. There are as many aſſociations in the ſtate as there are counties; and they meet twice in a year. Theſe are all combined in one general aſſociation, who meet annually.

All religions that are conſiſtent with the peace of ſociety are tolerated in Connecticut; and a ſpirit of liberality and catholiciſm is increaſing. There are very few religious ſects in this ſtate; the bulk of the people are congregationaliſts. Beſides theſe there are epiſcopalians and baptiſts; and formerly there was a ſociety of Sandimanians at New-Haven; but they are now reduced to a very ſmall number. The epiſcopalian churches are reſpectable, and are under the ſuperintendance of a biſhop. There were 29 congregations of the baptiſts in 1784. Theſe congregations, with thoſe in the neighbouring ſtates, meet in aſſociations, by delegation, annually.

9 Chief towns. There are a great number of very pleaſant towns, both maritime and inland, in Connecticut. It contains five incorporated towns or cities. Two of theſe, Hartford and New Haven, are the capitals of the ſtate. The general aſſembly is holden at the former in May, and at the latter in October, annually. See HARTFORD and *New*-HAVEN.

10 Colleges, academies, and ſchools. In no part of the world is the education of all ranks of people more attended to than in Connecticut. Almoſt every town in the ſtate is divided into diſtricts, and each diſtrict has a public ſchool kept in it a greater or leſs part of every year. Somewhat more than one third of the monies ariſing from a tax on the polls and rateable eſtate of the inhabitants, is appropriated to the ſupport of ſchools, in the ſeveral towns, for the education of children and youth. The law directs that a grammar ſchool ſhall be kept in every county town throughout the ſtate.

There is a grammar ſchool at Hartford, and another at New Haven, ſupported by a donation of governor Hopkins. This venerable and benevolent gentleman, in his laſt will, dated 1657, left in the hands of Theophilus Eaton, Eſq; and three others, a legacy of L. 1324, "as an encouragement, in theſe foreign plantations, of breeding up hopeful youths both at the grammar ſchool and college." In 1664, this legacy was equally divided between New Haven and Hartford; and grammar ſchools were erected, which have been ſupported ever ſince.

At Greenfield there is a reſpectable academy, under the care and inſtruction of the Rev. Dr Dwight. At Plainfield is another, under the care of the Rev. Mr Benedict. This academy has flouriſhed for ſeveral years, and furniſhed a number of ſtudents for Yale and Dartmouth colleges. At Norwich and Windham, likewiſe, are academies furniſhed with able inſtructors; each of theſe academies have 60 or 70 ſcholars.

Yale College was founded in 1700, and remained at Killingworth until 1707—then at Saybrook until 1716, when it was removed and fixed at New Haven. See NEW HAVEN.

11 Mines, minerals, and foſſils. On the bank of Connecticut river, two miles from Middleton, is a lead mine, which was wrought during the war, at the expence of the ſtate, and was productive. It is too expenſive to work in time of peace. Copper mines have been diſcovered and opened in ſeveral parts of the ſtate, but have proved unprofitable, and are much neglected. Iron mines are numerous and productive. Steel ore has been found in the mountains between Woodbury and New Milford. Talcs of various kinds, white, brown, and chocolate coloured cryſtals, zink or ſpelter, a ſemimetal, and ſeveral other foſſils and metals, have been found in Connecticut.

12 Mode of levying taxes. All freeholders in the ſtate are required by law to give in liſts of their polls and rateable eſtate, to perſons appointed in the reſpective towns to receive them, on or before the 20th of Auguſt annually. Theſe are valued according to law, arranged in proper order, and ſent to the general aſſembly annually in May.

The ſum total of the liſt of the polls and rateable eſtate of the inhabitants of Connecticut, as brought into the general aſſembly in May 1787, were as follows:

Sum total of the ſingle liſt	L. 1,484,901	6	4¾
Aſſeſſments, - - -	47,790	2	9
One quarter of the fourfolds, -	1,176	9	4
Total, -	L. 1,533,867	18	5¾

On this ſum taxes are levied, ſo much on the pound, according to the ſum propoſed to be raiſed. A tax of two-pence on the pound would raiſe L. 12,782, 4s.

The ordinary annual expences of government before the war amounted to near L. 4000 Sterling, excluſive of that which was appropriated to the ſupport of ſchools. The expences have ſince increaſed.

13 Mineral ſprings.

At Stafford is a medicinal ſpring, which is ſaid to be a ſovereign remedy for ſcorbutic, cutaneous, and other diſorders. At Guilford is a ſpring, whoſe water, it is ſaid, when ſeparated from the fountain, will evaporate even when put into a bottle and tightly corked.

14 Conſtitution and courts of juſtice.

It is difficult to ſay what is the conſtitution of this ſtate. Contented with the form of government which originated from the charter of Charles II. granted in 1662, the people have not been diſpoſed to run the hazard of framing a new conſtitution ſince the declaration of independence. They have tacitly adopted their old charter as the ground of civil government, ſo far as it is applicable to an independent people.

Agreeable to this charter, the ſupreme legiſlative authority of the ſtate is veſted in a governor, deputy-governor, twelve aſſiſtants or counſellors, and the repreſentatives of the people, ſtyled the *General Aſſembly*. The governor, deputy governor, and aſſiſtants, are annually choſen by the freemen in the month of May. The repreſentatives (their number not to exceed two from each town) are choſen by the freemen twice a-year, to attend the two annual ſeſſions, on the ſecond Thurſdays of May and October. This aſſembly has power to erect judicatories, for the trial of cauſes civil and criminal, and to ordain and eſtabliſh laws for ſettling the forms and ceremonies of government. By theſe laws the general aſſembly is divided into two branches, called the upper and lower houſes. The upper houſe is compoſed of the governor, deputy-governor, and aſſiſtants; the lower houſe, of the repreſentatives of the people. No law can paſs without the concurrence of both houſes. The judges of the ſuperior court hold their offices during the pleaſure of the general aſſembly. The judges of the county courts, and juſtices, are annually appointed. Sheriffs are appointed by the governor and council, without limitation of time. The governor is captain-general of the militia, the deputy-governor lieutenant-general. All other military offices are appointed by the aſſembly, and commiſſioned by the governor.

The mode of electing the governor, deputy governor, aſſiſtants, treaſurer, and ſecretary, is as follows: The freemen in the ſeveral towns meet on the Monday next after the firſt Tueſday in April, annually, and give in their votes for the perſons they chooſe for the ſaid offices reſpectively, with their names written on a piece of paper, which are received and ſealed up by a conſtable in open meeting, the votes for each office by themſelves, with the name of the town and office written on the outſide. Theſe votes, thus ſealed, are ſent to the general aſſembly in May, and there counted by a committee from both houſes. All freemen are eligible to any office in government. In chooſing aſſiſtants, twenty perſons are nominated, by the vote of each freeman, at the freemen's meeting for chooſing repreſentatives in September annually. Theſe votes are ſealed up, and ſent to the general aſſembly in October, and are there counted by a committee of both houſes, and the twenty perſons who have the moſt votes ſtand in nomination; out of which number the twelve who have the greateſt number of votes, given by the freemen at their meeting in April, are in May declared aſſiſtants in the manner abovementioned. The qualifications of freemen are, maturity in years, quiet and peaceable behaviour, a civil converſation, and freehold eſtate to the value of forty ſhillings *per annum*, or forty pounds perſonal eſtate in the liſt, certified by the ſelect men of the town; it is neceſſary alſo that they take the oath of fidelity to the ſtate. Their names are enrolled in the town clerk's office, and they continue freemen for life, unleſs disfranchiſed by ſentence of the ſuperior court, on conviction of miſdemeanor.

The courts are as follows: The juſtices of the peace, of whom a number are annually appointed in each town by the general aſſembly, have authority to hear and determine civil actions, where the demand does not exceed four pounds. If the demand exceeds forty ſhillings, an appeal to the county is allowed. They have cognizance of ſmall offences, and may puniſh by fine not exceeding forty ſhillings, or whipping not exceeding ten ſtripes, or ſitting in the ſtocks. There are eight county courts in the ſtate, held in the ſeveral counties by one judge and four juſtices of the quorum, who have juriſdiction of all criminal caſes, ariſing within their reſpective counties, where the puniſhment does not extend to life, limb, or baniſhment. They have original juriſdiction of all civil actions which exceed the juriſdiction of a juſtice. Either party may appeal to the ſuperior court, if the demand exceeds twenty pounds, except on bonds or notes vouched by two witneſſes.

There are ſeveral courts of probate in each county, conſiſting of one judge. The peculiar province of this court is, the probate of wills, granting adminiſtration of inteſtate eſtates, ordering diſtribution of them, and appointing guardians for minors, &c. An appeal lies from any decree of this court to the ſuperior court.

The ſuperior court conſiſts of five judges. It has authority in all criminal caſes extending to life, limb, or baniſhment, and other high crimes and miſdemeanors, to grant divorces, and to hear and determine all civil actions brought by appeal from the county courts, or the court of probate, and to correct the errors of all inferior courts. This is a circuit court, and has two ſtated ſeſſions in each county annually. The ſuperior and county courts try matters of fact by a jury, or without if the parties will agree.

There is a ſupreme court of errors, conſiſting of the deputy governor and the twelve aſſiſtants. Their ſole buſineſs is to determine writs of error brought on judgments of the ſuperior court, where the error complained of appears on the record. They have two ſtated ſeſſions annually, *viz.* on the Tueſdays of the weeks preceding the ſtated ſeſſions of the general aſſembly.

The county court is a court of chancery, empowered to hear and determine caſes in equity, where the matter in demand does not exceed one hundred pounds. The ſuperior court has cognizance of all caſes where the demand exceeds that ſum. Error may be brought from the county to the ſuperior court, and from the ſuperior court to the ſupreme court of errors, on judgment in caſes of equity as well as of law.

The general aſſembly only have power to grant pardons and reprieves, to grant commiſſions of bankruptcy, or protect the perſons and eſtates of unfortunate debtors.

The common law of England, ſo far as it is applicable to this country, is conſidered as the common law of this ſtate. The reports of adjudication in the courts of king's bench, common pleas, and chancery, are read in the courts of this ſtate as authorities; yet the judges do not conſider them as concluſively binding, unleſs founded on ſolid reaſons which will apply in this ſtate, or ſanctioned by concurrent adjudications of their own courts.

The feudal ſyſtem of deſcents was never adopted in this ſtate. All the real eſtate of inteſtates is divided equally among the children, males and females, except that the eldeſt ſon has a double portion. And all eſtates given in tail, muſt be given to ſome perſon then in being, or to their immediate iſſue, and ſhall become fee-ſimple eſtates to the iſſue of the firſt donee in tail. The widow of an inteſtate is intitled to a third part of the perſonal eſtate for ever, and to her dower, or third part of the houſes and lands belonging to the inteſtate at the time of his death, during her life.

15 Practice of law.

The practice of law in this ſtate has more ſimplicity, but leſs preciſion, than in England. Aſſiſtants and judges are impowered to iſſue writs through the ſtate, and juſtices through their reſpective counties. In theſe writs, the ſubſtance of the complaints or the declarations muſt be contained; and if neither of the parties ſhow good reaſon for delay, the cauſes are heard and determined the ſame term to which the writs are returnable. Few of the fictions of law, ſo common in the Engliſh practice, are known in this ſtate. The plaintiff always has his election to attach or ſummon the defendant. Attornies are admitted and qualified by the county courts. Previous to their admiſſion to the bar, they muſt ſtudy two years with a practiſing attorney in the ſtate, if they have had a college education, and three years if they have not; their morals muſt be good, and their characters unblemiſhed; and they muſt ſuſtain an examination by the attorneys of the court of the county where they are admitted, and be by them recommended to the court. When admitted to the county court, they can practice, without other qualifications, in any court in the ſtate. There are upon an average about thirteen attornies to each county, one hundred and four in the ſtate; a very great proportion for the real exigencies of the people. Yet from the litigious ſpirit of the citizens, the moſt of them find employment and ſupport. There is no attorney general, but there is one attorney to the ſtate in each county.

16 Hiſtory.

The preſent territory of Connecticut, at the time of the firſt arrival of the Engliſh, was poſſeſſed by the Pequot, the Mohegan, Podunk, and many other ſmaller tribes of Indians.

The Pequots were numerous and warlike. Their country extended along the ſea coaſt from Paukatuk to Connecticut river. About the year 1630, this powerful tribe extended their conqueſts over a conſiderable part of Connecticut, over all Long Iſland, and part of Narraganſet. Saſſacus, who was the grand monarch of the whole country, was king of this nation. The ſeat of his dominion was at New London; the ancient Indian name of which was Pequot.

The Mohegans were a numerous tribe, and their terrritory extenſive. Their ancient claim, which was ſurveyed and ſettled by commiſſioners from queen Anne in 1705, comprehended all New London county, except a narrow ſtrip of about eight miles wide, on the ſea coaſt, almoſt the whole of the county of Windham, and a part of the counties of Tolland and Hartford. Uncas, diſtinguiſhed for his friendſhip to the Engliſh, was the Sachem of this tribe.

The Podunks inhabited Eaſt Hartford, and the circumjacent country. The firſt Sachem of this tribe, of whom the Engliſh had any knowledge, was Tatanimoo. He was able to bring into the field more than 200 fighting men.

The firſt grant of Connecticut was made by the Plymouth council to the earl of Warwick, in 1630, and confirmed by his majeſty in council the ſame year. This grant comprehended all that part of New England which lies weſt from Narraganſett river, 120 miles on the ſea coaſt, from thence, in latitude and breath aforſaid, to the ſouth ſea. The year following, the earl aſſigned this grant to lord Say and Seal, lord Brook, and nine others.

No Engliſh ſettlements were attempted in Connecticut until the year 1633, when a number of Indian traders, having purchaſed of Zequaſſon and Natawanute, two principal Sachems, a tract of land at the mouth of Little river in Windſor, built a houſe and fortified it, and ever after maintained their right of ſoil upon the river.

The ſame year, a little before the arrival of the Engliſh, a company of Dutch traders came to Hartford, and built a houſe which they called the *Hirſe of Good Hope*, and erected a ſmall fort, in which they planted two cannon. The remains of this ſettlement are ſtill viſible on the bank of Connecticut river. This was the only ſettlement of the Dutch in Connecticut in theſe ancient times. The Dutch, aud after them the province of New York, for a long time claimed as far eaſt as the weſtern bank of Connecticut river. It belongs to the profeſſed hiſtorian to prove or diſprove the juſtice of this claim. Douglas ſays, "The partition line between New York and Connecticut, as eſtabliſhed December 1, 1664, run from the mouth of Memoroncok river, a little weſt from Byram river, N. N. W. and was the *ancient eaſterly limits of New York*, until November 23, 1683, when the line was run nearly the ſame as it is now ſettled." If Douglas is right, the New York claim could not have been well founded.

In 1634, Lord Say and Seal, &c. ſent over a ſmall number of men, who built a fort at Saybrook, and held a treaty with the Pequot Indians, who in a formal manner gave to the Engliſh their right to Connecticut river and the adjacent country.

In 1635, the Plymouth council granted to the Duke of Hamilton, all lands between Narraganſett and Connecticut rivers, and back into the country as far as Maſſachuſets ſouth line. This covered a part of the Earl of Warwick's patent, and occaſioned ſome diſputes in the colony. There were ſeveral attempts to revive the Hamilton claim, but were never proſecuted.

In October of this year, about ſixty perſons from Newtown, Dorcheſter, and Watertown, in Maſſachuſets, came and ſettled at Hartford, Wetherſfield, and Windſor, in Connecticut; and the June following the famous Mr Hooker and his company came and ſettled at Hartford, and was a friend and father to the colony to the day of his death.

The firſt court held in Connecticut was at Hartford, April 26, 1636.

The year 1637 was diſtinguiſhed by the war with the Pequots. This warlike nation had, for ſome time, been troubleſome neighbours. They ſolicited the Narraganſetts to join them in extirpating the Engliſh. They had ſurpriſed and killed ſeveral of the Engliſh upon Connecticut river. Theſe threatening appearances and actual hoſtilities induced the three colonies of Maſſachuſets, Plymouth, and Connecticut, to combine their forces, to carry the war into their country, and to attempt the entire deſtruction of the whole tribe. Myantonomo, the Narraganſett Sachem, and Uncas, Sachem of the Mohegans, ſent to the Engliſh and offered their ſervice to join with them againſt the Pequots. Forces were accordingly raiſed in all the colonies; but thoſe of Connecticut, on account of their vicinity to the enemy, were firſt in action. Captain Maſon, with 80 Engliſh and 100 Indians from Connecticut river, proceeded by water to the Narraganſett's country, where 200 of that tribe joined him. On the 24th of May, they began their march for Saſſacus fort on Pequot, now Thames river. They afterwards determined firſt to aſſault Myſtic fort, which was ſituated between them and Pequot river. On the morning of the 26th of May the attack was made. The Indians, after a midnight revel, were buried in a deep ſleep. At the moment of their approach the centinel happened to be gone into a wigwam to light his pipe. The barking of a dog gave the alarm. The Indians awoke, ſeized their arrows, and began their hideous yell. They were joined in their tremendous noiſe by the Indians in the Engliſh army, who were in the rear and afraid to approach. The battle was warm and bloody, and the victory complete. The fort was taken---about 70 wigwams burnt--- 50 or 60 of the Indians were killed---many were wounded and taken, and the reſt eſcaped. Saſſacus and his warriors at Pequot, ſtruck with terror at the news of this defeat, demoliſhed their principal fort, burnt their wigwams, and fled to the weſtward. Capt. Stoughton, with 160 men from Maſſachuſets, had by this time arrived at Saybrook. He with his forces joined Captain Maſon and purſued the Indians, and overtook and ſurrounded them in a great ſwamp near Fairfield. A Sachem and ninety-nine women and children came out and delivered themſelves up to their purſuers. Terms of peace were offered to the reſt: but after a ſhort parley they determined, that as they had lived they would die together. There were about 80 who made this reſolution. Part of theſe eſcaped by means of the darkneſs of the night. The reſt were either killed or taken. In this action the Indians had guns, which is the firſt account of their having uſed them. Saſſacus fled to the Mohawks, by whom it is reported he was murdered; but it is more probable that he and his company incorporated with them. Many of the Indian captives were unjuſtifiably ſent to Bermudas and ſold for ſlaves. The Pequot tribe was wholly extinguiſhed. This ſucceſsful expedition ſtruck the Indians that remained with ſuch terror, as reſtrained them from open hoſtilities for near forty years after.

The Engliſh thus obtained the country eaſt of the Dutch ſettlements, by right of conqueſt. The purſuit of the Indians led to an acquaintance with the lands on the ſea coaſt from Saybrook to Fairfield. It was reported to be a very fine country. This favourable report, induced Meſſrs Eaton and Hopkins, two very reſpectable London merchants, and Mr Davenport, a man of diſtinguiſhed piety and abilities, with their company, who arrived this year (1637) from London, to think of this part of the country as the place of their ſettlement. Their friends in Maſſachuſets, ſorry to part with ſo valuable a company, diſſuaded them from their purpoſe. Influenced, however, by the promiſing proſpects which the country afforded, and flattering themſelves that they ſhould be out of the juriſdiction of a general governor, with which the country was from time to time threatened, they determined to proceed. Accordingly, in March 1638, with the conſent of their friends on Connecticut river, they ſettled at New Haven, and laid the foundation of a flouriſhing colony, of which Quinnipiak, now New Haven, was the chief town. The firſt public worſhip, in this new plantation, was attended on Lord's day, April 18, 1638, under a large ſpreading oak. The Rev. Mr Davenport preached from Matt. iii. 1. on the temptations of the wilderneſs. Both colonies, by voluntary compact, formed themſelves into diſtinct commonwealths, and remained ſo until their union in 1665.

In 1639, the three towns on Connecticut river, already mentioned, finding themſelves without the limits of any juriſdiction, formed themſelves into a body politic, and agreed upon articles of civil government. Theſe articles were the foundation of the Connecticut charter, which was granted in 1662. The ſubſtance of the articles, ſo far as they reſpect the holding of aſſemblies, the time and manner of electing magiſtrates and other civil officers (except that in the old confederation no perſon was to be choſen governor more than once in two years), and the extent of legiſlative powers, was transferred into, and eſtabliſhed in ſaid charter.

The firſt church was gathered in New Haven this year, and conſiſted of ſeven members. Theſe were choſen by the ſettlers after Mr Davenport had preached from the words of Solomon, 'Wiſdom had builded her houſe, ſhe hath hewed out her ſeven pillars.' Theſe men were indeed the pillars of the church, to whom the reſt were added as they became qualified. They were alſo the court to try all civil actions.

The firſt ſetlers in New Haven had all things common; all purchaſes were made in the name and for the uſe of the whole plantation; and the lands were apportioned out to each family according to their number and original ſtock.

At their firſt election, in October 1639, Mr Theophilus Eaton was choſen governor for the firſt year. Their elections, by agreement, were to be annual; and the word of God their only rule in conducting the affairs of government in the plantation.

In 1643, the articles of confederation between the four New England colonies, mentioned under the article NEW ENGLAND, were unanimouſly adopted by the colonies of New Haven and Connecticut.

The Engliſh ſettlement on Delaware, which was under the juriſdiction of New Haven, was ſurprized by the Swedes, and the people put in irons, under a falſe pretence that they were entering into a conſpiracy with the Indians to extirpate the Swedes.

The general court of New Haven, this year, eſtabliſhed it as a fundamental article not to be diſputed, That none be admitted as free burgeſſes but church members, and that none but ſuch ſhould vote at elections. They alſo ordained, That each town chooſe from among themſelves judges (church members) to be a court, to have cognizance of all civil actions not exceeding twenty pounds; and of criminal cauſes, where the puniſhment was, ſitting in the ſtocks, whipping, and fining not exceeding five pounds. There was liberty of appeal from this to the court of magiſtrates. The court of magiſtrates conſiſted of all the magiſtrates throughout the colony, who were to meet twice a-year at New-Haven, for the trial of all capital cauſes. Six made a quorum. The general court was to conſiſt of the governor, deputy-governor, magiſtrates, and two repreſentatives from each town. The annual election of officers of government was at this time eſtabliſhed, and has ever ſince continued.

The unſettled ſtate of the colony had hitherto prevented their eſtabliſhing a code of laws. To ſupply this defect, the general court ordered, 'That the judicial laws of God, as they were delivered to Moſes, and as they are a fence to the moral, being neither typical nor ceremonial, nor having any reference to Canaan, ſhall be accounted of moral equity and generally bind all offenders, and be rule to all the courts in this juriſdiction in their proceedings againſt offenders, until they be branched out into particulars hereafter.'

About this time a war broke out between the Mohegan and Narraganſett Indians. A perſonal quarrel between Myantonomo, ſachem of the Narraganſetts, and Uncas ſachem of the Mohegans, was the foundation of the war. Myantonomo raiſed an army of 900 warriors, and marched towards the Mohegan country. Uncas by his ſpies received timely notice of their approach. His ſeat of reſidence was in ſome part of Norwich. He quickly collected 600 of his braveſt warriors, and told them, 'The Narraganſetts muſt not come into our town; we muſt meet them.' They accordingly marched about three miles to a large plain, where the two armies met, and halted within bow-ſhot of each other. A parley was propoſed by Uncas, and agreed to by Myantonomo. The ſachems met, and Uncas addreſſed his enemy as follows. 'You have a great many brave men: ſo have I. You and I have quarrelled; but theſe warriors, what have they done? Shall they die to avenge a private quarrel between us? No. Come like a brave man, as you pretend to be, and let us fight. If you kill me, my men ſhall be yours; if I kill you, your men ſhall be mine.' Myantonomo replied: 'My men came to fight, and they ſhall fight.' Uncas, like an experienced warrior, aware of the reſult of the conference from the ſuperior force of his enemy, had previouſly ſignified to his men, that if Myantonomo refuſed to fight him in ſingle combat, he would immediately fall, which was to be the ſignal for them to begin the attack. As ſoon therefore as Myantonomo had finiſhed his laconic ſpeech, Uncas dropped: his men inſtantly obeyed the ſignal, and poured in a ſhower of arrows upon the unſuſpecting Narraganſetts, and ruſhing on with their horrid yells and ſavage fierceneſs, put them to flight. Many were killed on the ſpot, the reſt were cloſely purſued, and ſome were precipitately driven down craggy precipices, and daſhed in pieces. At a place called, from this event, *Sachem's plain*, Uncas overtook and ſeized Myantonomo by the ſhoulder. They ſat down together; and Uncas with a hoop called in his men, and the battle ceaſed. Doubtful what to do with the royal priſoner, Uncas and his warriors, in council, determined to carry him to the governor and council at Hartford, and be adviſed by them. Thither he was accordingly conducted. The governor having adviſed with his council, told Uncas, that the Engliſh were not then at war with the Narraganſetts, and of courſe that it was not proper for them to intermeddle in the matter. Uncas was left to do with him as he pleaſed. Myantonomo was conducted back to the plain where he was taken, and put to death by Uncas himſelf. The tragic ſcene did not end with his death. Uncas, after the manner of the Indians, with his tomahawk cut off a large piece of fleſh from the ſhoulder of his ſlaughtered enemy, broiled and eat it, ſaying, with an air of ſavage triumph, 'It is the ſweeteſt meat I ever eat. It makes me have a ſtout heart.' His body was afterwards buried; and a pillar erected over it, the remains of which are viſible to this day.

The Narraganſetts were greatly enraged at the death of their prince, and reſolved to take vengeance on the Mohegans. The united colonies interpoſed to prevent a war between them, but in vain. The Narraganſetts reſolutely declared, they would continue the war until they had Unca's head. But as Uncas had ever been a friend to the Engliſh, they joined him againſt his enemies, and were victorious. Such, however, was the enmity of the Narraganſetts to the Engliſh, that they afterwards ſent ſome of their men to Uncas, with large preſents, to induce him to join with them in a war with the colonies. Uncas replied, "Go tell your king that I will go to Norwich, and adviſe with Major John Maſon and Mr Fitch; if they tell me to join him and fight againſt the Engliſh, I will join him." In the war that happened ſoon after, Uncas aſſiſted the Engliſh, and the Narraganſetts were ſubdued, and never after were formidable.

In conſideration of the ſucceſs and increaſe of the New England colonies, and that they had been of no charge to the nation, and in proſpect of their being in future very ſerviceable to it, the Engliſh parliament, March 10, 1643, granted them an exemption from all cuſtoms, ſubſidies, and other duties, until further order.

In 1644, the Connecticut adventurers purchaſed of Mr Fenwick, agent for Lord Say and Seal, and Lord Brook, their right to the colony of Connecticut, for L. 1600.

The hiſtory of Connecticut is marked with traces of the ſame ſpirit which appears to be characteriſtic of the Maſſachuſets, in different ſtages of their hiſtory. Indeed, as Maſſachuſets was the ſtock whence Connecticut proceeded, this is to be expected.

The colonies of Connecticut and New Haven, from their firſt ſettlement, increaſed rapidly; tracts of land were purchaſed of the Indians, and new towns ſettled from Stamford to Stonington, and far back into the country, when, in 1661, Major John Maſon, as agent for the colony, bought of the natives all lands which had not before been purchaſed by particular towns, and made a public ſurrender of them to the colony, in the preſence of the general aſſembly. Having done theſe things, the colonies petitioned King Charles II. for a charter, and their petition was granted. His Majeſty, on the 23d of April 1662, iſſued his letters patent under the great ſeal, ordaining that the colony of Connecticut ſhould for ever hereafter be one body corporate and politic, in fact and in name, confirming to them their ancient grant and purchaſe, and fixing their boundaries as follows, viz. "All that part of his Majeſty's dominions in New England, in America, bounded eaſt by Narraganſett river, commonly called *Narraganſett bay*, where the river falleth into the ſea; and on the north by the line of Maſſachuſets plantation, and on the ſouth by the ſea, and in longitude as the line of the Maſſachuſets colony, running from eaſt to weſt, that is to ſay, from the ſaid Narraganſett bay on the eaſt, to the ſouth ſea on the weſt part, with the iſlands thereunto belonging." This charter has ever ſince remained the baſis of the government of Connecticut.

Such was the ignorance of the Europeans reſpecting the geography of America, when they firſt aſſumed the right of giving away lands which the God of nature had long before given to the Indians, that their patents extended they knew not where, many of them were of doubtful conſtruction, and very often covered each other in part, and have produced innumerable diſputes and miſchiefs in the colonies, ſome of which are not ſettled to this day. Connecticut conſtrued her charter literally, and paſſing over New York, which was then in poſſeſſion of the ſubjects of a Chriſtian prince, claimed, in latitude and breadth mentioned therein, to the South Sea. Accordingly purchaſes were made of the Indians, on the Delaware river, weſt of the weſtern bounds of New York, and within the ſuppoſed limits of Connecticut charter, and ſettlements were made thereon by people from, and under the juriſdiction of, Connecticut. The charter of Pennſylvania, granted to William Penn, in 1681, covered theſe ſettlements. This laid the foundation for a diſpute, which for a long time was maintained with warmth on both ſides. The matter was at laſt ſubmitted to gentlemen choſen for the purpoſe, who decided the diſpute in favour of Pennſylvania. Many, however, ſtill aſſert the juſtice of the Connecticut claim. The ſtate of Connecticut has lately ceded to Congreſs all their lands weſt of Pennſylvania, except a reſerve of 20 miles ſquare. This ceſſion Congreſs have accepted, and thereby indubitably eſtabliſhed the right of Connecticut to the reſerve.

The colony of New Haven, though unconnected with the colony of Connecticut, was comprehended within the limits of their charter, and, as they concluded, within their juriſdiction. But New Haven remonſtrated againſt their claim, and refuſed to unite with them until they ſhould hear from England. It was not until the year 1665, when it was believed that the king's commiſſioners had a deſign upon the New England Charters, that theſe two colonies formed a union, which has ever ſince amicably ſubſiſted between them.

In 1672, the laws of the colony were reviſed, and the general court ordered them to be printed; and alſo, that "every family ſhould buy one of the law books; ſuch as pay in ſilver, to have a book for 12d. ſuch as pay in wheat, to pay a peck and half a book; and ſuch as pay in peaſe, to pay 2s. a book, the peaſe at 3s. the buſhel." Perhaps it is owing to this early and univerſal ſpread of law books, that the people of Connecticut are to this day ſo fond of the law. In 1750, the laws of Connecticut were again reviſed, and publiſhed in a ſmall folio volume of 258 pages. Dr Douglas obſerves, that they were the moſt natural, equitable, plain, and conciſe code of laws for plantations hitherto extant." There has been a reviſion of them ſince the peace, in which they were greatly and very judiciouſly ſimplified.

The years 1675 and 1676 were diſtinguiſhed by the wars with Philip and his Indians, and with the Narraganſetts, by which the colony was thrown into great diſtreſs and confuſion. The inroads of the enraged ſavages were marked with cruel murders, and with fire and devaſtation.

In 1684, the charter of Maſſachuſets bay and Plymouth were taken away, in conſequence of Quo warrantos which had been iſſued againſt them. The charter of Connecticut would have ſhared the ſame fate, had it not been for ——— Wadſworth, Eſq; who, having very artfully procured it when it was on the point of being delivered up, buried it under an oak tree in Hartford, where it remained until all danger was over, and then was dug up and reaſſumed.

Connecticut has ever made rapid advances in population. There have been more emigrations from this than from any of the other ſtates, and yet it is at preſent full of inhabitants. This increaſe, under the divine benediction, may be aſcribed to ſeveral cauſes. The bulk of the inhabitants are induſtrious, ſagacious huſbandmen. The farms furniſh them with all the neceſſaries, moſt of the conveniences, and but few of the luxuries of life. They of courſe are generally temperate, and, if they chooſe, can ſubſiſt with as much independance as is conſiſtent with happineſs. The ſubſiſtence of the farmer is ſubſtantial, and does not depend on incidental circumſtances, like that of moſt other profeſſions. There is no neceſſity of ſerving an apprenticeſhip to the buſineſs, nor of a large ſtock of money to commence it to advantage. Farmers, who deal much in barter, have leſs need of money than any other claſs of people. The eaſe with which a comfortable ſubſiſtence is obtained, induces the huſbandman to marry young. The cultivation of his farm makes him ſtrong and healthful. He toils cheerfully through the day---eats the fruit of his own labour with a gladſome heart--- at night devoutly thanks his bounteous God for his daily bleſſings--- retires to reſt, and his ſleep is ſweet. Such circumſtances as theſe have greatly contributed to the amazing increaſe of inhabitants in this ſtate.

Beſides, the people live under a free government, and have no fear of a tyrant. There are no overgrown eſtates, with rich and ambitious landlords, to have an undue and pernicious influence in the election of civil officers. Property is equally enough divided, and muſt continue to be ſo as long as eſtates deſcend as they now do. No perſon is prohibited from voting, or from being elected into office, on account of his poverty. He who has the moſt merit, not he who has the moſt money, is generally choſen into public office. As in inſtances of this, it is to be obſerved, that many of the citizens of Connecticut, from the humble walks of life have ariſen to the firſt offices in the ſtate, and filled them with dignity and reputation. That baſe buſineſs of electioneering, which is ſo directly calculated to introduce wicked and deſigning men into office, is yet but little known in Connecticut. A man who wiſhes to be choſen into office, acts wiſely for that end, when he keeps his deſires to himſelf.

A thirſt for learning prevails among all ranks of people in the ſtate. More of the young men in Connecticut, in proportion to their numbers, receive a public education, than in any of the ſtates. Dr Franklin and other literary characters have honoured this ſtate by ſaying, that it is the *Athens of America*.

The revolution, which ſo eſſentially affected the governments of moſt of the colonies, produced no very perceptible alteration in the government of Connecticut. While under the juriſdiction of Great Britain, they elected their own governors, and all ſubordinate civil officers, and made their own laws in the ſame manner and with as little controul as they now do. Connecticut has ever been a republic, and perhaps as perfect and as happy a republic, as has ever exiſted. While other ſtates, more monarchical in their government and manners, have been under a neceſſity of undertaking the difficult taſk of altering their old, or forming new conſtitutions, and of changing their monarchical for republican manners. Connecticut has uninterruptedly proceeded in her old track, both as to government and manners; and by theſe means has avoided thoſe convulſions which have rent other ſtates into violent parties.

CONNECTION, or CONNEXION, the relation or dependence of one thing upon another.

CONNECTION, or *Continuity*, in the drama, conſiſts in the joining of the ſeveral ſcenes together.

The connection is ſaid to be obſerved, when the ſcenes of an act ſucceed one another immediately, and are ſo joined as that the ſtage is never left empty.

CONNECTIVES, in grammar, one of the four ſpecies under which, according to Mr Harris, all words may be included. They are of two kinds; and as they connect ſentences or words, are called by the different names of *conjunctions* and *prepoſitions*. See GRAMMAR.

CONNIVENT VALVES, in anatomy, thoſe wrinkles, cellules, and vaſcules, which are found in the inſide of the two inteſtines ilium and jejunum. See ANATOMY, n° 93. *et ſeq.*

CONNOISSEUR, a French term, of late uſed in Engliſh; it literally denotes a perſon well verſed in any thing; being formed of the verb *connoître*, to know, underſtand." Hence it comes to be uſed in our language for a critic, or a perſon who is a thorough judge or maſter in any way, particularly in matters of painting and ſculpture.

CONNOR (Bernard), a learned phyſician, was born in the county of Kerry, in Ireland, about the year 1666. Having determined to apply himſelf to the ſtudy of phyſic, he went to France, and reſided ſometime in the univerſity of Montpelier. Afterward he went to Paris; where he obtained great ſkill in medicine, anatomy, and chemiſtry. From thence he travelled to Venice, with the two ſons of the high-chancellor of Poland; and then taking a tour through great part of Germany, went to Warſaw, where he was made phyſician to king John Sobieſki. In 1695, he came to England, read a courſe of lectures in London and Oxford, and became member of the Royal Society and College of Phyſicians; afterwards, being invited to Cambridge, he read public lectures there, and made various experiments in chemiſtry. He has rendered himſelf memorable for a philoſophical and medical treatiſe in Latin, entitled, *Evangelium Medici*, i. e. "the Phyſician's Goſpel;" tending to explain the miracles performed by Chriſt as natural events, upon the principles of natural philoſophy. He wrote alſo a hiſtory of Poland; and died in 1698, aged 32.

CONNOR, a city of Ireland, in the county of Antrim, and province of Ulſter. W. Long. 6. 30. N. Lat. 54. 50.

CONOCARPUS, BUTTON-WOOD: A genus of the monogynia order, belonging to the pentandria claſs of plants; and in the natural method ranking under the 48th order, *Aggregatæ*. The corolla is pentapetalous; the ſeeds naked, ſolitary, inferior; the flowers aggregate. There are two ſpecies, the erecta and procumbens, both natives of the Weſt Indies. They riſe to the height of about 16 feet, but are trees of no beauty, nor is the wood of them uſed for any mechanic purpoſe in the countries where they grow naturally. They are, however, preſerved in ſome botanic gardens in Britain for the ſake of variety.

CONOID, in geometry, a ſolid body, generated by the revolution of a conic ſection about its axis. See CONIC *Sections*.

CONOIDES, in anatomy, a gland found in the third ventricle of the brain, called *pinealis*, from its reſemblance to a pine-apple. See ANATOMY, n° 132.

CONON, the renowned Athenian general and admiral, flouriſhed 394 years before Chriſt. See ATTICA, n° 162, 163. After his defeat by Lyſander, he fled to Evagoras king of Cyprus: after which he put himſelf under the protection of Artaxerxes king of Perſia; with whoſe army he delivered Athens from the oppreſſion of ſtrangers, and rebuilt its walls. In the 360th year of Rome, he beat the Lacedemonians in a ſea-fight near Cnidus upon the coaſt of Aſia, deprived them of the ſovereign rule they had on ſea ever ſince the taking of Athens, and had ſome other conſiderable advantages over them: but falling into the hands of Teribazus a Perſian, who envied his glory, he was put to death.

CONOPS, in zoology; a genus of inſects belonging to the order diptera, the characters of which are: The roſtrum is porrected, and jointed like a knee. The antennæ terminate by a flat and ſolid articulation, reſembling the bowl of a ſpoon, with a lateral briſtle, which when cloſely examined appears to be very hairy. Of this genus there are ſeveral ſpecies. 1. The calcitrans is to be found every where, eſpecially in autumn, when it haraſſes the horſes, and draws blood from them with its ſting. 2. The macrocephala might at firſt ſight be miſtaken for a ſpecies of waſp. It is ſmooth; the forepart of the head is lemon-colour, as are the poiſers; the feet are dun-coloured. The thorax is variegated with black and reddiſh dun. The ſame takes place with reſpect to the ſegments of the abdomen, ſome of which are edged with lemon-colour, chiefly the ſecond, and part of the third, towards the ſides. The wings are brown, watered, and clouded. This beautiful conops is found in meadows. There are eleven or twelve other ſpecies.

CONOVIUM, (anc. geog.) a town of the Ordovices, in Britain. From its ruins aroſe, at the diſtance of four miles, *Aberconwey*, the mouth of the Conwey, in Caernarvonſhire; and on the ſpot where *Conovium* ſtood is a hamlet, called *Cærhean*, the old town, (Camden.)

CONQUEST, in civil juriſprudence, is the acquiſition of property in common by a number of perſons.

In ſome countries they confound acquiſition with conqueſt; but according to the moſt general acceptation, acquiſition is the gaining of unappropriated goods before the eſtabliſhment of a community: whereas by the term *conqueſt*, is ordinarily intended whatever is acquired by a number of perſons in community; or by ſome one for all the others.—As it is more eſpecially in the union of perſons by marriage, that a community of property takes place; ſo it is in reference to them that we frequently uſe the word *conqueſt*. There are nevertheleſs conqueſts alſo among other perſons who are in a tacit community or ſociety; ſuch as obtain by particular local cuſtoms. According to this ſenſe of the word, it has been contended by ſeveral, that William I. claimed Britain; that is, not by right of arms, but by right of conqueſt or acqueſt; under promiſe of ſucceſſion made by Edward the Confeſſor, and a contract entered into by Harold to ſupport his pretenſions to that ſucceſſion: and by old writers, *conqueſtus*, *acquiſitio*, and *perquiſitio*, are frequently uſed as ſynonymous terms.

CONQUEST, in the law of nations, as the acquiſition of ſovereignty by force of arms, by ſome foreign prince: who reduces the vanquiſhed under his empire. The right of conqueſt is derived from the laws of war; and when a people is ſubjected, the conduct of the conqueror is regulated by four kinds of law. Firſt, the law of nature, which dictates whatever tends to ſelf-preſervation; ſecondly, our reaſon, which teaches us to uſe others, as we would be treated ourſelves; thirdly, the laws of political ſociety, to which nature has not aſſigned any preciſe boundary; laſtly, the law which is derived from the particular circumſtances attending the conqueſt. Thus, a ſtate conquered by another will be treated in one of the four methods following: Either the conqueror will continue it under its own laws, and will only claim the exerciſe of civil and eccleſiaſtical ſovereignty: or he will impoſe a new form of government; or he will deſtroy the frame of their ſociety, and incorporate the inhabitants with others: or he will exterminate them.

CONRAD II. elected emperor of Germany in 1004. He was obliged to take the field againſt moſt of the German dukes who had revolted from him; and he put Erneſt duke of Suabia under the ban of the empire. This being one of the earlieſt inſtances of ſuch a proſcription, the formula is inſerted here for its ſingularity. "We declare thy wife a widow, thy children orphans; and we ſend thee, in the name of the devil, to the four corners of the world." It was in the reign of this prince that the German fiefs became hereditary. He died in 1039.

CONRAD III, emperor of Germany in 1138. The duke of Bavaria oppoſed his election, and being put under the ban of the empire, and deprived of his duchy, he could not ſurvive his diſgrace. The margrave of Auſtria was ordered by the Emperor to take poſſeſſion of Bavaria; but Welſti, uncle to the deceaſed duke, attacked him, and was defeated near the caſtle of Winſburg: the battle fought upon this occaſion is famous in hiſtory, as having given riſe to the party names of *Guelphs* and *Gibbelines*, afterwards aſſumed in Italy. The parole of the day with the Bavarians was *Welſti*, from the name of their general; that of the Imperialiſts *Werblingen*, from a ſmall village where Frederic Duke of Suabia, their commander, had been nurſed: by degrees theſe names ſerved to diſtinguiſhed the two parties: and the Italians, who could not accuſtom themſelves to ſuch rough words, formed from them their Guelphs and Gibbelines. He died in 1152.

CONRAD of Lichtenau, or Abbas Uſpergenſis, wa author of an Univerſal Chronology from the creation to 1229, continued by an anonymous writer to Cha. V. He collected a fine library, and died about the year 1240.

CONRADIN, or CONRAD, junior, ſon of Conrad IV. was acknowledged Emperor by the Gibbelines, who received him in triumph at Rome: but Pope Alexander IV. had publiſhed a cruſade againſt this orphan; and Urban VII. his ſucceſſor, gave the empire to Charles of Anjou, brother to Louis IX. king of France; and the unfortunate youth, though powerfully ſupported even by the Turks, loſt a battle, in which he was taken priſoner, and was beheaded by order of his baſe opponent, publicly at Naples in 1229, in the 18th year of his age. In him ended the race of the Dukes of Suabia, which had produced ſeveral kings and emperors.

CONSANGUINITY, or KINDRED, is defined by the writers on theſe ſubjects to be, *vinculum perſonarum ab eodem ſtipite deſcendentium;* the connection or relation of perſons deſcended from the ſame ſtock or common anceſtor." This conſanguinity is either lineal or collateral.

Lineal conſanguinity is that which ſubſiſts between perſons of whom one is deſcended in a direct line from the other, as between John Stiles (the *propoſitus* in the table of conſanguinity) and his father, grandfather, great-grandfather, and ſo upwards in the direct aſcending line; or between John Stiles and his ſon, grand-ſon, great grand-ſon, and ſo downwards in the direct deſcending line. Every generation, in this direct lineal conſanguinity, conſtitutes a different degree, reckoning either upwards or downwards: the father of John Stiles is related to him in the firſt degree, and ſo likewiſe is his ſon; his grandſire and grandſon, in the ſecond; his great-grandſire and great-grandſon in the third. This is the only natural way of

Conſanguinity.

reckoning the degrees in the direct line; and therefore univerſally obtains, as well in the civil and canon, as in the common law.

The doctrine of lineal conſanguinity is ſufficiently plain and obvious; but it is, at the firſt view, aſtoniſhing to conſider the number of lineal anceſtors which every man has, within no very great number of degrees: and ſo many different bloods is a man ſaid to contain in his veins, as he hath lineal anceſtors. Of theſe he hath two in the firſt deſcending degree; his own parents: he hath four in the ſecond; the parents of his father, and the parents of his mother: he hath eight in the third, the parents of his two grandfathers, and of his two grandmothers: and, by the ſame rule of progreſſion, he hath 128 in the ſeventh; 1024 in the tenth; and at the 20th degree, or the diſtance of 20 generations, every man hath above a million of anceſtors, as common arithmetic will demonſtrate (A). This lineal conſanguinity, we may obſerve, falls ſtrictly within the definition of *vinculum perſonarum ab eodem ſtipite deſcendentium*; ſince lineal relations are ſuch as deſcend one from the other, and both of courſe from the ſame common anceſtor.

Collateral kindred anſwers to the ſame deſcription: collateral relations agreeing with the lineal in this, that they deſcend from the ſame ſtock or anceſtor; but differing in this, that they do not deſcend the one from the other. Collateral kinſmen, then, are ſuch as lineally ſpring from one and the ſame anceſtor, who is the *ſtirps*, or "root," the *ſtipes*, "trunk," or common ſtock, from whence theſe relations are branched out. As if John Stiles hath two ſons, who have each a numerous iſſue: both theſe iſſues are lineally deſcended from John Stiles as their common anceſtor; and they are collateral kinſmen to each other, becauſe they are all deſcended from this common anceſtor, and all have a portion of his blood in their veins, which denominates them *conſanguineous*.

We muſt be careful to remember, that the very being of collateral conſanguinity conſiſts in this deſcent from one and the ſame common anceſtor. Thus Titius and his brother are related; why? becauſe both are derived from one father: Titius and his firſt couſin are related; why? becauſe both deſcend from the ſame grandfather; and his ſecond couſin's claim to conſanguinity is this, that they are both derived from one and the ſame great-grandfather. In ſhort, as many anceſtors as a man has, ſo many common ſtocks he has from which collateral kinſmen may be derived. And as we are taught by holy writ, that there is one couple of common anceſtors belonging to us all, from whom the whole race of mankind is deſcended, the obvious and undeniable conſequence is, that all men are in ſome degree related to one another. For, indeed, if we only ſuppoſe each couple of our anceſtors to have left, one with another, two children; and each of thoſe children to have left, on an average, two more (and without ſuch a ſuppoſition the human ſpecies muſt be daily diminiſhing); we ſhall find that all of us have now ſubſiſting near 270 millions of kindred in the 15th degree, at the ſame diſtance from the ſeveral common anceſtors as we ourſelves are; beſides thoſe that are one or two degrees nearer to or farther from the common ſtock, who may amount to as many

---

(A) This will ſeem ſurpriſing to thoſe who are unacquainted with the increaſing power of progreſſive numbers; but it is palpably evident from the following table of a geometrical progreſſion, in which the firſt term is 2, and the denominator alſo 2: or, to ſpeak more intelligibly, it is evident, for that each of us has two anceſtors in the firſt degree, the number of whom is doubled at every remove; becauſe each of our anceſtors has alſo two immediate anceſtors of his own.

16	65536
17	131072
18	262144
19	524288
20	1048576

A ſhorter way of finding the number of anceſtors at any even degree, is by ſquaring the number of anceſtors at half that number of degrees. Thus, 16, the number anceſtors at 4 degrees, is the ſquare of 4, the number of anceſtors at two; 256 is the ſquare of 16; 65536 of 256; and the number of anceſtors at 40 degrees would be the ſquare of 1,048,576, or upwards of a million of millions.

Conſanguinity.

more (B). And if this calculation would appear incompatible with the number of inhabitants on the earth, it is becauſe, by intermarriages among the ſeveral deſcendents from the ſame anceſtor, a hundred or a thouſand modes of conſanguinity may be conſolidated in one perſon; or he may be related to us a hundred or a thouſand different ways.

The method of computing theſe degrees in the canon law, which we have adopted, is as follows. We begin at the common anceſtor, and reckon downwards; and in whatſoever degree the two perſons, or the moſt remote of them, is diſtant from the common anceſtor, that is the degree in which they are related to each other. Thus, Titius and his brother are related in the firſt degree; for from the father to each of them is counted only one; Titius and his nephew are related in the ſecond degree; for the nephew is two degrees removed from the common anceſtor, *viz.* his own grandfather, the father of Titius: or (to give a more illuſtrious inſtance from the Engliſh annals) King Henry VII. who ſlew Richard III. in the battle of Boſworth, was related to that prince in the fifth degree. Let the *propoſitus*, therefore, in the table of conſanguinity, repreſent King Richard III. and the claſs marked E, King Henry VII. Now their common ſtock or anceſtor was King Edward III. the *abavus* in the ſame table: from him to Edmund Duke of York, the *proavus* is one degree; to Richard Earl of Cambridge, the *avus*, two; to Richard Duke of York, the *pater*, three; to King Richard III. the *propoſitus*, four; and from King Edward III. to John of Gant (A) is one degree: to John Earl of Somerſet (B) two; to John Duke of Somerſet (C) three; to Margaret Counteſs of Richmond (D) four; to King Henery VII. (E) five. Which laſt-mentioned prince, being the fartheſt removed from the common ſtock, gives the denomination to the degree of kindred in the canon and municipal law. Though according to the computation of the civilians (who count upwards from either of the perſons related, to the common ſtock, and then downwards again to the other; reckoning a degree for each perſon both aſcending and deſcending) theſe two princes were related in the ninth degree: for from King Richard III. to Richard Duke of York is one degree; to Richard Earl of Cambridge two; to Edmund Duke of York three; to King Edward III. the common anceſtor, four; to John of Gant five; to John Earl of Somerſet ſix; to John Duke of Somerſet ſeven; to Margaret Counteſs of Richmond eight; to King Henry VII. nine. See the Table of

Conſanguinity.

(B) This will ſwell more conſiderably than the former calculation: for here, though the firſt term is but 1, the denominator is 4; that is, there is *one* kinſman (a brother) in the firſt degree, who makes, together with the *propoſitus*, the two deſcendents from the firſt couple of anceſtors; and in every other degree, the number of kindred muſt be the *quadruple* of thoſe in the degree which immediately precedes it. For ſince each couple of anceſtors has two deſcendents who increaſe in a duplicate ratio, it will follow, that the ratio in which all the deſcendents increaſe downwards, muſt be double to that in which the anceſtors increaſe upwards: but we have ſeen that the anceſtors increaſe in a duplicate ratio: therefore the deſcendents muſt increaſe in a double duplicate; that is, in a quadruple ratio.

Collateral Degrees.	*Number of Kindred.*
1	1
2	4
3	16
4	64
5	256
6	1024
7	4096
8	16384
9	65536
10	262144
11	1048576
12	4194304
13	16777216
14	67108864
15	268435456
16	1073741824

18	17179869184
19	68719476736
20	274877906944

This calculation may alſo be formed by a more compendious proceſs, *viz.* by ſquaring the couples, or half the number of anceſtors, at any given degree; which will furniſh us with the number of kindred we have in the ſame degree, at equal diſtance with ourſelves from the common ſtock, beſides thoſe at unequal diſtances. Thus, in the tenth lineal degree, the number of anceſtors is 1024; its half, or the couples, amount to 512; the number of kindred in the tenth collateral degree amounts therefore to 262144, or the ſquare of 512. And if we will be at the trouble to recollect the ſtate of the ſeveral families within our own knowledge, and obſerve how far they agree with this account; that is, whether, on an average, every man has not one brother or ſiſter, four firſt-couſins, ſixteen ſecond-couſins, and ſo on; we ſhall find, that the preſent calculation is very far from being overcharged.

Conſanguinity (Plate CXLVI), wherein all the degrees of collateral kindred to the *propoſitus* are computed, as far as the tenth of the civilians and the ſeventh of the canoniſts incluſive; the former being diſtinguiſhed by the numeral letters, the latter by the common ciphers.

CONSANGUINITY and *Affinity* (degrees of), forbidden in marriage. See MARRIAGE; and LAW, Part III. Nº clx. 4.

CONSANGUINITY and *Affinity*, an objection againſt a judge. See LAW, Part III. Nº clvi. 12. Againſt a witneſs, *ibid.* clxxxiv. 12.

CONSCIENCE, a ſecret teſtimony of the ſoul, whereby it gives its approbation to things that are naturally good, and condemns thoſe that are evil. See MORAL *Philoſophy*.

A man of integrity will never liſten to any reaſon, or give way to any meaſure, or be miſled by any inducement, againſt conſcience.---The inhabitants of a great town offered Marſhal de Turenne 100,000 crowns, upon condition he would take another road, and not march his troops their way. He anſwered them, "As your town is not on the road I intend to march, I cannot accept the money you offer me."---The Earl of Derby, in the reign of Edward III. making a deſcent in Guienne, carried by ſtorm the town of Bergerac, and gave it up to be plundered. A Welch knight happened by chance to light upon the receiver's office. He found there ſuch a quantity of money that he thought himſelf obliged to acquaint his general with it, imagining that ſo great a booty naturally belonged to him. But he was agreeably ſurpriſed when the earl told him, with a pleaſant countenance, that he wiſhed him joy of his good fortune; and that he did not make the keeping of his word to depend upon the great or little value of the thing he had promiſed. -- In the ſiege of Faliſci by Camillus general of the Romans, the ſchoolmaſter of the town, who had the children of the ſenators under his care, led them abroad under the pretext of recreation, and carried them to the Roman camp, ſaying to Camillus, that by this artifice he had delivered Faliſci into his hands. Camillus abhorring this treachery, obſerved, "That there were laws for war as well as for peace; and that the Romans were taught to make war with integrity not leſs than with courage." He ordered the ſchoolmaſter to be ſtripped, his hands to be bound behind his back, and to be delivered to the boys to be laſhed back into the town. The Falerians, formerly obſtinate in reſiſtance, ſtruck with an act of juſtice ſo illuſtrious, delivered themſelves up to the Romans; convinced that they would be far better to have the Romans for their allies than their enemies.

It is a ſaying, That no man ever offended his own conſcience, but firſt or laſt it was revenged upon him. The power of conſcience indeed has been remarked in all ages, and the examples of it upon record are innumerable. The following is related by Mr Fordyce, in his *Dialogues on Education* †, as a real occurrence which happened in a neighbouring ſtate not many years ago. A jeweller, a man of good character and conſiderable wealth, having occaſion in the way of his buſineſs to travel at ſome diſtance from the place of his abode, took along with him a ſervant, in order to take care of his portmanteau. He had with ſome of his beſt jewels, and a large ſum of money, to which his ſervant was likewiſe privy. The maſter having occaſion to diſmount on the road, the ſervant watching his opportunity, took a piſtol from his maſter's ſaddle and ſhot him dead on the ſpot; then rifled him of his jewels and money, and hanging a large ſtone to his neck, he threw him into the neareſt canal. With this booty he made off to a diſtant part of the country, where he had reaſon to believe that neither he nor his maſter where known. There he began to trade in a very low way at firſt, that his obſcurity might ſcreen him from obſervation, and in the courſe of a good many years ſeemed to riſe, by the natural progreſs of buſineſs into wealth and conſideration; ſo that his good fortune appeared at once the effect and reward of induſtry and virtue. Of theſe he counterfeited the appearance ſo well, that he grew into great credit, married into a good family, and by laying out his ſudden ſtores diſcreetly, as he ſaw occaſion, and joining to all an univerſal affability, he was admitted to a ſhare of the government of the town, and roſe from one poſt to another, till at length he was choſen chief magiſtrate. In this office he maintained a fair character, and continued to fill it with no ſmall applauſe both as a governor and a judge; till one day as he ſat on the bench with ſome of his brethren, a criminal was brought before him who was accuſed of murdering his maſter. The evidence came out full, the jury brought in their verdict that the priſoner was guilty, and the whole aſſembly waited the ſentence of the preſident of the court (which he happened to be that day) with great ſuſpence. Mean while he appeared to be in unuſual diſorder and agitation of mind, and his colour changed often; at length he aroſe from his ſeat, and coming down from the bench, placed himſelf juſt by the unfortunate man at the bar. "You ſee before you (ſaid he, addreſſing himſelf to thoſe who had ſat on the bench with him), a ſtriking inſtance of the juſt awards of heaven, which this day, after 30 years concealment, preſents to you a greater criminal than the man juſt now found guilty." Then he made an ample confeſſion of his guilt, and of all its aggravations. "Nor can I feel (continued he) any relief from the agonies of an awakened conſcience, but by requiring that juſtice be forthwith done againſt me in the moſt public and ſolemn manner." We may eaſily ſuppoſe the amazement of all the aſſembly, and eſpecially of his fellow-judges. However, they proceeded, upon this confeſſion, to paſs ſentence upon him, and he died, with all the ſymptoms of a penitent mind.

Courts of CONSCIENCE, are courts for recovery of ſmall debts, conſtituted by act of parliament in London, Weſtminiſter, &c. and other populous and trading diſtricts.

CONSCIOUSNESS. Metaphyſicians, in lieu of the word *conſcience*: which ſeems appropriated to theological or moral matters, ordinarily uſe that of *conſciouſneſs*; whereby they mean an inner ſentiment of a thing, whereof one may have a clear and diſtinct notion. In this ſenſe they ſay that we do not know our own ſoul, nor are aſſured of the exiſtence of our own thoughts, otherwiſe than by ſelf-conſciouſneſs. See METAPHYSICS.

CONSCRIPT, in Roman antiquity, an appellation given to the ſenators of Rome, who were called *con-*

---

† Vol. p. 401

ſcript fathers, on account of their names being all entered in one regiſter.

CONSECRATION, the act of devoting any thing to the ſervice and worſhip of God. The Moſaical law ordained, that all the firſt-born, both of man and beaſt, ſhould be ſanctified or conſecrated to God. We find alſo, that Joſhua conſecrated the Gibeonites, as Solomon and David did the Nethinims, to the ſervice of the temple; and that the Hebrews ſometimes conſecrated their fields and cattle to the Lord, after which they were no longer in their power.

Among the ancient Chriſtians, the conſecration of churches was performed with a great deal of pious ſolemnity. In what manner it was done for the three firſt ages, is uncertain; the authentic accounts reaching no higher than the fourth, when, in the peaceable reign of Conſtantine, churches were every where built, and dedicated with great ſolemnity. Some think the conſecration conſiſted in ſetting up the ſign of the croſs, or in placing a communion-table in the church; and others, that no more was done than preaching a panegyrical ſermon in commemoration of the founder, and that then they proceeded to prayers, one of which was compoſed on purpoſe for the church to be conſecrated. The Romaniſts have a great deal of pious foppery in the ceremonies of conſecration; which they beſtow on almoſt every thing, as bells, candles, books, water, oil, aſhes, palms, ſwords, banners, pictures, croſſes, agnus-dei's roſes, childrens clouts, &c.

In England, churches have been always conſecrated with particular ceremonies, the form of which was left to the diſcretion of the biſhop. That obſerved by biſhop Laud, in conſecrating St Catherine Creed church, in London, gave great offence.

CONSECRATION is particularly uſed for the benediction of the elements in the euchariſt.

CONSECRATION, among medaliſts, is the ceremony of the apotheoſis of an emperor, or his tranſlation into heaven and reception among the gods. On medals the conſecration is thus repreſented: on one ſide is the emperor's head, crowned with laurel, ſometimes veiled; and the inſcription gives him the title of *divus*: on the reverſe is a temple, a buſtum, an altar, or an eagle taking its flight towards heaven, either from off the altar, or from a cippus: at other times the emperor is ſeen in the air, borne up by the eagle; the inſcription always, *conſecratio*. Theſe are the uſual ſymbols: yet on the reverſe of that of Antoninus is the Antonine column. In the apotheoſis of empreſſes, inſtead of an eagle there is a peacock. As to the honours rendered theſe princes after death, they were explained by the words *conſecratio*, *pater*, *divus*, and *deus*. Sometimes around the temple or altar are put, *memoria felix*, or *memoræ æternæ*: for princeſſes, *æternitas*, and *ſideribus recepta*; on the ſide of the head, *dea*, or Θεα.

CONSENT, in a general ſenſe, denotes much the ſame with ASSENT.

CONSENT of Parts, in the animal economy, an agreement or ſymphathy, whereby when one part is immediately affected, another at a diſtance becomes affected in the ſame manner.

This mutual accord or conſent is ſuppoſed to be effected by the commerce of nerves, and their artful diſtribution and ramification throughout the body. The effect is ſo ſenſible as even to come under the phyſician's cognizance: thus, the ſtone in the bladder, by vellicating the fibres there, will pain and draw them ſo much into ſpaſms, as to affect the coats of the bowels, in the ſame manner, by the intermediation of nervous threads, and make a colic there; and alſo extend their twitches ſometimes as far as the ſtomach, and occaſion grievous vomitings: the remedy, therefore, in ſuch caſes, is to regard the part originally affected, how remote and grievous ſoever may be the conſequences and ſymptoms in other places.

The fifth conjugation of nerves branched to the parts of the eye, the ear, thoſe of the mouth, cheeks, præcordia, and parts adjacent, &c. is ſuppoſed by naturaliſts to be the inſtrument of that particular and extraordinary conſent between thoſe parts. Hence it is, that a ſavoury thing ſeen or ſmelled excites the appetite, and affects the glands and parts of the mouth; and a ſhameful thing ſeen or heard affects the cheeks with bluſhes; on the contrary, if it pleaſe, it affects the præcordia, and excites the muſcles of the mouth and face to laughter; if it grieve, it affects the glands of the eyes, ſo as to occaſion tears, and the muſcles of the face, putting them into an aſpect of crying. Dr Willis, quoted by Mr Derham, imputes the pleaſure of kiſſing, and its effects, to this pair of nerves; which being branched both to the lips and the genital parts, when the former are affected an irritation is occaſioned in the latter. See SYMPATHY.

CONSENTES, the name which the Romans gave to the 12 ſuperior gods, the *Dii majorum gentium*. The word ſignifies as much as *conſentientes*; that is, who conſented to the deliberations of Jupiter's council. They were twelve in number, whoſe name Ennius has briefly expreſſed in theſe lines,

Juno, Veſta, Minerva, Ceres, Diana, Venus, Mars,
Mercurius, Jovi, Neptunus, Vulcanus, Apollo.

CONSEQUENCE, in logic, the concluſion, or what reſults from reaſon or argument. See CONCLUSION.

The conſequence is that other propoſition in which the extremes or premiſes of a ſyllogiſm are joined, or ſeparated; and is gained from what was aſſerted in the premiſes.

This word, in a more reſtrained ſenſe, is uſed for the relation or connection between two propoſitions, whereof one is inferred from the other.

CONSEQUENT, ſomething deduced or gathered from a former argumentation. But, in a more preciſe ſenſe, it is uſed for the propoſition which contains the concluſion, conſidered in itſelf, without any regard to the antecedent: in which ſenſe the conſequent may be true, though the conſequence be falſe. See the preceding article.

CONSERVATOR, an officer ordained for the ſecurity and preſervation of the privileges of ſome cities and communities, having a commiſſion to judge of and determine the differences among them.

In moſt catholic univerſities there are two conſervators; the conſervator of royal privileges, or thoſe granted by kings; and the conſervator of apoſtolical privileges, or thoſe granted by the pope. The firſt takes cognizance of perſonal and mixed cauſes between the regents, ſtudents, &c. and the latter of ſpiritual matters between eccleſiaſtics.

Anciently there were appointed conſervators of treaties of peace between princes; which conſervators became judges of the infractions made on a treaty, and were charged with procuring ſatisfaction to be made. Theſe were uſually the feudatories of the ſeveral powers. In lieu of conſervators princes now have recourſe to other indifferent princes to guarantee their treaties.

CONSERVATOR *of Scots Privileges*, at Campvere, is an officer belonging to the royal boroughs of Scotland, who takes care of the mercantile affairs of Scotland, agreeable to the ſtaple contract between them and the States-General.

CONSERVATOR *of the Peace*, in the ancient Engliſh cuſtoms, was a perſon who had an eſpecial charge, by virtue of his office, to ſee the king's peace kept. Till the erection of juſtices of the peace by king Edward III. there were ſeveral perſons who by common law were intereſted in keeping the ſame: ſome having that charge as incident to other offices; and others ſimply, or of itſelf, called *cuſtodes*, or *conſervators of the peace*. The chamberlain of Cheſter is ſtill a conſervator in that county; and petty conſtables are, by the common law, conſervators, &c. in the firſt ſenſe, within their own juriſdiction: ſo are alſo the coroner and the ſheriff within their own county. The king is the principal conſervator of the peace within all his dominions: the lord chancellor, lord treaſurer, lord high ſteward, lord marſhal, lord high conſtable, all the juſtices of the court of king's bench, by their office, and the maſter of the rolls, by preſcription, are general conſervators of the peace through the whole kingdom, and may commit breakers of the peace, and bind them in recogniſances to keep it.

CONSERVATOR *of the Truce, and Safe Conducts*, was an officer appointed in every ſea-port, under the king's letters patent. His charge was to inquire of all offences committed againſt the king's truce, and ſafe conducts upon the main ſea, out of the franchiſes of the cinque-ports, as the admirals were wont to do, and ſuch other things as are declared *anno* 3 Hen. V. cap. 6.

CONSERVATORIOS, are muſical ſchools eſtabliſhed for the inſtruction of children in the profeſſion of muſic. There are four of theſe at Venice, deſigned for the education of girls, and three at Naples, for the education of boys. It has been ſuggeſted that the operation of caſtration was performed in the conſervatorios; but the practice is abſolutely prohibited; and the young caſtrati are brought from Lucia in Puglia: but before the operation is performed, their voices are tried in a conſervatorio. The ſcholars of the Venetian conſervatorios have been chiefly celebrated for taſte and neatneſs of execution; and thoſe of Naples have had the reputation of being the firſt *contrapuntiſts*, or compoſers, in Europe.

CONSERVATORY, a term ſometimes uſed for a green-houſe or ice-houſe.

CONSERVE, in pharmacy, a form of medicine contrived to preſerve the flowers, herbs, roots, or fruits of ſeveral ſimples, as near as poſſible to what they are when freſh gathered. See PHARMACY.

CONSIGNMENT, in law, the depoſiting any ſum of money, bills, papers, or commodities, in good hands; either by appointment of a court of juſtice, in order to be delivered to the perſons to whom they are adjudged; or voluntarily, in order to their being remitted to the perſons they belong to, or ſent to the places they are deſigned for.

CONSIGNMENT *of Goods*, in commerce, is the delivering or making them over to another: thus, goods are ſaid to be conſigned to a factor, when they are ſent to him to be ſold, &c.; or when a factor ſends back goods to his principal, they are ſaid to be conſigned to him.

CONSISTENCE, in phyſics, that ſtate of a body wherein its component particles are ſo connected or entangled among themſelves, as not to ſeparate or recede from each other. It differs from continuity in this, that it implies a regard to motion or reſt, which continuity does not, it being ſufficient to denominate a thing continuous that its parts are contiguous to each other.

CONSISTENTES, in church-hiſtory, a kind of penitents who were allowed to aſſiſt at prayers, but who could not be admitted to receive the ſacrament.

CONSISTORY (*conſiſtorium*), ſignifies as much as *prætorium*, a tribunal: it is commonly uſed for a council-houſe of eccleſiaſtical perſons, or place of juſtice in the ſpiritual court; a ſeſſion or aſſembly of prelates. And every archbiſhop and biſhop of every dioceſe hath a conſiſtory court held before his chancellor or commiſſary in his cathedral church, or other convenient place of his dioceſe, for eccleſiaſtical cauſes. The biſhop's chancellor is the judge of this court, ſuppoſed to be ſkilled in the civil and canon law; and in places of the dioceſe far remote from the biſhop's conſiſtory, the biſhop appoints a commiſſary to judge in all cauſes within a certain diſtrict, and a regiſter to enter his decrees, &c.

CONSISTORY, at Rome, denotes the college of cardinals, or the pope's ſenate and council, before whom judiciary cauſes are pleaded. Du Cange derives the word from *conſiſtorium*; i. e. *locus ubi conſiſtitur*; uſed chiefly for a veſtibule, gallery, or anti-chamber, where the courtiers wait for admiſſion; and called *a conſiſtente multitudine*.

The conſiſtory is the firſt court, or tribunal of Rome: it never meets but when the pope pleaſes to convoke it: the pope preſides in it in perſon, mounted on a magnificent throne, and habited in his *pontificalia*; on the right are the cardinal-biſhops and prieſts, and on the left the cardinal deacons. The place where it is held, is a large hall in the apoſtolical palace, where princes and ambaſſadors of kings are received. The other prelates, prothonotaries, auditors of the rota and other officers, are ſeated on the ſteps of the throne: the courtiers ſit on the ground; ambaſſadors on the right, and conſiſtorial and fiſcal advocates behind the cardinals.

Beſides the public conſiſtory, there is alſo a private one, held in a retired chamber, called the *chamber of papegay*; the pope's throne here being only raiſed two ſteps high. No body is here admitted but the cardinals whoſe opinions are collected, and called *ſentences*. Here are firſt propoſed and paſſed all bulls for biſhoprics, abbeys, &c. Hence biſhoprics and abbeys are ſaid to be conſiſtorial benefices; in regard, they muſt be propoſed in the conſiſtory, the anates be paid to the pope, and his bulls taken. Anciently they were elective; but by the concordat, which aboliſhes elections, they are appointed to be collated by the pope alone, on the nomination of the prince.

CONSISTORY was alſo the name of a court under Conſtantine, where he ſat in perſon, and heard cauſes: the members of this court were called *comites*.

CONSISTORY is alſo uſed among the reformed, for a council or aſſembly of miniſters and elders, to regulate their affairs, diſcipline, &c.

CONSISTORY, or court Chriſtian in the Engliſh laws, is a council of eccleſiaſtical perſons, or the place of juſtice in an eccleſiaſtical or ſpiritual court. Every archbiſhop and biſhop has a conſiſtory-court, held before his chancellor or commiſſary, either in his cathedral, in ſome chapel, aiſle, or portico, belonging thereto; or in ſome other convenient place of his dioceſe, for eccleſiaſtical cauſes. The ſpiritual court was anciently, in the time of the Saxons, joined with the county or hundred court; and the original of the conſiſtory court, as divided from thoſe courts, is found in a law of the conqueror, quoted by lord Coke. From this court there lies an appeal to the archbiſhop of each province reſpectively.

CONSOLATION, one of the places in rhetoric wherein the orator endeavours to abate and moderate the grief or concern of another.

CONSOLE, in architecture, an ornament cut upon the key of an arch, which has a projecture, and on occaſion ſerves to ſupport little corniches, figures, buſts, and vaſes.

CONSOLIDATION, in law, the combining and uniting two benefices into one. The term is borrowed from the civil law; where it properly ſignifies an union of the poſſeſſion, or occupation, with the property. Thus, if a man have by legacy *uſum fructum fundi*, and afterwards buy the property, or fee-ſimple, of the heir; this is called a *conſolidation*.

CONSOLIDATION, in medicine, the action of uniting broken bones, or the lips of wounds, by means of *conſolidating remedies*, as they are called; which cleanſing with a moderate heat and force, taking corruption out of the wounds, and preſerving the temperature of the parts, cauſe the nouriſhment to be fitly applied to the part affected.

Among the many inſtances of the conſolidating power of blood and raw fleſh, we have a very remarkable one in Bartholine's Medical Obſervations. A man being condemned to have his noſe cut off by the hand of the common executioner, the friends, who were to be preſent, provided a new loaf of warm bread, which was cut in the middle, and the noſe received in it as it fell from the face: the noſe was after this nicely placed on the face again; and, being ſewed on, the whole in time conſolidated, and left no other marks of the ignominy than the ſcar round the whole noſe, and the traces of the ſtitches.

CONSONANCE, in muſic. See INTERVAL.

CONSONANT, a letter that cannot be ſounded without ſome ſingle or double vowel before or after it; as *b*, *c*, *d*, &c.

CONSORT, *Queen* CONSORT. See QUEEN.

CONSPIRACY, in law, ſignifies an agreement between two or more, falſely to indict, or procure to be indicted, an innocent perſon, of felony.

CONSPIRATORS are, by ſtatute, defined to be ſuch as bind themſelves by oath, covenant, or other alliance, to aſſiſt one another falſely and maliciouſly to indict perſons, or falſely to maintain pleas.

Conſpirators in treaſon, are thoſe that plot againſt the king and the government.

CONSTABLE, according to ſome, is a Saxon word, compounded of *coning*, "king," and *ſtaple*, which ſignifies the "ſtay or ſupport of the king." But as we borrowed the name as well as the office of *Conſtable* from the French, Sir William Blackſtone is rather inclined to deduce it, with Sir Henry Spelman and Dr Cowel, from that language; wherein it is plainly derived from the Latin *comes ſtabuli*, an officer well known in the empire; ſo called, becauſe, like the great conſtable of France, as well as the lord high conſtable of England, he was to regulate all matters of chivalry, tilts, tournaments, and feats of arms, which were performed on horſeback.—The

Lord High CONSTABLE *of England* is the ſeventh great officer of the crown; and he, with the earl marſhal of England, were formerly judges of the court of chivalry, called in king Henry IV.'s time *Curia Militaris*, and now the court of honour. It is the fountain of the martial law, and anciently was held in the king's hall. The power of the lord high conſtable was formerly ſo great, and of which ſo improper a uſe was made, that ſo early as the 13th of king Richard II. a ſtatute paſſed for regulating and abridging the ſame, together with the power of the earl marſhal of England; and by this ſtatute, no plea could be tried by them or their courts, that could be tried by the common law of the realm. The office of conſtable exiſted before the conqueſt. After the conqueſt, the office went with inheritance, and by the tenure of the manors of Harlefield, Newman, and Whitenhurſt, in Glouceſterſhire, by grand ſerjeanty in the family of the Bohuns Earl of Hereford and Eſſex, and afterwards in line of Sefford as heirs-general to them; but in 1521, this great office became forfeited to the king in the perſon of Edward Stafford duke of Buckingham, who was that year attainted for high treaſon; and in conſideration of its extenſive power, dignity, and large authority, both in time of war and peace, it has never been granted to any perſon, otherwiſe than *hac vice*, and that to attend at a coronation, or trial by combat. In France, the ſame office was alſo ſuppreſſed about a century after by an edict of Louis XIII; though it has been exerciſed, in the command of the MARSHALS, by the firſt officer in the army.

Lord high conſtable of Scotland was an office of great antiquity and dignity. The firſt upon record is Hugo de Morvelle in the reign of David I. He had two grand prerogatives, viz. Firſt, the keeping of the king's ſword, which the king, at his promotion, when he ſwears fealty, delivers to him naked. Hence the badge of the conſtable is a naked ſword.—Second, The abſolute and unlimited command of the king's armies while in the field, in the abſence of the king; but this command does not extend to caſtles and garriſons. He was likewiſe judge of all crimes committed within two leagues of the king's houſe, which precinct was called the *Chalmer of Peace*. Though his juriſdiction came at laſt to be exerciſed only as to crimes during the time of parliament, which ſome extended likewiſe to all general conventions. This office was conferred heritably upon the noble family of Errol, by king Robert Bruce; and with them it ſtill remains, being expreſsly reſerved by the treaty of union.

Inferior CONSTABLES. From the great office of high conſtable is derived that inferior order, ſince called the *conſtables of hundreds and franchiſes*; theſe were firſt ordained in the 13th year of Edward I. by the ſtatute of Wincheſter; which for the conſervation of the peace, and view of armour, appointed that two conſtables ſhould be choſen in every hundred and franchiſe. Theſe are what are now called *conſtabularii capitales* or *high conſtables*; becauſe continuance of time, and increaſe of people, &c. have occaſioned others of like nature, but inferior authority, in every town, called *petty conſtables*, or *ſub-conſtabularii*, firſt inſtituted about the reign of Edward III.

The former, or modern *high conſtables*, are appointed at the court-leets of the franchiſe or hundred over which they preſide; or, in default of that, by the juſtices at their quarter-ſeſſions; and are removeable by the ſame authority that appoints them. The *petty conſtables* have two offices united in them, the one ancient, and the other modern. Their ancient office is that of head borough, tithing-man, or borſholder; who are as ancient as the time of king Alfred: their more modern office is that of conſtable merely; which was appointed ſo lately as the reign of Edward III. in order to aſſiſt the high-conſtable. And in general the ancient head-boroughs, tithing-men, and borſholders, were made uſe of to ſerve as petty conſtables; though not ſo generally, but that in many places they ſtill continue diſtinct officers from the conſtables. They are all choſen by the jury at the court-leet; or if no court-leet be held, are appointed by two juſtices of the peace.

The general duty of all conſtables, both high and petty, as well as of the other officers, is to keep the king's peace in their ſeveral diſtricts; and to that purpoſe they are armed with very large powers of arreſting and impriſoning, of breaking open houſes, and the like: of the extent of which powers, conſidering what manner of men are for the moſt part put upon theſe offices, it is perhaps very well that they are generally kept in ignorance. One of their principal duties ariſing from the ſtatute of Wincheſter, which appoints them, is to keep watch and ward in their reſpective juriſdictions. Ward, guard, or *cuſtodia*, is chiefly intended of the day-time, in order to apprehend rioters, and robbers on the highways; the manner of doing which is left to the diſcretion of the juſtices of the peace and the conſtable; the hundred being, however, liable for all the robberies committed therein by day-light, for having kept negligent guard. Watch is properly applicable to the night only, (being called among the Saxons *wach't* or *wactu*); and it begins when ward ends, and ends when that begins: for, by the ſtatute of Wincheſter, in walled towns the gates ſhall be cloſed from ſun-ſetting to ſun-riſing; and watch ſhall be kept in every borough and town, eſpecially in the ſummer ſeaſon, to apprehend all rogues, vagabonds, and night-walkers, and make them give an account of themſelves. The conſtable may appoint watchmen at his diſcretion, regulated by the cuſtom of the place; and theſe, being his deputies, have, for the time being, the authority of their principal.

There are alſo conſtables denominated from particular places, as conſtable of the Tower, of Dover caſtle, of Windſor caſtle, of the caſtle of Caernarvon, and many other of the caſtles of Wales; whoſe office is the ſame with that of the caſtellani, or governors of caſtles.

CONSTABLES *of London*. The city of London is divided into 26 wards, and the wards into precincts, in each whereof is a conſtable. They are nominated by the inhabitants of each precinct on St Thomas's day, and confirmed, or otherwiſe, at the court of wardmote. After confirmation, they are ſworn into their offices at a court of aldermen, on the next Monday after Twefth day. Such as are choſen into the office, are obliged to place the king's arms, and the arms of the city, over their doors; and if they reſide in alleys, at the ends of ſuch alleys toward the ſtreets, to ſignify that a conſtable lives there, and that they may be the more eaſily found when wanted.

CONSTABLES *to Juſtices of the Peace*, in Scotland, are the proper officers for executing their orders. They have powers to ſuppreſs tumults, and to apprehend delinquents and thoſe who can give no good account of themſelves, and carry them to the next juſtice.

CONSTANCE, a ſtrong town of Germany, in the circle of Suabia, with a biſhop's ſee, whoſe biſhop is a prince of the empire. It has a handſome bridge, and ſeveral fine ſtructures, as well ſacred as profane. It carries on a great trade, and is well fortified; and though it pretends to be an imperial town, the Auſtrians keep a garriſon here. It is famous for a council held here in 1514, when there were three popes; but they were all depoſed, and Martin V. was elected in their room. The council cauſed Jerom of Prague to be burnt, though the emperior Sigiſmund had given him a ſafe conduct; in purſuance of this maxim, "that no faith is to be kept with heritics." They likewiſe condemned the doctrine of Wickliff, and ordered his bones to be burned 40 years after he was dead. However, the inhabitants now are Proteſtants. It is ſeated on a lake of the ſame name. E. Long. 9. 12. N. Lat. 47. 35.

CONSTANCE, a great lake of Germany, between Suabia and Swiſſerland. It is 30 miles in length, and 8 in breadth. It is croſſed by the river Rhine; and there are ſeveral towns on its banks.

CONSTANCY, in a general ſenſe, denotes immutability, or invariableneſs.—In ethics, or when applied to the human mind, the term implies reſolution or ſteadineſs, particularly under ſufferings and the trials of adverſity.

It was the ſaying of a heathen philoſopher, That there cannot be imagined upon earth a ſpectacle more worthy the regard of the Creator intent on his works, than a brave man ſuperior to his ſufferings. Nothing indeed can be more noble or honourable than to have courage enough to execute the commands of reaſon and conſcience; to maintain the dignity of our nature, and the ſtation aſſigned us; and to be proof againſt proverty, pain, and death itſelf, ſo far as not to do any thing that is ſcandalous or ſinful to avoid them. To be thus, is to be great above title and fortune. This argues the ſoul of an heavenly extraction, and is worthy the offspring of the Deity.

Of this virtue the following example, related in

Engliſh hiſtory, is here ſelected, as ſuperior perhaps, all circumſtances conſidered, to any other upon record.

Sir William Aſkew of Kelſay, in Lincolnſhire, had ſeveral daughters. His ſecond, named *Anne*, had received a genteel education; which, with an agreeable figure and good underſtanding, rendered her a very proper perſon to be at the head of a family. Her father, regardleſs of his daughter's inclination and happineſs, obliged her to marry a gentleman who had nothing to recommend him but his fortune, and who was a moſt bigoted Papiſt. No ſooner was he convinced of his wife's regard for the doctrines of the reformation from popery, than, by the inſtigation of the prieſts, he violently drove her from his houſe, though ſhe had born him two children, and her conduct was unexceptionable. Abandoned by her huſband, ſhe came up to London, in order to procure a divorce, and to make herſelf known to that part of the court who either profeſſed or were favourers of proteſtantiſm: but as Henry VIII. with conſent of parliament, had juſt enacted the law of the ſix articles, commonly called the *bloody ſtatute*, ſhe was cruelly betrayed by her own huſband; and, upon his information, taken into cuſtody, and examined concerning her faith. The act abovementioned denounced death againſt all thoſe who ſhould deny the doctrine of *tranſubſtantiation*; or that the bread and wine made uſe of in the ſacrament was not converted after conſecration into the *real* body and blood of Chriſt; or, maintain the neceſſity of receiving the ſacrament in both kinds; or affirm, that it was lawful for prieſts to marry; that the vows of celibacy might be broken; that private maſſes were of no avail; and that auricular confeſſion to a prieſt was not neceſſary to ſalvation. Upon theſe articles ſhe was examined by the inquiſitor, a prieſt, the lord-mayor of London, and the biſhop's chancellor; and to all their queries gave proper and pertinent anſwers; but not being ſuch as they approved, ſhe was ſent back to priſon, where ſhe remained eleven days to ruminate alone on her alarming ſituation, and was denied the ſmall conſolation of a friendly viſit. The king's council being at Greenwich, ſhe was once more examined by chancellor Wriotheſley, Gardiner biſhop of Wincheſter, Dr Cox, and Dr Robinſon; but not being able to convince her of her ſuppoſed errors, ſhe was ſent to the Tower. Mr Strype, from an authentic paper, gives us the following ſhort account of her examination, which may not, perhaps, be unentertaining or uſeleſs to the reader: "Sir Martin Bowes (lord mayor) ſitting with the council, as moſt meet for his wiſdom, and ſeeing her ſtand upon life and death, I pray you, quoth he, my lords, give me leave to talk to this woman? Leave was granted. *Lord Mayor.* Thou fooliſh woman, ſayeſt thou that the prieſt cannot make the holy body of Chriſt? *A. Aſkew.* I ſay ſo, my lord: for I have read that God made man; but that man made God I never read; nor I ſuppoſe ever ſhall read it. *Lord Mayor.* No! Though fooliſh woman, after the words of conſecration, is it not the Lord's body? *A. Aſkew.* No: it is but conſecrated bread, or ſacramental bread. *Lord Mayor.* What if a mouſe eat it after conſecration; what ſhall become of this mouſe? what ſayeſt thou, thou fooliſh woman? *A. Aſkew.* What ſhall become of her, ſay you, my lord? *Lord Mayor.* I ſay, that the mouſe is damned. *A. Aſkew.* Alack, poor mouſe!" Perceiving that ſome could not keep in their laughing, the council proceeded to the butchery and ſlaughter that they intended before they came there.—It was ſtrongly ſuſpected that Mrs Aſkew was favoured by ſome ladies of high rank; and that ſhe carried on a religious correſpondence with the queen. So that the chancellor Wriotheſley, hoping that he might diſcover ſomething that would afford matter of impeachment againſt that princeſs, the Earl of Hertford, or his Counteſs, who all favoured reformation, ordered her to be put to the rack: but her fortitude in ſuffering, and her reſolution not to betray her friends, was proof againſt that diabolical invention. Not a groan, not a word, could be extorted from her. The chancellor, provoked with what he called her obſtinacy, augmented her tortures with his own hands, and with unheard of violence: but her courage and conſtancy were invincible; and theſe barbarians gained nothing by their cruelties but everlaſting diſgrace and infamy. As ſoon as ſhe was taken from the rack, ſhe fainted away; but being recovered, ſhe was condemned to the flames. Her bones were diſlocated in ſuch a manner, that they were forced to carry her in a chair to the place of execution. While ſhe was at the ſtake, letters were brought her from the lord chancellor, offering her the king's pardon if ſhe would recant. But ſhe refuſed to look at them; telling the meſſenger, that "ſhe came not thither to deny her Lord and Maſter." The ſame letters were alſo tendered to three other perſons condemned to the ſame fate; and who, animated by her example, refuſed to accept them. Whereupon the lord-mayor commanded the fire to be kindled; and with ſavage ignorance cried out, *Fiat juſtitia*, "Let juſtice take its courſe." The faggots being lighted, ſhe commended her ſoul, with the utmoſt compoſure, into the hands of her Maker; and, like the great founder of the religion ſhe profeſſed, expired, *praying for her murderers*, July 16, 1546, about the 25th year of her age.

CONSTANTIA, a diſtrict at the Cape of Good Hope, conſiſting of two farms, which produce the well-known wine ſo much prized in Europe, and known by the name of *Cape* or *Conſtantia* wine. This place is ſituated at the diſtance of a mile and a half from Alphen, in a bending formed by and nearly under the ridge of hills, which comes from Meuiſen-mountain, and juſt where it ſtrikes off towards Hout-bay. One of theſe farms is called Little Conſtantia. Here the white Conſtantia wine is made. The other produces the red. According to M. De la Cail's account, not more than 60 *ſiggars* of red, and 90 of the white Conſtantia wine are made, each *ſiggar* being reckoned at 600 French pints, or about 150 Swediſh cans; ſo that the whole produce amounts to 22,500 cans. As the company are uſed to keep one third of this for themſelves, the remainder is always beſpoke by the Europeans long before it is made. At the Cape this wine is ſeldom ſeen at table, partly becauſe it is dear, and partly becauſe it is the produce of the country. The red Conſtantia wine ſells for about 60 rixdollars the half awin; but the white is uſually to be purchaſed at a more reaſonable rate. The genuine Conſtantia wine is undeniably a very racy and delicate deſert wine, and has ſomething peculiarly agreeable in the flavour of it. That its ſuperiority,

periority, however, is not owing to any thing peculiar in the manner of preparing it, ſeems extremely probable; for then, without doubt, a great deal more of it would be made. In fact, Dr Sparmann informs us, that the genuine wine can only be produced by certain particular ſoils. The diſtricts that lie next to theſe yield merely the common Cape wine, notwithſtanding that they have been planted with vine-ſtocks taken from this, as well as with ſome brought from the banks of the Rhine, whence it is ſuppoſed that the true Conſtantia ſort originally comes; nay, even tho' all the vineyards about Conſtantia ſeem to have the ſame ſoil. We have inſtances at the Cape, as well as in Europe, that good grapes ſometimes produce a bad wine; while, on the other hand, bad grapes will yield a good ſort of wine: therefore, towards making wine of a certain quality, beſides finer materials, there muſt be certain conditions and circumſtances, which, by a diligent and rational inveſtigation, might probably be explored to the great benefit of mankind.

Such as are apprized in what quantities Conſtantia wine is conſumed in Europe, will perhaps think the above calculation of the produce too limited. This, however, Dr Sparmann aſſures us, is by no means the caſe; the overplus being the produce of avarice, which goaded on by the deſire of gain, will always hit upon ſome method of ſatisfying the demands of luxury and ſenſuality. The votaries of theſe, accuſtomed to be put off with empty ſounds, do not ſeldom drink with the higheſt reliſh an imaginary Conſtantia, with which, however, this liquor has nothing in common beſides the mere name. It is therefore adviſable, even at the Cape itſelf, to take care, that whilſt one has a genuine ſample given one to taſte, one is not made to pay for a made-up red Conſtantia, which otherwiſe is in general ſold for half the price. When a wine of this kind has been (as it uſually is) meliorated by a voyage, and at the ſame time chriſtened with the pompous name of genuine Conſtantia, of which it has indeed in ſome meaſure the flavour, it eaſily ſells for ſuch in Europe.

CONSTANTINA, a ſtrong conſiderable town of Africa, in the kingdom of Algiers, and capital of a territory of the ſame name. It is the largeſt and ſtrongeſt place in all the eaſtern parts; and it is ſeated on the top of a great rock. There is no way to it but by ſteps cut out of the rock; and the uſual way of puniſhing criminals here is to throw them down the cliff. Here are a great many Roman antiquities, particularly a triumphal arch. E. Long. 7. 12. N. Lat. 36. 4.

CONSTANTINA, a town of Spain, in Andaluſia, and capital of a ſmall territory of the ſame name, with a caſtle ſeated on a mountain. W. Long. 5. 35. N. Lat. 37. 40.

CONSTANTINE, a kingdom of Barbary of that name in Africa. It is bounded on the north by the Mediterranean, on the eaſt by the kingdom of Tunis, on the ſouth by Bildulgerid, and on the weſt by the river Sufegmar, which ſeparates it from the kingdom of Bugia. The country is the new Numidia of the ancients, and had its own king: but it is now a province to Algiers.

CONSTANTINE the Great, the firſt emperor of the Romans who embraced Chriſtianity. His father, Conſtantius Clorus, rendered himſelf famous by his victorious expeditions to Germany and Britain: upon the abdication of Diocleſian, he ſhared the Roman empire with Galerius Maximinus in 305; and was at that time at York, where he died in 306; having firſt cauſed his ſon Conſtantine the Great to be proclaimed emperor by his army, and by the Engliſh. Galerius at firſt refuſed to admit Conſtantine to his father's ſhare in the imperial throne; but after having loſt ſeveral battles he conſented in 308. Maxentius, who ſucceeded Galerius oppoſed him; but was defeated, and drowned himſelf in the Tyber. The ſenate then declared Conſtantine *chief* or *firſt* Auguſtus, and Licinius his ſecond aſſociate in the empire, in 313. Theſe princes publiſhed an edict, in their joint names, in favour of the Chriſtians; but ſoon after Licinius, jealous of Conſtantine's renown, conceived an implacable hatred againſt him, and renewed the perſecutions againſt the Chriſtians. This brought on a rupture between the emperors; and a battle, in which Conſtantine was victorious. A ſhort peace enſued: but Licinius having ſhamefully violated the treaty, the war was renewed; when Conſtantine, totally defeating him, he fled to Nicomedia, where he was taken priſoner and ſtrangled in 323. Conſtantine, now become ſole maſter of the weſtern and eaſtern empires, immediately formed the plan of eſtabliſhing Chriſtianity as the religion of the ſtate; for which purpoſe, he convoked ſeveral eccleſiaſtical councils: but finding he was likely to meet with great oppoſition from the Pagan intereſt at Rome, he conceived the deſign of founding a new city, to be the capital of his Chriſtian empire; ſee CONSTANTINOPLE. The glory Conſtantine had acquire by eſtabliſhing the Chriſtian religion, was tarniſhed by the part he took in the perſecutions carried on by the Arians, towards the cloſe of his reign, againſt their Chriſtian brethren who differed from them: ſeduced by Euſebius, of Nicomedia, he baniſhed ſeveral eminent prelates: ſoon after which he died in 337, the 66th year of his age, and 31ſt of his reign.

As to the character of Conſtantine, he was chaſte, pious, laborious, and indefatigable; a great general, ſucceſsful in war, and deſerving his ſucceſs by his ſhining valour and by the brightneſs of his genius; a protector of arts, and an encourager of them by his beneficence. If we compare him with Auguſtus, we ſhall find that he ruined idolatry, by the ſame precautions and the ſame addreſs that the other uſed to deſtroy liberty. Like Auguſtus, he laid the foundation of a new empire; but leſs ſkilful, and leſs polite, he could not give it the ſame ſtability: he weakened the body of the ſtate by adding to it, in ſome meaſure, a ſecond head in the foundation of Conſtantinople; and tranſporting the centre of motion and ſtrength too near the eaſtern extremity, he left without heat, and almoſt without life, the weſtern parts, which ſoon became a prey to the barbarians. The Pagans were too much his enemies to do him juſtice. Eutropius ſays, that in the former part of his reign he was equal to the moſt accompliſhed princes, and in the latter to the meaneſt. The younger Victor, who makes him to have reigned more than 31 years, pretends, that in the firſt 10 years he was a hero; in the 12 ſucceeding

Conſtantine, Conſtantinople.

ones a robber; and in the 10 laſt a ſpendthrift. It is eaſy to perceive, with reſpect to theſe two reproaches of Victor's, that the one relates to the riches which Conſtantine took from idolatry, and the other to thoſe with which he loaded the church.

CONSTANTINE emperor of the Eaſt in 902, left the care of the empire to his wife Helena, who loaded the people with taxes, and ſold all the offices in church and ſtate to the higheſt bidders; while the emperor employed himſelf in reading, writing, and the fine arts, till he became as good an architect and painter as he was a bad prince: he wrote ſeveral biographical and geographical works, which would have done honour to his name, if he had not neglected his duty to compoſe them. He died in 960.

CONSTANTINE (Dracoſes), the ſon of Emmanuel Paleologus, was placed on the throne by ſultan Amurath in 1448. But Mahomet II. his ſucceſſor, reſolving to dethrone him, laid ſiege to Conſtantinople by ſea and land, and took it by aſſault in 1453, after it had held out 58 days. The unfortunate emperor ſeeing the Turks enter the breaches, threw himſelf into the midſt of the enemy; and was cut to pieces; the children of the imperial houſe were maſſacred by the ſoldiers; and the women reſerved to gratify the luſt of the conqueror; and thus terminated the dynaſty of the Conſtantines, 1123 years after its eſtabliſhment at Conſtantinople.

CONSTANTINE (Robert), a learned phyſician born at Caen, taught polite literature in that city; and acquired great reputation by his ſkill in the Greek language, in hiſtory, and in medicine. He died in 1603, aged 103. He wrote a dictionary in Greek and Latin, and other works, which are eſteemed.

1 Removing the imperial ſeat to this city the cauſe of the decline of the weſtern empire.

CONSTANTINOPLE, the modern name of the city of BYZANTIUM in Thrace. It was enlarged and beautified by the Roman emperor Conſtantine the Great, in the year 330. At the ſame time he transferred thither the ſeat of the empire; and this removal is generally thought to have been one of the principal cauſes of the ſudden decline of the weſtern empire after this period.

2 Conſtantine defeats the Goths,

In the year 332, the Sarmatians implored Conſtantine's aſſiſtance againſt the Goths, who had made an irruption into their territories, and deſtroyed every thing with fire and ſword. The emperor readily granted their requeſt, and gained a complete victory. Near 100,000, of the enemy periſhed either in the battle, or after it with hunger and cold. In conſequence of this overthrow, the Goths were obliged to ſue for peace; but the ungrateful Sarmatians no ſooner found themſelves delivered from their enemies, than they turned their arms againſt their benefactor, and ravaged the provinces of Mæſia and Thrace. The emperor, receiving intelligence of this treachery, returned with incredible expedition, cut great numbers of them in pieces, and obliged the reſt to ſubmit to what terms he was pleaſed to impoſe.

3 And the Sarmatians

4 Is highly reſpected.

Conſtantine ſeems to have been a prince very highly reſpected, even by far diſtant nations. In 333, according to Euſebius, ambaſſadors arrived at Conſtantinople from the Blemyes, Indians, Ethiopians, and Perſians, courting his friendſhip. They were received in a moſt obliging manner; and learning from the ambaſſadors of Sapor king of Perſia, that there were great numbers of Chriſtians in their maſter's dominions, Conſtantine wrote a letter in their behalf to the Perſian monarch.

Conſtantinopolitan hiſtory.

Next year, the Sarmatians being again attacked by the Goths, found themſelves obliged to ſet at liberty and arm their ſlaves againſt them. By this means they indeed overcame the Goths; but the victorious ſlaves turning their arms againſt their maſters, drove them out of the country. This misfortune obliged them, to the number of 300,000, to apply for relief to the Roman emperor, who incorporated with his legions ſuch as were capable of ſervice; and gave ſettlements to the reſt in Thrace, Scythia, Macedon, and Italy. This was the laſt remarkable action of Conſtantine the Great. He died on May 25, 337, having divided the empire among his children and nephews, in the following manner. Conſtantine, his eldeſt ſon, had Gaul, Spain, and Britain: Conſtantius, the ſecond, had Aſia, Syria, and Egypt: and Conſtans, the youngeſt, Illyricum, Italy, and Africa. To his nephew Dalmatius, he gave Thrace, Macedon, and Achaia; and to king Annibalianus, his other nephew, Armenia Minor, Pontus, Cappadocia, and the city of Cæſarea, which he deſired might be the capital of his kingdom

5 He takes a number of Sarmatians into his army.

6 His death, and diviſion of the empire.

7 All his relations murdered except his three ſons and two nephews.

After the death of Conſtantine, the army and ſenate proclaimed his three ſons emperors, without taking any notice of his two nephews, who were ſoon after murdered, with Julius Conſtantius the late emperor's brother, and all their friends and adherents. Thus the family of Conſtantine was at once reduced to his three ſons, and two nephews Gallus and Julian, the ſons of Julius Conſtantius; and of theſe the former owed his life to a malady, from which no one thought he could recover; and the latter to his infancy, being then at moſt about ſeven years of age. The three brothers divided among themſelves the dominions of the deceaſed princes; but did not long agree together. In 340, Conſtantine having in vain ſolicited Conſtans to yield part of Italy to him, raiſed a conſiderable army; and under pretence of marching to the aſſiſtance of his brother Conſtantius, who was then at war with the Perſians, made himſelf maſter of ſeveral places in Italy. Hereupon Conſtans detached part of his army againſt him; and Conſtantine, being drawn into an ambuſcade near Aquileia, was cut off with his whole forces. His body was thrown into the river Anſa; but being afterwards diſcovered, was ſent to Conſtantinople, and interred there near the tomb of his father

8 Conſtantine invades the dominions of Conſtans.

9 Is defeated and killed.

10 Conſtans ſole maſter of the Weſt.

11 Magnentius revolts againſt him.

By the defeat and death of his brother, Conſtans remained ſole maſter of all the weſtern part of the empire, in the quiet poſſeſſion of which he continued till the year 350. This year, Magnentius, the ſon of one Magnus, a native of Germany, finding Conſtans deſpiſed by the army on account of his indolence an inactivity, reſolved to murder him, and ſet up for himſelf. Having found means to gain over the chief officers of the army to his deſigns, he ſeized on the Imperial palace at Autun, and diſtributed among the populace what ſums he found there; which induced not only the city, but the neighbouring country, to eſpouſe his cauſe. But Conſtans being informed of what had paſſed, and finding himſelf unable to reſiſt the uſurper, fled towards Spain. He was overtaken, however, by Gaiſo, whom Magnentius had ſent after him with a choſen

Conſtantinopolitan hiſtory.

choſen body of troops, who diſpatched with many wounds the unhappy prince at Helena, a ſmall village ſituated near the foot of the Pyrenees.

12 Conſtans murdered.

Thus Conſtantius acquired a right to the whole Roman empire; though one half of it was ſeized by Magnentius after the murder of Conſtans. The former had been engaged in a war with the Perſians, in which little advantage was gained on either ſide; but the Perſians now giving no more diſturbance, the emperor marched againſt the uſurpers in the weſt.

13 Three pretenders to the empire.

Beſides Magnentius, there were at this time two other pretenders to the weſtern empire. Veteranio, general of the foot in Pannonia, had, on the firſt news of the death of Conſtans, cauſed himſelf to be proclaimed emperor by the legions under his command. He was a native of Upper Mæſia, and advanced in years when he uſurped the ſovereignty; but ſo illiterate, that he then firſt learned to read. The third pretender was Flavius Popilius Nepotianus, ſon of Eutropia the ſiſter of Conſtantine the Great. Having aſſembled a company of gladiators and men of deſperate fortunes, he aſſumed the purple on the 3d of June 350, and in that attire preſented himſelf before the gates of Rome. The prefect Anicetus, who commanded there for Magnentius, ſallied out againſt him with a body of Romans; who were ſoon driven back into the city.

14 Nepotianus makes himſelf maſter of Rome.

Soon after Nepotianus made himſelf maſter of the city itſelf, which he filled with blood and ſlaughter. Magnentius being informed of what had happened, ſent againſt this new competitor his chief favourite and prime miniſter Marcellinus. Nepotianus received him with great reſolution; a bloody battle enſued between the ſoldiers of Magnentius and the Romans who had eſpouſed the cauſe of Nepotianus;

15 He is defeated and killed.

but the latter being betrayed by a ſenator, named Heraclitus, his men were put to flight, and he himſelf killed, after having enjoyed the ſovereignty only 28 days. Marcellinus ordered his head to be carried on the point of a lance through the principal ſtreets of the city; put to death all thoſe who had declared for him; and under pretence of preventing diſturbances, commanded a general maſſacre of all the relations of Conſtantine.

16 Tyranny of Magnentius.

Soon after, Magnentius himſelf came to Rome to make the neceſſary preparations for reſiſting Conſtantius, who was exerting himſelf to the utmoſt in order to revenge the death of his brother. In the city he behaved moſt tyrannically, putting to death many perſons of diſtinction, in order to ſeize their eſtates; and obliged the reſt to contribute half of what they were worth towards the expence of the war. Having by this means raiſed great ſums, he aſſembled a mighty army compoſed of Romans, Germans, Gauls, Franks, Britons, Spaniards, &c.

17 Sends propoſals of peace to Conſtantius.

At the ſame time, however, dreading the uncertain iſſues of war, he diſpatched ambaſſadors to Conſtantius with propoſals of accommodation. Conſtantius ſet out from Antioch about the beginning of autumn; and, paſſing through Conſtantinople, arrived at Heraclea, where he was met by the deputies from Magnentius, and others from Veteranio, who had agreed to ſupport each other in caſe the emperor would hearken to no terms. The deputies of Magnentius propoſed in his name a match between him and Conſtantia, or rather Conſtantina, the ſiſter of Conſtantius, and widow of Annibalianus; offering, at the ſame time, to Conſtantius the ſiſter of Magnentius. At firſt the emperor would hearken to no terms; but afterwards, that he might not have to oppoſe two enemies at once, concluded a ſeparate treaty with Veteranio, by which he agreed to take him for his partner in the empire. But when Veteranio aſcended the tribunal along with Conſtantius, the ſoldiers pulled him down from thence, crying out, That they would acknowledge no other emperor than Conſtantius alone. On this Veteranio threw himſelf at the emperor's feet, and implored his mercy. Conſtantius received him with great kindneſs, and ſent him to Pruſia in Bithynia, where he allowed him a maintenance ſuitable to his quality.

Conſtantius, now maſter of all Illyricum, and of the army commanded by Veteranio, reſolved to march againſt Magnentius without delay.

18 Gallus ſent againſt the Perſians.

In the mean time, however, on advice that the Perſians were preparing to invade the eaſtern provinces, he married his ſiſter Conſtantina to his couſin-german Gallus; created him Cæſar on the 15th of March; and allotted him for his ſhare not only all the Eaſt, but likewiſe Thrace and Conſtantinople. About the ſame time Magnentius gave the title of Cæſar to his brother Decentius, whom he diſpatched into Gaul to defend that country againſt the barbarians who had invaded it;

19 Conſtantius ſtirs up the Franks to invade Gaul.

for Conſtantius had not only ſtirred up the Franks and Saxons to break into that province by promiſing to relinquiſh to them all the places they ſhould conquer, but had ſent them large ſupplies of men and arms for that purpoſe. On this encouragement the barbarians invaded Gaul with a mighty army, overthrew Decentius in a pitched battle, committed every where dreadful ravages, and reduced the country to a moſt deplorable ſituation. In the mean time Magnentius having aſſembled a numerous army, left Italy, and croſſing the Alps, advanced into the plains of Pannonia, where Conſtantius, whoſe main ſtrength conſiſted in cavalry, was waiting for him. Magnentius, hearing that his competitor was encamped at a ſmall diſtance, invited him by a meſſenger to the extenſive plains of *Sciſcia* on the Save, there to decide which of them had the beſt title to the empire.

20 Is defeated by Magnentius.

This challenge was by Conſtantius received with great joy; but as his troops marched towards Sciſcia in diſorder, they fell into an ambuſcade, and were put to flight with great ſlaughter. With this ſucceſs, Magnentius was ſo elated, that he rejected all terms of peace which were now offered by Conſtantius;

21 Magnentius defeated at Murſa.

but after ſome time, a general engagement enſued at Murſa, in which Magnentius was entirely defeated, with the loſs of 24,000 men. Conſtantius, though victor, is ſaid to have loſt 30,000, which ſeems improbable.

22 This battle fatal to the empire.

All authors, however, agree, that the battle of Murſa proved fatal to the weſtern empire, and greatly contributed to its ſpeedy decline.

After his defeat at Murſa, Magnentius retired into Italy, where he recruited his ſhattered forces as well as he could. But the beginning of the following year 352, Conſtantius, having aſſembled his troops, ſurpriſed and took a ſtrong caſtle on the Julian Alps, belonging to Magnentius, without the loſs of a man. After this the emperor advanced in order to force the reſt; upon which Magnentius was ſtruck with ſuch terror, that he immediately abandoned Aquileia, and ordered the troops that guarded the other paſſes of the Alps to follow him. Thus Conſtantius entering Italy without oppoſition, made himſelf maſter of Aquileia. From thence he advanced to Pavia, where Magnentius gained a conſiderable advantage over him. Notwithſtanding this loſs, however, Conſtantius reduced the whole country bordering on the Po, and Magnentius's men deſerted to him in whole troops, delivering up to him the places they had garriſoned; by which the tyrant was ſo diſheartened, that he left Italy, and retired with all his forces into Gaul. Soon after this, Africa, Sicily, and Spain, declared for Conſtantius; upon which Magnentius ſent a ſenator, and after him ſome biſhops, to treat of a peace; but the emperor treated the ſenator as a ſpy, and ſent back the biſhops without any anſwer.—Magnentius now finding his affairs deſperate, and that there were no hopes of pardon, recruited his army in the beſt manner he could, and diſpatched an aſſaſſin into the Eaſt to murder Gallus Cæſar; hoping that his death would oblige the emperor to withdraw his forces from Gaul, and march in perſon to the defence of the Eaſtern provinces, which were threatened by the Perſians. The aſſaſſin gained over ſome of Gallus's guards: but the plot being diſcoverd before it could be put in execution, they were all ſeized and executed as traitors.

23 **Magnentius attempts to get Gallus murdered.**

24 **Magnentius defeated a ſecond time, kills all his family and himſelf.**

In 353, the war againſt Magnentius was carried on with more vigour than ever, and at laſt happily ended by a battle fought in the Higher Dauphiny. Magnentius, being defeated, took ſhelter in Lyons; but the few ſoldiers who attended him, deſpairing of any further ſucceſs, reſolved to purchaſe the emperors favour by delivering up to him his rival, the author of ſo calamitous a war. Accordingly they ſurrounded the houſe where he lodged; upon which the tyrant, in deſpair, ſlew with his own hand his mother, his brother Deſiderius whom he had created Cæſar, and ſuch of his friends and relations as were with him; and then, fixing his ſword in a wall, threw himſelf upon it, in order, to avoid a more ſhameful death which he had reaſon to apprehend.

After the death of Magnentius, his brother Decentius Cæſar, who was marching to his aſſiſtance, and had already reached Sens, finding himſelf ſurrounded on all ſides by the emperor's forces, choſe rather to ſtrangle himſelf than fall alive into the hands of his enemies. Thus Conſtantius was left ſole maſter of the Roman empire. His panegyriſts tell us, that after his victory he behaved with the greateſt humanity, forgiving and receiving into favour his greateſt enemies; but other hiſtorians differ conſiderably from them, and tell us that Conſtantius now became haughty, imperious, and cruel, of which many inſtances are given.

25 **Conſtantius ſole maſter of the empire.**

26 **Many grievous calamities.**

This year the empire was ſubjected to very grievous calamities. Gaul was ravaged by the barbarians beyond the Rhine, and the diſbanded troops of Magnentius. At Rome, the populace roſe on account of a ſcarcity of proviſions. In Aſia, the Iſaurian robbers over-ran Lycaonia and Pamphylia; and even laid ſiege to Seleucia, a city of great ſtrength; which, however, they were not able to make themſelves maſters of. At the ſame time, the Saracens committed dreadful ravages in Meſopotamia; the Perſians alſo invaded the province of Anthemuſia on the Euphrates. But the Eaſtern provinces were not ſo much haraſſed by the barbarians as by Gallus Cæſar himſelf, who ought to have protected them. That prince was naturally of a cruel, haughty, and tyrannical diſpoſition; but being elated with his ſucceſſes againſt the Perſians, he at laſt behaved more like a tyrant and a madman than a governor. His natural cruelty is ſaid to have been heightened by the inſtigations of his wife Conſtantina, who is by Ammianus ſtyled the *Megæra*, or "fury of her ſex;" and he adds, that her ambition was equal to her cruelty. Thus all the provinces and cities in the Eaſt were filled with blood and ſlaughter. No man, however innocent, was ſure to live or enjoy his eſtate a whole day; for Gallus's temper being equally ſuſpicious and cruel, thoſe who had any private enemies took care to accuſe them of crimes againſt the ſtate, and with Gallus it was the ſame thing to be accuſed and condemned. At laſt the emperor being informed from all quarters of the evil conduct of his brother-in-law, and being at the ſame time told that he aſpired to the ſovereignty, reſolved upon his ruin. For this end he wrote letters to Gallus and Conſtantina, inviting them both into Italy. Though they had both ſufficient reaſon to fear the worſt, yet they durſt not venture to diſobey the emperor's expreſs command. Conſtantina, who was well acquainted with her brother's temper, and hoped to pacify him by her artful inſinuation, ſet out firſt, leaving Gallus at Antioch: but ſhe had ſcarce entered the province of Bithynia, when ſhe was ſeized with a fever which put an end to her life. Gallus now deſpairing of being able to appeaſe his ſovereign, thought of openly revolting; but moſt of his friends deſerted him on account of his inconſtant and cruel temper, ſo that he was at laſt obliged to ſubmit to the pleaſure of Conſtantius. He advanced, therefore, according to his orders; but at Petavium was arreſted, and ſtripped of all the enſigns of his dignity. From thence he was carried to *Flanona*, now *Fianone* in Dalmatia, where he was examined by two of his moſt inveterate enemies. He confeſſed moſt of the crimes laid to his charge; but urged as an excuſe the evil counſels of his wife Conſtantina. The emperor, provoked at this plea which reflected on his ſiſter, and inſtigated by the enemies of Gallus, ſigned a warrant for his execution, which was performed accordingly.

27 **Tyranny of Gallus.**

28 **He is put to death.**

29 **War with the Germans.**

All this time the emperor had been engaged in a war with the Germans: he had marched againſt them in perſon; and though he gained no advantage, the barbarians thought proper to make peace with him. This, however, was but ſhort-lived. No ſooner was the Roman army withdrawn, than they began to make new inroads into the empire. Againſt them Conſtantius diſpatched Arbetio with the flower of the army; but he fell into an ambuſcade, and was put to flight with the loſs of a great number of men. This loſs, however, was ſoon retrieved by the valour of *Arintheus*, who became famous in the reign of Valens, and of two other officers, who falling upon the Germans, without waiting the orders of their general, put them to flight, and obliged them to leave the Roman territories.

The tranquillity of the empire, which enſued on this repulſe of the Germans, was ſoon interrupted by a pretended conſpiracy, by which in the end a true one was produced. Sylvanus, a leading man among the

30 **Sylvanus betrayed by Arbetio.**

31 **He is forced to revolt.**

[31] **Is murdered.**

the Franks, commanded in Gaul, and had there performed great exploits againſt the barbarians. He had been raiſed to this poſt by Arbetio; but only with a deſign to remove him from the emperor's preſence, in order to accompliſh his ruin, which he did in the following manner: One *Dynames*, keeper of the emperor's mules, leaving Gaul, begged of Sylvanus letters of recommendation to his friends at court; which being granted, the traitor eraſed all but the ſubſcription. He then inſerted directions to the friends of Sylvanus for the carrying on a conſpiracy; and delivering theſe forged letters to the prefect Lampridius, they were by him ſhowed to the emperor. Thus Sylvanus was forced to revolt, and cauſe himſelf to be proclaimed emperor by the troops under his command. In the mean time, however, Dynames having thought proper to forge another letter, the fraud was diſcovered, and an enquiry ſet on foot, which brought to light the whole matter. Sylvanus was now declared innocent, and letters ſent to him by the emperor confirming him in his poſt; but theſe were ſcarce gone, when certain news arrived at the court of Sylvanus having revolted, and cauſed himſelf to be proclaimed emperor. Conſtantius, thunderſtruck at this news, diſpatched againſt him Urſicinus, an officer of great integrity, as well as valour and experience in war; who forgetting his former character, pretended to be Sylvanus's friend, and thus found means to cut him off by treachery.

32 **Gaul ravaged by the barbarians.**

33 **Julian created Cæſar.**

The barbarians, who had been hitherto kept quiet by the brave Sylvanus, no ſooner heard of his death, than they broke into Gaul with greater fury than ever. They took and pillaged above forty cities, and among the reſt Cologne, which they levelled with the ground. At the ſame time the Quadi and Sarmatians entering Pannonia, deſtroyed every thing with fire and ſword. The Perſians alſo, taking advantage of the abſence of Urſicinus, over-ran, without oppoſition, Armenia and Meſopotamia; Proſper and Manſonianus, who had ſucceeded that brave commander in the government of the Eaſt, being more intent upon pillaging than defending the provinces committed to their care. Conſtantius, not thinking it adviſable to leave Italy himſelf, reſolved at laſt to raiſe his couſin Julian, the brother of Gallus, to the dignity of Cæſar. Julian ſeems to have been a man of very extraordinary talents; for though before this time he had been entirely buried in obſcurity, and converſed only with books, no ſooner was he put at the head of an army than he behaved with the ſame bravery, conduct, and experience, as if he had been all his life bred up to the art of war. He was appointed governor of Gaul; but before he ſet out, Conſtantius gave him in marriage his ſiſter Helena, and made him many valuable preſents. At the ſame time, however, the jealous emperor greatly limited his authority; gave him written inſtructions how to behave; ordered the generals who ſerved under him to watch all his actions no leſs than thoſe of the enemy; and ſtrictly enjoined Julian himſelf not to give any largeſſes to the ſoldiery.

Julian ſet out from Milan on the 1ſt of December 355, the emperor himſelf accompanying him as far as Pavia, from whence he purſued his journey to the Alps, attended only by 360 ſoldiers. On his arrival at Turin he was firſt acquainted with the loſs of Cologne, which had been kept concealed from the emperor. He arrived at Vienne before the end of the year, and was received by the people of that city and the neighbourhood with extraordinary joy.

34 **He ſets out for Gaul.**

35 **Defeats the barbarians.**

36 **Repairs the fortifications of Cologne.**

37 **Idolatry declared capital by Conſtantius.**

In 356, the barbarians beſieged *Autun*; to relieve which place, Julian marched with what forces he could raiſe. When he came there, he found the ſiege raiſed: on which he went in purſuit of the barbarians to Auxerre, croſſing with no ſmall danger thick woods and foreſts, from Auxerre to *Troies*. On his march he was ſurrounded on all ſides by the barbarians, who moved about the country in great bodies; but he put them to flight with an handful of men, cut great numbers of them in pieces, and took ſome priſoners. From Troies he haſtened to Rheims, where the main body of the army, commanded by Marcellus, waited his arrival. Leaving Rheims, he took his route towards Decempagi, now *Dieuze*, on the Seille in Lorrain, with a deſign to oppoſe the Germans who were buſy in ravaging that province. But the enemy attacking his rear unexpectedly, would have cut off two legions, had not the reſt of the army, alarmed at the ſudden noiſe, turned back to their aſſiſtance. A few days afterwards he defeated the Germans, though with great loſs to his own army; the victory, however, opened him a way to Cologne. This city he found abandoned by the barbarians. They had neglected to fortify it: but Julian commanded the ancient fortifications to be repaired with all poſſible expedition, and the houſes to be rebuilt; after which he retired to Sens, and there took up his winter-quarters. This year alſo Conſtantius entered Germany on the ſide of Rhætia, laid waſte the country far and wide; and obliged the barbarians to ſue for peace, which was readily granted. The ſame year he enacted two laws; by one of which it was declared capital to ſacrifice, or pay any kind of worſhip, to idols; the other, granting the effects of condemned perſons to belong to their children and relations within the third degree, except in caſes of magic and treaſon; but this laſt one he revoked two years after.

In the beginning of the year 357, the barbarians beſieged Julian a whole month in Sens; Marcellus, the commander in chief, never once offering to aſſiſt him. Julian, however, ſo valiantly defended himſelf with the few forces he had, that the barbarians at laſt retired. After this, Conſtantius declared Julian commander in chief of all the forces in Gaul; appointing under him one *Severus*, an officer of great experience, and of a quite different diſpoſition from Marcellus. On his arrival in Gaul, Julian received him with great joy, raiſed new troops, and ſupplied them with arms which he luckily found in an old arſenal. The emperor, reſolving at all events to put a ſtop to the terrible devaſtations committed by the barbarous nations, chiefly by the Alemans, wrote to Julian to march directly againſt them. At the ſame time he ſent Barbatio, who had been appointed general in place of Sylvanus, with a body of 25 or 30,000 men, out of Italy, in order to incloſe the enemy between two armies. The Leti, however, a German nation, paſſing between the armies, advanced as far as Lyons, hoping to ſurpriſe that wealthy city; but meeting with a warmer reception than they expected, contented themſelves with ravaging the country all round it. On the firſt

38 The Leti cut off by Julian.

39 He forces the barbarians to abandon the iſlands of the Rhine.

40 Entirely defeats them at Straſbourg.

notice of this expedition, Julian detached ſtrong parties to guard the paſſages through which he knew the barbarians muſt return. Thus they were all cut off except thoſe who marched near the camp of Barbatio; who was ſo far from cutting off their retreat, that he complained by a letter to Conſtantius of ſome officers for attempting it. Theſe officers, among whom was Valentinian, afterwards emperor of the Weſt, were, by the orders of Conſtantius, caſhiered for their diſobedience. The other barbarians either fortified themſelves in the countries which they had ſeized, ſtopping up all the avenues with huge trees, or took ſhelter in the iſlands formed by the Rhine. Julian reſolved firſt to attack the latter; and with this view demanded ſome boats of Barbatio: but he, inſtead of complying with his juſt requeſt, immediately burnt all his boats, as he did on another occaſion the proviſions which had been ſent to both armies, after he had plentifully ſupplied his own. Julian, not in the leaſt diſheartened with this unaccountable conduct, perſuaded ſome of the moſt reſolute of his men to wade over to one of the iſlands. Here they killed all the Germans who had taken ſhelter in it. They then ſeized their boats, and purſued the ſlaughter in ſeveral other iſlands, till the enemy abandoned them all, and retired to their reſpective countries with their wives and what booty they could carry. On their departure, Barbatio attempted to lay a bridge of boats over the Rhine; but the enemy, appriſed of his intention, threw a great number of huge trees into the river, which being carried by the ſtream againſt the boats, ſunk ſeveral of them, and parted the reſt. The Roman general then thought proper to retire; but the barbarians falling unexpectedly upon him in his retreat, cut great numbers of his men in pieces, took moſt of his baggage, laid waſte the neighbouring country, and returned in triumph loaded with booty. Elated with this ſucceſs, they aſſembled in great numbers under the command of *Chnodomarius*, a prince of great renown among them, and ſix other kings. They encamped in the neighbourhood of Straſbourg. Here they were encountered by Julian; who put them to flight, with the loſs of 6 or 8000 of their men ſlain in the field, and a vaſtly greater number drowned in the river; while Julian himſelf loſt only 243 private men and four tribunes. In this action Chnodomarius was taken, and ſent to Rome, where he ſoon after died.

41 He enters Germany and concludes a truce with the barbarians.

42 Remarkable laws of Conſtantius.

After the battle, Julian advanced with all his army to Mayence, where he built a bridge over the Rhine and entered Germany, having with difficulty prevailed upon his army to follow him. Here he ravaged the country till the time of the autumnal equinox, when being prevented by ſnow from advancing any further, he began to repair the fort of Trajan, by ſome ſuppoſed to be the caſtle of Cromburgh, about three or four leagues from Frankfort. The barbarians were now ſo much alarmed, that they ſent deputies to treat of a peace; but this Julian refuſed to grant them upon any terms. He conſented, however, to a truce for ſeven months, upon their promiſing to ſtore with proviſions the fort he was building in their country. This year Conſtantius made ſome remarkable laws. By one he puniſhed with confiſcation ſuch as renounced the Chriſtian for the Jewiſh religion; and by another, addreſſed to Felix biſhop of Rome, he exempted all merchandizing eccleſiaſtics, with their wives, children, and domeſtics, from every impoſition ordinary and extraordinary; ſuppoſing the gains they made to be applied by them to the relief of the poor.

43 Julian conquers the Franks.

44 Grants a peace to the Germans.

In 358, as ſoon as the ſeaſon was fit for action, Julian took the field againſt the Franks, with a deſign to conquer them before the truce he had concluded with the Alemans was expired. The Franks were at that time divided into ſeveral tribes, the moſt powerful of which were the Salii and Chamavi. The firſt of theſe ſent deputies, intreating that he would ſuffer them to remain as friends to the empire in the country they poſſeſſed. But Julian, without paying any regard to this deputation, entered their country, and obliged them to ſubmit; after which he allotted them lands in Gaul, incorporating great numbers of them into his cavalry. He next marched againſt the Chamavi, whom he defeated and obliged to retire beyond the Rhine. Afterwards he rebuilt three forts on the river Meuſe, which had been deſtroyed by the barbarians; but wanting proviſions in a country ſo often ravaged, he ordered 6 or 800 veſſels to be built in Britain for the conveying corn from thence into Gaul. Julian continued in the country of the Chamavi till the expiration of his truce with the Alemans; and then laying a bridge of boats over the Rhine, he entered their country, putting all to fire and ſword. At laſt two of their kings came in perſon to him to ſue for peace: which Julian granted, upon their promiſing to ſet at liberty the captives they had taken; to ſupply a certain quantity of corn when required; and to furniſh wood, iron, and carriages, for repairing the cities they had ruined. The priſoners whom he at this time releaſed, amounted to upwards of 20,000.

45 Expedition of Conſtantius againſt ſome German nations.

46 He expels the Limigantes.

Soon after the vernal equinox of this year 358, Conſtantius marched in perſon againſt the Quadi and Sarmatians, whoſe country lay beyond the Danube. Having croſſed that river on a bridge of boats, he laid waſte the territories of the Sarmatians; who thereupon came in great numbers, together with the Quadi, pretending to ſue for peace. Their true deſign was to ſurpriſe the Romans; but the latter ſuſpecting it, fell upon them ſword in hand, and cut them all in pieces. This obliged the reſt to ſue for peace in good earneſt, which was granted on the delivery of hoſtages. The emperor then marched againſt the *Limigantes*, that is, the ſlaves who, in 334, had driven the Sarmatians out of their country, and ſeized it for themſelves.* They uſed the ſame artifice as the Sarmatians and Quadi had done, coming in great numbers under pretence of ſubmitting, but prepared to fall upon him unexpectedly if opportunity offered. The emperor, obſerving their ſurly looks, and diſtruſting them, cauſed his troops ſurround them inſenſibly while he was ſpeaking. The Limigantes then diſpleaſed with the conditions he offered them, laid their hands on their ſwords: on which they were attacked by the Roman ſoldiers. Finding it impoſſible to make their eſcape, they made with great fury towards the tribunal, but were repulſed by the guards forming themſeves into a wedge, and every one of them cut in pieces. After this, the emperor ravaged their country to ſuch a degree, that they were in the end obliged to ſubmit to the only condition he thought proper to allow them, which was to quit their

country,

* See n° 5.

country, and retire to a more diſtant place. The country was then reſtored to the Sarmatians who were its original poſſeſſors.

47 Haughty embaſſy from Sapor king of Perſia.

This year is alſo remarkable for a very haughty embaſſy from Sapor king of Perſia. The ambaſſador, named *Narſes*, brought a letter, in which the Perſian monarch ſtyled himſelf "king of kings, brother of the ſun and moon," &c. He acquainted the emperor that he might lawfully inſiſt on having all the countries beyond the river Strymon in Macedon delivered up to him; but leſt his demands ſhould ſeem unreaſonable, he would be contented with Armenia and Meſopotamia, which had been moſt unjuſtly taken from his grandfather Narſes. He added, that unleſs juſtice was done him, he was reſolved to aſſert his right by force of arms. This letter was preſented to Conſtantius wrapped up in a piece of white ſilk; but he, without entering into any negociation with the ambaſſador, wrote a letter to Sapor, in which he told him, that as he had maintained the Roman dominions in their full extent, when he was poſſeſſed only of the Eaſt, he could not ſuffer them to be curtailed now when he was maſter of the whole empire. In a few days, however, he ſent another letter with rich preſents; being very deſirous at leaſt to put off the war till he had ſecured the northen provinces againſt the incurſions of the barbarians, that he might then employ all the forces of the empire againſt ſo formidable an enemy. This embaſſy proved unſucceſsful, as did alſo another which was ſent ſoon after. The laſt ambaſſadors were impriſoned as ſpies, but afterwards diſmiſſed unhurt.

48 A law againſt magicians, &c.

By a law of Conſtantius dated in 358, all magicians, augurs, aſtrologers, and pretenders to the art of divination, were declared enemies to mankind; and ſuch of them as were found in the court either of the emperor or of Julian, he commanded to be put to the torture, and ſpecified what torments they were to undergo.

In 359, Julian continued his endeavours for relieving the province of Gaul, which had ſuffered ſo much from the incurſions of the barbarians. He erected magazines in different places, viſited the cities which had ſuffered moſt, and gave orders for repairing their walls and fortifications properly. He then croſſed the Rhine, and purſued the war in Germany with great ſucceſs, inſomuch that the barbarians ſubmitted to ſuch terms as he pleaſed to impoſe.

49 Treachery of the Limigantes.

In the mean time the emperor, having received intelligence that the Limigantes had quitted the country in which he had placed them, haſtened to the banks of the Danube, in order to prevent their entering Pannonia. On his arrival he ſent deputies, deſiring to know what had induced them to abandon the country which had been allotted them. The Limigantes anſwered, in appearance with the greateſt ſubmiſſion imaginable, that they were willing to live as true ſubjects of the empire in any other place; but that the country he had allotted them was quite uninhabitable, as they could demonſtrate if they were but allowed to croſs the river, and lay their complaints before him. This requeſt was granted; but while he aſcended his tribunal, the barbarians unexpectedly fell upon his guards ſword in hand, killed ſeveral of them, and the emperor with difficulty ſaved himſelf by flight.

50 They are all cut off.

The reſt of the troops, however, ſoon took the alarm, and ſurrounding the Limigantes, cut them all off to a man.

51 The heathens cruelly perſecuted.

This year Conſtantius inſtituted a court of inquiſition againſt all thoſe who conſulted heathen oracles. Paulus Catena, a noted and cruel informer, was diſpatched into the Eaſt to proſecute them; and Modeſtus, then count of the Eaſt, and equally remarkable for his cruelty, was appointed judge. His tribunal was erected at Scythopolis in Paleſtine; whither perſons of both ſexes, and of every rank and condition, were daily dragged in crowds from all parts, and either confined in dungeons, or torn in pieces in a moſt cruel and barbarous manner by racks, or publicly executed.

52 The Perſians begin hoſtilities.

In 359, Sapor king of Perſia began hoſtilities, being encouraged thereto by the abſence of Urſicinus, whom the emperor had recalled, and appointed in his room one Sabinianus, a perſon very unfit for ſuch an office. During this campaign, however, he made very little progreſs; having only taken two Roman forts, and deſtroyed the city of Amida, the ſiege of which is ſaid to have coſt him 30,000 men. On the firſt news of the Perſian invaſion, Conſtantius had thought proper to ſend Urſicinus into the Eaſt; but his enemies prevented him from receiving the ſupplies neceſſary for carrying on the war, ſo that he found it impoſſible to take any effectual means for ſtopping the progreſs of the Perſians. On his return, he was unexpectedly charged with the loſs of Amida, and all the diſaſters that had happened during the campaign. Two judges were appointed to inquire into his conduct; but they, being creatures of his enemies, left the matter doubtful. On this Urſicinus was ſo much exaſperated, that he appealed to the emperor, and in the heat of paſſion, let fall ſome unguarded expreſſions, which being immediately carried to the emperor, the general was deprived of all his employments.

53 Conſtantius marches in perſon againſt them.

Conſtantius reſolved to march next year in perſon againſt the Perſians; but in the mean time, dreading to encounter ſo formidable an enemy, he applied himſelf wholly to the aſſembling of a mighty army, by which he might be able fully to cope with them. For this purpoſe he wrote to Julian to ſend him part of his forces, without conſidering that by ſo doing he left the province of Gaul expoſed to the ravages of the barbarians. Julian reſolved immediately to comply with the emperor's orders; but at the ſame time to abdicate the dignity of Cæſar, that he might not be blamed for the loſs of the province. Accordingly he ſuffered the beſt ſoldiers to be draughted out of his army. They were, however, very unwilling to leave him, and at laſt proclaimed him emperor.

54 Julian proclaimed emperor.

Whether this was done abſolutely againſt Julian's conſent or not is uncertain; but he wrote to the emperor, and perſuaded the whole army alſo to ſend a letter along with his, in which they acquainted Conſtantius with what had happened, and entreated him to acknowledge Julian as his partner in the empire. But this was poſitively refuſed by Conſtantius, who began to prepare for war. Julian then, deſigning to be before-hand with the emperor, cauſed his troops take an oath of allegiance to himſelf, and with ſurpriſing expedition made himſelf maſter of the whole country of Illyricum, and the important paſs ſeparating that country from Thrace. Conſtantius was thunder-ſtruck with this news; but hearing that the Perſians had retired, he marched

55 Conſtantius marches againſt him but dies.

with all his forces againſt his competitor. On his arrival at Tarſus in Cilicia, he was ſeized with a feveriſh diſtemper, occaſioned chiefly by the uneaſineſs and perplexity of his mind. He purſued his march, however, to Mopſucrene, a place on the borders of Cilicia, at the foot of Mount Taurus. Here he was obliged to ſtop by the violence of his diſorder which increaſed every day, and at laſt carried him off on the 13th of November 361, in the 45th year of his age.

56 Julian reſtores the heathen religion.

By the death of Conſtantius Julian now became maſter of the whole Roman empire without a rival. He had been educated in the Chriſtian religion; but ſecretly apoſtatized from it long before, and as ſoon as he ſaw himſelf maſter of Illyricum openly avowed his apoſtacy, and cauſed the temples of the gods to be opened. When the meſſengers arrived at Naiſſus in Illyricum, where he then was, to acquaint him with his being ſole maſter of the empire, they found him conſulting the entrails of victims concerning the event of his journey. As the omens were uncertain, he was at that time very much embarraſſed and perplexed; but the arrival of the meſſengers put an end to all his fears, and he immediately ſet out for Conſtantinople. At Heraclea he was met by almoſt all the inhabitants of this metropolis, into which he made his public entry on the 11th of December 361, being attended by the whole ſenate in a body, by all the magiſtrates, and by the nobility magnificently dreſſed, every one teſtifying the utmoſt joy at ſeeing ſuch a promiſing young prince raiſed to the empire without bloodſhed. He was again declared emperor by the ſenate of Conſtantinople; and as ſoon as that ceremony was over, he cauſed the obſequies of Conſtantius to be performed with great pomp.

57 Condemns ſome of the late emperor's miniſters.

The firſt care of Julian was to inquire into the conduct of the late emperor's miniſters. Several of theſe having been found guilty of enormous crimes, were condemned and executed; particularly the noted informer Paulus Catena, and another named *Apodamus*, were ſentenced to be burnt alive. Along with theſe, however, was put to death one Urſula, a man of unexceptionable character, and to whom Julian himſelf was highly indebted. He had been ſupplied with money by Urſula unknown to the emperor, at the time when he was ſent into Gaul with the title of Cæſar, but without the money neceſſary for the ſupport of that dignity. For what reaſon he was now put to death, hiſtorians do not acquaint us. Julian himſelf tells us, that he was executed without his knowledge.

58 Reforms the court.

The emperor next ſet about reforming the court. As the vaſt number of officers was in his time become an intolerable burden, he diſcharged all thoſe whom he thought uſeleſs. He reduced, among the reſt, the officers called *agentes in rebus*, from 10 000 to 17; and diſcharged thouſands of cooks, barbers, &c. who by their large ſalaries drained the exchequer. The *curioſi*, whoſe office it was to inform the emperor of what had paſſed in the different provinces, were all diſcharged, and that employment entirely ſuppreſſed. Thus he was enabled to eaſe the people of the heavy taxes with which they were loaded: and this he did by abating a fifth part of all taxes and impoſts throughout the kingdom.

59 Recalls the philoſophers, magicians, &c.

As to religious matters, Julian, as before obſerved, was a Pagan, and immediately on his acceſſion to the throne, reſtored the heathen religion. He invited to court the philoſophers, magicians, &c. From all parts; nevertheleſs he did not raiſe any perſecution againſt the Chriſtians. On the contrary, he recalled from baniſhment all the orthodox biſhops who had been ſent into exile during the former reign; but with a deſign, as is obſerved both by the Chriſtian and Pagan writers, to raiſe diſturbances and ſow diſſenſions in the church.

60 Marches againſt the Perſians.

As the Perſians were now preparing to carry on the war with vigour, Julian found himſelf under a neceſſity of marching againſt them in perſon. But before he ſet out, he enriched the city of Conſtantinople with many valuable gifts. He formed a large harbour to ſhelter the ſhips from the ſouth wind, built a magnificent porch leading to it, and in another porch a ſtately library, in which he lodged all his books. In the month of May, A. D. 362, he ſet out for Antioch; and on the firſt of January renewed in that city the ſacrifices to Jupiter for the ſafety of the empire, which had been ſo long omitted. During his ſtay in this city, he continued his preparations for the Perſian war, erecting magazines, making new levies, and above all conſulting the oracles, aruſpices, magicians, *&c.* The oracles of Delphi, Delos, and Dodona, aſſured him of victory. The aruſpices, indeed, and moſt of his courtiers and officers, did all that lay in their power to divert him from his intended expedition; but the deceitful anſwers of the oracles and magicians, and the deſire of adding the Perſian monarch to the many kings he had already ſeen humbled at his feet, prevailed over all other conſiderations. Many nations ſent deputies to him offering their aſſiſtance; but theſe offers he rejected, telling them that the Romans were to aſſiſt their allies, but ſtood in no need of any aſſiſtance from them. He likewiſe rejected, and in a very diſobliging manner, the offers of the Saracens; anſwering them, when they complained of his ſtopping the penſion paid them by other emperors, that a warlike prince had ſteel, but no gold; which they reſenting, joined the Perſians, and continued faithful to them to the laſt. However, he wrote to Arſaces king of Armenia, enjoining him to keep his troops in readineſs to execute the orders he ſhould ſoon tranſmit to him.

61 Croſſes the Euphrates.

Having made the neceſſary preparations for ſo important an enterpriſe, Julian ſent orders to his troops to croſs the Euphrates, deſigning to enter the enemy's country before they had the leaſt notice of his march; for which purpoſe he had placed guards on all the roads. From Antioch he proceeded to Litarba, a place about 15 leagues diſtant, which he reached the ſame day. From thence he went to Beræa, where he halted a day, and exhorted the council to reſtore the worſhip of the gods; but this exhortation, it ſeems, was complied with but by few. From Beræa he proceeded to Batnæ; and was better pleaſed with the inhabitants of the latter, becauſe they had, before his arrival, reſtored the worſhip of the gods. There he offered ſacrifices; and having immolated a great number of victims, he purſued the next day his journey to Hierapolis, the capital of the province of Euphrateſiana, which he reached on the 9th of March. Here he lodged in the houſe of one for whom he had a particular eſteem, chiefly becauſe neither Conſtantius nor

Gallus, who had both lodged in his houſe, had been able to make him renounce the worſhip of his idols. As he entered this city, 50 of his ſoldiers were killed by the fall of a porch. He left Hierapolis on the 13th of March; and having paſſed the Euphrates on a bridge of boats, came to Batnæ a ſmall city of Oſrhoene, about 10 leagues from Hierapolis; and here 50 more of his ſoldiers were killed by the fall of a ſtack of ſtraw. From Batnæ he proceeded to Carrhæ; where, in the famous temple of the moon, it is ſaid, he ſacrificed a woman to that planet.

62 Invades Perſia.

While Julian continued in this city, he received advice that a party of the enemies horſe had broke into the Roman territories. On this he reſolved to leave an army in Meſopotamia, to guard the frontiers of the empire on that ſide, while he advanced on the other into the heart of the Perſian dominions. This army conſiſted, according to ſome, of 20,000, according to others, of 30,000 choſen troops. It was commanded by Procopius, and Sebaſtian a famous manichean who had been governor of Egypt, and had perſecuted there, with the utmoſt cruelty, the orthodox Chriſtians. Theſe two were to join, if poſſible, Arſaces king of Armenia, to lay waſte the fruitful plains of Media, and meet the emperor in Aſſyria. To Arſaces Julian himſelf wrote, but in the moſt diſobliging manner imaginable, threatening to treat him as a rebel if he did not execute, with the utmoſt punctuality, the orders given him; and at the concluſion told him, that the God he adored would not be able to ſcreen him from his indignation.

There were two roads leading from Carrhæ to Perſia; the one to the left by Niſibis; the other to the right through the province of Aſſyria, along the banks of the Euphrates. Julian choſe the latter, but cauſed magazines to be erected on both roads; and, after having viewed his army, ſet out on the 25th of March. He paſſed the Abora, which ſeparated the Roman and Perſian dominions, near its conflux with the Euphrates; after which he broke down the bridge, that his troops might not be tempted to deſert, ſeeing they could not return home. As he proceeded on his march, a ſoldier and two horſes were ſtruck dead by a flaſh of lightning; and a lion of an extraordinary ſize preſenting himſelf to the army, was in a moment diſpatched by the ſoldiers with a ſhower of darts. Theſe omens occaſioned great diſputes between the philoſophers and aruſpices: the latter looking upon them as inauſpicious, adviſed the emperor to return; but the former refuted their arguments with others more agreeable to Julian's temper.

63 Lays waſte Aſſyria.

64 Advances to Cteſiphon.

Having paſſed the Abora, Julian entered Aſſyria, which he found very populous, and abounding with all the neceſſaries of life: but he laid it waſte far and near, deſtroying the magazines and proviſions which he could not carry along with him; and thus he put it out of his power to return the ſame way he came; a ſtep which was judged very impolitic. As he met with no army in the field to oppoſe him, he advanced to the walls of Cteſiphon, the metropolis of the Perſian empire; having reduced all the ſtrong holds that lay in his way. Here, having cauſed the canal to be cleared, which was formerly dug by Trajan between theſe two rivers, he conveyed his fleet from the former to the latter. On the banks of the Tigris he was oppoſed by the enemy. But Julian paſſed that river in ſpite of their utmoſt efforts, and drove them into the city with the loſs of a great number of their men, he himſelf, in the mean time, loſing only 70 or 75.

65 Begins his retreat, but is diſtreſſed for want of proviſions.

Julian had now advanced ſo far into the enemy's country, that he found it neceſſary to think of a retreat, as it was impoſſible for him to winter in Perſia. For this reaſon he made no attempt on Cteſiphon, but began to march back along the banks of the Tigris, ſoon after he had paſſed that river. In the mean time the king of Perſia was aſſembling a formidable army, with a deſign to fall upon the Romans in their march; but being deſirous of putting an end to ſo deſtructive a war, he ſent very advantageous propoſals of peace to Julian. Theſe the Roman emperor very imprudently rejected; and ſoon after, deceived by treacherous guides, he quitted the river, and entered into an unknown country totally laid waſte by the enemy, and where he was continually haraſſed, by ſtrong parties, who in a manner ſurrounded his army, and attacked him ſometimes in the front, and ſometimes in the rear. A ſtill worſe ſtep he was perſuaded to take by the treacherous guides already mentioned; and this was to burn his fleet, leſt it ſhould fall into the hands of the enemy. As ſoon as the fleet was ſet on fire, the whole army cried out, that the emperor was betrayed, and that the guides were traitors employed by the enemy. Julian ordered them immediately to be put to the rack, upon which they confeſſed the treaſon; but it was too late. The fleet was already in flames; they could by no means be extinguiſhed; and no part was ſaved except 12 veſſels, which were deſigned to be made uſe of in the building of bridges, and for this purpoſe were conveyed over land in waggons.

66 Is mortally wounded in a ſudden attack by the Perſians.

The emperor thus finding himſelf in a ſtrange country, and his army greatly diſpirited, called a council of his chief officers, in which it was reſolved to proceed to Corduene, which lay ſouth of Armenia, and belonged to the Romans. With this view, they had not proceeded far when they were met by the king of Perſia, at the head of a very numerous army, attended by his two ſons, and all the principal nobility of the kingdom. Several ſharp encounters happened, in which, though the Perſians were always defeated, yet the Romans reaped no advantages from their victories, but were reduced to the laſt extremity for want of proviſions. In one of theſe ſkirmiſhes, when the Romans were ſuddenly attacked, the emperor, eager to repulſe the enemy, haſtened to the field of battle without his armour, when he received a mortal wound by a dart, which, through his arm and ſide, pierced his very liver. Of this wound he died the ſame night, the 26th of June 363, in the 32d year of his age, after having reigned ſcarce 20 months from the time he became ſole maſter of the Roman empire.

67 Jovian raiſed to the empire.

As Julian had declined naming any ſucceſſor, the choice of a new emperor devolved on the army. They unanimouſly choſe Jovian, a very able commander, whoſe father had lately reſigned the poſt of *comes domeſticorum*, in order to lead a retired life. The valour and experience of Jovian, however, were not ſufficient to extricate the Roman army from the difficulties in which they had been plunged by the imprudence of his predeceſſor. The famine raged in the

68 Concludes a peace with the Perſians.

camp to ſuch a degree, that not a ſingle man would have been left alive, had not the Perſians unexpectedly ſent propoſals of peace. Theſe were now received with the utmoſt joy. A peace was concluded for 30 years; the terms of which were, that Jovian ſhould reſtore to the Perſians the five provinces which had been taken from them in the reign of Diocleſian, with ſeveral caſtles, and the cities of Niſibis and Singara. After the concluſion of the treaty, Jovian purſued his march without moleſtation. When he arrived at Antioch, he revoked all the laws that had been made in the former reign againſt Chriſtianity and in favour of paganiſm. He eſpouſed alſo the cauſe of the orthodox Chriſtians againſt the Arians; and recalled all thoſe who had been formerly baniſhed, particularly Athanaſius, to whom he wrote a very obliging letter with his own hand. It is generally believed alſo that Athanaſius, at the deſire of Jovian, now compoſed the creed which ſtill goes by his name, and is ſubſcribed by all the biſhops in Europe. But this emperor did not live to make any great alterations, or even to viſit his capital as emperor; for in his way to Conſtantinople he was found dead in his bed, on the 16th or 17th of February 364, after he had lived 33 years, and reigned ſeven months and 40 days.

69 His death.

70 Valentinian choſen emperor, chooſes Valens for his partner.

After the death of Jovian, Valentinian was choſen emperor. Immediately on his acceſſion, the ſoldiers mutinied, and with great clamour required him to chooſe a partner in the ſovereignty. Though he did not inſtantly comply with their demand, yet in a few days he choſe his brother Valens for his partner; and, as the empire was threatened on all ſides with an invaſion of the barbarous nations, he thought proper to divide it. This famous partition was made at Mediana in Dacia; when Valens had for his ſhare the whole of Aſia, Egypt, and Trace; and Valentinian all the Weſt; that is, Illyricum, Italy, Gaul, Spain, Britain, and Africa.

71 Procopius revolts.

After this partition, Valens returned to Conſtantinople, where the beginning of his reign was diſturbed by the revolt of Procopius, a relation of Julian. On the death of that emperor, he had fled into Taurica Cherſoneſus for fear of Jovian; but not truſting the barbarians who inhabited that country, he returned in diſguiſe into the Roman territories, where having gained over an eunuch of great wealth, by name *Eugenius*, lately diſgraced by Valens, and ſome officers who commanded the troops ſent againſt the Goths, he got himſelf proclaimed emperor. At firſt he was joined only by the loweſt of the people, but at length he was acknowledged by the whole city of Conſtantinople. On the news of this revolt, Valens would have abdicated the ſovereignty, had he not been prevented by the importunities of his friends. He therefore diſpatched ſome troops againſt the uſurper; but theſe were gained over, and Procopius continued for ſome time to gain ground. It is probable he would finally have ſucceeded, had he not become ſo much elated with this good fortune, that he grew tyrannical and inſupportable to his own party. In conſequence of his alteration in his diſpoſition, he was firſt abandoned by ſome of his principal officers; and ſoon after defeated in battle, taken priſoner, and put to death.

72 Is defeated and put to death.

73 War with the Goths.

This revolt produced a war betwixt Valens and the Goths. The latter, having been ſolicited by Procopius, and ſent 3000 men to his aſſiſtance. On hearing the news of the uſurper's death, they marched back; but Valens detached againſt them a body of troops, who took them all priſoners notwithſtanding the vigorous reſiſtance they made. Athanaric, king of the Goths, expoſtulated on this proceeding with Valens; but that emperor proving obſtinate, both parties prepared for war. In 367 and 369, Valens gained great advantages over his enemies; and obliged them to ſue for peace, which was concluded upon terms very advantageous to the Romans. The reſt of this reign contains nothing remarkable, except the cruelty with which Valens perſecuted the orthodox clergy. The latter ſent 80 of their number to him, in order to lay their complaints before him; but he, inſtead of giving them any relief, determined to put them all to death. But the perſon who was ordered to execute this ſentence, fearing leſt the public execution of ſo many eccleſiaſtics might raiſe diſturbances, ordered them all to be put on board a ſhip, pretending that the emperor had ordered them only to be ſent into baniſhment; but when the veſſel was at ſome diſtance from land, the mariners ſet fire to it, and made their own eſcape in the boat. The ſhip was driven by a ſtrong wind into an harbour, where it was conſumed and all that were in it. A perſecution was alſo commenced againſt magicians, or thoſe who had books of magic in their cuſtody. This occaſioned the deſtruction of many innocent perſons; for books of this kind were often conveyed into libraries unknown to the owners of them, and this was certainly followed by death and confiſcation of goods. Hereupon perſons of all ranks were ſeized with ſuch terror that they burnt their libraries, leſt books of magic ſhould have been ſecretly conveyed in amongſt the others. In 378, the Goths, whom Valens had admitted into Thrace, advanced from that province to Macedon and Theſſaly, where they committed dreadful ravages. They afterwards blocked up the city of Conſtantinople, plundered the ſuburbs, and at laſt totally defeated and killed the emperor himſelf. The day after the battle, hearing that an immenſe treaſure was lodged in Adrianople, the barbarians laid ſiege to that place: but being quite ſtrangers to the art of beſieging towns, they were repulſed with great ſlaughter; upon which they dropped that enterpriſe, and returned before Conſtantinople. But here great numbers of them were cut in pieces by the Saracens, whom Maria their queen had ſent to the aſſiſtance of the Romans; ſo that they were obliged to abandon this deſign likewiſe, and retire from the neighbourhood of that city.

74 Eighty orthodox clergy eccleſiaſtics put to death.

75 Magicians perſecuted.

76 Valens defeated and killed by the Goths.

77 Gratian takes Theodoſius for his partner.

By the death of Valens, the empire once more fell into the hands of a ſingle perſon. This was Gratian, who had held the empire of the Weſt after the death of Valentinian. He repulſed many barbarous nations who threatened the empire at that time with diſſolution; but finding himſelf preſſed on all ſides, he ſoon reſolved to take a colleague, in order to eaſe him of ſome part of the burden. Accordingly, on the 19th of January 379, he declared Theodoſius his partner in the empire, and committed to his care all the provinces which had been governed by Valens.

Theodoſius is greatly extolled by the hiſtorians of thoſe ages on account of his extraordinary valour and piety; and for theſe qualifications has been honoured with

87 Miſerable ſtate of the empire on his acceſſion.

with the ſirname of *the Great*. From the many perſecuting laws, however, made in his time, it would ſeem that his piety was at leaſt very much miſguided; and that if he was naturally of a human and compaſſionate diſpoſition, ſuperſtition and paſſion had often totally obſcured it. He certainly was a man of great conduct and experience in war, and indeed the preſent ſtate of the empire called for an exertion of all his abilities. The provinces of Dacia, Thrace, and Illyricum, were already loſt; the Goths, Taifali, Alans, and Huns, were maſters of the greateſt part of theſe provinces, and had ravaged and laid waſte the reſt. The Iberians, Armenians, and Perſians, were likewiſe up in arms, and ready to take advantage of the diſtracted ſtate of the empire. The few ſoldiers, who had ſurvived the late defeat, kept within the ſtrong holds of Thrace, without daring ſo much as to look abroad, much leſs face the victorious enemy, who moved about the country in great bodies. But notwithſtanding this critical ſituation, the hiſtorians of thoſe times give us no account of the tranſactions of the year 379. Many great battles indeed are ſaid to have been fought, and as many victories obtained by Theodoſius; but the accounts of theſe are ſo confuſed and contradictory, that no ſtreſs can be laid upon them.

79 The Goths defeated by Theodoſius.

In the month of February 380, Theodoſius was ſeized with a dangerous malady, ſo that Gratian found himſelf obliged to carry on the war alone. This emperor, apprehending that the neighbouring barbarians might break into ſome of the provinces, concluded a peace with the Goths, which was confirmed by Theodoſius on his recovery. The treaty was very advantageous to the barbarians; but they, diſregarding all their engagements, no ſooner heard that Gratian had left Illyricum, than they paſſed the Danube, and breaking into Thrace and Pannonia, advanced as far as Macedon, deſtroying all with fire and ſword. Theodoſius, however, drawing together his forces, marched againſt them; and, according to the moſt reſpectable authorities, gained a complete victory; though Zoſimus relates, that he was utterly defeated.

The following year, Athanaric, the moſt powerful of all the Gothic princes, being driven out by a faction at home, recurred to Theodoſius, by whom he was received with great tokens of friendſhip. The emperor himſelf went out to meet him, and attended him with his numerous retinue into the city. The Gothic prince died the ſame year; and Theodoſius cauſed him to be buried after the Roman manner with ſuch pomp and ſolemnity, that the Goths, who attended him in his flight, returned home with a reſolution never to moleſt the Romans any more. Nay, out of gratitude to the emperor, they took upon them to guard the banks of the Danube, and prevent the empire from being invaded on that ſide.

80 Gratian murdered by Maximus,

In 383, one Maximus revolted againſt Gratian in Britain; and in the end, having got the unhappy emperor into his power, cauſed him to be put to death, and aſſumed the empire of the Weſt himſelf. Gratian had divided his dominions with his brother Valentinian, whom he allowed to reign in Italy and Weſt Illyricum, reſerving the reſt to himſelf. Maximus therefore, immediately after his uſurpation, ſent deputies to Theodoſius, aſſuring him that he had no deſigns on the dominions of Valentinian. As Theodoſius at that time found himſelf in danger from the barbarians, he not only forbore to attack Maximus after this declaration, but even acknowledged him for his partner in the empire.

81 Who invades the dominions of Valentinian.

It was not long, however, before the ambition of the uſurper prompted him to break his promiſe. In 387, he paſſed the Alps on a ſudden; and meeting with no oppoſition, marched to Milan where Valentinian uſually reſided. The young prince fled firſt to Aquileia; and from thence to Theſſalonica, to implore the protection of Theodoſius. The latter, in anſwer to Valentinian's letter, informed him, that he was not at all ſurpriſed at the progreſs Maximus had made, becauſe the uſurper had protected, and Valentinian had perſecuted, the orthodox Chriſtians. At laſt he prevailed on the young prince to renounce the Arian hereſy which he had hitherto maintained; after which Theodoſius promiſed to aſſiſt him with all the forces of the Eaſt. At firſt, however, he ſent meſſengers to Maximus, earneſtly exhorting him to reſtore the provinces he had taken from Valentinian, and content himſelf with Gaul, Spain, and Britain.

82 His ſucceſs.

But the uſurper would hearken to no terms. This very year he beſieged and took Aquileia, Quaderna, Bononia, Mutina, Rhegium, Placentia, and many other cities in Italy. The following year he was acknowledged in Rome, and in all the provinces of Africa. Theodoſius, therefore, finding a war inevitable, ſpent the remaining months of this and the beginning of the following year in making the neceſſary preparations. His army conſiſted chiefly of Goths, Huns, Alans, and other barbarians, whom he was glad to take into the ſervice in order to prevent their raiſing diſturbances on the frontiers.

83 Defeated and put to death by Theodoſius.

He defeated Maximus in two battles, took him priſoner, and put him to death. The uſurper had left his ſon Victor, whom he created Auguſtus, in Gaul, to awe the inhabitants in his abſence. Againſt him the emperor diſpatched Arbogaſtes, who took him priſoner after having diſperſed the troops that attended him, and put him to death. The victory was uſed afterwards by Theodoſius with great clemency and moderation.

84 The temples in Alexandria, and throughout all Egypt, deſtroyed.

In 389, Theodoſius took a journey to Rome; and, according to Prudentius, at this time converted the ſenate and people from idolatry to Chriſtianity. The next year was remarkable for the deſtruction of the celebrated temple of Serapis in Alexandria; which, according to the deſcription of Ammianus Marcellinus, ſurpaſſed all others in the world, that of Jupiter Capitolinus alone excepted. The reaſon of its being now deſtroyed was as follows. Theophilus, biſhop of Alexandria, having begged and obtained of the emperor an old temple, formerly conſecrated to Bacchus, but then ruined and forſaken, with a deſign to convert it into a church, the workmen found among the rubbiſh ſeveral obſcene figures, which the biſhop, to ridicule the ſuperſtition of the Heathens, cauſed to be expoſed to public view. This provoked the Pagans to ſuch a degree, that they flew to arms; and falling unexpectedly upon the Chriſtians, cut great numbers of them in pieces. The latter, however, ſoon took arms in their own defence; and being ſupported by the few ſoldiers who were quartered in the city, began to repel force by force. Thus a civil war was kindled and no day paſſed without ſome encounter. The Pagans uſed to retire to the temple of Serapis: and thence ſallying out unexpectedly ſeized on ſuch Chriſtians as they met, and, dragging them into the temple, either forced them by the moſt exquiſite torments to ſacrifice to their idol, or, if they refuſed, racked them to death. As they ſoon expected to be attacked by the emperor's troops, they choſe a philoſopher named *Olympus* for their leader, with a deſign to defend themſelves to the laſt extremity. The emperor, however, would not ſuffer any puniſhment to be inflicted upon them for the lives of thoſe they had taken away, but readily forgave them: however, he ordered all the temples of Alexandria to be immediately pulled down, and commanded the biſhop to ſee his orders put in execution. The Pagans no ſooner heard that the emperor was acquainted with their proceedings than they abandoned the temple, which was in a ſhort time deſtroyed by Theophilus; nothing being left except the foundations, which could not be removed on account of the extraordinary weight and ſize of the ſtones. Not ſatisfied with the deſtruction of the Alexandrian temples, the zealous biſhop encouraged the people to pull down all the other temples, oratories, chapels, and places ſet apart for the worſhip of the heathen gods throughout Egypt, and the ſtatues of the gods themſelves to be either burnt or melted down. Of the innumerable ſtatues which at that time were to be found in Egypt, he is ſaid to have ſpared but one, *viz.* that of an ape, in order to expoſe the Pagan religion to ridicule. On his return to Conſtantinople, Theodoſius ordered ſuch temples as were yet ſtanding to be thrown down, and the Arians to be every where driven out of the cities.

85
Valentinian murdered by Arbogaſtes, who raiſes Eugenius to the empire.

In 392 Valentinian, emperor of the Weſt, was treacherouſly murdered by Arbogaſtes his general; who, though he might afterwards have eaſily ſeized on the ſovereignty himſelf, choſe to confer it upon one Eugenius, and to reign in his name. This new uſurper, though a Chriſtian, was greatly favoured by the Pagans, who were well apprized that he only bore the title of emperor, while the whole power lodged in Arbogaſtes, who pretended to be greatly attached to their religion. The aruſpices began to appear anew, and informed him that he was deſtined to the empire of the whole world; that he would ſoon gain a complete victory over Theodoſius, who was as much hated as Eugenius was beloved by the gods, &c. But though Eugenius ſeemed to favour the Pagans, yet in the very beginning of his reign he wrote to St Ambroſe. The holy man did not anſwer his letter till he was preſſed by ſome friends to recommend them to the new prince; and then he wrote to this infamous uſurper with all the reſpect due to an emperor. Soon after his acceſſion to the empire, Eugenius ſent deputies to Theodoſius; and they are ſaid to have been received by him in a very obliging manner. He did not, however, intend to enter into any alliance with this uſurper, but immediately began his military preparations. In 394, he ſet out from Conſtantinople, and was at Adrianople on the 15th of June that year. He bent his march through Dacia, and the other provinces between Thrace and the Julian Alps, with a deſign to force the paſſes of theſe mountains, and break into Italy before the army of Eugenius was in a condition to oppoſe him. On his arrival at the Alps, he found theſe paſſes guarded by Flavianus prefect of Italy, at the head of a conſiderable body of Roman troops. Theſe were utterly defeated by Theodoſius, who thereupon croſſed the Alps and advanced into Italy. He was ſoon met by Eugenius; and a bloody battle enſued, without any deciſive advantage on either ſide. The next day the emperor led his troops in perſon againſt the enemy, utterly defeated them, and took their camp.

86
Eugenius defeated, taken priſoner, and put to death.

Eugenius was taken priſoner by his own men, and brought to Theodoſius, who reproached him with the murder of Valentinian, with the calamities he had brought on the empire by his unjuſt uſurpation, and with putting his confidence in Hercules, and not in the true God; for on his chief ſtandard he had diſplayed the image of that fabulous hero. Eugenius begged earneſtly for his life; but while he lay proſtrate at the emperor's feet, his own ſoldiers cut off his head, and carrying it about on the point of a ſpear, ſhowed it to thoſe in the camp, who had not yet ſubmitted to Theodoſius. At this they were all thunderſtruck; but being informed that Theodoſius was ready to receive them into favour, they threw down their arms and ſubmitted.

87
Arbogaſtes lays violent hands on himſelf.

After this, Arbogaſtes, deſpairing of pardon, fled to the mountains; but being informed that diligent ſearch was made for him, he laid violent hands on himſelf. His children, and thoſe of Eugenius, took ſanctuary in churches; but the emperor not only pardoned, but took the opportunity of converting them to Chriſtianity, reſtored to them their paternal eſtates, and raiſed them to conſiderable employments in the ſtate. Soon after this, Theodoſius appointed his ſon Honorius emperor of the Weſt, aſſigning him for his ſhare Italy, Gaul, Spain, Africa, and Weſt Illyricum.

88
Theodoſius dies.

The next year, as he prepared for his return to Conſtantinople, he was ſeized with a dropſy, owing to the great fatigues he had undergone during the war. As ſoon as he perceived himſelf to be in danger, he made his will; by which he bequeathed the empire of the Eaſt to Arcadius, and confirmed Honorius in the poſſeſſion of the Weſt. He likewiſe confirmed the pardon which he had granted to all thoſe who had borne arms againſt him, and remitted a tribute which had proved very burdenſome to the people; and charged his two ſons to ſee theſe points of his will executed. He died at Milan on the 17th of January 395, in the 16th of his reign and 50th of his age.

89
Empire uſurped by Baſiliſcus.

From the time of Theodoſius to the time when the Roman empire in the Weſt was totally deſtroyed by the Goths, we find but very little remarkable in the hiſtory of Conſtantinople. At this time the eaſtern empire was uſurped by Baſiliſcus, who had driven out Zeno the lawful emperor; being aſſiſted in his conſpiracy by the empreſs Verina his ſiſter. Zeno fled into Iſauria, whither he was purſued by Illus and Trecondes, two of the uſurper's generals; who having eaſily defeated the few troops he had with him, forced the unhappy prince to ſhut himſelf up in a caſtle, which they immediately inveſted. But in a ſhort time Baſiliſcus having diſobliged the people by his cruelty, avarice, and other bad qualities, for which he was no leſs remarkable than his predeceſſor had been, his generals joined with Zeno, whom they reſtored to the throne. After his reſtoration, Zeno, having got Baſiliſcus into his power, confined him in a caſtle of Cappadocia together with his wife Zenonides, where they both

periſhed

90 Is ſtarved to death.

91 Great fire at Conſtantinople.

periſhed with hunger and cold. This happened in the year 467, after Baſiliſcus had reigned about 20 months. During the time of this uſurpation a dreadful fire happened at Conſtantinople, which conſumed great part of the city, with the library containing 120,000 volumes; among which were the works of Homer, written, as is ſaid, on the great gut of a dragon 120 feet long.

The misfortunes which Zeno had undergone did not work any reformation upon him. He ſtill continued the ſame vicious courſes which had given occaſion to the uſurpation of Baſiliſcus. Other conſpiracies were formed againſt him, but he had the good fortune to eſcape them. He engaged in a war with the Oſtrogoths, in which he proved unſucceſsful, and was obliged to yield the provinces of Lower Dacia and Mœſia to them. In a ſhort time, however, Theodoric their king made an irruption into Thrace, and advanced within 15 miles of Conſtantinople, with a deſign to beſiege that capital: but the following year, 485, they retired in order to attack Odoacer king of Italy; of which country Theodoric was proclaimed king in 493. The emperor Zeno died in the year 491, in the 65th year of his age, and 17th of his reign.

92 Decline of the Roman empire, to what owing.

The Roman empire had now for a long time been on the decline: the ancient valour and military diſcipline which had for ſuch a long time rendered the Romans ſuperior to other nations, had greatly degenerated; ſo that they were now by no means ſo powerful as formerly. The tumults and diſorders which had happened in the empire from time to time by the many uſurpations, had contributed alſo to weaken it very much. But what proved of the greateſt detriment was the allowing vaſt ſwarms of barbarians to ſettle in the different provinces, and to ſerve in the Roman empire in ſeparate and independent bodies. This had proved the immediate cauſe of the diſſolution of the weſtern empire; but as it affected the eaſtern parts leſs, the Conſtantinopolitan empire continued for upwards of 900 years after the weſtern one was totally diſſolved. The weak and imprudent adminiſtration of Zeno, and Anaſtaſius who ſucceeded him, had reduced the eaſtern empire ſtill more; and it might poſſibly have expired in a ſhort time after the weſtern one, had not the wiſe and vigorous conduct of Juſtin, and his partner Juſtinian, revived in ſome meaſure the ancient martial ſpirit which had originally raiſed the Roman empire to its higheſt pitch of grandeur.

93 It revives under Juſtin and Juſtinian.

Juſtin aſcended the throne in 518. In 521 he engaged in a war with the Perſians, who had all along been very formidable enemies to the Roman name. Againſt them he employed the famous Beliſarius: but of him we hear nothing remarkable till after the acceſſion of Juſtinian. This prince was the nephew of Juſtin, and was by him taken as his partner in the empire in 527; and the ſame year Juſtin died, in the 77th year of his age and 9th of his reign. Juſtinian being now ſole maſter of the empire, bent his whole force againſt the Perſians. The latter proved ſucceſsful in the firſt engagement; but were ſoon after utterly defeated by Beliſarius on the frontiers of Perſia, and likewiſe by another general named *Dorotheus* in Armenia. The war continued with various ſucceſs during the firſt five years of Juſtinian's reign. In the ſixth year a peace was concluded upon the following terms: 1. That the Roman emperor ſhould pay to Coſrhoes, the king of Perſia, 1000 pounds weight of gold. 2. That both princes ſhould reſtore the places they had taken during the wars. 3. That the commander of the Roman forces ſhould no longer reſide at Daras on the Perſian frontiers, but at a place called *Conſtantina* in Meſopotamia, as he had formerly done. 4. That the Iberians, who had ſided with the Romans, ſhould be at liberty to return to their own country or ſtay at Conſtantinople. This peace, concluded in 532, was ſtyled *eternal*; but in the event proved of very ſhort duration.

94 Juſtinian's war with the Perſians.

95 Great tumult in Conſtantinople.

About this time happened at Conſtantinople the greateſt tumult mentioned in hiſtory. It began among the different factions in the circus, but ended in an open rebellion. The multitude, highly diſſatiſfied with the conduct of John the *prefectus prætorio*, and of Trebonianus then queſtor, forced Hypatius, nephew to the emperor Anaſtaſius, to accept the empire, and proclaimed him with great ſolemnity in the forum. As the two abovementioned miniſters were greatly abhorred by the populace on account of their avarice, Juſtinian immediately diſcharged them, hoping by that means to appeaſe the tumult: but this was ſo far from anſwering the purpoſe, that the multitude only grew the more outrageous upon it; and moſt of the ſenators joining them, the emperor was ſo much alarmed, that he had thoughts of abandoning the city and making his eſcape by ſea. In this dilemma the empreſs Theodora encouraged and perſuaded him rather to part with his life than the kingdom; and he at laſt reſolved to defend himſelf to the utmoſt, with the few ſenators who had not yet abandoned him. In the mean time, the rebels having attempted in vain to force the gates of the palace, carried Hypatius in triumph to the circus; where, while he was beholding the ſports from the imperial throne, amidſt the ſhouts and acclamations of the people, Beliſarius, who had been recalled from Perſia, entered the city with a conſiderable body of troops. Being then appriſed of the uſurpation of Hypatius, he marched ſtraight to the circus; fell ſword in hand upon the diſarmed multitude: and with the aſſiſtance of a band of Heruli, headed by Mundus governor of Illyricum, cut about 30,000 of them in pieces. Hypatius the uſurper, and Pompeius another of the nephews of Anaſtaſius, were taken priſoners and carried to the emperor, by whoſe orders they were both beheaded, and their bodies caſt into the ſea. Their eſtates were confiſcated, and likewiſe the eſtates of ſuch ſenators as had joined with them; but the emperor cauſed great part of their lands and effects to be afterwards reſtored, together with their honours and dignities, to their children.

96 Another war with the Perſians.

Juſtinian having now no other enemy to contend with, turned his arms againſt the Vandals in Africa, and the Goths in Italy; both which provinces he recovered out of the hands of the barbarians *. But before his general Beliſarius had time to eſtabliſh fully the Roman power in Italy, he was recalled in order to carry on the war againſt Coſrhoes king of Perſia, who, in defiance of the treaty formerly concluded in 532, entered the Roman dominions at the head of a powerful army. The ſame year, however, a peace was concluded between the two nations upon the following conditions: 1. That the Romans ſhould, within in two months, pay to the Perſian king 5000 pounds weight of gold, and an annual penſion of 500. 2. That the Perſians ſhould relinquiſh all claim to the fortreſs of Daras, and maintain a body of troops to guard the Caſpian gates, and prevent the barbarians from breaking into the empire. 3. That upon payment of the abovementioned ſum, Coſrhoes ſhould immediately withdraw his troops from the Roman dominions. The treaty being ſigned, and the ſtipulated ſum paid, Coſrhoes began to march back again; but by the way plundered ſeveral cities as if the war had ſtill continued. Hereupon Juſtinian reſolved to purſue the war with the utmoſt vigour; and for that purpoſe diſpatched Beliſarius into the eaſt. But ſoon after he was obliged to recal him in order to oppoſe the Goths who had gained great advantages in Italy after his departure.

---

* See *Barbary* and *Goths*.

97 Peace concluded.

The Perſian war was then carried on with indifferent ſucceſs till the year 558, when a peace was concluded upon the emperor again paying an immenſe ſum to the enemy. The ſame year the Huns, paſſing the Danube in the depth of winter, marched in two bodies directly for Conſtantinople; and laying waſte the countries through which they paſſed, came, without meeting the leaſt oppoſition, within 150 furlongs of the city. But Beliſarius marching out againſt them with an handful of men, put them to flight; the emperor, however, to prevent them from invading the empire anew, agreed to pay them an annual tribute, upon their promiſing to defend the empire againſt all other barbarians, and to ſerve in the Roman armies when required. This was the laſt exploit performed by Beliſarius, who on his return to Conſtantinople was diſgraced, ſtripped of all his employments, and confined to his houſe, on pretence of a conſpiracy againſt the emperor *. In the year 565 a real conſpiracy was formed againſt Juſtinian, which he happily eſcaped, and the conſpirators were executed; but the emperor did not long ſurvive it, being carried off by a natural death in 566, in the 39th year of his reign.

During the reign of Juſtinian, the majeſty of the Roman empire ſeemed to revive. He recovered the provinces of Italy and Africa out of the hands of the barbarians, by whom they had been held for a number of years;

98 Decline of the empire after Juſtinian.

but after his death they were ſoon loſt, and the empire tended faſt to diſſolution. In 569 Italy was conquered by the Lombards, who held it for the ſpace of 200 years. Some amends, however, was made for the loſs by the acquiſition of *Perſarmenia;* the inhabitants of which, being perſecuted by the Perſians on account of the Chriſtian religion which they profeſſed, revolted to the Romans. This produced a war between the two nations, who continued to weaken each other, till at laſt the Perſian monarchy was utterly overthrown, and that of the Romans greatly reduced by the Saracens †. Theſe new enemies attacked the Romans in the year 632, and purſued their conqueſts with incredible rapidity. In the ſpace of four years they reduced the provinces of Egypt, Syria, and Paleſtine. In 648 they were alſo maſters of Meſopotamia, Phœnicia, Africa, Cyprus, Aradus, and Rhodes; and having defeated the Roman fleet, commanded by the emperor Conſtans in perſon, they concluded a peace on condition of keeping the vaſt extent of territory they had ſeized, and paying for it 1000 nummi a-year.

99 Unſucceſsful expedition againſt the Lombards.

An expedition againſt the Lombards was about this time undertaken, but with very little ſucceſs, a body of 20,000 Romans being almoſt entirely cut off by one of the Lombard generals. In 671 the Saracens ravaged ſeveral provinces, made a deſcent in Sicily, took and plundered the city of Syracuſe, and over-ran the whole iſland, deſtroying every thing with fire and ſword.

100 Conſtantinople beſieged by the Saracens.

In like manner they laid waſte Cilicia; and having paſſed the winter at Smyrna, they entered Thrace in the ſpring of the year 672, and laid ſiege to Conſtantinople itſelf. Here, however, they were repulſed with great loſs: but next ſpring they renewed their attempt, in which they met with the ſame bad ſucceſs; many of their ſhips being burnt by the *ſea-fire*, as it was called, becauſe it burnt under water: and in their return home their fleet was wrecked off the Scyllæan promontory. At laſt a peace was concluded for 30 years, on condition that the Saracens ſhould retain all the provinces they had ſeized; and that they ſhould pay to the emperor and his ſucceſſors 3000 pounds weight of gold, 50 ſlaves, and as many choice horſes.

101 Empire invaded by the Bulgarians.

This peace was ſcarce concluded, when the empire was invaded by a new enemy, who proved very troubleſome for a long time. Theſe were the Bulgarians; who breaking into Thrace, defeated the Roman army ſent againſt them, and ravaged the country far and wide. The emperor conſented to pay them an annual penſion, rather than continue a doubtful war; and allowed them to ſettle in Lower Mœſia, which from them was afterwards called *Bulgaria*. In 687, they were attacked by Juſtinian II. who entered their country without provocation, or regarding the treaties formerly concluded with them. But they falling ſuddenly upon him, drove him out of their country, and obliged him to reſtore the towns and captives he had taken. In 697, this emperor was depoſed; and in his exile fled to Trebelis king of the Bulgarians, by whom he was kindly entertained, and by whoſe means he was reſtored to his throne; but ſoon forgetting this favour, he invaded the country of the Bulgarians, with a deſign to wreſt from them thoſe provinces which he had yielded to them.

102 They defeat Juſtinian II.

He was attended in this expedition by no better ſucceſs than his ingratitude deſerved, his army being utterly defeated, and he himſelf obliged to make his eſcape in a light veſſel to Conſtantinople. The Bulgarians continued their inroads and ravages at different times, generally defeated the Romans who ventured to oppoſe them, till the year 800, the ſeventh of the reign of Nicephorus, when they ſurpriſed the city of Sardica, in Mœſia, and put the whole garriſon, conſiſting of 6000 men, to the ſword. The emperor marched againſt them with a conſiderable army: but the enemy retired at his approach; and he, inſtead of purſuing them, returned to Conſtantinople.

103 Their country cruelly ravaged by Nicephorus.

Two years after, he entered Bulgaria at the head of a powerful army, deſtroying every thing with fire and ſword. The king offered to conclude a peace with him upon honourable terms; but Nicephorus, rejecting his propoſals, continued to waſte the country, deſtroying the cities, and putting all the inhabitants, without diſtinction of ſex or age, to the ſword. The king was ſo much affected with theſe cruelties which were exerciſed on his ſubjects, that he ſent a ſecond embaſſy to Nicephorus, offering to conclude

---

* See *Beliſarius*.

† See *Arabia*.

a peace with him upon any terms, provided he would quit his country.

104 Who is cut off with his whole army.

But Nicephorus diſmiſſing the ambaſſadors with ſcorn, the Bulgarian monarch attacked unexpectedly the Roman camp, forced it, and cut off almoſt the whole army, with the emperor himſelf, and a great number of patricians. His ſucceſſor Michael likewiſe engaged in war with the Bulgarians; but being utterly defeated, he was ſo grieved that he reſigned the empire. After this the Bulgarians continued to be very formidable enemies to the empire till the year 979, when they were attacked by Baſilius II.

105 Their country invaded by Baſilius II.

The Bulgarians were at that time governed by a king named *Samuel*; who having ravaged the Roman territories, as was the common practice of his nation, Baſilius ſent againſt him one Nicephorus Uranus at the head of a powerful army. Uranus, leaving his baggage at Lariſſa, reached by long marches the Sperchius, and encamped with his whole army over againſt the enemy, who lay on the oppoſite bank. As the river was greatly ſwelled with the heavy rains that had lately fallen, Samuel, not imagining the Romans would attempt to paſs it, ſuffered his troops to roam in large parties about the country in queſt of booty. But Uranus having at length found out a place where the river was fordable, paſſed it in the dead of the night without being perceived. He then fell upon the Bulgarians who were left in the camp, and lay for the moſt part aſleep: cut great numbers of them in pieces: took a great number of priſoners, with all their baggage; and made himſelf maſter of their camp. Samuel and his ſon were dangerouſly wounded; and would have been taken, had they not all that day concealed themſelves among the dead. The next night they ſtole away to the mountains of Ætola, and from thence made their eſcape into Bulgaria. The following year the emperor entered Bulgaria at the head of a numerous and well-diſciplined army; defeated Samuel in a pitched battle, and took ſeveral ſtrong cities. The emperor himſelf, however, at laſt, narrowly eſcaped being cut off with his whole army; being unexpectedly attacked by the Bulgarians in a narrow paſs. From this danger he was relieved by the arrival of Nicephorus Xiphias, governor of Philpopolis, with a conſiderable body of troops; who falling upon the enemies rear, put them to flight.

106 His monſtrous cruelty.

Baſilius purſued them cloſe; and having taken an incredible number of captives, cauſed their eyes to be pulled out, leaving to every hundred a guide with one eye, that he might conduct them to Samuel. This ſhocking ſpectacle ſo affected the unhappy king, that he fell into a deep ſwoon, and died two days after. The Roman emperor purſued his conqueſts, and in the ſpace of two years made himſelf maſter of moſt of the enemies' ſtrong holds.

107 The country ſubdued.

He defeated alſo the ſucceſſor of Samuel in ſeveral engagements; and having at laſt killed him in battle, the Bulgarians ſubmitted themſelves without reſerve. The vaſt treaſures of their princes were by Baſilius diſtributed among his ſoldiers by way of donative. Soon after, the widow of the late king, with her ſix daughters and three of her ſons, ſurrendered themſelves to the Roman emperor, by whom they were received with the utmoſt civility and reſpect. This obliging behaviour encouraged the three other ſons of the late king, and moſt of the princes of the blood, who had taken ſhelter in the mountains, to ſubmit, and throw themſelves on the emperor's mercy.

108 Ibatzes alone holds out.

Ibatzes, however, a perſon nearly allied to the royal family, who had diſtinguiſhed himſelf in a very eminent manner during the whole courſe of the war, refuſed to ſubmit, and fled to a ſteep and craggy mountain, with a deſign to defend himſelf there to the laſt extremity. Baſilius endeavoured to cauſe him ſubmit by fair means, but he equally deſpiſed both threats and promiſes.

109 He is taken by a ſtratagem.

At laſt Euſtathius Daphnomelus, whom Baſilius had lately appointed governor of Achridus, the chief city of Bulgaria, undertook to ſecure him by a moſt deſperate and improbable ſcheme. Without communicating his deſign to any, he repaired, with two perſons in whom he could confide, to the mountain on which Ibatzes had fortified himſelf. He hoped to paſs undiſcovered among the many ſtrangers who flocked thither to celebrate the approaching feaſt of the Virgin Mary, for whom Ibatzes had a particular veneration. In this he found himſelf miſtaken; for he was known by the guards, and carried before the prince. To him he pretended to have ſomething of importance to communicate; but as ſoon as Ibaztes had retired with him into a remote place, Daphnomelus threw himſelf ſuddenly upon him, and with the aſſiſtance of the two men whom he had brought with him, pulled out both his eyes, and got ſafe to an abandoned caſtle on the top of the hill. Here they were immediately ſurrounded by the troops of Ibatzes; but Daphnomelus exhorting them now to ſubmit to the emperor, by whom he aſſured them they would be well received, they congratulated Daphnomelus on his ſucceſs, and ſuffered him to conduct the unhappy Ibatzes a priſoner to Baſilius. The emperor was no leſs ſurpriſed than pleaſed at the ſucceſs of this bold attempt; and rewarded Daphnomelus with the government of Dyrrhachium, and all the rich moveables of his priſoner. After this, having accompliſhed the entire reduction of Bulgaria, he returned to Conſtantinople with an incredible number of captives; where he was received by the ſenate and people with all poſſible demonſtrations of joy.

All this time the Saracens had at intervals invaded the Roman dominions, and even attempted to make themſelves maſters of Conſtantinople. Their internal diviſions, however, rendered them now much leſs formidable enemies than they had formerly been; ſo that ſome provinces were even recovered for a time out of their hands; though the weak and diſtracted ſtate of the empire rendered it impoſſible to preſerve ſuch conqueſts.

110 The empire invaded by the Turks.

But in 1041, the empire was invaded by an enemy, not very powerful at that time indeed, but who by degrees gathered ſtrength ſufficient to overthrow both the Roman and Saracen empires.

111 Account of them.

Theſe were the Turks; who having quitted their ancient habitations in the neighbourhood of mount Caucaſus, and paſſed the Caſpian ſtraits, ſettled in Armenia Major, about the year 844. There they continued an unknown and deſpicable people, till the inteſtine wars of the Saracens gave them an opportunity of aggrandizing themſelves. About the year 1030, Mohammed the ſon of Sambrael ſultan of Perſia, not finding himſelf a match for Piſaris ſultan of Babylon, with whom he was at war, had re-

recourſe to the Turks, who ſent him 3000 men under the command of one Tangrolipix, a leading man among them. By their aſſiſtance Mohammed defeated his adverſary; but when the Turks deſired leave to return home, he refuſed to part with them. Upon this they withdrew without his conſent to a neighbouring deſart; and being there joined by ſeveral diſcontented Perſians, began to make frequent inroads into the ſultan's territories. Againſt them Mohammed immediately diſpatched an army of 20,000 men; who, being ſurpriſed in the night, were utterly defeated by Tangrolipix. The fame of this victory drew multitudes to him from all parts; ſo that in a ſhort time Tangrolipix ſaw himſelf at the head of 50,000 men. Upon this Mohammed marched againſt them in perſon, but was thrown from his horſe in the beginning of the engagement, and killed by the fall; upon which his men threw down their arms, and ſubmitted to Tangrolipix.

After this victory the Turkiſh general made war upon the ſultan of Babylon: whom he at length ſlew, and annexed his dominions to his own. He then ſent his nephew, named *Cutlu-Moſes*, againſt the Arabians; but by them he was defeated, and forced to fly towards Media.

112 They defeat the Romans.

Through this province he was denied a paſſage by Stephen the Roman governor; upon which Cutlu-Moſes was obliged to force a paſſage by encountering the Roman army. Theſe he put to flight, took the governor himſelf priſoner, and without any further oppoſition reached the confines of Perſia, where he ſold Stephen for a ſlave. Returning from thence to Tangrolipix, he excuſed in the beſt manner he could, his defeat by the Arabians; but at the ſame time acquainted him with his victory over the Romans in Media, encouraging him to invade that fertile country, which he ſaid might be eaſily conquered, as it was inhabited by none but *women*, meaning the Romans. At that time Tangrolipix did not hearken to his advice, but marched againſt the Arabians at the head of a numerous army. He was, however, attended with no better ſucceſs than his nephew had been; and therefore began to reflect on what he had told him. Soon after he ſent Aſan his brother's ſon with an army of 20,000 men to reduce Media.

113 A Turkiſh army entirely cut off.

Purſuant to his orders, the young prince entered that country, and committed every where dreadful ravages: but being in the end drawn into an ambuſh by the Roman generals, he was cut off with his whole army.

114 They again invade the empire.

Tangrolipix, no way diſcouraged by this misfortune, ſent a new army into Media near 100,000 ſtrong; who after having ravaged the country without oppoſition, laid ſiege to Artza a place of great trade, and therefore reckoned the moſt wealthy in thoſe parts. Not being able to reduce it by any other means, they ſet it on fire; and thus in a ſhort time it was utterly deſtroyed: the buildings being reduced to aſhes, and 150,000 of the inhabitants periſhing either by the flames or the ſword. After this Abraham Halim, half brother to Tangrolipix, hearing that the Romans, reinforced with a body of troops under the command of Liparites governor of Iberia, had taken the field, marched againſt them, and offered them battle;

115 An obſtinate engagement.

which they not declining, the two armies engaged with incredible fury. The victory continued long doubtful; but at length inclined to the Romans; who nevertheleſs did not think proper to purſue the fugitives, as their general Liparites was taken priſoner. The emperor, greatly concerned for the captivity of Liparites, diſpatched ambaſſadors with rich preſents, and a large ſum of money to redeem him, and at the ſame time to conclude an alliance with Tangrolipix. The ſultan received the preſents; but generouſly returned them together with the money to Liparites, whom he ſet at liberty without any ranſom: only requiring him, at his departure, never more to bear arms againſt the Turks. Not long after, Tangrolipix ſent a perſon of great authority among the Turks, with the character of ambaſſador, to Conſtantinople; who having arrogantly exhorted the emperor to ſubmit to his maſter, and acknowledge himſelf his tributary, was ignominiouſly driven out of the city,

Tangrolipix, highly affronted at the reception his ambaſſador had met with, entered Iberia while the emperor Conſtantine Monomachus was engaged in a war with the Patzinacæ, a Scythian nation. Having ravaged that country, he returned from thence to Media and laid ſiege to Mantzichierta,

116 The Turks beſiege Mantzichierta.

a place defended by a numerous garriſon, and fortified with a triple wall and deep ditches. However, as it was ſituated in an open plain country, he hoped to be maſter of it in a ſhort time. But finding the beſieged determined to defend themſelves to the laſt extremity, he reſolved to raiſe the ſiege, after he had continued it 30 days. One of his officers, however, named *Alcan*, prevailed on him to continue it but one day longer, and to commit the management of the attacks to him. This being granted, Alcan diſpoſed his men with ſuch ſkill, and ſo encouraged them by his example, that notwithſtanding the vigorous oppoſition they met with, the place would have probably been taken, had not Alcan been ſlain as he was mounting the wall. The beſieged, knowing him by the richneſs of his armour, drew him by the hair into the city, and cutting off his head threw it over the wall among the enemy: which ſo diſheartened them, that they gave over the aſſault and retired.

117 The ſiege raiſed.

The next ſpring Tangrolipix returned, and ravaged Iberia with the utmoſt cruelty, ſparing neither ſex nor age. But on the approach of the Roman army he retired to Tauris, leaving 30,000 men behind him to infeſt the frontiers of the empire. This they did with great ſucceſs, the borders being through the avarice of Monomachus unguarded. Till the time of this emperor, the provinces bordering on the countries of the barbarians had maintained, at their own charge, forces to defend them; and were on that account exempted from paying tribute: but as Monomachus exacted from them the ſame ſums that were paid by others, they were no longer in a condition to defend themſelves.

In 1063 died the emperor Conſtantine Ducas, having left the empire to his three ſons, Michael, Andronicus, and Conſtantine: but as they were all very young, he appointed the empreſs Eudocia regent during their minority,

118 The empreſs Eudocia forced to ſwear that ſhe will never marry.

after having required of her an oath never to marry; which oath was with great ſolemnity lodged in the hands of the patriarch. He likewiſe obliged the ſenators ſolemnly to ſwear that they would acknowledge none for their ſovereign but his three ſons. No ſooner, however was he dead, than the Turks, hearing that the empire was governed by a woman, broke into Meſopotamia, Cilicia, and Cappadocia, deſtroying all with fire and ſword. The empreſs was no way in a condition to oppoſe them, the greater part of the army having been diſbanded in her huſband's life-time, and the troops that were ſtill on foot being undiſciplined, and altogether unfit for ſervice. The concern which this gave the empreſs was aggravated by the ſeditious ſpeeches of a diſcontented party at home, who repeated on all occaſions that the preſent ſtate of affairs required a man of courage and addreſs at the helm, inſtead of a weak and helpleſs woman; and as they imagined the empreſs would never think of marrying, in conſequence of the oath ſhe had taken, they hoped by theſe ſpeeches to induce the people to revolt, and chooſe a new emperor.

119 The empreſs determines to break her oath.

This Eudocia was aware of; and therefore determined to prevent the evils that threatened herſelf and her family, by marrying ſome perſon of merit who was capable of defeating their enemies both at home and abroad. At this time one Romanus Diogenes, a perſon of a moſt beautiful aſpect, extraordinary parts, and illuſtrious birth, being accuſed of aſpiring to the empire, tried, and convicted, was brought forth to receive ſentence of death. But the empreſs, touched with compaſſion at his appearance, gently upbraided him with his ambition, ſet him at liberty, and ſoon after appointed him commander in chief of all her forces.

120 She recovers the writing in which it was contained,

In this ſtation he acquitted himſelf ſo well, that the empreſs reſolved to marry him if ſhe could but recover the writing in which her oath was contained out of the hands of the patriarch. In order to this, ſhe applied to a favourite eunuch; who going to the patriarch, told him, that the empreſs was ſo taken with his nephew named *Bardas*, that ſhe was determined to marry and raiſe him to the empire, provided the patriarch, abſolved her from the oath ſhe had taken, and convinced the ſenate of the lawfulneſs of her marriage. The patriarch, dazzled with the proſpect of his nephew's promotion, readily undertook to perform both. He firſt obtained the conſent of the ſenate by repreſenting to them the dangerous ſtate of the empire, and exclaiming againſt the raſh oath which the jealouſy of the late emperor had extorted from the empreſs. He then publicly diſcharged her from it; reſtored the writing to her; and exhorted her to marry ſome deſerving object, who being entruſted with an abſolute authority, might be capable of defending the empire.

121 And marries Romanus Diogenes.

The empreſs, thus diſcharged from her oath, married a few days after Romanus Diogenes; who was thereupon proclaimed emperor, to the great diſappointment of the patriarch.

122 He paſſes over into Aſia.

As the new emperor was a man of great activity and experience in war, he no ſooner ſaw himſelf veſted with the ſovereign power, than he took upon him the command of the army, and paſſed over into Aſia with the few forces he could aſſemble, recruiting and inuring them on his march to military diſcipline, which had been utterly neglected in the preceding reigns. On his arrival in this continent, he was informed that the Turks had ſurpriſed and plundered the city of Neocæſarea, and were retiring with their booty.

123 He defeats the Turks.

On this news he haſtened after them at the head of a choſen body of light armed troops, and came up with them on the third day. As the Turks were marching in diſorder, without the leaſt apprehenſion of an enemy, Romanus cut great numbers of them in pieces, and eaſily recovered the booty; after which he purſued his march to Aleppo, which he retook from them, together with Hierapolis, where he built a ſtrong caſtle.

124 Gains a ſecond victory.

As he was returning to join the forces he had left behind him, he was met by a numerous body of Turks, who attempted to cut off his retreat. At firſt he pretended to decline an engagement through fear; but attacked them afterwards with ſuch vigour when they leaſt expected it, that he put them to flight at the firſt onſet, and might have gained a complete victory had he thought proper to purſue them. After this, ſeveral towns ſubmitted to him; but the ſeaſon being now far ſpent, the emperor returned to Conſtantinople. The following year he paſſed over into Aſia early in the ſpring; and being informed that the Turks had ſacked the rich city of Iconium, beſides gaining other conſiderable advantages, he marched in perſon againſt them. But the Turks, not thinking it adviſable to wait his coming, retired in great haſte.

125 They are again defeated.

The Armenians, however, encouraged by the approach of the emperor's army, fell upon the enemy in the plains of Tarſus, put them to flight, and ſtripped them both of their baggage and the booty they had taken. The ſpring following the emperor once more entered Aſia at the head of a conſiderable army which he had raiſed, and with incredible pains diſciplined during the winter. When the two armies drew near to each other, Axan, the Turkiſh Sultan, and ſon of the famous Tangrolipix, ſent propoſals to Romanus for a laſting and honourable peace.

126 The Romans defeated and the emperor taken.

Theſe were imprudently rejected, and a deſperate engagement enſued, when, in ſpite of the utmoſt efforts of the emperor, his army was routed, and he himſelf wounded and taken priſoner. When this news was brought to Axan, he could ſcarcely believe it; but being convinced by the appearance of the royal captive in his preſence, he tenderly embraced him, and addreſſed him in an affectionate manner: "Grieve not (ſaid he), moſt noble emperor, at your misfortune; for ſuch is the chance of war, ſometimes overwhelming one, and ſometimes another: you ſhall have no occaſion to complain of your captivity; for I will not uſe you as my priſoner, but as an emperor." The Turk was as good as his word. He lodged the emperor in a royal pavilion; aſſigned him attendants, with an equipage ſuitable to his quality; and diſcharged ſuch priſoners as he deſired. After he had for ſome days entertained his royal captive with extraordinary magnificence, a perpetual peace was concluded betwixt them, and the emperor diſmiſſed with the greateſt marks of honour imaginable. He then ſet out with the Turkiſh ambaſſador for Conſtantinople, where the peace was to be ratified; but by the way he was informed that Eudocia had been driven from the throne by John the brother of Conſtantine Ducas, and Pſellus a leading man in the ſenate, who had confined her to a monaſtery, and proclaimed her eldeſt ſon, Michael Ducas, emperor.

127 Eudocia depoſed and confined in a monaſtery.

On this intelligence, Romanus retired to a ſtrong caſtle near Theodoſiopolis, where he hoped in a ſhort time to be joined by great numbers of his friends and adherents. But in the mean time John, who had taken upon him to act as guardian to the young prince, diſpatched Andronicus with a conſiderable army againſt him. Andronicus having eaſily feated the ſmall army which Romanus had with him, obliged him to fly to Adana a city in Cilicia, where he was cloſely beſieged, and at laſt obliged to ſurrender. **128 Romanus put to death.** Andronicus carried his priſoner into Phrygia, where he fell dangerouſly ill, being as was ſuſpected, ſecretly poiſoned. But the poiſon being too ſlow in its operation, John ordered his eyes to be put out; which was done with ſuch cruelty that he died ſoon after in the year 1067, having reigned three years and eight months.

129 The Turks again invade the empire. Axan was no ſooner informed of the tragical end of his friend and ally; than he reſolved to invade the empire anew; and that not with a deſign only to plunder as formerly, but to conquer, and keep what he had once conquered. **130 They defeat the Romans.** The emperor diſpatched againſt him Iſaac Comnenus, with a conſiderable army; but he was utterly defeated and taken priſoner by Axan. Another army was quickly ſent off under the command of John Ducas the emperor's uncle. He gained at firſt ſome advantages, and would probably have put a ſtop to their conqueſts, had not one Ruſelius, or Urſelius, revolted with the troops he had under his command, cauſed himſelf to be proclaimed emperor, and reduced ſeveral cities in Phrygia and Cappadocia. Againſt him John marched with all his forces, ſuffering the Turks in the mean time to purſue their conqueſts: but coming to an engagement with the rebels, his army was entirely defeated and he himſelf taken priſoner. **131 They gain a ſecond victory.** Notwithſtanding this victory, Reſelius was ſo much alarmed at the progreſs of the Turks, that he not only releaſed his priſoner, but joined with him againſt the common enemy, by whom they were both defeated and taken priſoners. Axan, however, was for ſome time prevented from purſuing his conqueſts by Cutlu-Moſes, nephew to the late Tangrolipix. He had revolted againſt his uncle; but being defeated by him in a pitched battle, had taken refuge in Arabia, whence he now returned at the head of a conſiderable army, in order to diſpute the ſovereignty with Axan. But while the two armies were preparing to engage, the kalif of Babylon, who was ſtill looked upon as the ſucceſſor of the great prophet, interpoſed his authority. He repreſented the dangers of their inteſtine diſſenſions; and by his mediation, an agreement was as laſt concluded, on condition that Axan ſhould enjoy undiſturbed the monarchy lately left him by his father, and Cutlu-Moſes ſhould poſſeſs ſuch provinces of the Roman empire as he or his ſons ſhould in proceſs of time conquer.

After this agreement, both the Turkiſh princes turned their forces againſt the empire; and before the **132 They conquer ſeveral provinces.** year 1077, made themſelves maſters of all Media, Lycaonia, Cappadocia, and Bithynia, fixing the capital city of their empire at Nice in the latter province. During all this time, the emperors of Conſtantinople, as well as their ſubjects, ſeemed to be in a manner infatuated. No notice was taken of the great progreſs made by theſe barbarians. The generals were ambitious only of ſeizing the tottering empire, which ſeemed ready to fall a prey to the Turks; and, after it was obtained, ſpent their time in oppreſſing their ſubjects, rather than in making any attempts to repulſe the enemy.

At laſt Alexius Comnenus, having wreſted the empire from Nicephoru Botoniates, in 1077, began to prepare for oppoſing ſo formidable an enemy. But before he ſet out, as his ſoldiers had committed great outrages on his acceſſion to the empire, he reſolved **133 Alexius Comnenus ſtops their progreſs.** to make confeſſion of his ſins, and do open penance for thoſe he had ſuffered his army to commit. Accordingly he appeared in the attire of a penitent before the patriarch and ſeveral other eccleſiaſtics, acknowledged himſelf guilty of the many diſorders that had been committed by his ſoldiers, and begged of the patriarch to impoſe upon him a penance ſuitable to the greatneſs of his crimes. The penance enjoined him and his adherents by the patriarch was to faſt, lie upon the ground, and practiſe ſeveral other auſterities for the ſpace of 40 days. This command was religiouſly obeyed, and the emperor then began to prepare for war with ſo much vigour, that Solyman, the Turkiſh ſultan, ſon and ſucceſſor to Cultu-Moſes, diſpatched ambaſſadors to Alexius with propoſals of peace. Theſe were at firſt rejected; but the emperor was at laſt glad to accept them on certain advice, that Robert Guiſchard, duke of Puglia and Calabria, was making great preparations againſt him in the Weſt.

134 Robert Guiſchards expedition againſt the emperor. To this expedition, Robert was incited by Michael Ducas. That prince had been depoſed by Nicephoru Botoniates, and towards the end of the uſurper's reign fled into the Weſt, where he was received by Robert, who was prevailed on to favour his cauſe. For this purpoſe, Robert made great Preparations; and theſe were continued even after the depoſition of Botoniates. **135 He paſſes over into Epirus and beſieges Dyrrhachium.** He ſailed with all his forces from Brunduſium; and landing at Buthrotum in Epirus, made himſelf maſter of that place, while his ſon Bohemond with part of the army reduced Aulon, a celebrated port and city in the country now called *Albania*. From thence they advanced to Dyrrhachium, which they inveſted both by ſea and land; but met with a moſt vigorous oppoſition from George Paleologus, whom the emperor had entruſted with the defence of that important place. In ſpite of the utmoſt efforts of the enemy, this commander held out till the arrival of the Venetian fleet, by whom Robert's navy commanded by Bohemond was utterly defeated, the admiral himſelf having narrowly eſcaped being taken priſoner. After this victory, the Venetians landed without loſs of time, and being joined by Paleologus's men, fell upon Robert's troops with ſuch fury, that they deſtroyed their works, burnt their engines, and forced them back to their camp in great diſorder. As the Venetians were now maſters at ſea, the beſieged were ſupplied with plenty of proviſions, while a famine began to rage in the camp of the enemy; and this calamity was ſoon followed by a plague, which in the ſpace of three months is ſaid to have deſtroyed ten thouſand men. Nothwithſtanding all theſe diſaſters, however, Robert did not abandon the ſiege: having found means to ſupply his famiſhed troops with proviſions, he continued it with ſuch vigour, that the courage of the beſieged began at laſt to fail them; and Paleologus ſent repeated meſſages to the emperor, acquainting him that he would be obliged to ſurrender unleſs very ſpeedily aſſiſted. On this Alexius marched in perſon to the relief of the city, but was defeated with great loſs by Robert. The whole right wing of Alexius's army, finding themſelves hard preſſed by the enemy, fled to a church dedicated to St Michael, imagining they would there find themſelves in a place of ſafety; but the victorious army purſuing them, ſet fire to the church, which was burnt to aſhes with all who were in it. The emperor himſelf with great difficulty made his eſcape, leaving the enemy maſters of his camp and all his baggage.

136 The city ſurrenders.

Soon after this defeat, the city ſurrendered; and Alexius being deſtitute of reſources for carrying on the war, ſeized on the wealth of churches and monaſteries, which gave much offence to the clergy, and had like to have occaſioned great diſturbances in the Imperial city. At the ſame time, Alexius entering into an alliance with Henry emperor of Germany, perſuaded him to invade the dominions of Robert in Italy. At firſt Henry met with great ſucceſs; but was ſoon overcome, and driven out of that country by Robert. Bohemond, in the mean time, reduced ſeveral places in Illyricum; and, having defeated Alexius in two pitched battles, entered Theſſaly, and ſat down before Lariſſa. This place, being defended by an officer of great courage and experience in war, held out till the emperor came to its relief. Soon after his arrival he found means to draw a ſtrong party of Bohemond's men into an ambuſcade, and cut them off almoſt entirely. However, in the battle which was fought a few days after, Bohemond had the advantage; but his troops mutinying and refuſing to carry on the war, he was obliged to return to Italy. Alexius taking advantage of his abſence, recovered ſeveral cities; and being informed that Robert was making great preparations againſt him, he had recourſe once more to the Venetians. By them he was aſſiſted with a powerful fleet, which defeated that of Robert in two engagements; but being ſoon after ſurpriſed by him, they were defeated with the loſs of almoſt their whole navy. Robert is ſaid to have uſed his victory with great barbarity, putting many of his priſoners to death with unheard-of torments. The Venetians equipped a ſecond fleet; and joining that of the emperor, fell unexpectedly upon Robert's navy, who were riding without the leaſt apprehenſion in Buthrotum, ſunk moſt of his ſhips, and took a great number of priſoners, his wife and younger ſons having narrowly eſcaped falling into their hands.

137 The war ended by the death of Robert.

Robert made great preparations to revenge this defeat; but was prevented by death from executing his deſigns: and, after his deceaſe, his ſon Roger did not think proper to purſue ſo dangerous and expenſive a war. He therefore recalled his troops, and the places which had been conquered by Robert and Bohemond ſubmitted anew to the emperor.

138 The Scythian war.

This war was ſcarce ended, when the Scythians paſſing the Danube laid waſte great part of Thrace, committing every where the greateſt barbarities. Againſt them the emperor diſpatched an army under the command of Pacurianus and Branas. The latter inſiſted upon engaging the enemy contrary to the opinion of his colleague; and his raſhneſs cauſed the loſs of the greater part of the army, who were cut off by the Scythians, together with the two generals. *Talicius*, an officer who had ſignalized himſelf on many occaſions, was appointed to command the army in their room. He fell upon the enemy as they lay ſecurely in the neighbourhood of Philippopolis, cut great numbers of them in pieces, and obliged the reſt to retire in great confuſion. The following ſpring, however, they returned in ſuch numbers, that the emperor reſolved to march againſt them in perſon. Accordingly he ſet out for Adrianople, and from thence to a place called *Lardea*.

139 The Romans defeated.

Here, contrary to the advice of his beſt officers, he ventured a battle; in which he was utterly defeated with the loſs of vaſt numbers of his men, he himſelf eſcaping with the utmoſt difficulty. The next year he was attended with no better ſucceſs, his army being entirely defeated with the loſs of his camp and baggage.

140 They at laſt defeat the Scythians.

In the year following, 1084, the emperor retrieved his credit; and gave the Scythians ſuch an overthrow, that very few eſcaped the general ſlaughter. Notwithſtanding this diſaſter, however, they again invaded the empire in 1093: To this they were encouraged by an impoſtor called *Leo*, who pretended to be the eldeſt ſon of Romanus Diogenes. The young prince had been ſlain in a battle with the Turks; but as the Scythians only wanted a pretence to renew the war, they received the impoſtor with joy. By a ſtratagem, however, Leo was murdered; and the Scythians being afterwards overthrown in three great battles, were obliged to ſubmit on the emperor's own terms.

141 The Holy War.

Since the year 1083, the war had been carried on with the Turks with various ſucceſs; but now an aſſociation was formed in the Weſt againſt theſe infidels, which threatened the utter ruin of the Turkiſh nation. This was occaſioned by the ſuperſtition of the Chriſtians, who thought it a meritorious action to venture their lives for the recovery of the Holy Land, poſſeſſed at that time by the Turks and Saracens. Had the weſtern princes been properly aſſiſted by the emperors of the Eaſt in this undertaking, the Turks had undoubtedly been unable to reſiſt them; but ſo far from this, the Latins were looked upon by them as no leſs enemies than the Turks; and indeed whatever places they took from the infidels, they never thought of reſtoring to the emperors of Conſtantinople, to whom they originally belonged, but erected a number of ſmall independent principalities; which neither having ſufficient ſtrength to defend themſelves, nor being properly ſupported by one another, ſoon became a prey to the Turks.

142 Dreadful fire at Conſtantinople.

In the year 1203, happened a dreadful fire at Conſtantinople, occaſioned by ſome Latin ſoldiers. Theſe had plundered a moſque, which the Turks reſiding in Conſtantinople had been ſuffered to build there. For this reaſon they were attacked by the infidels; who being much ſuperior to them in numbers, the Latins found themſelves obliged to ſet fire to ſome houſes, in order to make their eſcape with ſafety. The flame ſpreading in an inſtant from ſtreet to ſtreet, reduced in a ſhort time great part of the city to aſhes, with the capacious ſtore-houſes which had been built at a vaſt expence on the quay. The late emperor Iſaac Angelus, who had been reſtored to his throne by the Latins, died ſoon after their departure from Conſtantinople, leaving his ſon Alexius ſole maſter of the empire. The young prince, to diſcharge the large ſums he had promiſed to the French and Venetians for their aſſiſtance, was obliged to lay heavy taxes on his ſubjects; and this, with the great eſteem and friendſhip ſhowed to his deliverers, raiſed a general diſcontent among the people of Conſtantinople, who were ſworn enemies to the Latins. This encouraged John Ducas, ſurnamed *Murtzuphlus*, from his joined

143 Murtzuphlus ſtrangles the emperor.

144 The city plundered by the Latins.

and thick eye-brows, to attempt the ſovereignty. Unhappily he found means to put his treacherous deſigns in execution; and ſtrangled the young prince with his own hands. After this he preſented himſelf to the people; told them what he had done, which he pretended was in order to ſecure their liberties; and earneſtly intreated them to chooſe an emperor who had courage enough to defend them againſt the Latins, that were ready to oppreſs and enſlave them. On this he was inſtantly ſaluted emperor by the inconſtant multitude; but this uſurpation proved the ruin of the city. The Latins immediately reſolved to revenge the death of the young prince; and, as they had been ſo often betrayed and retarded in their expeditions to the Holy Land by the emperors of Conſtantinople, to make themſelves maſters of that city, and ſeize the empire for themſelves. In conſequence of this reſolution they muſtered all their forces in Aſia, and having croſſed the ſtraits, laid ſiege to Conſtantinople, by ſea and land. The tyrant, who was a man of great courage and experience in war, made a vigorous defence. The Latins, however, after having battered the walls for ſeveral days together with an incredible number of engines, gave a general aſſault on the 8th of April 1204. The attack laſted from break of day till three in the afternoon, when they were forced to retire, after having loſt ſome of their engines, and a great number of men. The aſſault was nevertheleſs renewed four days after; when, after a warm diſpute, the French planted their ſtandard on one of the towers; which the Venetians obſerving, they quickly made themſelves maſters of four other towers, where they likewiſe diſplayed their enſigns. In the mean time three of the gates being broke down by the battering rams, and thoſe who had ſcaled the walls having killed the guards, and opened the gates between the towers they had taken, the whole army entered, and drew up in battle array between the walls. The Greeks fled up and down in the greateſt confuſion; and ſeveral parties were by the Latins diſpatched to ſcour the ſtreets, who put all they met to the ſword, without diſtinction of age or condition. Night put a ſtop to the dreadful ſlaughter, when the princes ſounding the retreat, placed their men in different quarters of the city, with orders to be upon their guard, not doubting but they ſhould be attacked early next morning. They were ſurpriſed, however, at that time by the entire ſubmiſſion of the Greeks; to whom they promiſed their lives, but at the ſame time, ordering them to retire to their houſes, they gave up the city to be plundered by the ſoldiers for that day. They ſtrictly enjoined their men to abſtain from ſlaughter, to preſerve the honour of the women, and to bring the whole booty into one place, that a juſt diſtribution might be made according to the rank and merit of each individual. The Greeks had undoubtedly concealed their moſt valuable effects during the night; many perſons of the firſt rank had eſcaped, and carried along with them immenſe treaſures; the ſoldiers had probably, as is uſual in all ſuch caſes, reſerved things of great value for themſelves, notwithſtanding all prohibitions to the contrary; and yet the booty, without the ſtatues, pictures, and jewels, amounted to a ſum almoſt incredible. As for Murtzuphlus, he made his eſcape in the night; embarking on a ſmall veſſel with *Euphroſyne*, the wife of *Alexius Angelus* a late uſurper, and her daughter *Eudoxia*, for whoſe ſake he had abandoned his lawful wife.

145 The Latins expelled.

Conſtantinople continued ſubject to the Latins till the year 1261, when they were expelled by one *Alexius Strategopulus*. He was a perſon of an illuſtrious family; and, for his eminent ſervices, diſtinguiſhed with the title of *Cæſar*. He had been ſent againſt Alexius Angelus deſpot of Epirus, who now attempted to recover ſome places in Theſſaly and Greece from Michael Paleologus, one of the Greek emperors, that, ſince the capture of Conſtantinople, had kept their court at Nice; and to try whether he could on his march ſurpriſe the imperial city itſelf. Alexius, having paſſed the ſtraits encamped at a place called *Rhegium*, where he was informed by the natives that a ſtrong body of the Latins had been ſent to the ſiege of *Dapnuſa*, that the garriſon was in great want of proviſions, and that it would be no difficult mattter to ſurpriſe the city. Hereupon the Greek general reſolved at all events to attempt it; in which he was encouraged by ſome of the inhabitants, who, coming privately to his camp, offered themſelves to be his guides. He approached the walls in the dead of the night, which ſome of his men ſcaled without being obſerved; and, killing the centries whom they found aſleep, opened one of the gates to the reſt of the army. The Greeks ruſhing in, put all they met to the ſword; and at the ſame time, to create more terror, ſet fire to the city in four different places. The Latins, concluding from thence that the enemy's forces were far more numerous than they really were, did not ſo much as attempt either to drive them out, or to extinguiſh the flames. In this general confuſion, the emperor Baldwin, quitting the enſigns of majeſty fled with Juſtinian the Latin patriarch, and ſome of his intimate friends, to the ſea-ſide; and there, embarking on a ſmall veſſel, ſailed firſt to Eubœa, and afterwards to Venice, leaving the Greeks in full poſſeſſion of Conſtantinople. When news of this ſurpriſing and altogether unexpected ſucceſs of Alexius were firſt brought to Paleologus, he could ſcarce give credit to it; but receiving ſoon after letters from Alexius himſelf, with a particular account of ſo memorable an event, he ordered public thanks to be returned in all the churches, appeared in public in his imperial robes, attended by the nobility in their beſt apparel, and ordered couriers to be diſpatched with the agreeable news into all parts of the empire.

146 Entry of Michael Paleologus into the city.

Soon after having ſettled his affairs at Nice, he ſet out for Conſtantinople with the empreſs, his ſon Andronicus, the ſenate, and nobility, to take poſſeſſion of the imperial city, and fix his reſidence in that place that had originally been deſigned for the ſeat of the eaſtern empire. Having paſſed the ſtraits, he advanced to the *golden gate*, and continued ſome days without the walls, while the citizens were buſied in making the neceſſary preparations to receive him with a magnificence ſuitable to the occaſion. On the day appointed, the golden gate, which had been long ſhut up, was opened, and the emperor entering it amidſt the repeated acclamations of the multitude, marched on foot to the great palace. He was preceded by the biſhop of *Cyzicus*, who carried an image of the Virgin Mary, ſuppoſed to have been done by St Luke, and fol-

147 He reſolves to reſtore it to its former grandeur.

followed by all the great officers, nobility, and chief citizens, pompouſly dreſſed. Public thanks were again returned in the church of St Sophia, at which the emperor aſſiſted in perſon, with the clergy, the ſenate, and nobility. Theſe exerciſes were ſucceeded by all ſorts of rejoicings; after which the emperor carefully ſurveyed the imperial city. This ſurvey greatly allayed his joy. He ſaw the ſtately palaces and other magnificent buildings of the Roman emperors lying in ruins; the many capacious buildings that had been erected by his predeceſſors, at an immenſe charge, deſtroyed by fire, and other unavoidable accidents of war; ſeveral ſtreets abandoned by the inhabitants, and choaked up with rubbiſh, &c. Theſe objects gave the emperor no ſmall concern, and kindled in him a deſire of reſtoring the city to its former luſtre. In the mean time, looking upon Alexius as the reſtorer of his country, he cauſed him to be clad in magnificent robes; placed with his own hand a crown on his head; ordered him to be conducted through the city, as it were in triumph; decreed that for a whole year the name of Alexius ſhould be joined in the public prayers with his own: and, to perpetuate the memory of ſo great and glorious an action, he commanded his ſtatue to be erected on a ſtately pillar of marble before the church of the Apoſtles. His next care was to re-people the city, many Greek families having withdrawn from it while it was held by the Latins, and the Latins now preparing to return to their reſpective countries. The former were recalled home; and the latter, in regard of the great trade they carried on, were allowed many valuable privileges, which induced them not to remove. The Greeks were allowed to live in one of the moſt beautiful quarters of the city, to be governed by their own laws and magiſtrates, and to trade without paying cuſtoms or taxes of any kind. Great privileges were likewiſe granted to the natives of Venice and Piſa, which encouraged them to lay aſide all thoughts of removing, and the trade they carried on proved afterwards highly advantageous to the ſtate.

148 Great diſturbances occaſioned by the treachery of Paleologus.

It was not long, however, before theſe regulations were altered. The emperor being ſoon after informed that Baldwin, lately expelled from Conſtantinople, had married his daughter to Charles king of Sicily, and given him, by way of dowry, the imperial city itſelf, he ordered the Genoeſe, who were become very numerous, to remove firſt to Heraclea, and afterwards to Galata, where they continued. As for the Piſans and Venetians, who were not ſo numerous and wealthy, they were allowed to continue in the city. Paleologus, though he had cauſed himſelf to be proclaimed emperor, and was poſſeſſed of abſolute ſovereignty, was as yet only guardian to the young emperor John Laſcaris, then about 12 years of age. But having now ſettled the ſtate, and having gained the affections both of natives and foreigners, he began to think of ſecuring himſelf and his poſterity in the full enjoyment of the empire; and for this reaſon cruelly ordered the eyes of the young prince to be put out, pretending that none but himſelf had any right to the city or empire of Conſtantinople, which he alone had recovered out of the hand of the Latins.

149 Union of the Greek and Latin churches.

This piece of treachery and inhumanity involved him in great troubles. The patriarch immediately excommunicated him; and he would in all probability have been driven from the throne by a combination of the weſtern princes, had he not engaged pope Urban IV. to eſpouſe his cauſe, by promiſing to ſubmit himſelf and his dominions to the Latin Church. Thus, indeed, he diverted the preſent ſtorm; but this proceeding cauſed the greateſt diſturbances, not only in Conſtantinople, but throughout the whole empire, nor was Paleologus able to reconcile his ſubjects to this union.

150 Diſſolved.

In 1283 Michael died, and was ſucceeded by his ſon Andronicus. His firſt ſtep was to reſtore the ancient Greek ceremonies, thinking he could not begin his reign with a more popular act. But thus he involved himſelf in difficulties ſtill greater than before. Though Michael had not been able fully to reconcile his Greek ſubjects to the Latin ceremonies, yet he had in ſome degree accompliſhed his purpoſe. The Latins had got a conſiderable footing in the city, and defended their ceremonies with great obſtinacy; ſo that the empire was again thrown into a ferment by this imprudent ſtep.

151 War with the Turks.

All this time the Turks had been continuing their encroachments on the empire, which had it not been for the cruſades publiſhed againſt them by the Pope, they would in all probability have made themſelves maſters of before this time. They were now, however, very ſucceſsfully oppoſed by Conſtantine the emperor's brother: but his valour rendered him ſuſpected by the emperor; in conſequence of which he was thrown into priſon, along with ſeveral perſons of great diſtinction. On the removal of this brave commander, the Turks, under the famous Othoman, made themſelves maſters of ſeveral places in Phrygia, Caria, and Bithynia; and, among the reſt, of the city of Nice. To put a ſtop to their conqueſts, the emperor diſpatched againſt them Philanthropenus and Libadarius, two officers of great experience in war. The former gained ſome advantages over the enemy; but being elated with his ſucceſs, cauſed himſelf to be proclaimed emperor. This rebellion, however, was ſoon ſuppreſſed, Philanthropenus being betrayed by his own men: but the Turks taking advantage of theſe inteſtine commotions, not only extended their dominions in Aſia, but conquered moſt of the iſlands in the Mediterranean; and being maſters at ſea, infeſted the coaſts of the empire, to the utter ruin of trade and commerce.

From this time the Roman empire tended faſt to diſſolution. After the revolt of Philanthropenus, the emperor could no longer truſt his ſubjects, and therefore hired the Maſſagetes to aſſiſt him: but they, behaving in a careleſs manner, were firſt defeated by their enemies, and afterwards turned their arms againſt thoſe they came to aſſiſt. He next applied to the Catalans, who behaved in the ſame manner; and having ravaged the few places left the emperor in Aſia, returned into Europe, and called the Turks to their aſſiſtance.

152 Their firſt appearance in Europe.

This happened in the year 1292, and was the firſt appearance of the Turks in Europe. This enterprize, however, was unſucceſsful. Having loaded themſelves with booty, they offered to depart quietly if they were allowed a ſafe paſſage, and ſhips to tranſport them to Aſia. To this the emperor, willing to get rid of ſuch troubleſome gueſts, readily conſented, and ordered the veſſels to be got ready with all poſſible expedition. But the Greek officers obſerving the immenſe booty with which they were loaded, reſolved to fall upon them in the night, and cut them all off at once. This ſcheme, however, was not managed with ſuch ſecrecy but that the Turks had notice of it, and therefore prepared for their defence. They firſt ſurpriſed a ſtrong caſtle in the neighbourhood, and then found means to acquaint their countrymen in Aſia with their dangerous ſituation. Their brethren, enticed with the hopes of booty, were not long of coming to their aſſiſtance; and having croſſed the Helleſpont in great numbers, ravaged the adjacent country, making excurſions to the very gates of Conſtantinople. At laſt the emperor determined to root them out; and accordingly marched againſt them with all his forces, the country people flocking to him from all quarters. The Turks at firſt gave themſelves over for loſt; but finding the Greeks negligent of diſcipline, they attacked their army unexpectedly, utterly defeated it, and made themſelves maſters of the camp. After this unexpected victory, they continued for two years to ravage Thrace in the moſt terrible manner. At laſt, however, they were defeated; and being afterwards ſhut up in the Cherſoneſus, they were all cut in pieces or taken.

153 They are all cut in pieces, or taken.

Soon after new commotions took place in this unhappy empire, of which the Turks did not fail to take the advantage. In 1327 they made themſelves maſters of moſt of the cities on the Mæander; and, among the reſt, of the ſtrong and important city of Pruſa in Bithynia. The next year, however, Othoman, who may juſtly be ſtyled the founder of the Turkiſh monarchy, being dead, the emperor laid hold of that opportunity to recover Nice, and ſome other important places, from the infidels. But theſe were loſt the year following, together with Abydus and Nicomedia: and in 1330 a peace was concluded upon condition that they ſhould keep all their conqueſts. This peace they obſerved no longer than ſerved their own purpoſes; for new commotions breaking out in the empire, they purſued their conqueſts, and by the year 1357 had reduced all Aſia. They next paſſed the Helleſpont under the conduct of Solyman the ſon, or as others will have it, the brother of Orchanes, the ſucceſſor of Othoman, and ſeized on a ſtrong caſtle on the European ſide. Soon after the Turkiſh ſultan died, and was ſucceeded by Amurath. He extended the conqueſts of his predeceſſors, and in a ſhort time reduced all Thrace, making Adrianople the ſeat of his empire. Amurath was ſlain by treachery in a little time after, and was ſucceeded by his ſon Bajazet. This prince greatly enlarged his dominions by new conqueſts. In a ſhort time he reduced the countries of Theſſaly, Macedon, Phocis, Peloponneſus, Myſia, and Bulgaria, driving out the deſpots or petty princes who ruled there. Elated with his frequent victories, he began to look upon the Greek emperor, to whom nothing was now left but the city of Conſtantinople and the neighbouring country, as his vaſſal. Accordingly he ſent him an arrogant and haughty meſſage, commanding him to pay a yearly tribute, and ſend his ſon Manuel to attend him in his military expeditions. This demand the emperor was obliged to comply with, but died ſoon after in the year 1392.

154 Adrianople taken by the Turks.

Manuel no ſooner heard of his father's death than he haſtened to Conſtantinople, without taking leave of the ſultan, or acquainting him with the reaſons of his ſudden departure. At this Bajazet was ſo highly offended, that he paſſed with great expedition out of Bithynia into Thrace, ravaged the country adjoining to Conſtantinople, and at laſt inveſted the city itſelf both by ſea and land. In this extremity Manuel had recourſe to the weſtern princes; who ſent him an army of 130,000 men, under the command of Sigiſmund king of Hungary, and John count of Nevers. But though the weſtern troops proved at firſt ſucceſsful, they were in the end defeated with great ſlaughter by Bajazet, who then returned to the ſiege with greater vigour than ever. As he found, however, that the citizens were determined to hold out to the laſt, he applied to John, the ſon of Manuel's elder brother, who had a better title to the crown than Manuel himſelf. With him he entered into a private agreement, by virtue of which Bajazet was to place John upon the throne of Conſtantinople; on the other hand, John was to deliver up the city to the Turks, and remove the imperial ſeat to Peloponneſus, which the ſultan promiſed to relinquiſh to him and his poſterity. At the ſame time he ſent deputies to the inhabitants of Conſtantinople, offering to withdraw his army, and ceaſe from further hoſtilities, provided they expelled Manuel and placed John upon the throne. This propoſal rent the city into two factions; but Manuel prevented the miſchiefs which were ready to enſue, by a voluntary reſignation, upon condition that he ſhould be allowed to retire to whatever place he thought proper with his wife and children.

155 Bajazet beſieges Conſtantinople.

With this condition John readily complied; and Manuel having received him into the city, and conducted him to the palace, ſet ſail for Venice. From thence he went to the courts of all the weſtern princes to ſolicit their aſſiſtance againſt the Turks, whoſe power was grown formidable to all Europe. He was every where received with the greateſt demonſtrations of eſteem, and promiſed large ſupplies; all Chriſtendom being now alarmed at the progreſs of the infidels.

In the mean time Bajazet did not fail to put John in mind of his promiſe; but the citizens refuſing to comply with ſuch a ſcandalous treaty, the ſiege was renewed, and the city aſſaulted with more fury than ever. When it was already reduced to the laſt extremity, news were brought the ſultan that Tamerlane, the victorious Tartar, having over-run all the Eaſt with incredible celerity, had now turned his arms againſt the Turks, and was preparing to break into Syria. Bajazet, alarmed at the danger that threatened him, raiſed the ſiege in great haſte, and advanced againſt Tamerlane with a very numerous and well-diſciplined army; but the Tartar totally defeated and took him priſoner, after having cut moſt of his men in pieces: and thus Conſtantinople was preſerved for the preſent.

156 He is defeated and taken priſoner by Tamerlane.

But this relief was of ſhort duration. In 1424 the city was again beſieged by Amurath II. The inhabitants defended themſelves with great bravery; but muſt in the end have ſubmitted, had not the emperor prevailed upon the prince of Caramania to countenance an impoſtor and pretender to the Turkiſh throne. This obliged Amurath to raiſe the ſiege, and march with all his forces againſt the uſurper, whom he ſoon reduced.

157 Amurath beſieges Conſtantinople.

158 The ſiege raiſed.

Conſtantinopolitan hiſtory.

reduced. Having then no other enemies to contend with, he entered Macedon at the head of a powerful army; and having ravaged the country far and near, he took and plundered Theſſalonica, as he did alſo moſt of the cities of Ætolia, Phocis, and Bœotia. From Greece he marched into Servia; which country he ſoon reduced. He next broke into the dominions of the king of Hungary, and beſieged the ſtrong city of Belgrade; but here he met with a vigorous repulſe, no fewer than 15,000 Turks being ſlain by the Chriſtians in one ſally, which obliged the ſultan to drop the enterprize and retire.

159
Succeſs of John Hunniades againſt the Turks.

In his retreat he was attacked by the celebrated John Hunniades, who cut great numbers of his men in pieces, and obliged the reſt to fly with precipitation. Not long after he gained a ſtill more complete victory over the enemy in the plains of Tranſylvania, with the loſs of only 3000 of his own men, whereas 20,000 of the Turks were killed on the field of battle, and almoſt an equal number in the purſuit. Amurath, who was then at Adrianople, ſent an army into Tranſylvania far more numerous than the former; but they were attended with no better ſucceſs, being cut off almoſt to a man by the brave Hungarian.

160
He is at laſt defeated.

He gained ſeveral other victories no leſs remarkable; but was at laſt entirely defeated in 1448; and with this defeat ended all hopes of preſerving the Roman empire. The unhappy emperor was now obliged to pay an annual tribute of 300,000 aſpers to the ſultan; and to yield up to him ſome ſtrong holds which he ſtill held on the Euxine Sea. However, as he doubted not but Amurath would ſoon attempt to become maſter of the city itſelf, he renewed the union between the Greek and Latin churches, hoping that this would induce the weſtern princes to aſſiſt him in the defence of the city againſt the Turks. This union produced great diſturbances, which the emperor did not long ſurvive, but died in 1448, leaving the empire, now confined within the walls of Conſtantinople, to his brother Conſtantine.

Amurath the Turkiſh ſultan died in 1450, and was ſucceeded by his ſon Mohammed. In the beginning of his reign he entered into an alliance with Conſtantine, and pretended a great deſire to live in friendſhip with him and the other Chriſtian princes; but no ſooner had he put an end to a war in which he was engaged with Ibrahim king of Caramania, than he built a ſtrong fort on the European ſide of the Boſphorus, oppoſite to another in Aſia; in both of which he placed ſtrong garriſons. Theſe two caſtles commanded the Straits; and the former being but five miles from the city, kept it in a manner blocked up. This ſoon produced a miſunderſtanding between him and the emperor, which ended in the ſiege of the city.

161
Conſtantinople beſieged by Mohammed.

The ſiege commenced on the ſixth of April 1453. Mohammed's numerous forces covering the plains before it on the land-ſide, and a fleet of 300 ſail blocking it up by ſea. The emperor, however, had taken care to ſecure the haven, in which were three large ſhips, 20 ſmall ones, and a great number of galleys, by means of a chain drawn croſs the entrance. Mohammed began the ſiege by planting batteries as near the city as he could, and raiſing mounts in ſeveral places as high as the walls themſelves, whence the beſieged were inceſſantly galled with ſhowers of arrows. He had in his camp a piece of ordnance of prodigious ſize, which is ſaid to have carried a ball of 100 pounds weight, made of hard black ſtone brought from the Euxine Sea. With this vaſt piece the enemy made ſeveral breaches in the walls; which, however, were repaired with incredible expedition by the beſieged. But Mohammed, the better to carry on the ſiege, cauſed new levies to be made throughout his extenſive dominions, by which his army was ſoon increaſed to near 400,000 men; while the garriſon conſiſted only of 9000 regular troops, *viz.* 6000 Greeks and 3000 Genoeſe and Venetians. As the enemy continued to batter the walls day and night without intermiſſion, a great part of them was at laſt beaten down; but while the Turks were buſy in filling up the ditch, in order to give the aſſault, a new wall was built. This threw the tyrant into a prodigious rage, which was greatly heightened when he ſaw his whole fleet worſted by five ſhips, four of which were laden with corn from Peloponneſus, and the others with all manner of proviſions from the iſle of Chios. Theſe opened themſelves a way through the whole Turkiſh fleet; and, to the inexpreſſible joy of the Chriſtians; at laſt got ſafe into the harbour.

162
He conveys 80 galleys over land into the haven.

The Turks attempted ſeveral times to force the haven; but all their efforts proving ineffectual, Mohammed formed a deſign of conveying 80 galleys over land for the ſpace of eight miles into it. This he accompliſhed by means of certain engines, the contrivance of a renegado; and having then either taken or ſunk all the ſhips contained in it, he cauſed a bridge to be built over it with ſurpriſing expedition. By this means the city was laid open to an aſſault from that ſide likewiſe. The place was now aſſaulted on all ſides; and Conſtantine being well appriſed that he could not long hold out againſt ſuch a mighty fleet and ſo numerous an army, ſent deputies to Mohammed, offering to acknowledge himſelf his vaſſal, by paying him yearly what tribute he ſhould think proper to impoſe, provided he raiſed the ſiege and withdrew. The tyrant anſwered that he was determined at all events to become maſter of the city: but if the emperor delivered it up forthwith, he would yield up to him Peloponneſus, and other provinces to his brothers, which they ſhould enjoy peaceably as his friends and allies: but if he held out to the laſt extremity, and ſuffered it to be taken by aſſault, he would put him and the whole nobility to the ſword, abandon the city to be plundered by his ſoldiers, and carry the inhabitants into captivity.

This condition was raſhly rejected by the emperor; who thereby involved himſelf and all his ſubjects in the moſt terrible calamity.

163
A mutiny in the Turkiſh camp.

The ſiege was renewed with more vigour than ever, and continued till the 25th of May; when a report being ſpread in the Turkiſh camp that a mighty army was advancing in full march to the relief of the city under the conduct of the celebrated John Hunniades, the common ſoldiers, ſeized with a panic, began to mutiny, and preſs Mohammed in a tumultuous manner to break up the ſiege. Nay, they openly threatened him with death, if he did not immediately abandon the enterprize and retire from before the city, which they deſpaired of being able to reduce before the arrival of the ſuppoſed ſuccours. Mohammed was upon the point of complying with their demand,

mand, when he was adviſed by Zagan, a Turkiſh officer of great intrepidity, and an irreconcileable enemy to the Chriſtian name, to give without loſs of time a general aſſault. To this he ſaid the ſoldiery, however mutinous, would not be averſe, provided the ſultan ſolemnly promiſed to abandon the city to be plundered by them. As ſuch an advice beſt ſuited the humour of Mohammed, he readily embraced it; and cauſed a proclamation to be publiſhed throughout the camp, declaring, that he gave up to his ſoldiers all the wealth of that opulent city, requiring to himſelf only the empty houſes.

The deſire of plunder ſoon got the better of that fear which had ſeized the Turkiſh army, and they unanimouſly deſired to be led on to the attack. Hereupon Conſtantine was ſummoned for the laſt time to deliver up the city, with a promiſe of his life and liberty; but to this he anſwered, that he was unalterably determined either to defend the city or to periſh with it.

164 A general aſſault given.

The attack began at three in the morning on Tueſday the 29th of May; ſuch troops were firſt employed as the ſultan valued leaſt, and deſigned them for no other purpoſe than to tire the Chriſtians, who made a prodigious havock of that diſorderly multitude. After the carnage had laſted ſome hours, the Janizaries and other freſh troops advanced in good order, and renewed the attack with incredible vigour. The Chriſtians ſummoning all their courage and reſolution, twice repulſed the enemy; but being in the end quite ſpent, they were no longer able to ſtand their ground; ſo that the enemy in ſeveral places broke into the city. In the mean time Juſtiniani, the commander of the Genoeſe and a ſelect body of Greeks, having received two wounds, one in the thigh and the other in the hand, was ſo diſheartened, that he cauſed himſelf to be conveyed to Galata, where he ſoon after died of grief. His men, diſmayed at the ſudden flight of their general, immediately quitted their poſts and fled in the utmoſt confuſion.

165 Bravery of the emperor.

However the emperor, attended with a few of the moſt reſolute among the nobility, ſtill kept his poſt, ſtriving with unparalleled reſolution to oppoſe the multitude of barbarians that now broke in from every quarter. But being in the end overpowered with numbers, and ſeeing all his friends lie dead on the ground, "What! (cried he aloud) is there no Chriſtian left alive to ſtrike off my head?" He had ſcarce uttered theſe words, when one of the enemy, not knowing him, gave him a deep cut acroſs the face with his ſabre; and at the ſame time, another coming behind him, with a blow on the back part of his head laid him dead on the ground.

166 He is killed.

After the death of the emperor, the few Chriſtians that were left alive betook themſelves to flight; and the Turks, meeting with no further oppoſition, entered the city, which they filled with blood and ſlaughter.

167 The town plundered and the inhabitants maſſacred.

They gave no quarter, but put all they met to the ſword, without diſtinction. Many thouſands took refuge in the church of St Sophia, but they were all maſſacred in their aſylum by the enraged barbarians; who, prompted by their natural cruelty, the deſire of revenge, and love of booty, ſpared no place nor perſon. Moſt of the nobility were, by the ſultan's orders, cut off, and the reſt kept for purpoſes more grevious than death itſelf. Many of the inhabitants, among whom were ſome men of great learning, found means to make their eſcape while the Turks were buſied in plundering the city. Theſe embarking on five ſhips then in the harbour, arrived ſafe in Italy; where, with the ſtudy of the Greek tongue, they revived the liberal ſciences, which had long been neglected in the Weſt. After the expiration of three days, Mohammed commanded his ſoldiers to forbear all further hoſtilities on pain of death; and then put an end to as cruel a pillage and maſſacre as any mentioned in hiſtory. The next day he made his public and triumphal entry into Conſtantinople, and choſe it for the ſeat of the Turkiſh empire, which it has continued to be ever ſince.

168 Preſent ſtate of city.

This city is now called by the Turks *Iſtampol*, and by the Greeks *Iſtampoli* or *Stampoli*. It is ſeated at the eaſtern extremity of Romania, on a ſmall neck of land which advances towards Natolia, from which it is ſeparated by a channel of a mile in breadth. The ſea of Marmora waſhes its walls on the ſouth, and a gulph of the channel of Conſtantinople does the ſame on the north. It is delightfully ſituated between the Black Sea and the Archipelago, from whence it is ſupplied with all neceſſaries. The grand ſeignior's palace, called the *Seraglio*, is ſeated on the ſea-ſide, and is ſurrounded with walls flanked with towers, and ſeparated from the city by canals. It is ſaid the harbour will eaſily hold 1200 ſhips. The number of houſes muſt needs be prodigious, ſince one fire has burnt down 30,000 in a day, without greatly changing the aſpect of the city. However, in general, they are but mean, eſpecially on the outſide, where there are few or no windows; and the ſtreets being narrow, gives them a melancholy look. They reckon that there are 3770 ſtreets, ſmall and great, but they are ſeldom or never clean; and the people are infeſted with the plague almoſt every year. The inhabitants are half Turks, two thirds of the other half Chriſtians, and the reſt Jews. Here are a great number of ancient monuments ſtill remaining, and particularly the ſuperb temple of Sophia, which is turned into a moſque, and far ſurpaſſes all the reſt. The ſtreet called *Adrianople* is the longeſt and broadeſt in the city; and the bazars, or bezeſteins, are the markets for ſelling all ſorts of merchandize. The old and the new are pretty near each other: and are large ſquare buildings, covered with domes, and ſupported by arches and pilaſters. The new is the beſt, and contains all ſorts of goods which are there expoſed to ſale. The market for ſlaves, of both ſexes, is not far off; and the Jews are the principal merchants, who bring them here to be ſold. There are a great number of young girls brought from Hungary, Greece, Candia, Ruſſia, Mingrelia, and Georgia, for the ſervice of the Turks, who generally buy them for their ſeraglios. The great ſquare, near the moſque of ſultan Bajazet, is the place for public diverſions, where the jugglers and mountebanks play a great variety of tricks. The circumference of this city is by ſome ſaid to be 15 miles, and by Mr Tournefort 23 miles; to which if we add the ſuburbs, it may be 34 miles in compaſs. The ſuburb called *Pera* is charmingly ſituated; and is the place where the ambaſſadors of England, France, Venice, and Holland, reſide. This city is built in the form of a triangle; and as the ground riſes gradually, there is a view of the whole town from the ſea. The public buildings, ſuch as the palaces, the moſques, bagnios, and caravanſaries for the entertainment of ſtrangers, are many of them very magnificent. E. Long. 29. 20. N. Lat. 41. 4.

CONSTAT, in law, the name of a certificate which the clerk of the pipe and auditors of the exchequer make at the requeſt of any perſon who intends to plead or move in that court for the diſcharge of any thing; and the effect of it is, the certifying what does *conſtare* upon record touching the matter in queſtion.—A conſtat is held to be ſuperior to a certificate; becauſe this may err or fail in its contents; that cannot, as certifying nothing but what is evident upon record.

Alſo the exemplification under the great ſeal of the inrolment of any letters-patent is called a *conſtat*.

CONSTELLATION, in aſtronomy, a ſyſtem of ſeveral ſtars that are ſeen in the heavens near to one another. Aſtronomers not only mark out the ſtars, but, that they may better bring them into order, they diſtinguiſh them by their ſituation and poſition in reſpect to each other; and therefore they diſtribute them into aſteriſms or conſtellations, allowing ſeveral ſtars to make up one conſtellation: and for the better diſtinguiſhing and obſerving them, they reduce the conſtellations to the forms of animals, as men, bulls, bears, &c.; or to the images of ſome things known, as of a crown, a harp, a balance, &c.; or give them the names of thoſe whoſe memories, in conſideration of ſome notable exploit, they had a mind to tranſmit to future ages.

The diviſion of the ſtars by images and figures is of great antiquity, and ſeems to be as old as aſtronomy itſelf: for in the moſt ancient book of Job, Orion, Arcturus, and the Pleiades, are mentioned; and we meet with the names of many of the conſtellations in the writings of the firſt poets, Homer and Heſiod.

The ancients, in their diviſion of the firmament, took in only ſo much as came under their notice, diſtributing it into 48 conſtellations; but the modern aſtronomers comprehend the whole ſtarry firmament, dividing it into three regions. See ASTRONOMY-*Index*.

CONSTERNATION is defined by ethical writers to be an exceſs of horror, owing to the ill government of our admiration and fear: or ſuch an immoderate degree of fear as confounds the faculties, and incapacitates a perſon for conſultation and execution.

CONSTIPATION, in medicine, a hardneſs of the belly, with great coſtiveneſs. See COSTIVENESS.

CONSTITUENT PART, in phyſiology, an eſſential part in the compoſition of any thing, differing little from what is otherwiſe called *element* or *principle*.

CONSTITUTION, in matters of policy, ſignifies the form of government eſtabliſhed in any country or kingdom.

CONSTITUTION alſo denotes an ordinance, deciſion, regulation, or law, made by authority of any ſuperior, eccleſiaſtical or civil.

Apoſtolical CONSTITUTIONS, a collection of regulations attributed to the apoſtles, and ſuppoſed to have been collected by St Clement, whoſe name they likewiſe bear.

It is the general opinion, however, that they are ſpurious, and that St Clement had no hand in them. They appeared firſt in the 4th age, but have been much changed and corrupted ſince that time. They are divided into eight books, conſiſting of a great number of rules and precepts, relating to the duties of Chriſtians, and particularly the ceremonies and diſcipline of the church. Mr Whiſton, in oppoſition to the general opinion, aſſerts them to be a part of the ſacred writing, dictated by the apoſtles in their meetings, and written down from their own mouth by St Clement; and intended as a ſupplement to the New Teſtament, or rather as a ſyſtem of Chriſtian faith, and polity. The reaſon why the Conſtitutions are ſuſpected by the orthodox, and perhaps the reaſon alſo why their genuineneſs is defended by Mr Whiſton, is, that they ſeem to favour Arianiſm.

CONSTITUTION, in a phyſical ſenſe, ſignifies the particular temperature of the body.

It is curious to obſerve, ſays Dr Percival, the revolution which hath taken place, within this century, in the conſtitutions of the inhabitants of Europe. Inflammatory diſeaſes more rarely occur, and, in general, are much leſs rapid and violent in their progreſs than formerly (A); nor do they admit of the ſame antiphlogiſtic method of cure that was practiſed with ſucceſs 100 years ago. The experienced Sydenham makes 40 ounces of blood the mean quantity to be drawn in the acute rheumatiſm; whereas this diſeaſe, as it now appears in the London hoſpitals, will not bear above half that evacuation. Vernal intermittents are frequently cured by a vomit and the bark, without veneſection; which is a proof that at preſent they are accompanied with fewer ſymptoms of inflammation than they were wont to be. This advantageous change, however, is more than counterbalanced by the introduction of a numerous claſs of nervous ailments, in a great meaſure unknown to our anceſtors; but which now prevail univerſally, and are complicated with almoſt every other diſtemper. The bodies of men are enfeebled and enervated; and it is not uncommon to obſerve very high degrees of irritability, under the external appearance of great ſtrength and robuſtneſs. The hypochondria, palſies, cachexies, dropſies, and all thoſe diſeaſes which ariſe from laxity and debility, are in our days endemic every where; and the hyſterics, which uſed to be peculiar to the women, as the name itſelf indicates, now attack both ſexes indiſcriminately. It is evident that ſo great a revolution could not be effected without a concurrence of many cauſes; but amongſt theſe (according to Dr Percival), the preſent general uſe of tea * holds the firſt and principal rank. The ſecond place may perhaps be allowed to exceſs in ſpirituous liquors. This pernicious cuſtom, in many inſtances at leaſt, owes its riſe to the former, which,

* See *Tea*.

(A) The decreaſe in the violence of inflammatory diſeaſes may perhaps in part be aſcribed to the preſent improved method of treating them. Moderate evacuations, cool air, aceſcent diet, and the liberal uſe of ſaline and antimonial medicines, are better adapted to check the progreſs of fevers, than copious bleedings, ſtimulating purgatives, and profuſe ſweats excited by theriaca and mithridate.

which, by the lowneſs and depreſſion of ſpirits it occaſions, renders it almoſt neceſſary to have recourſe to ſomething cordial and exhilarating. And hence proceed thoſe odious and diſgraceful habits of intemperance, with which many of the ſofter ſex are now, alas! chargeable.

CONSTRICTOR, an appellation given to ſeveral muſcles, on account of their conſtringing or cloſing ſome of the orifices of the body.

CONSTRICTION, in geometry, is the drawing ſuch lines, ſuch a figure, &c. as are previouſly neceſſary for making any demonſtration appear more plain and undeniable.

Conſtruction of Equations. See EQUATIONS.

CONSTRUCTION, in grammar; ſyntax, or the arranging and connecting the words of a ſentence according to the rules of the language. See GRAMMAR, and LANGUAGE.

The conſtruction is generally more ſimple, eaſy, and direct, in the modern tongues than in the ancient: we have very few of thoſe inverſions which occaſion ſo much embarraſſment and obſcurity in the Latin; our thoughts are uſually delivered in the ſame order wherein the imagination conceives them: the nominative caſe, for inſtance, always precedes the verb, and the verb goes before the oblique caſes it governs.

The Greeks and Latins, M. St. Evremont obſerves, uſually end their periods, where, in good ſenſe and reaſon, they ſhould have begun; and the elegance of their language conſiſts, in ſome meaſure, in this capricious arrangement, or rather in this tranſpoſal and diſorder of the words. See LANGUAGE.

Conſtruction of Statutes, among lawyers. See LAW, Part II. nº 49.

CONSUALIA, in antiquity, feaſts which were held among the ancients, in honour of the god Conſus *i. e.* Neptune; different from thoſe other feaſts of the ſame deity called Neptunalia. They were introduced with a magnificent cavalcade, or proceſſion on horſeback; becauſe Neptune was reputed to have firſt taught men the uſe of horſes; whence his ſurname of Ἱππιος, *Equeſtris.*

Evander is ſaid to have firſt inſtituted this feaſt: it was re-eſtabliſhed by Romulus, under the name of *Conſus;* becauſe it was ſome god under the denomination of Conſus, that ſuggeſted to him the rape of the Sabines. It is ſaid, that it was with a view to this rape that he made that eſtabliſhment. This, however, is certain, that it was to this feaſt all his neighbours were invited; when, taking advantage of the ſolemnities and ſacrifices, he ſeized the women. To draw the greater concourſe of people, he gave out, that he had found an altar hid under ground, which he intended to conſecrate, with ſacrifices to the god to whom it had been originally erected. Thoſe who take upon them to explain the myſteries of the heathen theology, ſay, that the altar hid under ground, is a ſymbol of the ſecret deſign of Romulus to ſeize his neighbours wives.

The conſualia were of the number of feaſts called ſacred; as being conſecrated to a divinity.—Originally they were not diſtinguiſhed from thoſe of the Circus: whence it is, that Valerius Maximus ſays, that the rape of the Sabines was effected at the games of the Circus. Plutarch obſerves, that during the days of this ſolemnity, horſes and aſſes were left at reſt, and were dreſſed up with crowns, &c. on account of its being the feaſt of Neptunus Equeſtris.—Feſtus ſays, the cavalcade was performed with mules; it being an opinion, that this was the firſt animal uſed to draw the car.

Servius gives us to underſtand, that the conſualia fell on the 13th of Auguſt; Plutarch, in the life of Romulus, places them on the 18th, and the old Roman calendar on the 21ſt of that month.

CONSUBSTANTIAL, in theology, a term of like import with co-eſſential; denoting ſomething of the ſame ſubſtance with another. The orthodox believe the Son of God to be conſubſtantial with the Father.

The term ομȣσιος, *conſubſtantial,* was firſt adopted by the fathers of the councils of Antioch and Nice, to expreſs the orthodox doctrine the more preciſely, and to ſerve as a barrier and precaution againſt the errors and ſubtleties of the Arians; who owned every thing excepting the conſubſtantiality.

The Arians allowed, that the word was God, as having been made God; but they denied that he was the ſame God, and of the ſame ſubſtance with the Father: accordingly they exerted themſelves to the utmoſt to aboliſh the uſe of the word. The emperor Conſtantine uſed all his authority with the biſhops to have it expunged out of the ſymbols; but it ſtill maintained itſelf, and is at this day, as it was then, the diſtinguiſhing criterion between an Athanaſian and an Arian.

Sandius will have it, that the word conſubſtantial was unknown till the time of the council of Nice; but it is certain it had been before propoſed to the council of Antioch, wherein Paulus Samoſatenus had been condemned; though it had there the fortune to be rejected. Curcellæus, on the other hand, maintains, that it was an innovation in doctrine in the council of Nice, to admit an expreſſion, the uſe whereof had been aboliſhed by the council of Antioch.

According to St Athanaſius, the word conſubſtantial was only condemned in the council of Antioch, inaſmuch as it implied the idea of a pre-exiſtent matter, prior to the things formed thereof: now, in this ſenſe, it is certain, the Father and the Son are not conſubſtantial, there having been no pre-exiſtent matter.

CONSUBSTANTIATION, a tenet of the Lutheran church with regard to the manner of the change made in the bread and wine in the euchariſt. The divines of that profeſſion maintain, that after conſecration, the body and blood of our Saviour are ſubſtantially preſent, together with the ſubſtance of the bread and wine, which is called conſubſtantiation, or impanation.

CONSUL, the chief magiſtrate of the Roman commonwealth, inveſted with regal authority for the ſpace of one year. They were two in number, called conſuls *a conſulendo,* and annually choſen in the Campus Martius. The two firſt conſuls were L. Jun. Brutus, and L. Tarquinius Collatinus, choſen in the year of Rome 244, after the expulſion of the Tarquins. In the firſt times of the republic the two conſuls were always choſen from Patrician families or noblemen, but the people obtained the privilege in the year of Rome 388, of electing one of the conſuls from their own body, and ſometimes both were plebeians. The firſt conſul among the plebeians was L. Sextius. It was required that every candidate for the conſulſhip ſhould be 43 years of age, called *legitimum tempus*. He was always to appear at the election as a private man without a retinue, and it was requiſite before he canvaſſed for the office to have diſcharged the functions of quæſtor, edile, and prætor. Sometimes theſe qualifications were diſregarded. Val. Corvinus was made a conſul in his 23d year, and Scipio in his 24th. Young Marius, Pompey, and Auguſtus, were alſo under the proper age when they were inveſted with the office, and Pompey had never been quæſtor or prætor. The power of the conſuls was unbounded, and they knew no ſuperior but the gods and the laws; but after the expiration of their office their conduct was minutely ſcrutinized by the people, and miſbehaviour was often puniſhed by the laws. The badge of their office was the *prætexta*, a robe fringed with purple, afterwards exchanged for the *toga picta* or *palmata*. They were preceded by 12 lictors carrying the *faſces* or bundles of ſticks, in the middle of which appeared an axe. The axe, as being the characteriſtic rather of tyranny than of freedom, was taken away from the *faſces* by Valerius Poplicola, but it was reſtored by his ſucceſſor. They took it by turns monthly to be preceded by the lictors while at Rome, leſt the appearance of two perſons with the badges of royal authority ſhould raiſe apprehenſions in the multitude. While one appeared publicly in ſtate, only a crier walked before the other, and the lictors followed behind without the faſces. Their authority was equal; yet the Valerian law gave the right of priority to the older, and the Julian law to him who had moſt children; and he was generally called *conſul major* or *prior*. As their power was abſolute, they preſided over the ſenate, and could convene and diſmiſs it at pleaſure. The ſenators were their counſellors; and among the Romans the manner of reckoning their years was by the name of the conſuls, and by *M. Tull. Cicerone et L. Antonio Conſulibus*, for inſtance, the year of Rome 689 was always underſtood. This cuſtom laſted from the year of Rome 244 till the 1294, or 541ſt year of the Chriſtian era. In public aſſemblies the conſuls ſat in ivory chairs, and held in their hand an ivory wand called *ſcipio eburneus*, which had an eagle on its top as a ſign of dignity and power. When they had drawn by lot the provinces over which they were to preſide during their conſulſhip, they went to the capitol to offer their prayers to the gods, and intreat them to protect the republic; after this they departed from the city arrayed in their military dreſs and preceded by the lictors. Sometimes the provinces were aſſigned them without drawing by lot, by the will and appointment of the ſenators. At their departure they were provided by the ſtate with whatever was requiſite during their expedition. In their provinces they were both attended by the 12 lictors, and equally inveſted with regal authority. They were not permitted to return to Rome without the ſpecial command of the ſenate; and they always remained in the province till the arrival of their ſucceſſor. At their return they harangued the people, and ſolemnly proteſted that they had done nothing againſt the laws or intereſt of their country, but had faithfully and diligently endeavoured to promote the greatneſs and welfare of the ſtate. No man could be conſul two following years; yet this inſtitution was ſometimes broken, and we find Marius re-elected conſul after the expiration of his office during the Cimbrian war. The office of conſul, ſo dignified during the times of the commonwealth, became a mere title under the emperors, and retained nothing of its authority but the uſeleſs enſigns of original dignity. Even the duration of the office, which was originally annual, was reduced to two or three months by J. Cæſar; but they who were admitted on the firſt of January denominated the year, and were called *ordinarii*. Their ſucceſſors during the year were diſtinguiſhed by the name of *ſuffecti*. Tiberius and Claudius abridged the time of the conſulſhip; and the emperor Commodus made no leſs than 25 conſuls in one year. Conſtantine the Great renewed the original inſtitution, and permitted them to be a whole year in office.

CONSUL, at preſent, is an officer eſtabliſhed by virtue of a commiſſion from a king or ſtate, in all foreign countries of any conſiderable trade, to facilitate and diſpatch buſineſs, and protect the merchants of the nation. The Engliſh conſuls are to keep up a correſpondence with the miniſters of England reſiding in the courts whereon their conſulate depends. They are to ſupport the commerce and the intereſt of the nation; to diſpoſe of the ſums given and the preſents made to the lords and principals of places, to obtain their protection, and prevent the inſults of the natives on the merchants of the nation.

CONSUMMATION, the end, period, or completion of any work. Thus, we ſay, the *conſummation* of all things, meaning the end of the world. By the incarnation, all the prophecies are ſaid to be *conſummated*. See PROPHECY, and ACCOMPLISHMENT.

CONSUMMATION of Marriage, denotes the laſt act of marriage, which makes its accompliſhment; or the moſt intimate union between the married pair, &c.

CONSUMPTION, in medicine, a word of very extenſive ſignification, implies all diſorders that bring any decay or waſte upon the conſtitution; but is moſt commonly uſed for the *phthiſis pulmonalis*. See MEDICINE-*Index*.

CONSUMPTIOM, in farriery. See FARRIERY, § viii.

CONSUS, the pagan god of counſel. He had an altar under ground in the great circus at Rome, to ſhow that counſel ought to be kept ſecret. See CONSUALIA.

CONTACT, is when one line, plane, or body, is made to touch another; and the parts that do thus touch are called the *points* or *places of contact*.

CONTAGION, in phyſic, the communicating a diſeaſe from one body to another. In ſome diſeaſes it is only effected by an immediate contact or touch, as the venom of the pox; in others it is conveyed by infected clothes, as the itch; and in others it is ſuppoſed to be tranſmitted through the air at a conſiderable diſtance, by means of ſteams or effluvia exſpiring from the ſick, as in the plague and other peſtilential diſorders, in which caſe the air is ſaid to be contagious, though this has been diſputed.

CONTEMPLATION, an act of the mind, whereby it applies itſelf to conſider and reflect upon the works of God, nature, &c.

CONTEMPORARY, or COTEMPORARY, a perſon or thing that exiſted in the ſame age with another. Thus, Socrates, Plato, and Ariſtophanes, were contemporaries.

CONTEMPT, in a general ſenſe, the act of deſpiſing, or the ſtate of being deſpiſed.

CONTEMPT, in law, is a diſobedience to the rules and orders of a court, which hath power to puniſh ſuch offence; and as this is ſometimes a greater, and ſometimes a leſſer offence, ſo it is puniſhed with greater or leſs puniſhment, by fine, and ſometimes by impriſonment.

CONTENT, in geometry, the area or quantity of matter or ſpace included in certain bounds.

CONTESSA, a port-town, of Turkey in Europe, in the province of Macedonia, ſituated on a bay of the Archipelago, about 200 miles weſt of Conſtantinople. E. Long. 25. 0. N. Lat. 41. 0.

CONTEXT, among divines and critics, that part of ſcripture or other writing which lies about the text, before or after it, or both. To take the full and genuine ſenſe of the text, the context ſhould be regarded.

CONTEXTURE, a word freqently uſed in ſpeaking both of the works of nature and art; and denoting the diſpoſition and union of the conſtituent parts with reſpect to one another.

CONTI, a town of Picardy in France, with the title of a principality. It is ſeated on the river Seille, in E. Long. 2. 17. N. Lat. 49. 54.

CONTIGUITY, in geometry, is when the ſurface of one body touches that of another.

CONTIGUOUS, a relative term underſtood of things diſpoſed ſo near each other, that they join their ſurfaces or touch. The houſes in ancient Rome were not contiguous as ours are, but all inſulated.

CONTINENCE, in ethics, a moral virtue, by which we reſiſt concupiſcence. It ſhould ſeem that there is this diſtinction between chaſtity and continence, in that it requires no effort to be chaſte, which reſults from conſtitution; whereas continence appears to be the conſequence of a victory gained over ourſelves. The verb *continere*, in the Latin, ſignifies "to reſtrain." The term, however, is moſt uſually applied to men; as *chaſtity* is to women. See CHASTITY.

Continence is a virtue that makes but an inconſiderable figure in our days. However, we ought not to loſe our ideas of things, though we have debauched our true reliſh in our practice: for, after all, ſolid virtue will keep its place in the opinion of the wiſe and ſenſible part of mankind. And though cuſtom has not made it ſo ſcandalous as it ought to be to inſnare innocent women, and triumph in the falſehood; ſuch actions as we ſhall relate muſt be accounted true gallantry, and riſe higher in our eſteem the farther they are removed from our imitation.

Livy, Val. Maximus, &c.

1. Scipio the Younger, when only 24 years of age, was appointed by the Roman republic to the command of the army againſt the Spaniards. His wiſdom and valour would have done honour to the moſt experienced general. Determined to ſtrike an important blow, he formed a deſign of beſieging Carthagena, then the capital of the Carthaginian empire in Spain. His meaſures were ſo judiciouſly concerted, and with ſo much courage and intrepidity purſued, both by ſea and land, that notwithſtanding a bold and vigorous defence, the capital was taken by ſtorm. The plunder was immenſe. Ten thouſand free-men were made priſoners; and above 300 more, of both ſexes, were received as hoſtages. One of the latter, a very ancient lady, the wife of Mandonius, brother of Indibilis king of the Ilergetes, watching her opportunity, came out of the crowd, and, throwing herſelf at the conqueror's feet, conjured him, with tears in her eyes, to recommend to thoſe who had the ladies in their keeping to have regard to their ſex and birth. Scipio, who did not underſtand her meaning at firſt, aſſured her that he had given orders that they ſhould not want for any thing. But the lady replied, "Thoſe conveniences are not what affect us. In the condition to which fortune hath reduced us, with what ought we not to be contented? I have many other apprehenſions, when I conſider, on one ſide, the licentiouſneſs of war; and, on the other, the youth and beauty of the princeſſes which you ſee here before us; for as to me, my age protects me from all fear in this reſpect." She had with her the daughters of Indibilis, and ſeveral other ladies of high rank, all in the flower of youth, who conſidered her as their mother. Scipio then comprehending what the ſubject of her fear was, "My own glory (ſays he), and that of the Roman people, are concerned in not ſuffering that virtue, which ought always to be reſpected wherever we find it, ſhould be expoſed in my camp to a treatment unworthy of it. But you give me a new motive for being more ſtrict in my care of it, in the virtuous ſolicitude you ſhow in thinking only of the preſervation of your honour, in the midſt of ſo many objects of fear." After this converſation, he committed the care of the ladies to ſome officers of experienced prudence, ſtrictly commanding that they ſhould treat them with all the reſpect they could pay to the mothers, wives, and daughters, of their allies and particular friends. It was not long before Scipio's integrity and virtue were put to the trial. Being retired in his camp, ſome of his officers brought him a young virgin of ſuch exquiſite beauty, that ſhe drew upon her the eyes and admiration of every body. The young conqueror ſtarted from his ſeat with confuſion and ſurprize; and, like one thunderſtruck, ſeemed to be robbed of that preſence of mind and ſelf-poſſeſſion ſo neceſſary in a general, and for which Scipio was remarkably famous. In a few moments, having rallied his ſtraggling ſpirits, he inquired of the beautiful captive, in the moſt civil and polite manner, concerning her country, birth, and connections; and finding that ſhe was betrothed to a Celtiberian prince named Allucius, he ordered both him and the captive's parents to be ſent for. The Spaniſh prince no ſooner appeared in his preſence, than, even before he ſpoke to the father and mother, he took him aſide; and, to remove the anxiety he might be in on account of the young lady, he addreſſed him in theſe words: "You and I are young, which admits of my ſpeaking to you with more liberty. Thoſe who brought me your future ſpouſe, aſſured me, at the ſame time, that you loved her with extreme tenderneſs: and her beauty left me no room to doubt it. Upon which

reflecting, that if, like you, I had thought on making an engagement, and were not wholly engroſſed with the affairs of my country, I ſhould deſire that ſo honourable and legitimate a paſſion ſhould find favour, I think myſelf happy in the preſent conjuncture to do you this ſervice. Though the fortune of war has made me your maſter, I deſire to be your friend. Here is your wife: take her, and may the gods bleſs you with her. One thing, however, I would have you be fully aſſured of, that ſhe has been amongſt us as ſhe would have been in the houſe of her father and mother. Far be it from Scipio to purchaſe a looſe and momentary pleaſure at the expence of virtue, honour, and the happineſs of an honeſt man. No: I have kept her for you, in order to make you a preſent worthy of you and of me. The only gratitude I require of you for this ineſtimable gift is, that you would be a friend to the Roman people." Allucius's heart was too full to make him any anſwer: but throwing himſelf at the general's feet, he wept aloud. The captive lady fell into the ſame poſture; and remained ſo, till the father burſt out into the following words: "Oh! divine Scipio! the gods have given you more than human virtue! Oh! glorious leader! Oh! wondrous youth! does not that obliged virgin give you, while ſhe prays to the gods for your proſperity, rapture above all the tranſports you could have reaped from the poſſeſſion of her injured perſon?"

The relations of the young lady had brought with them a very conſiderable ſum for her ranſom: but when they ſaw that ſhe was reſtored to them in ſo generous and godlike a manner, they intreated the conqueror, with great earneſtneſs, to accept that ſum as a preſent; and declared, by his complying, that new favour would complete their joy and gratitude. Scipio, not being able to reſiſt ſuch warm and earneſt ſolicitations, told them that he accepted the gift, and ordered it to be laid at his feet: then addreſſing himſelf to Allucius, I add (ſays he) to the portion which you are to recieve from your father-in-law this ſum; which I deſire you to accept as a marriage-preſent."

If we conſider that Scipio was at this time in the prime of life, unmarried, and under no reſtraint, we cannot but acknowledge, that the conqueſt he made of himſelf was far more glorious than that of the Carthaginian empire: and though his treatment of this captive prince was not more delicate and generous than what might juſtly be expected from a perſon endowed with reaſon and reflection; yet conſidering how few there are in his circumſtances who would have acted as he did, we cannot but applaud his conduct, and propoſe him as a ſuitable example to future ages. Nor was his virtue unrewarded. The young prince, charmed with the liberality and politeneſs of Scipio, went into his country to publiſh the praiſes of ſo generous a victor. He cried out, in the tranſports of his gratitude, "That there was come into Spain a young hero like the gods; who conquered all things leſs by the force of his arms than the charms of his virtue and the greatneſs of his beneficence." Upon this report all Celtiberia ſubmitted to the Romans; and Allucius returned in a ſhort to Scipio, at the head of 1400 choſen horſe, to facilitate his future conqueſts. To render the marks of his gratitude ſtill more durable, Allucius cauſed the action we have juſt related to be engraven on a ſilver ſhield, which he preſented to Scipio; a preſent infinitely more eſtimable and glorious than all his treaſures and triumphs. This buckler, which Scipio carried with him when he returned to Rome, was loſt, in paſſing the Rhone, with part of the baggage. It continued in that river till the year 1665, when ſome fiſhermen found it. It is now in the king of France's cabinet.

2. The circumſtance which raiſes Alexander the Great above many conquerors, and, as it were, above himſelf, is the uſe he made of his victory after the battle of Iſſus. This is the moſt beautiful incident in his life. It is the point of view in which it is his intereſt to be conſidered; and it is impoſſible for him not to appear truly great in that view. By the victory of Iſſus he became poſſeſſed of the whole Perſian empire; not only Syſigambis, Darius's mother, was his captive, but alſo his wife and daughters, princeſſes whoſe beauty was not to be equalled in all Aſia. Alexander, like Scipio, was in the bloom of life, a conqueror, free, and not yet engaged in matrimony: nevertheleſs, his camp was to thoſe princeſſes a ſacred aſylum, or rather a temple, in which their chaſtity was ſecured as under the guard of virtue itſelf; and ſo highly revered, that Darius, in his expiring moments, hearing the kind treatment they had met with, could not help lifting up his dying hands towards heaven, and wiſhing ſucceſs to ſo wiſe and generous a conqueror, who could govern his paſſions at ſo critical a time. Plutarch informs us more particularly, that the princeſſes lived ſo retired in the camp, according to their own deſire, that they were not ſeen by any perſon except their own attendants; nor did any other perſon dare to approach their apartments. After the firſt viſit, which was a reſpectful and ceremonious one, Alexander, to avoid expoſing himſelf to the dangers of human frailty, made a ſolemn reſolution never to viſit Darius's queen any more. He himſelf informs us of this memorable circumſtance, in a letter written by him to Parmenio, in which he commanded him to put to death certain Macedonians who had forced the wives of ſome foreign ſoldiers. In this letter was the following paragraph: "For as to myſelf, it will be found that I neither ſaw nor would ſee the wife of Darius; and did not ſuffer any one to ſpeak of her beauty before me."

Plutarch.

3. Iſocrates informs us, that Nicocles, king of Salamin, gloried in never having known any woman beſides his wife; and was amazed that all other contracts of civil ſociety would be treated with due regard, whilſt that of marriage, the moſt ſacred and inviolable of obligations, was broken through with impunity; and that men ſhould not bluſh to commit an infidelity with reſpect to their wives, of which, ſhould their wives be guilty, it would throw them in the utmoſt anguiſh and fury.

4. Henry VI. king of England, though unhappy in his family and government, was nevertheleſs poſſeſſed of many virtues. He was ſo remarkable for his chaſtity, that before his marriage he would not allow any lady of a ſuſpicious character and ungarded conduct to frequent the court: and having obſerved one day ſome ladies with their boſoms uncovered, he turned away his eyes from the indecent object, and reprimanded them ſmartly in the ſimple dialect of the times;

Rapin.

“ Fy, fy, (ſaid he) for ſhame; forſooth ye be to blame.”

5. In the reign of king Charles II. when licentiouſneſs was at its height in Britain, a yeoman of the guards refuſed the miſtreſs of a king. The lady, who was diſſatisfied with her noble lover, had fixed her eyes upon this man, and thought ſhe had no more to do than ſpeak her pleaſure. He got out of her way. He refuſed to underſtand her; and when ſhe preſſed him further, he ſaid, “ I am married.” The ſtory reached the king, with all its circumſtances: but they who expected an extravagant laugh upon the occaſion were diſappointed. He ſent for the perſon: he found him a gentleman, though reduced to that mean ſtation; and “ Odds fiſh, man (ſays he), though I am not honeſt enough to be virtuous myſelf, I value them that are.” He gave him an appointment, and reſpected him for life.

6. The extreme parts of Scotland, whoſe people are deſpiſed for their poverty, are honeſt in this reſpect to a wonder; and in the Swede's dominion, towards the pole, there is no name for adultery. They thought it an offence man could not commit againſt man; and have no word to expreſs it in their language. The unpoliſhed Lapland peaſant, with theſe thoughts, is, as a human creature, much more reſpectable than the gay Briton, whoſe heart is ſtained with vices, and eſtranged from natural affection; and he is happier. The perfect confidence mutually repoſed between him and the honeſt partner of his breaſt, entails a ſatisfaction even in the loweſt poverty. It gilds the humble heart, and lights the cabin; their homely meal is a ſacrifice of thanks, and every breath of ſmoke ariſes in incenſe. If hand be laid upon hand, it is ſure affection; and if ſome infant plays about their knees, they look upon him and upon each other with a delight that greatneſs ſeldom knows, becauſe it feels diſtruſt.

CONTINENT, in general, an appellation given to things continued without interruption; in which ſenſe we ſay, *continent fever*, &c.

CONTINENT, in geography, a great extent of land not interrupted by ſeas, in contradiſtinction to iſland and peninſula, &c. See GEOGRAPHY.—Sicily is ſaid to have been anciently torn from the continent of Italy; and it is an old tradition, which ſome antiquaries ſtill have a regard to, that Britain was formerly a part of the continent of France.

The world is uſually divided into two great continents, the old and the new. Whether there exiſts in the *ſouthern hemiſphere* another continent, or the whole be only an immenſe watery region, is a queſtion that for near three centuries has engaged the attention of the learned as well as the commercial world, and given riſe to many intereſting voyages and diſcoveries; concerning which, ſee the article SOUTH *Sea*.

CONTINGENT, ſomething caſual or unuſual. Hence future contingent, denotes a conditional event which may or may not happen, according as circumſtances fall out.

CONTINGENT, is alſo a term of relation for the quota that falls to any perſon upon a diviſion. Thus each prince of Germany in time of war is to furniſh ſo many men, ſo much money, and munition, for his contingent.

CONTINUED, or CONTINUAL, in a general ſenſe, means inceſſant, or proceeding without interruption.

CONTINUED Fever, is ſuch a one as ſometimes remits, but never intermits or goes entirely off till its period.

CONTINUED Baſs, in muſic, thus called, ſays Rouſſeau, becauſe it is continued through the whole piece. Its principal uſe, beſides that of regulating the harmony, is to ſupport the voice and preſerve the tone. They pretend that it was one *Ludovico Viana*, of whom a treatiſe ſtill remains, who towards the end of the laſt century firſt put the continued baſs in practice.

CONTINUED Proportion, in arithmetic, is that where the conſequent of the firſt ratio is the ſame with the antecedent of the ſecond; as, 4 : 8 : : 8 : 16; in contradiſtinction to diſcrete proportion.

CONTINUITY, is defined by ſome ſchoolmen the immediate coheſion of parts in the ſame quantum; by others, a mode of body, whereby its extremities become one: and by others, a ſtate of body reſulting from the mutual implication of its parts. There are two kinds of continuity, mathematical and phyſical. The firſt is merely imaginary, ſince it ſuppoſes real or phyſical parts where there are none. The other, or phyſical continuity, is that ſtate of two or more particles, in which their parts are ſo mutually implicated as to conſtitute one uninterrupted quantity or continuum.

CONTINUO, in muſic, ſignifies the thorough baſs, as *baſſo continuo* is the continual or thorough baſs, which is ſometimes marked in muſic-books by the letters B. C.

CONTOBABDITES, a ſect in the ſixth century. Their firſt leader was Severus of Antioch; who was ſucceeded by John the grammarian ſurnamed Philoponus, and one Theodoſius, whoſe followers were alſo called *Theodoſians*. Part of them, who were willing to receive a book compoſed by Theodoſius on the Trinity, made a ſeparate body, and were called *Contobabdites*, from ſome place, which Nicephorus does not mention, but which muſt apparently have been the place where they held their aſſemblies. The Contobabdites allowed of no biſhops; which is the only circumſtance given us concerning them.

CONTOR, CONDOR, or CUNDUR, the American name of a ſpecies of VULTUR.

CONTORSION, in general, ſignifies the action of twiſting or wreſting a member of the body out of its natural ſituation. Rope dancers accuſtom themſelves to contorſions of their limbs, from their youth, to render the fibres of their articulations lax, and ſupple to all kinds of poſtures.

CONTORSION, in medicine, has many ſignifications. 1. It denotes the iliac paſſion. 2. An incomplete diſlocation, when a bone is in part, but not entirely, forced from its articulation. 3. A diſlocation of the vertebræ of the back ſide-ways, or a crookedneſs of theſe vertebræ. And, 4. A diſorder of the head, in which it is drawn towards one ſide, either by a ſpaſmodic contraction of the muſcles on the ſame ſide, or a palſy of the antagoniſt muſcles on the other.

CONTORTÆ, the name of the 30th order in Linnæus's næus's Fragments of a natural method, conſiſting of plants which have a ſingle petal that is twiſted or bent to one ſide. This order contains the following genera, viz. echites, cerbera, gardenia, genipa, microcnemum, nerium, periploca, rawolfia, tabernæmontana, vinca, apocynum, aſclepias, comeraria, ceropegia, cynanchum, plumeria, ſtapelia.

CONTOUR, in painting, the outline, or that which defines a figure.

A great part of the ſkill of the painter lies in managing the contours well. Contour, with the Italian painters, ſignifies the lineaments of the face.

CONTOURNE, in heraldry, is uſed when a beaſt is repreſented ſtanding or running with its face to the ſiniſter ſide of the eſcutcheon, they being always ſuppoſed to look to the right, if not otherwiſe expreſſed.

CONTOURNIATED, a term among antiquaries applied to medals, the edges of which appear as if turned in a lath. This ſort of work ſeems to have had its origin in Greece; and to have been deſigned to perpetuate the memories of great men, particularly thoſe who had bore away the prize at the ſolemn games. Such are thoſe remaining of Homer, Solon, Euclid, Pythagoras, Socrates, and ſeveral athletæ.

CONTRABAND, in commerce, a prohibited commodity, or merchandiſe bought or ſold, imported or exported, in prejudice to the laws and ordinances of a ſtate, or the public prohibitions of the ſovereign. Contraband goods are not only liable to confiſcation themſelves, but alſo ſubject all other allowed merchandiſe found with them in the ſame box, bale, or parcel, together with the horſes, waggons, &c. which conduct them. There are contrabands likewiſe, which, beſides the forfeiture of the goods, are attended with ſeveral penalties and diſabilities.

CONTRACT, in a general ſenſe, a mutual conſent of two or more parties, who voluntarily promiſe and oblige themſelves to do ſomething; pay a certain ſum, or the like. All donations, exchanges, leaſes, &c. are ſo many different contracts.

Contract is particularly uſed in common law, for an agreement or covenant between two, with a lawful conſideration or cauſe. As, if I ſell my horſe for money; or covenant, in conſideration of L. 20, to make you a leaſe of a farm; theſe are good contracts becauſe there is *quid pro quo*.

Uſurious Contract, is a contract to pay more intereſt for money than the laws allow. See Usury.

Thoſe contracts are ſaid to be *null* which the law prohibits the making of; ſuch are all contracts between perſons incapable of contracting, as minors, religious, lunatics, wives without conſent of their huſbands, &c.

Contract is alſo uſed for the inſtrument in writing, which ſerves as a proof of the conſent granted, and the obligation paſſed between the parties.

Among the ancient Romans, contracts, and all voluntary acts, were written, either by the parties themſelves, or by one of the witneſſes, or by a domeſtic ſecretary of one of the parties, whom they called a *notary*, but who was no public perſon as among us.

The contract, when finiſhed, was carried to the magiſtrate, who gave it a public authority by receiving it *inter acta*, into the number of acts under his juriſdiction; giving each of the parties a copy thereof, tranſcribed by his clerks or domeſtic regiſters, and ſealed with his ſeal. Which practice paſſed into France, where it obtained a long time.

CONTRACTILE force, that property or power inherent in certain bodies, whereby, when extended, they are enabled to draw themſelves up again to their former dimenſions.

CONTRACTION, in phyſics, the diminiſhing the extent or dimenſions of a body, or the cauſing its parts to approach nearer to each other; in which ſenſe it ſtands oppoſed to dilatation or expanſion.

Contraction is frequently uſed, by anatomical writers, to expreſs the ſhrinking up of a fibre, or an aſſemblage of fibres, when extended.

Convulſions and ſpaſms proceed from a preternatural contraction of the fibres of the muſcles of the part convulſed. On the contrary, paralytic diſorders generally proceed from a too great laxneſs of the fibres of the parts affected; or from the want of that degree of contraction neceſſary to perform the natural motion or action of the part. In the firſt, therefore, the animal ſpirits are ſuppoſed to flow, either in too great a quantity, or irregularly; and, in the laſt, the animal ſpirits are either denied a free paſſage into the part affected, or the tenſion of the fibrillæ is ſuppoſed inſufficient to promote the circulation.

Contraction, in grammar, is the reducing of two ſyllables into one, as *can't* for *cannot*, *ſhould'ſt* for *ſhouldeſt*, &c.

CONTRADICTION, a ſpecies of direct oppoſition, wherein one thing is found diametrically oppoſite to another.

CONTRADICTORY propositions, are oppoſites, one of which imports a mere and naked denial of the other.

Seeming contradictories is when the members of a period quite diſagree in appearance and ſound, but perfectly agree and are conſiſtent in ſenſe: thus,

> " Cowards die many times before their death:
> " The valiant never taſte of death but once."
>
> Shakespeare.

CONTRAFISSURE, in ſurgery, a kind of fracture, or fiſſure, in the cranium, which ſometimes happens on the ſide oppoſite to that which received the blow, or, at leaſt, at ſome diſtance from it.

CONTRAINDICATION, in medicine, is an indication which forbids that to be done which the main ſcope of a diſeaſe points out.

Suppoſe, *e. gr.* in the cure of a diſeaſe a vomit were judged proper; if the patient be ſubject to a vomiting of blood, it is a ſufficient contraindication as to its exhibition.

CONTRARIETY, an oppoſition between two things, which imports their being contrary to one another; and conſiſts in this, that one of the terms implies a negation of the other, either mediately or immediately; ſo that contrariety may be ſaid to be the contraſt, or oppoſition of two things, one of which imports the abſence of the other, as love and hatred.

CONTRAST; oppoſition or diſſimilitude of figures, by which one contributes to the viſibility or effect of the others. See Resemblance.

CONTRAST, in painting and ſculpture, expreſſes an oppoſition or difference of poſition, attitude, *&c.* of two or more figures, contrived to make variety in a painting, *&c.* as where, in a groupe of three figures, one is ſhown before, another behind, and another ſideways, they are ſaid to be in contraſt.

The contraſt is not only to be obſerved in the poſition of ſeveral figures, but alſo in that of the ſeveral members of the ſame figure: thus, if the right arm advance fartheſt, the right leg is to be hindermoſt; if the eye be directed one way, the arm to go the contrary way, *&c.* The contraſt muſt be purſued even in the drapery.

CONTRAST, in architecture, is to avoid the repetition of the ſame thing, in order to pleaſe by variety.

CONTRATE-WHEEL, in watch-work, that next to the crown, the teeth and hoop whereof lie contrary to thoſe of the other wheels, from whence it takes its name. See WATCH-*Making*.

CONTRAVALLATION, or *the Line of* CONTRAVALLATION, in fortification, a trench guarded with a parapet, and uſually cut round about a place by the beſiegers, to ſecure themſelves on that ſide, and to ſtop the ſallies of the garriſon. See FORTIFICATION.

CONTRAVENTION, in law, a man's failing to diſcharge his word, obligation, duty, or the laws or cuſtoms of the place.

CONTRAYERVA, in botany. See DORSTENIA.

CONTRE, in heraldry, an appellation given to ſeveral bearings, on account of their cutting the ſhield contrary and oppoſite ways: thus we meet with contre-bend, contre-chevron, contre-pale, *&c.* when there are two ordinaries of the ſame nature oppoſite to each other, ſo as colour may be oppoſed to metal, and metal to colour.

CONTRIBUTION, the payment of each perſon's quota of the part he is to bear in ſome impoſition, or common expence. See CONTINGENT, *&c.*—Contributions are either involuntary, as thoſe of taxes and impoſts; or voluntary, as thoſe of expences for carrying on ſome undertaking for the intereſt of the community.

CONTRIBUTIONS, in a military ſenſe, are impoſitions paid by frontier countries to ſecure themſelves from being plundered, and ruined by the enemy's army. The peaſants till their ground under their faith of contributions, as ſecurely as in time of profound peace.

CONTRITION, in theology, a ſorrow for our ſins, reſulting from the reflection of having offended God, from the ſole conſideration of his goodneſs, without any regard to the puniſhment due to the treſpaſs, and attended with a ſincere reſolution of reforming them. The word is derived from the Latin *conterere*, to break or bruiſe.

CONTROL, is properly a double regiſter kept of acts, iſſues, &c. of the officers or commiſſioners in the revenue, army, &c. in order to perceive the true ſtate thereof, and to certify the truth, and the due keeping of the acts ſubject to the enregiſterment.

CONTROLLER an officer appointed to control or overſee the accounts of other officers; and on occaſion, to certify whether or no things have been controlled or examined.

In Britain there are ſeveral officers of this name: as controller of the king's houſe, controller of the navy, controller of the cuſtoms, controller of the mint, &c.

CONTROLLER of the Hanaper, an officer that attends the lord chancellor daily, in term and in ſeal-time, to take all things ſealed in leathern bags from the clerks of the hanaper, and to take the number and effect thereof, and enter them in a book, with all the duties belonging to the king and other officers for the ſame, and ſo charge the clerk of the hanaper with them.

CONTROLLER of the Houſehold, the ſecond officer under the lord ſteward. The name of his office comes from the French word *contrerouler*. His office is to control the accounts and reckonings of the Green Cloth, of which board he is always a member. He carries, a white ſtaff, and is always one of the privy-council. He has L. 107: 17: 6 a-year wages, and L.1092: 2: 6 board-wages.

CONTROLLER of the Pipe, an officer of the exchequer, that makes out a ſummons twice every year, to levy the farms and debts of the pipe. See PIPE and EXCHEQUER.

CONTROLLERS of the Pells, two officers of the exchequer, who are the chamberlain's clerks, and keep a control of the pell of receipts, and going out.

CONTUMACY, in law, a refuſal to appear in court when legally ſummoned, or the diſobedience to the rules and orders of a court having power to puniſh ſuch offence.

CONTUSION, in medicine and ſurgery, any hurt of the body that is inflicted by a blunt inſtrument. See SURGERY.

CONVALLESCENCE, in medicine, the inſenſible recovery of health; or that ſtate in which, after the cure of a diſorder, the body which has been reduced, has not yet regained its vigour, but begins to reſume its powers. Proper aliments conduce to the re-eſtabliſhment of the languid faculties; but as the tone of the bowels is weakened, the digeſtive faculty is not equal to its office, which is ſhown by light ſweats over the whole body; and the ſmalleſt exceſs in this reſpect is oftentimes the occaſion of dangerous relapſes. A perſon in this ſtate is like a taper relumined, which the leaſt degree of wind is ſufficient to extinguiſh.

CONVALLARIA, or, *LILY of the VALLEY*, in botany, a genus of the monogynia order, belonging to the hexandria claſs of plants; and in the natural method ranking under *Sarmentaceæ*, or 11th order. The corolla is ſexfid; the berry ſpotted and trilocular. The ſpecies are eight, three of which are natives of Britain, *viz.* the maialis, or may-lily; the multiflora, or ſolomon's-ſeal; and the polygonatum, or ſweet-ſmelling ſolomon's-ſeal. They are plants of conſiderable beauty, and may eaſily be propagated by their creeping roots.

CONVENARUM URBS, or *Lugdunum*, (anc. geog.) a town of the Convenae, a people of Gallia Narbonenſis at the foot of the Pyrennees. Its origin was owing to the Sertorian war, Pompey compelling the robbers of the Pyrenees and fugitive ſlaves to ſettle there, (Pliny). It ſtood near the head of the Garonne. Now St Bertrand, in Gaſcony. E. Long. 30′, Lat. 43° 15′.

CONVENTICLE, a diminutive of convent; denoting, properly, a cabal, or ſecret aſſembly, of a part of the monks of a convent, to make a brigue or party in the election of an abbot. From the ill uſe of theſe aſſemblies, the word is come into diſrepute; and now ſtands for any miſchievous, ſeditious, or irregular aſſembly. F. Doucine obſerves, the occidentals always eſteemed the fifth general council an unlawful conventicle.

The term conventicle is ſaid, by ſome, to have been firſt applied in England to the ſchools of Wickliff, and has been ſince uſed to ſignify the religious aſſemblies of all in that country who do not conform to the eſtabliſhed doctrines and worſhip of the church of England.

By 22 Car. II. cap. 1. it is enacted, That if any perſons of the age of 16 years, ſubjects of this kingdom, ſhall be preſent at any conventicle, where there are five or more aſſembled, they ſhall be fined 5 s. for the firſt offence, and 10s. for the ſecond; and perſons preaching incur a penalty of L. 20. Alſo ſuffering a meeting to be held in a houſe, &c. is liable to L. 20 penalty. Juſtices of peace have power to enter ſuch houſes, and ſeize perſons aſſembled, &c. And if they neglect their duty, they ſhall forfeit L. 100. And if any conſtable, &c. know of ſuch meetings, and do not inform a juſtice of peace, or chief magiſtrate, &c. he ſhall forfeit L. 5. But the 1ſt W. and M. cap 18. ordains, that proteſtant diſſenters ſhall be exempt from penalties: though, if they meet in a houſe with the doors locked, barred, or bolted, ſuch diſſenters ſhall have no benefit from 1 W. and M. Officers of the government, &c. preſent at any conventicle, at which there ſhall be ten perſons, if the royal family be not prayed for in expreſs words, ſhall forfeit L. 40 and be diſabled; (Stat. 10 Anne, cap. 2.)

CONVENTION, a treaty, contract, or agreement between two or more parties.

Convention is alſo a name given in England to an extraordinary aſſembly of parliament, or the eſtates of the realm, held without the king's writ. Of this kind was the convention parliament which reſtored Charles II. This parliament met above a month before his return, and ſat full ſeven months after his reſtoration, and enacted ſeveral laws ſtill in force, which were confirmed by ſtat. 13 Car. II. c. 7. and c. 14. Such alſo was the convention of eſtates in 1688, who, upon the retreat of king James II. came to a concluſion that he had abdicated the throne, and that the right of ſucceſſion devolved to king William and queen Mary; whereupon their aſſembly expired as a convention, and was converted into a parliament.

Convention of Eſtates, in Scotland, was partly of the nature of a parliament; but differing in this, that the former could only lay on taxes, while parliament could both impoſe taxes and make laws.

CONVENTUAL, ſomething belonging to a convent or monaſtery. See Monastery, and Coenobite.

Conventual is particularly uſed for a religious who actually reſides in a convent; in contradiſtinction to thoſe who are only gueſts, or are entertained there, or in poſſeſſion of benefices depending on the houſe. See Monk.

CONVENTUS juridici, were courts of juſtice eſtabliſhed in the Roman provinces; with a reſort or extent of juriſdiction, circumſcribed and confined within certain limits of diſtrict, whither all who were of the reſort were to repair for juſtice. The unſeaſonable affectation of changing forms of war into forms of civil courts, proved the ruin of Varus and of three legions in Germany, (Florus). *Conventum agere*, is to hold a court of juſtice.

CONVERGING, or *Convergent Lines*, in geometry, are ſuch as continually approach nearer one another, or whoſe diſtances become ſtill leſs and leſs. Theſe are oppoſed to divergent lines, the diſtances of which become continually greater: thoſe lines which converge one way, diverge the other.

Converging Rays, in optics, thoſe rays that, iſſuing from divers points of an object, incline towards another, till at laſt they meet and croſs, and then become diverging rays.

CONVERSATION, or discourse, ſignifies an interlocution between two, or among more perſons; with this diſtinction, that converſation is uſed for any general intercourſe of ſentiments whatever, whereas a diſcourſe means a converſation limited to ſome particular ſubject.

There is no part, perhaps, of ſocial life which affords more real ſatisfaction than thoſe hours which one paſſes in rational and unreſerved converſation. That converſation, however, may anſwer the ends for which it was deſigned, the parties who are to join in it muſt come together with a determined reſolution to pleaſe, and to be pleaſed.

In the conduct of it, be not eager to interrupt others, or uneaſy at being yourſelf interrupted; ſince you ſpeak either to amuſe or inſtruct the company, or to receive thoſe benefits from it. Give all, therefore, leave to ſpeak in turn. Hear with patience, and anſwer with preciſion. Inattention is ill manners; it ſhows contempt; and contempt is never forgiven.

Trouble not the company with your own private concerns, as you do not love to be troubled with thoſe of others. Yours are as little to them as theirs are to you. You will need no other rule whereby to judge of this matter.

Contrive, but with dexterity and propriety, that each perſon may have an opportunity of diſcourſing on the ſubject with which he is beſt acquainted. He will be pleaſed, and you will be informed. By obſerving this rule, every one has it in his power to aſſiſt in rendering converſation agreeable; ſince, though he may not chooſe, or be qualified, to ſay much himſelf, he can propoſe queſtions to thoſe who are able to anſwer them.

Avoid ſtories, unleſs ſhort, pointed, and quite *a-propos*. He who deals in them, ſays Swift, muſt either have a very large ſtock, or a good memory, or muſt often change his company. Some have a ſet of them ſtrung together like onions; they take poſſeſſion of the converſation by an early introduction of one, and then you may have the whole rope; and there is an end of every thing elſe, perhaps, for that meeting, though you may have heard all twenty times before.

Talk often, but not long. The talent of haranguing private company is inſupportable. Senators and barriſters are apt to be guilty of this fault; and members who never harangue in the houſe, will often do it out of the houſe. If the majority of the company be naturally ſilent, or cautious, the converſation will flag, unleſs it be often renewed by one among them who can ſtart new ſubjects. Forbear, however, if poſſible, to broach a ſecond before the firſt is out, leſt your ſtock ſhould not laſt, and you ſhould be obliged to come back to the old barrel. There are thoſe who will repeatedly croſs upon and break into the converſation with a freſh topic, till they have touched upon all, and exhauſted none. Economy here is neceſſary for moſt people.

Laugh not at your own wit and humour; leave that to the company.

When the converſation is flowing in a ſerious and uſeful channel, never interrupt it by an ill-timed jeſt. The ſtream is ſcattered, and cannot be again collected.

Diſcourſe not in a whiſper, or half-voice, to your next neighbour. It is ill-breeding, and, in ſome degree, a fraud; converſation-ſtock being, as one has well obſerved, a joint and common property.

In reflections on abſent people, go no farther than you would go if they were preſent. "I reſolve (ſays biſhop Beveridge) never to ſpeak of man's virtues to his face, nor of his faults behind his back:" ---A golden rule! the obſervation of which would, at one ſtroke, baniſh flattery and defamation from the earth.

CONVERSE, in mathematics. One propoſition is called the *converſe* of another, when, after a concluſion is drawn from ſomething ſuppoſed in the converſe propoſition, that concluſion is ſuppoſed; and then, that which in the other was ſuppoſed, is now drawn as a concluſion from it: thus, when two ſides of a triangle are equal, the angles under theſe ſides are equal; and, on the converſe, if theſe angles are equal, the two ſides are equal.

CONVERSION, in a moral ſenſe, implies a repentance for a temper and conduct unworthy our nature, and unbecoming our obligations to its Author, and a reſolution to act a wiſer and a better part for the future.

CONVERSION, in war, a military motion, whereby the front of a battalion is turned where the flank was, in caſe the battalion is attaked in the flank.

CONVERSION of Equations, the ſame with reduction of equations by multiplication. See ALGERBA.

CONVERT, a perſon who has undergone a converſion.

CONVERT is chiefly uſed in reſpect of changes from one religion, or religious ſect, to another. Converts with relation to the religion turned to, are denominated *apoſtates* with regard to that they have relinquiſhed.

The Jews formerly converted to Chriſtianity in England, were called *converſos*. Henry III. built them a houſe in London, and allowed them a competent ſubſiſtence for their lives; which houſe was called *domus converſorum*. But the number afterwards increaſing, they grew a burden to the crown; upon which they were diſtributed among the monaſteries: and after the expulſion of the Jews under Edward. III. the *domus converſorum* was given for keeping of the rolls.

CONVERTS, in a monaſtic ſenſe, are lay-friars, or brothers, admitted for the ſervice of the houſe: without orders, and not allowed to ſing in the choir. Till the eleventh century, the word was uſed for perſons who embraced the monkiſh life at the age of diſcretion; by which they were diſtinguiſhed from thoſe devoted in their childhood by their parents, called *oblati*. But in the eleventh century, when, they began to receive into monaſteries illiterate perſons, incapable of being clerks, and only deſtined for bodily labour, the ſignification of the word was neceſſarily changed. F. Mabillon obſerves, that it was John firſt abbot of Vallambroſa who firſt introduced theſe brother-converts, diſtinguiſhed by their ſtate from the monks of the choir, who were then either clerks or capable of becoming ſo.

CONVEX, an appellation given to the exterior ſurface of gibbous or globular bodies; in oppoſition to the hollow inner ſurface of ſuch bodies, which is called *concave*: thus we ſay, a convex frieze, lens, mirror, ſuperficies, &c.

CONVEXITY, the exterior ſurface of a convex, *i. e.* gibbous and globular thing; in oppoſition to concavity, or the inner ſurface, which is hollow or depreſſed. See CONCAVE.

The word is of a peculiar import in catoptrics and dioptrics; where it is applied to mirrors and lenſes.

A convex mirror repreſents its images ſmaller than the objects; as a concave one repreſents them larger: a convex mirror reflects the rays from it, diverging; and therefore diſperſes and weakens their effect: as a concave one reflects them converging, ſo as they concur in a point, and have their effect increaſed: and by how much the mirror is a portion of a ſmaller ſphere, by ſo much does it diminiſh the objects, and diſperſe the rays the more. See MIRROR.

A convex lens is either convex on both ſides, called a *convexo-convex*; or it is plain an one ſide and convex on the other, called a *plano-convex*; or concave on one ſide and convex on the other, called a *convexo-concave*, or *concavo-convex*, as the one or the other ſurface prevails, *i. e.* as this or that is a portion of a ſmaller ſphere. All convex lenſes inflect the rays of light in their paſſage, *i. e.* ſend them out from their convex ſurface converging, ſo as that they concur in a point or focus. Hence all convex lenſes magnify, *i. e.* repreſent their images larger than their objects; and this the more as they are portions of ſmallar ſpheres.

CONVEYANCE, in law, a deed or inſtrument that paſſes land, &c. from one perſon to another.

CONVICT, in common law, a perſon that is found guilty of an offence by the verdict of a jury. See the following article.

CONVICTION, in law. When a jury has given a verdict upon trial, finding the priſoner guilty, he is ſaid to be *convicted* of the crime whereof he ſtands indicted. See TRIAL.

When the offender is thus convicted, there are two collateral circumſtances that immediately ariſe. 1. On a conviction in general for any felony, the reaſonable expences of proſecution are by ſtatute 25 Geo. II. c. 36. to be allowed the proſecutor out of the county-ſtock, if he petitions the judge for that purpoſe; and by ſtatute 27. Geo. II. c. 3. poor perſons, bound over to give evidence, are likewiſe intitled to be paid their charges, as well without conviction as with it. 2. On a conviction of larceny in particular, the proſecutor ſhall have reſtitution of his goods by virtue of the ſtatute 21 Hen. VIII. c. 11. For by the common law there was no reſtitution of goods upon an indictment; becauſe it is at the ſuit of the king only; and therefore the party was enforced to bring an appeal of robbery, in order to have his goods again. But, it being conſidered that the party proſecuting the offender by indictment, deſerves to the full as much encouragement as he who proſecutes by appeal, this ſtatute was made, which enacts, that if any perſon be convicted of larceny by the evidence of the party robbed, he ſhall have full reſtitution of his money, goods, and chattels, or the value of them out of the offender's goods, if he has any, by a writ to be granted by the juſtices. And the conſtruction of this act having been in great meaſure conformable to the law of appeals, it has therefore in practice ſuperſeded the uſe of appeals of larceny. For inſtance, as formerly upon appeals, ſo now upon indictments of larceny, this writ of reſtitution ſhall reach the goods ſo ſtolen, notwithſtanding the property of them is endeavoured to be altered by ſale in market overt. And though this may ſeem ſomewhat hard upon the buyer, yet the rule of law is, that *ſpoliatus debet ante omnia reſtitui*, eſpecially when he has uſed all the diligence in his power to convict the felon. And, ſince the caſe is reduced to this hard neceſſity, that either the owner or the buyer muſt ſuffer; the law prefers the right of the owner, who has done a meritorious act by purſuing a felon to condign puniſhment, to the right of the buyer, whoſe merit is only negative, that he has been guilty of no unfair tranſaction. And it is now uſual for the court, upon the conviction of a felon, to order, without any writ, immediate reſtitution of ſuch goods as are brought into court, to be made to the ſeveral proſecutors. Or elſe, ſecondly, without ſuch writ of reſtitution, the party may peaceably retake his goods wherever he happens to find them, unleſs a new property be fairly acquired therein. Or, laſtly, if the felon be convicted and pardoned, or be allowed his clergy, the party robbed may bring his action of trover againſt him for his goods, and recover a ſatisfaction in damages. But ſuch action lies not before proſecution; for ſo felonies would be made up and healed: and alſo recaption is unlawful, if it be done with intention to ſmother and compound the larceny; it then becoming the heinous offence of *theft-bote*.

It is not uncommon, when a perſon is convicted of a miſdemeanor, which principally and more immediately affects ſome individual, as a battery, impriſonment, or the like, for the court to permit the defendant to *ſpeak with the proſecutor*, before any judgement is pronounced; and if the proſecutor declares himſelf ſatisfied, to inflict but a trivial puniſhment. This is done to reimburſe the proſecutor his expences, and make him ſome private amends, without the trouble and circuity of a civil action. But it is ſurely a dangerous practice: and, though it may be entruſted to the prudence and diſcretion of the judges in the ſuperior courts of record, it ought never to be allowed in local or inferior juriſdictions, ſuch as the quarter-ſeſſions: where proſecutions for aſſaults are by this means too frequently commenced rather for private lucre than for the great ends of public juſtice. Above all, it ſhould never be ſuffered, where the teſtimony of the proſecutor himſelf is neceſſary to convict the defendant: for by this means the rules of evidence are entirely ſubverted; the proſecutor becomes in effect a plantiff, and yet is ſuffered to bear witneſs for himſelf. Nay, even a voluntary forgiveneſs by the party injured, ought not, in true policy, to intercept the ſtroke of juſtice. "This (ſays an elegant writer who pleads with equal ſtrength for the *certainty*, as for the lenity of puniſhment), may be an act of good nature and humanity, but is contrary to the good of the public. For although a private citizen may diſpenſe with ſatiſfaction for his private injury, he cannot remove the neceſſity of public example. The right of puniſhing belongs not to any one individual in particular, but to the ſociety in general, or to the ſovereign who repreſents that ſociety; and a man may renounce his own portion of this right, but he cannot give up that of others."

Conviction, in theology, expreſſes the firſt degree of repentance, wherein the ſinner becomes ſenſible of his guilt, of the evil nature of ſin, and of the danger of his own ways.

CONVOCATION, an aſſembly of the clergy of England, by their repreſentatives, to conſult of eccleſiaſtical matters. It is held during the ſeſſion of parliament, and conſiſts of an upper and a lower houſe. In the upper ſit the biſhops, and in the lower the inferior clergy, who are repreſented by their proctors; conſiſting of all the deans and archdeacons, of one proctor for every chapter, and two for the clergy of every dioceſe, in all 143 divines; *viz.* 22 deans, 53 archdeacons, 24 prebendaries, and 44 proctors of the dioceſian clergy. The lower houſe chooſes its prolocutor; whoſe buſineſs it is to take care that the members attend, to collect their debates and votes, and to carry their reſolutions to the upper houſe. The convocation is ſummoned by the king's writ, directed to the archbiſhop of each province, requiring him to ſummon all biſhops, deans, archdeacons, &c.

The power of the convocation is limited by a ſtatute of Henry VIII. They are not to make any canons or eccleſiaſtical laws without the king's licence; nor, when permitted to make any, can they put them in execution, but under ſeveral reſtrictions. They have the examining and cenſuring all heretical and ſchiſmatical books and perſons, &c. but there lies an appeal to the king in chancery, or to his delegates The clergy in convocation, and their ſervants, have the ſame privileges as members of parliament.

Since the year 1665, when the convocation of the clergy gave up the privilege of taxing themſelves to the houſe of commons, they ſeldom have been allowed to do any buſineſs; and are generally prorogued from time to time till diſſolved, a new one being generally called along with a new parliament. The only equivalent for giving up the privilege of taxing themſelves, was their being allowed to vote at elections for members to the houſe of commons, which they had not before.

CONVOLUTION, a winding motion, proper to the trunks of ſome plants, as the convolvulus, or bindweed; the claſpers of vines, bryony, &c.

CONVOLVULUS, BIND-WEED: A genus of the pentandria order, belonging to the monogynia claſs of plants; and in the natural method ranking under the 29th order, *Campanaceæ*. The corolla is campanulated and plaited; there are two ſtigmata; the capſule is bilocular, and the cells are diſpermous. Of this genus there is a great number of ſpecies, the moſt remarkable of which are the following.

1. The ſepium, or large white bind-weed, is often a troubleſome weed in gardens, when its roots are interwoven with thoſe of trees and ſhrubs, or under hedges, as every ſmall piece of root is apt to grow. It flouriſhes under moiſt hedges, and hath white or purpliſh bloſſoms. 2. The ſcammonia, or Syrian bindweed, grows naturally in Syria. The roots are thick, run deep into the ground, and are covered with a dark bark. The branches extend on every ſide to the diſtance of 10 or 12 feet; they are ſlender, and trail on the ground, and are garniſhed with narrow, arrow-pointed leaves. The flowers are of a pale yellow, and come out from the ſide of the branches, two ſitting upon each long footſtalk: theſe are ſucceeded by roundiſh ſeed-veſſels, having three cells filled with ſeeds. 3. The purpureus, or convolvulus major, is an annual plant growing naturally in Aſia and America, but has been long cultivated in the Britiſh gardens. If theſe plants are properly ſupported, they will riſe 10 or 12 feet high in warm ſummers. There are three or four laſting varieties: the moſt common hath a purple flower; the others have a white, a red, or a whitiſh-blue flower, which laſt hath white ſeeds. They flower in June, July, and Auguſt, and their ſeeds ripen in autumn. 4. The nil, or blue bind-weed, riſes with a twining ſtalk 8 or 10 feet high, garniſhed with heart-ſhaped leaves, divided into three lobes, which end in ſharp points. Theſe are woolly, and ſtand upon long footſtalks. The flowers alſo come out on long footſtalks, each ſuſtaining two flowers of a very deep blue colour, whence their name of anil or indigo. This is one of the moſt beautiful plants of the genus: it flowers all the latter part of the ſummer: and in good ſeaſons the ſeeds ripen very well in the open air. 5. The battatas, or Spaniſh potatoes, hath eſculent roots, which are annually imported from Spain and Portugal, where they are greatly cultivated for the table, but they are too tender to thrive in the open air in Britain. Their roots are like the common potato, but require much more room: for they ſend out many trailing ſtalks, which extend ſix or eight feet every way; and at their joints ſend out roots which in warm countries grow to be very large bulbs; ſo that from a ſingle root planted 40 or 50 large potatoes are produced. 6. The canarienſis, with ſoft woolly leaves, is a native of the Canaries; but hath long been preſerved in the Britiſh gardens. It hath a ſtrong fibrous root, from whence ariſe ſeveral twining woody ſtalks, which, where they have ſupport, will grow more than 20 feet high, garniſhed with oblong heart-ſhaped leaves, which are ſoft and hairy. The flowers are produced from the wings of the leaves, ſeveral ſtanding upon one footſtalk. They are for the moſt part of a pale blue; but there is a variety with white flowers, They appear in June, July, and Auguſt, and ſometimes ripen ſeeds there. 7. The tricolor, or convolvulus minor, is a native of Portugal; but hath long been cultivated in the gardens of Britain. It is an annual plant, which hath ſeveral thick herbaceous ſtalks growing about two feet long, which do not twine like the other ſorts, but decline toward the ground, upon which many of the lower branches lie proſtrate; they are garniſhed with ſpear-ſhaped leaves, which ſit cloſe to the branches; the footſtalks of the flowers come out juſt above the leaves of the ſame joint, and at the ſame ſide of the ſtalks. They are about two inches long, each ſuſtaining one large open bell-ſhaped flower, which in ſome is of a fine blue colour with a white bottom; in others they are pure white, and ſome are beautifully variegated with both colours. The white flowers are ſucceeded by white ſeeds, and the blue by dark-coloured ſeeds; which difference is pretty conſtant. 8. The ſoldanella, or ſea-bindweed, ſtyled alſo *braſſica marina*, grows naturally on the ſea-beaches in many parts of England, but cannot be long preſerved in gardens. It hath many ſmall white ſtringy roots, which ſpread wide and ſend out ſeveral weak trailing branches. Theſe twine about the neighbouring plants like thoſe of the common bindweed, garniſhed with kidney-ſhaped leaves like thoſe of the leſſer celandine. The flowers are produced on the ſide of the branches at each joint. They are of a reddiſh purple colour, and appear in July. They are ſucceeded by round capſules, having three cells, each containing one black ſeed. 9. The turpethum is a native of the iſland of Ceylon. This hath fleſhy thick roots which ſpread far in the ground, and abound with a milky juice that flows out when the roots are broken or wounded, and ſoon hardens into a reſinous ſubſtance when expoſed to the ſun and air. From the root ſhoot forth many twining branches, which twiſt about each other, or the neighbouring plants, like the common bindweed. They are garniſhed with heart-ſhaped leaves that are ſoft to the touch, like thoſe of the marſhmallow. The flowers are produced at the joints on the ſide of the ſtalks, ſeveral ſtanding together on the ſame footſtalk: they are white, and ſhaped like thoſe of the common great bindweed, and are ſucceeded by round capſules, having three cells containing two ſeeds each. 10. The jalappa, or jalap, uſed in medicine, is a native of Haleppo in Spaniſh America, ſituated between La Vera Cruz and Mexico. It hath a large root of an oval form, which is full of a milky juice; from which come out many herbaceous twining ſtalks riſing eight or ten feet high, garniſhed with variable leaves; ſome of them being heart-ſhaped, others angular, and ſome oblong and pointed. They are ſmooth, and ſtand upon long footſtalks; the flowers are ſhaped like thoſe of the common greater bindweed, each footſtalk ſupporting only one flower.

Culture. The firſt and ſecond ſorts are propagated by ſeeds, which muſt be ſown on a border of light earth. The ſecond ſort muſt have ſome tall ſtakes placed near them for their branches to twine about, otherwiſe they will ſpread on the ground and make a bad appearance. The third ſort is annual, and muſt be propagated by ſeeds ſown on a hot-bed in the ſpring, and towards the end of May they ſhould be planted out in warm borders, and treated in the ſame manner with the former. The fourth ſpecies is ſometimes propagated in Britain. The roots muſt be planted on a hot-bed in the ſpring; and if the plants are covered in bad weather with glaſſes, they will produce flowers and ſome ſmall bulbs from the joints of the ſtalks: but if they are expoſed to the open air, they ſeldom grow to any ſize. The fifth is propagated by laying down the young ſhoots in the ſpring, which generally put out roots in three or four mouths: they may then be taken from the old plants, and each placed in a ſeparate pot, which is to be ſet in the ſhade till they have taken new root; after which they may be placed with other hardy green-houſe plants till autumn, when they ſhould be removed into the greenhouſe, and afterwards treated in the ſame manner as myrtles and other green-houſe plants. The turpeth and jalap are too tender to live in Britain, unleſs they are conſtantly keep in a ſtove. The other ſpecies require no particular directions for their cultivation.

Uſes. The root of the firſt ſort is a very acrid purgative to the human race, but is eaten by hogs in large quantities without any detriment. The inſpiſſated juice of the ſecond ſpecies is uſed in medicine as a ſtrong purgative; as are alſo the roots of the jalappa and turpethum. The ſoldanella has likewiſe been uſed with the ſame intention. Half an ounce of the juice, or a drachm of the powder, is an acrid purge. The leaves applied externally are ſaid to diminiſh dropſical ſwellings of the feet. See SCAMMONY, JALAP, and TURPETH.

CONVOY, in naval affairs, one or more ſhips of war, employed to accompany and protect merchant ſhips, and prevent their being inſulted by pirates, or the enemies of the ſtate in time of war.

CONVOY, in military matters, a body of men that guard any ſupply of men, money, ammunition, or proviſions, conveyed by land into a town, army, or the like, in time of war.

CONUS, a CONE, in botany: a ſpecies of fruit or ſcaly ſeed-veſſel, ſo termed by Tournefort and other botaniſts. Linnæus has ſubſtituted STROBILUS in its place.

CONVULSION, a preternatural and violent contraction of the membranous and muſcular parts of the body. See (the *Index* ſubjoined to) MEDICINE.

CONWAY, a market-town of Caernarvonſhire in North Wales, ſituated near the mouth of a river of the ſame name, 15 miles weſt of St Aſaph. W. Long. 3. 50. N. Lat. 53. 20.

CONYZA, FLEABANE; a genus of the polygamia ſuperflua order, belonging to the ſyngeneſia claſs of plants; and in the natural method ranking under the 49th order, *Compoſitæ*. The pappus is ſimple, the calyx imbricated and roundiſh, the corollulæ of the radius trifid. There are 19 ſpecies, none of which merit any particular deſcription.

CONZA, a town of the kingdom of Naples in Italy, ſituated on the farther principate, on the river Offanto, 50 miles ſouth-eaſt of the city of Naples. E. Long. 16. 0. N. Lat. 41. 0. It is the ſee of an archbiſhop.

COOK (Sir Anthony), deſcended from Sir Thomas Cook lord mayor of London, was born in 1506, and ſuppoſed to have been educated at Cambridge. He was ſo eminent for his learning, piety, and prudence, that the guardians of king Edward VI. appointed him to be his chief inſtructor in learning, and to form his manners. He had four daughters; and being reſolved to have ſons by education, leſt he ſhould have none by birth, he taught his daughters thoſe leſſons by night that he had inſtilled into the prince by day: he was happy in his endeavours, as they proved learned in Greek and Latin, and equally diſtinguiſhed by virtue, piety, and good fortune. Mildred was married to the great lord Burleigh; Ann to Sir Nicholas Bacon, lord keeper of the great ſeal; Eliſabeth to Sir John Ruſſel, ſon and heir of Francis earl of Bedford; and Catharine to Sr Henry Killigrew. He lived in exile during the Marian perſecution; and returning on the acceſſion of queen Elizabeth, ſpent the reſt of his days in peace and honour, dying in 1576.

COOK (Captain James), one of the moſt celebrated navigators ever produced by Britain or any other country, was the ſon of James Cook, ſuppoſed to have been a native of the county of Northumberland. His ſtation was no higher than that of a ſervant in huſbandry, and he was married to a woman in his own ſphere of life at Morton, a village in the North riding of Yorkſhire. From this place they removed to another village, in the ſame riding named *Marton*, where Captain Cook was born on the 27th of October 1728. He was one of nine children, all of whom are now dead except a daughter, who married a fiſherman of Redcar. He received the firſt rudiments of education from the ſchoolmiſtreſs of the village; and afterwards, on his father's removal to Great Ayton, he was put to a day ſchool, at the expence of Mr Skottow, his father's employer, where he was inſtructed in writing and in a few of the firſt rules of arithmetic. Before the age of thirteen he was bound apprentice to Mr W. Sanderſon, a haberdaſher or ſhopkeeper at Straiths, about ten miles from Whitby: but ſome diſagreement taking place between him and his maſter, he indulged his own inclination in binding himſelf apprentice to Meſſrs Walkers of Whitby, who had ſeveral veſſels in the coal trade; and after ſerving a few years longer in the ſituation of a common ſailor, he was at length raiſed to be mate of one of Mr Walker's ſhips. During all this period it is not recollected that he exhibited any thing peculiar either in his abilities or conduct.

Early in the year 1755, when hoſtilities broke out between France and England, Cook entered on board the Eagle of ſixty guns, to which veſſel Sir Hugh Palliſer was ſoon after appointed, who ſoon diſtinguiſhed him as an active and diligent ſeaman; and his promotion was forwarded by a letter of recommendation which was written by Mr Oſbaldeſton, member for Scarborough, at the requeſt of ſeveral neighbours, in Mr Cook's favour. On the 15th of May 1759, he was appointed maſter of the Mercury, which ſoon after ſailed to America, and joined the fleet under Sir Charles Saunders at the memorable ſiege of Quebec. His intereſt with the admiralty appears even then to have been very ſtrong; for on Mr Oſbaldeſton's letter he was appointed maſter of the Grampus ſloop; but the proper maſter having unexpectedly returned to her, the appointment did not take place. Four days after he was made maſter of the Garland; when upon inquiry it was found that he could not join her, as the veſſel had already ſailed; and the next day, May 15th 1759, he was made maſter of the Mercury. On this occaſion he was recommended by Captain Palliſer to a difficult and dangerous ſervice, *viz.* to take the ſoundings of the river St Lawrence, between the iſland of Orleans and the north ſhore, which he performed in the moſt complete manner; and ſoon afterwards he was employed to ſurvey the moſt dangerous parts of the river below Quebec: theſe were his firſt efforts with the pencil. After this expedition he was appointed, on the 22d of September, maſter of the Northumberland, ſtationed at Halifax, where he firſt read Euclid, and applied to aſtronomy and other branches of ſcience. In the year 1762 he was with the Northumberland, aſſiſting at the recapture of Newfoundland; and in the latter end of the ſame year he returned to England, and married, at Barking in Eſſex, Miſs Elizabeth Batts. Early in 1763, when admiral (then Captain) Greaves was appointed governor of Newfoundland, Mr Cook went out with him to ſurvey the coaſts of that iſland. At the end of the ſeaſon he returned to England; but in the beginning of 1764, Sir Hugh Palliſer being appointed governor of Newfoundland and Labradore, Mr Cook accompanied him in the ſame capacity of ſurveyor, and had the Grenville ſchooner to attend him on that buſineſs; in this ſituation he continued till 1767.

While Mr Cook remained on this ſtation, he had an opportunity of exhibiting publicly a ſpecimen of his progreſs in the ſtudy of aſtronomy, by a ſhort paper printed in the 57th volume of the Philoſophical Tranſactions, intitled "An obſervation of an eclipſe of the ſun at the iſland of Newfoundland, Auguſt 5, 1766, with the longitude of the place of obſervation deduced from it." Mr Cook's obſervation was made at one of the Burgeo iſlands near Cape Ray, in N. Lat. 47° 56′ 19″, and by the compariſons of it made by Mr Mitchel with an obſervation of Dr Hornſby at Oxford, it appeared to have been accurately done; and Mr Cook at that time obtained the character of an able aſtronomer.

In the mean time a ſpirit for geographical diſcoveries, which had gradually declined ſince the beginning of the 17th century, began to diſcover itſelf anew. Two voyages of this kind had been performed in the reign of George II. the one under Captain Middleton, the other by Captains Moore and Smyth, with a view to diſcover a northweſt paſſage through Hudſon's Bay to the Eaſt Indies. Two others, under Captains Byron, Wallis, and Carteret, had been undertaken ſoon after the concluſion of the peace in 1763 by order of his preſent Majeſty; and before the return of theſe navigators, who were ordered to ſail round the world, another voyage was reſolved upon for aſtronomical purpoſes. It having been calculated that a tranſit of Venus over the ſun's diſk would happen in 1769, a long memorial to his Majeſty was preſented by the Royal Society; in which they ſet forth the great importance of making proper obſervations on this phenomenon, the regard that had been paid to it by the different courts of Europe, and intreating, among other things, that a veſſel might be fitted out, at the expence of government, for conveying proper perſons to ſome of the Friendly Iſlands, in order to make the neceſſary obſervations. This being complied with on the part of his Majeſty, Alexander Dalrymple, Eſq; an eminent member of the Royal Society, was appointed to take the command of the bark appropriated for the purpoſe. In the execution of the project, however, an unexpected difficulty occurred. Mr Dalrymple, ſenſible of the impoſſibility of guiding a veſſel through unknown and dangerous ſeas without any proper command over the crew, demanded a brevet commiſſion as captain of the veſſel, in the ſame manner as had formerly been granted to Dr Halley in a voyage of diſcovery made by him. This commiſſion Sir Edward Hawke abſolutely refuſed to ſign; declaring, when preſſed upon the ſubject, that he would rather ſuffer his right hand to be cut off than truſt any of his Majeſty's ſhips to a perſon who had not been properly bred to the ſervice: and in this proceeding he ſeemed to be juſtified by the mutinous behaviour of Dr Halley's crew; who, denying the legality of his authority over them, had involved him in a very diſagreeable diſpute, and which was attended with pernicious conſequences. Mr Dalrymple, on the other hand, being equally determined in his refuſal to proceed without the authority in queſtion, there was a neceſſity for finding out ſome perſon of ſcience who might alſo be free from the objection made by Sir Edward Hawke. Mr Cook therefore was propoſed by Mr Stephens; and his recommendation being ſeconded by Sir Hugh Palliſer, he was immediately appointed to direct the expedition; and on this occaſion was promoted to the rank of lieutenant in his Majeſty's ſervice.

Mr Cook's commiſſion as lieutenant was dated May 25, 1768; a veſſel of 370 tons, named the *Endeavour*, was provided for him; and while the neceſſary preparations were making for the voyage, Captain Wallis returned. It having been recommended to this gentleman to fix upon a proper place for making the aſtronomical obſervations, he had accordingly choſen the iſland named by him *George's Iſland*, but ſince known by the name of *Otaheite*; judging alſo that Port Royal harbour in it would afford an eligible ſituation. This propoſal being accepted, directions for the purpoſe were accordingly given to Mr Cook, with whom Mr Charles Green was joined in the aſtronomical part; the latter having been aſſiſtant to Dr Bradley in the Royal Obſervatory at Greenwich, and thus judged to be every way qualified for the office. The lieutenant was likewiſe accompanied by Mr Banks, now Sir Joſeph Banks, Dr Solander, &c. The principal deſign of the voyage was, as has already been hinted, to make obſervations on the tranſit of Venus; but this being done, Mr Cook was directed to make further diſcoveries in the Pacific Ocean; and on the 30th of July 1768 he ſet ſail on his expedition. An account of the voyage, and the diſcoveries made during the time of it, is given in the next article: here it is ſufficient to obſerve, that throughout the whole Mr Cook approved himſelf an able ſeaman; and from his behaviour both to his own people and to the ſavage nations he occaſionally met with, ſhowed a moſt exact regard to the rules both of juſtice and humanity. On his firſt arrival at Otaheite, the following regulations were drawn up for his people, which he took care ſhould be punctually obeyed: 1. To endeavour, by every fair means, to cultivate a friendſhip with the natives, and to treat them with all imaginable humanity. 2. A proper perſon or perſons to be appointed to treat with the natives for proviſions, fruits, &c. and no other perſon belonging to the ſhip to do ſo without leave. 3. Every perſon on ſhore to attend punctually to his duty, and to pay proper attention to his tools or arms; and if loſt through negligence, to have the full value charged againſt his pay, with ſuch farther puniſhment inflicted as occaſion might require. 4. The ſame penalty to be inflicted on every one who ſhould embezzle, trade with, or offer to trade with, any part of the ſhips ſtores; and, 5. No iron to be given in exchange for any thing but proviſions. His rigid adherence to theſe rules was manifeſted in ſeveral inſtances, particularly by ſeverely puniſhing the ſhip's butcher, who had threatened the life of a woman, wife to one of the chiefs of the iſland, for refuſing a ſtone hatchet on the terms he propoſed. On erecting their obſervatory, in order to go through the aſtronomical operations, an accident happened which had like to have diſconcerted the whole ſcheme. This was the loſs of their quadrant, which had been ſtolen by ſome of the natives; but, chiefly through the exertions of Mr Banks, it was recovered, and the obſervations made accordingly. Scarce was this accompliſhed, however, before another theft of the natives demanded the moſt ſerious conſideration of the commander. Some of them taking advantage of the attention of the officers being otherwiſe engaged, took the opportunity of breaking into one of the ſtore-rooms, and ſtealing from thence a bag of ſpike nails of no leſs than an hundred weight. This was a moſt important affair; for as thoſe nails were of great eſtimation among the Indians, the poſſeſſion of ſuch quantity muſt undoubtedly have much leſſened their value, and thus rendered proviſions of every kind greatly dearer on the iſland than before. One of the thieves therefore being diſcovered, was puniſhed with 200 laſhes: notwithſtanding which he obſtinately refuſed to diſcover any of his accomplices. Repeated thefts committed afterwards required all the wiſdom and reſolution of Mr Cook to conduct himſelf in a proper manner. After due conſideration, he judged it to be a matter of importance to put an end to theſe practices at once, by doing ſomething which might engage the natives themſelves to prevent them for their common intereſt. This, however, he was not at preſent able to accompliſh; nor indeed did it ſeem poſſible to prevent them without uſing fire-arms, which from motives of humanity he ſtill determined to avoid. At laſt, after a ſtay of three months, when preparing to take his leave, the moſt diſagreeable adventure took place that he had hitherto met with. This was the deſertion of two of his people, who having married young women of the country, determined to take up their reſidence in it. Mr Cook was now obliged to ſeize ſome of the chiefs, and to inform them that they could not obtain their liberty unleſs the deſerters were recovered. This at laſt produced the deſired effect; the deſerters were given up, and Mr Cook ſet ſail, along with Tupia (who had formerly been the prime miniſter to Oberea, a princeſs of the iſland) and a boy of 12 years of age, both of whom were deſirous of accompanying him to England.

While Mr Cook proceeded to viſit others of the South Sea Iſlands, Tupia occaſionally ſerved as an interpreter. On his arrival in New Zealand, Mr Cook found the people extremely hoſtile and inſolent. At their very firſt meeting, one of the natives having threatened to dart his lance into the boat, was ſhot dead. Another, having carried off Mr Green's hanger, was fired at with ſmall ſhot, and upon his ſtill refuſing to reſtore it, was fired at with ball and killed. This, however, produced very little effect on the reſt, who offered to make an attack upon them, till ſeveral muſkets were fired with ſmall ſhot, which wounded three or four more. Next day the commander, having determined to force ſome of the natives on board in order to conciliate their affections by kind treatment, directed his men to follow two canoes whom he perceived under way before him. One made her eſcape, but the other, not obſerving the boats in purſuit, was overtaken; on which the ſavages plied their oars ſo briſkly, that the ſhip's boats were not able to keep up with them. Tupia, whoſe language the New Zealanders underſtood, called to them to return, with aſſurances that no hurt ſhould be done them; but they continued their flight without minding him. A muſket was then fired over their heads with a view to intimidate them, but upon this they prepared to fight; and on the coming up of the boats began the attack with ſo much vigour, that the lieutenant's people were obliged to fire upon them with ball, by which four out of ſeven that were in the boat were killed, and the other three jumped into the water, and were taken on board.

This part of Mr Cook's conduct ſeems inconſiſtent with that humanity for which he was in general ſo eminently diſtinguiſhed; he was aware of the cenſure, and makes the following apology. "Theſe people certainly did not deſerve death for not chooſing to confide in my promiſes, or not conſenting to come on board my boat, even if they had apprehended no danger: but the nature of my ſervice required me to obtain a knowledge of their country, which I could no otherwiſe obtain but by forcing into it in an hoſtile manner, or gaining admiſſion through the confidence and good will of the people. I had already tried the power of preſents without effect; and I was now prompted by my deſire to avoid farther hoſtilities, to attempt to get ſome of them on board; the only method we had left of convincing them that we intended them no harm, and had it in our power to contribute to their gratification and convenience. Thus far my intentions certainly were not criminal; and tho' in the conteſt, which I had not the leaſt reaſon to expect, our victory might have been complete without ſo great an expence of life; yet in ſuch ſituations, when the command to fire has once been given, no man can pretend to reſtrain its exceſs, or preſcribe its effect."

Notwithſtanding the diſaſter juſt mentioned, to which the three New Zealanders, who were taken on board, had been witneſſes, they were ſoon conciliated, and began to ſing with a degree of taſte that ſurpriſed the Engliſh gentlemen. They were boys, the oldeſt about 19 and the youngeſt about 11; but no kindneſs which could be ſhown them was in any degree effectual to bring about a reconcilation with the reſt. On the contrary, having perceived the ſhip in ſome diſtreſs, they inſtantly ſhowed a diſpoſition to make an attack; and from this they were only prevented by the firing of a four-pounder charged with grape ſhot. Even this did not produce any permanent effect; another attack was determined upon, and would undoubtedly have been made, had not Tupia informed them, that if they perſiſted in the attempt, the arms of their adverſaries, like thunder, would deſtroy every one of them. This was enforced by the fire of another four-pounder with grape ſhot, which ſpreading wide in the water, terrified them to ſuch a degree that they began to paddle away as faſt as poſſible. Notwithſtanding this, however, ſome intercourſe began to take place; but in every inſtance the New Zealanders manifeſted their hoſtility and treachery in ſuch a manner as ſhowed that they were not to be gained by fair means. At laſt an attempt to carry off Tayeto, Tupia's boy, rendered it abſolutely neceſſary to fire upon them in order to reſcue him from certain deſtruction, ſome of the ſavages having got him into a canoe, where they held him down by violence. In conſequence of this one of the ſavages was killed on the ſpot, and ſeveral more wounded, by the diſcharge of muſkets from the boats; Tayeto recovered his liberty, jumped into the water, and ſwam to the ſhip. Some partial intercourſe again took place; but ſtill it appeared that the innate rancour of theſe ſavages was neither to be ſubdued by fair means nor foul; and it was only by the powerful arguments of cannon and muſketry that they could be kept from attempting to do miſchief.

From the account of this voyage publiſhed by Dr Hawkeſworth, indeed, it appears that a conſiderable number of ſavages periſhed in a manner ſimilar to that abovementioned, and they ſeem to have manifeſted a more hoſtile behaviour than afterwards: on thoſe melancholy occaſions, however, it is obſerved to the honour of Mr Cook, that his humanity was eminently conſpicuous beyond that of the common people, who all along ſhowed as much inclination to deſtroy the Indians as a ſportſman does to kill the game he purſues.

While Mr Cook coaſted the iſlands of New Zealand, he was ſometimes in the moſt imminent danger of being ſhipwrecked. In the latitude of 35° ſouth, and in the midſt of ſummer in that climate, he met with ſuch a gale of wind as he ſcarce ever experienced before; ſo that he was no leſs than three weeks in getting ten leagues to the weſtward, and two more before he could get 30 leagues farther. Fortunately, however, they were all this time a conſiderable way from land, otherwiſe it is probable that the ſtorm muſt have proved fatal.

Mr Cook having ſpent ſix months in circumnavigating and fully exploring the iſlands of New Zealand, he ſailed from thence on the 31ſt of March 1770. It muſt be obſerved, however, that the extreme hoſtility manifeſted by the inhabitants in that part of the iſland where he firſt arrived, was not univerſally diffuſed, but that a friendly intercourſe was for a long time maintained with thoſe about Queen Charlotte's Sound. From New Zealand he proceeded to New Holland, and on the 28th of April came in ſight of Botany Bay. Here all their endeavours to induce the natives to have any intercourſe with them proved ineffectual, tho' happily there was no blood ſpilt in any quarrel.

During their navigation round New Holland, the coaſts of which are full of dangerous rocks and ſhoals, our navigators were brought into a more perilous ſituation than ever; and from which the eſcape was ſo extraordinary, that it deſerves a particular relation. This happened on the 10th of June 1770, as they purſued their courſe from Trinity Bay, and nearly in the latitude aſſigned to the iſlands diſcovered by Quiros. At that time they had the advantage of a fine breeze and a clear moonlight; and in ſtanding off from ſix till near nine o'clock, the ſhip had deepened her water from 14 to 21 fathoms; but while the navigators were at ſupper, it ſuddenly ſhoaled to 12, 10, and 8 fathoms, in the ſpace of a few minutes. Every thing was then ready for putting the ſhip about, when they ſuddenly got into deep water again, and continued in 20 and 21 fathoms for ſome time, ſo that the gentlemen went to bed in perfect ſecurity. A little before eleven, however, the water ſhoaled at once from 20 to 17 fathoms; and before the lead could be heaved again, the ſhip ſtruck, and remained immoveable, excepting as far as ſhe was heaved up and down and daſhed againſt the rocks by the ſurge. The alarm was now univerſal, and not indeed without the greateſt reaſon. It appeared that the veſſel had been lifted over the ledge of a rock, and lay in a hollow within it, where there were in ſome places from three to four fathoms water, and in others ſcarce as many feet: the ſheathing boards were disjoined, and floating round the ſhip in great numbers; and at laſt the falſe keel alſo was deſtroyed, while the rock kept grating her bottom with ſuch force as to be heard in the fore ſtore-room. It was now neceſſary to lighten the ſhip as much as poſſible; and this was done with all expedition to the amount of more than 50 tons. In the morning of the 11th of June they diſcovered the land at about eight leagues diſtance, without any iſland between, on which they could have been ſent aſhore in the event of the ſhip going to pieces, that ſo they might have been carried to the main land by turns. To add to their diſtreſs, the ſhip drew ſo much water, that it could ſcarce be kept under by three pumps. Laſtly, it appeared, that even the riſing of the tide, on which they had ultimately depended for relief, was inſufficient to anſwer the purpoſe, as the day-tide fell conſiderably ſhort of that in the night-time. Having therefore lightened the ſhip ſtill further, by throwing out every thing that could poſſibly be ſpared, they waited with patience for the next tide; when, after incredible exertion, the ſhip righted, and they got her over the ledge of the rock into deep water. By continual labour, however, the men were at laſt ſo much exhauſted, that they could not ſtand to the pumps more than five or ſix minutes at a time; after which they threw themſelves flat on the deck, though a ſtream of water between three and four inches deep ran over it; and in this ſituation they lay till others, exhauſted as well as themſelves, took their places, on which they ſtarted up again, and renewed their exertions. In this dreadful extremity Mr Monkhouſe, a midſhipman, propoſed the expedient of fothering the ſhip, as it is called, by which means he ſaid he had ſeen a merchant ſhip brought from Virginia to London after ſhe had ſprung a leak that admitted more than four feet water in an hour. The expedient being approved of, it was put into execution in the following manner. He

Cook.

took a lower ſtudding-ſail, and having mixed a large quantity of oakum and wool together, ſtitched them down by handfuls as lightly as poſſible; the whole being afterwards ſpread over with the dung of the ſheep and other filth. The ſail was then hauled under the ſhip's bottom by means of ropes which kept it extended. When it came under the leak, the wool and oakum, with part of the ſail, were forced inwards by the preſſure of the water, which thus prevented its own ingreſs in ſuch an effectual manner, that one pump, inſtead of three, was now ſufficient to keep it under. Thus they got the ſhip into a convenient port on the coaſt of New Holland, where there was an opportunity of fully repairing her defects. Here they diſcovered that their preſervation had not been owing entirely to the expedient abovementioned; for one of the holes was in a great meaſure filled up by a piece of rock which had broken off and ſtuck in it; and this hole was ſo large, that had it not been filled up in the manner juſt mentioned, they muſt undoubtedly have periſhed notwithſtanding all the aſſiſtance that could have been derived from the pumps.

The dangers they ſuſtained in navigating this coaſt were innumerable, inſomuch that for very near three months they were obliged to have a man conſtantly in the chains heaving the lead. They were always entangled among rocks and ſhoals, which could not have failed to deſtroy a leſs experienced navigator; and even Mr Cook, with all his ſagacity, could not ſometimes have extricated himſelf, had it not been for the favourable interpoſition of ſome natural events, which no human penetration could foreſee or have the leaſt dependence upon. Of this we ſhall only give the following inſtance. Having at laſt, as they thought, got ſafely over the vaſt reefs of ſunk rocks with which the coaſt of New Holland is ſurrounded, they flattered themſelves that all danger was paſſed, and the vaſt ſwell of the water convinced them that they were now in the open ocean. The remembrance of former dangers, however, induced them frequently to take the precaution of ſounding; notwithſtanding which, in the latitude of about 14½° S. they found themſelves one morning only about a mile diſtant from the moſt hideous breakers, though the ſea all around was unfathomable. Their ſituation was rendered the more dreadful by its being a dead calm, at the ſame time that they were carried towards the rock with ſuch rapidity, that by the time they had got the ſhip's head turned by means of the boats, ſhe was ſcarcely 100 yards diſtant from it. Their only reſource then was to tow the ſhip, if poſſible, by means of the boats and pinnace, out of a ſituation ſo very perilous; but all their efforts would have been unſucceſsful, had not a breeze of wind ſprung up, which, though too light to have been noticed at any other time, was found to ſecond their efforts ſo effectually, that the ſhip began to move perceptibly from the reef in an oblique direction: during the time that this breeze laſted, which was not more than ten minutes, they had made a conſiderable way. A dead calm ſucceeding, they began to loſe ground, and in a little time were driven within 200 yards of the rocks: but fortunately the breeze returned, and laſted ten minutes more; during which time a ſmall opening was perceived in the reef at the diſtance of about a quarter of a mile. The mate being ſent out to examine this opening, reported that it was not more than the length of the ſhip in breadth, but that there was ſmooth water within. On this it was determined to puſh into it by all means. The attempt failed of ſucceſs; as juſt when they had brought the ſhip with great labour to the mouth of the opening, they found a current ſetting out from it by reaſon of the tide now beginning to ebb. But though their hopes were diſappointed in getting through the opening, they were, by the current ſetting out from it, driven in a very ſhort time to the diſtance of a quarter of a mile from the rocks; and by dint of towing and other exertions, they were got by noon to the diſtance of two miles. This temporary deliverance, however, afforded but ſmall proſpect of being ultimately relieved. They had ſtill no other expectation than of being forced back into their former ſituation by the return of the tide; but happily they now perceived another opening about a mile to the weſtward. Mr Hicks the lieutenant being ſent to examine this opening, returned with an account of its being narrow and hazardous, but capable of being paſſed. To this place therefore the ſhip was directed by every poſſible means; and a light breeze happening to ſpring up, they fortunately reached it, and were inſtantly hurried through with great rapidity by the current of the returning tide; which, had it not been for this opening, would undoubtedly have daſhed them to pieces againſt the rocks.

From the time they quitted the coaſt of New Holland till their arrival at Batavia in the iſland of Java, our navigators met with no other danger but what is common in ſea-voyages. They were obliged to ſtay for ſome time at this place to repair their damages; and on viewing the condition of the ſhip, found they had more reaſon than ever to admire the manner in which they had been preſerved. Both the falſe-keel and main-keel were greatly injured; great part of the ſheathing was torn off; ſeveral of the planks were much damaged, and among theſe there were two, and half of another, which for ſix feet in length were not above the eighth part of an inch in thickneſs, beſides being penetrated with worms quite to the timbers. Here the crew were exceſſively annoyed by ſickneſs, which obliged them to remain much longer than they would otherwiſe have done: and it is worthy of notice, that every one of the crew was ill excepting the ſail-maker, an old man between 70 and 80 years of age, and who was drunk every night. Poor Tupia, with his boy Tayetto, fell ſacrifices to the unhealthineſs of the climate, as well as the ſurgeon, three ſeamen, and Mr Green's ſervant. Nor did the evil ſtop here; for on their ſetting out from Batavia, the ſeeds of diſeaſe which had been received there broke out in the moſt violent and fatal manner, inſomuch that in the courſe of about ſix weeks there died one of Mr Banks's aſſiſtants, by name Mr Sporing, Mr Parkingſon his natural hiſtory painter, Mr Green the aſtronomer, the boatſwain, carpenter, and mate; Mr Monkhouſe the midſhipman, the corporal of the marines, two of the carpenter's crew, and nine ſeamen. Even the jolly old ſail-maker could now hold out no longer; but whether his death might not in ſome meaſure be attributed to his being leſs plentifully ſupplied with liquors than formerly, might have deſerved inquiry. Theſe unfortunate events probably made a conſiderable impreſſion on Mr Cook's mind; and perhaps induced him to direct his attention to thoſe methods of preſerving the health of ſeamen which he afterwards put in execution with ſo much ſucceſs. After touching at St Helena, they continued their voyage for England, where they arrived on the 11th of June 1771; and on the 29th of Auguſt the ſame year, his Majeſty teſtified his approbation of Mr Cook's conduct by appointing him a captain in the navy. On this occaſion Mr Cook wiſhed to have been advanced to the rank of poſt-captain, which, though not more profitable than the other, is more honourable; but this being inconſiſtent with the rules of preferment in the navy, the earl of Sandwich, at that time at the head of the admiralty, could not agree to it.

Captain Cook was not allowed to remain long inactive. The idea of a ſouthern continent had long been entertained, and Mr Dalrymple had renewed the attention of the public towards the queſtion, by his hiſtorical collection of voyages to the Pacific Ocean, publiſhed in two quarto volumes, one in 1770, the other in 1771. To determine the matter finally, Captain Cook was again ſent out: and the object of this voyage was not merely to ſettle the queſtion juſt mentioned, but to extend the geography of the globe to its utmoſt limits. That the undertaking might be carried on with the greater advantage, it was determined to employ two ſhips, on the choice and equipment of which the utmoſt attention was beſtowed. The ſucceſsful voyage which had already been made in the Endeavour, ſuggeſted the idea of that ſhip being a proper model for the two which were to be ſent out; and the opinion of Lord Sanwich concurring with the general idea, two veſſels, conſtructed by the ſame perſon who had built the Endeavour, were purchaſed for the voyage. Theſe were about 14 or 16 months old at the time they were purchaſed; and in the opinion of Captain Cook, were as fit for the purpoſe as if they had been but newly built. The larger of the two, of 462 tons burden, was named the Reſolution; the ſmaller, of 336 tons, had the name of the Adventure; the complement of men on board the former, of which Captain Cook was commander, being 112; on the latter, commanded by Mr Tobias Furneaux, 81. In their equipment, every article that could be ſuppoſed neceſſary, however much out of the common line, was procured, and every circumſtance that could be ſuppoſed to contribute to the ſucceſs of the voyage was attended to in the moſt ſcrupulous manner. Beſides the uſual ſtores and proviſions, all of which were of the beſt kinds, the ſhips were furniſhed with malt, ſour-krout, ſalted cabbage, portable ſoup, ſalop, muſtard, marmalade of carrots, beer, and inſpiſſated wort. Mr Hodges, an excellent landſcape painter, was engaged to make drawings and paintings of ſuch objects as required them. Mr John Reinhold Forſter, with his ſon, were both engaged, in order to explore and collect the natural hiſtory of the countries through which they paſſed; and laſtly, that nothing might be wanting to render the voyage as complete as poſſible, Mr William Wales and Mr William Bayley were engaged by the board of longitude to make celeſtial obſervations. They were furniſhed with the beſt inſtruments of every kind, and among the reſt with four time-pieces; three conſtructed by Mr Arnold, and one by Mr Kendal on Mr Harriſon's principles.

At Plymouth Captain Cook received his inſtructions; which were not only to ſail round the globe, but to ſail round it in high ſouthern latitudes, and to make ſuch traverſes as might finally reſolve the queſtion concerning the ſouthern continent. In purſuance of theſe inſtructions he ſet ſail on the 13th of July 1772, and on the 29th of the ſame month reached the Madeiras. As he proceeded afterwards in his voyage, he made three puncheons of beer from the inſpiſſated wort carried out along with him, and found it excellently to anſwer the purpoſe, provided the material could have been kept without fermentation in its inſpiſſated ſtate; but as this was found impoſſible, the expedient ſeems to have failed. In this voyage, however, the Captain uſed with the greateſt ſucceſs ſuch methods as appeared likely to contribute to the preſervation of the health of his men. In rainy weather, he took care that the ſhip ſhould be aired and dried by means of fires made between the decks, the damp places were ſmoked, and the people were ordered to air their bedding, and waſh and dry their clothes, whenever an opportunity offered. Thus he reached the Cape of Good Hope without having a ſingle man ſick. Having left it, and kept on his courſe to the ſouthward, he ſoon began to meet with cold and ſtormy weather, by which he loſt almoſt the whole of his live ſtock of ſheep, hogs, and geeſe. The bad effects of this ſtormy weather upon the men were guarded againſt by an addition to their clothing, and giving them a dram on particular occaſions. On the ſixth of December, being in the latitude of 50° 40′, he fell in with iſlands of ice, and continued among them in various latitudes till the 17th of January 1773; when he ſet ſail for new Zealand, which he reached on the 27th.

The reception of our navigator by the new Zealanders was now much more friendly than in the former voyage, ſo that there were no conteſts with the natives; nor did Captain Cook obſerve any one of thoſe whom he had ſeen before, neither was there the ſmalleſt remembrance of former hoſtilities. Having ſtaid in this country till the 7th of June, our navigators ſet ſail for Otaheite; but during the voyage the crews of both ſhips were attacked by the ſcurvy. Thoſe of the Adventure were in a very ſickly ſtate; the cook was dead, and 20 of her beſt men incapable of duty. On board the reſolution matters were much better; and the only reaſon that could be conjectured for the difference was, that the people of the Adventure had been in an habit of body more inclined to the ſcurvy than thoſe of the Reſolution, and had eat fewer vegetables. Here it was obſerved, that the averſion of ſeamen to a change of diet is ſo great, that it can only be overcome by the ſteady and perſevering example of a commander. While he remained at New Zealand, the Captain had diſcovered a tree which greatly reſembled the American black ſpruce. Perſuaded, therefore, that it would be attended with effects equally ſalutary on the health of the people, he employed them in brewing beer from it. This was done while they continued at Duſky bay, in order to ſupply the want of vegetables, which were not to be procured there ; but on removing to Queen Charlotte's Sound, they were more fortunate. Captain Cook himſelf went to look out for antiſcorbutic vegetables ; and returned in a very ſhort time with a boat-load of ſcurvy-graſs, celery, &c. Theſe were boiled with the peas and wheat ; and though ſome of the people diſliked them at firſt, they ſoon became ſo ſenſible of their good effects, that they cheerfully followed the example of the reſt ; and the freedom of the crew from the ſcurvy and other diſtempers was by every one attributed to the New Zealand ſpruce beer and vegetables. From this time forward the Captain had ſcarce occaſion to give orders for gathering vegetables when they came to any land.

During this voyage Captain Cook experienced another narrow eſcape from ſhipwreck. Being becalmed at the diſtance of half a league from a reef of rocks near Oſnaburg iſland, it was found neceſſary to order out the boats to tow off the ſhips ; but this was found impoſſible. The calm continuing, and the ſituation of our navigators becoming every moment more dangerous, the Captain attempted to get through an opening in the reef which he had judged practicable : but on approaching it, found that there was not ſufficient depth of water ; at the ſame time that the draught of the tide through it forced the ſhip thither in a manner ſcarce to be reſiſted. One of the warping machines, with about 400 fathoms of rope, was then ordered out, but did not produce any effect. They were within two cables length of the breakers, and no bottom could be found for caſting anchor. Having no other reſource, however, they did drop an anchor ; but before it took hold, the Reſolution was in leſs than three fathoms of water, and ſtruck at every fall of the ſea, which broke violently cloſe under her ſtern, threatening deſtruction to every one on board. At laſt the tide ceaſing to act in the ſame direction, the boats were ordered to try to tow off the veſſel ; in which being aſſiſted by the land-breeze, which fortunately ſprung up at that inſtant, they with much labour ſucceeded.

Having ſpent a conſiderable time in the South Sea iſlands, Captain Cook returned to New Zealand, and from thence ſet ſail for the ſouthern part of the continent of America. Here he explored all the iſlands in the neighbourhood, and then returned to England, where he arrived in ſafety on the 30th of July 1774, having been abſent three years and 18 days ; and in all that time loſt only one man, who died of a conſumption probably begun before he ſet out on the voyage.

The reception our navigator now met with was ſuited to his merit. He was immediately raiſed to the rank of poſt-captain, and ſoon after unanimouſly elected a member of the Royal Society ; from whom he received the prize of the gold medal for the beſt experimental paper that had appeared throughout the year. It was the cuſtom of Sir John Pringle, at the delivery of this medal, annually to make an elaborate diſcourſe, containing the hiſtory of that part of ſcience for which the medal was given ; and as the ſubject of Captain Cook's paper (the means of preſerving the health of ſeamen) was analogous to the profeſſion of Sir John Pringle himſelf as a phyſician, he had the greater opportunity of diſplaying his eloquence on the occaſion. The ſpeech he made was in the higheſt degree honourable to Captain Cook. He remarked, that the Society had never more meritoriouſly beſtowed the medal than on the perſon who now received it. " If (ſays he) Rome decreed the civic crown to him who ſaved the life of a ſingle citizen, what wreaths are due to the man who, having himſelf ſaved many, perpetuates in your Tranſactions the means by which Britain may now, on the moſt diſtant voyages, preſerve numbers of her intrepid ſons, her mariners ; who, braving every danger, have ſo liberally contribued to the fame, to the opulence, and to the maritime empire of the country ?" Theſe honourable teſtimonies of the public regard, however, Captain Cook did not receive, being already embarked on another voyage, from which he never returned.

The third voyage of this celebrated navigator was not undertaken by any expreſs command of his Majeſty. Captain Cook had already done ſo much, that it was thought but reaſonable he ſhould now ſpend the remainder of his life in quiet ; and in order to enable him to do this in the more comfortable manner, beſides his rank of poſt-captain in the navy, he was alſo made a captain in Greenwich. Still, however, there were ſome points in the ſcience of geography which had very much engaged the attention of the public, and were indeed of ſuch importance as to become a national concern. Theſe were to diſcover the connection between Aſia and America, and to determine whether there was not a poſſibility of ſhortening the paſſage to the Eaſt Indies by ſailing round the northern parts of the continents of Europe and Aſia. Many attempts, indeed, had already been made by various navigators of different nations ; but all of them had failed, and, what was worſe, had left the point ſtill undetermined. An act of parliament had been paſſed in 1745, by which a reward of L.20,000 was held out to the ſhips of any of his Majeſty's ſubjects for accompliſhing this important voyage, but without mentioning any thing of thoſe belonging to his Majeſty ; and this reward was further confined to the finding out of the north-weſt paſſage to the Eaſt Indies through Hudſon's Bay. In the year 1776, however, both the errors juſt mentioned were corrected. It was now enacted, " That if any ſhip belonging to any of his Majeſty's ſubjects, or to his Majeſty, ſhall find out, and ſail through, any paſſage by ſea between the Atlantic and Pacific Oceans, in any direction or parallel of the northern hemiſphere, to the northward of the 52d degree of northern latitude ; the owners of ſuch ſhips, if belonging to any of his Majeſty's ſubjects, or the commanders, officers, and ſeamen, of ſuch ſhip belonging to his Majeſty, ſhall receive, as a reward for ſuch diſcovery, the ſum of L.20,000.

It was not, as has already been hinted, now deemed proper to ſolicit Captain Cook to undergo freſh dangers by undertaking a voyage of this kind ; nevertheleſs, as he was univerſally looked upon to be the fitteſt perſon in the kingdom for the purpoſe, the eyes of every perſon were tacitly fixed upon him : he was conſulted on every thing relating to it, and ſolicited to name the perſon whom he judged moſt proper to conduct it. To determine this point, Captain Cook, Sir Hugh Palliſer, and Mr Stephens, were invited to the houſe of Lord Sandwich to dinner ; where, beſides the conſideration of the proper officer for conducting the expedition, many things were ſaid concerning the nature of the deſign. They enlarged upon its grandeur and dignity, its conſequences to navigation and ſcience, and the completeneſs it would give to the whole ſyſtem of diſcoveries; until at laſt Captain Cook was ſo much inflamed by the repreſentation of the importance of the voyage, that he ſtarted up, and declared that he would conduct it himſelf. This was what the parties preſent had deſired, and probably expected; his offer was therefore inſtantly laid before the king, and Captain Cook appointed commander of the Expedition by the 10th of February 1776. At the ſame time it was agreed, that on his return from the voyage he ſhould be reſtored to his place at Greenwich; and if no vacancy occurred during the interval, the officer who ſucceeded him was to reſign in his favour. The inſtructions he now received were, that he ſhould attempt the high latitudes between the continents of Aſia and America, and if poſſible return to England along the northern coaſts of Aſia and Europe. This was moſt probably the reſult of the Captain's own deliberations, and what had been ſuggeſted by him to Lord Sandwich and other people in power. He was particularly deſired to ſail firſt into the Pacific Ocean thro' the chain of newly diſcovered iſlands which he had lately viſited. After having croſſed the equator, and paſſed into the northern parts of the ocean juſt mentioned, he was then to hold ſuch a courſe as might tend to ſettle many intereſting points of geography, and produce ſome intermediate diſcoveries, before he arrived at the main ſcene of operation. With regard to this principal object, he was ordered, immediately on his arrival on the coaſt of New Albion, to proceed northward as far as the latitude of 65 degrees, without loſing any time in exploring creeks or rivers previous to his arrival in that latitude: and for his further encouragement, the act of 1745, offering a premium for the diſcovery of the paſſage, was amended in the manner abovementioned. That nothing might be wanting which could promote the ſucceſs of the grand expedition, Lieutenant Pickerſgill was ſent out, in 1776, with directions to explore the coaſts of Baffin's Bay; and the next year Lieutenant Young was commiſſioned not only to examine the weſtern parts of that bay, but to endeavour to find a paſſage on that ſide from the Atlantic to the Pacific Ocean. Nothing, however, was performed by either of theſe gentlemen which in the leaſt could promote Captain Cook's ſucceſs. Two veſſels were provided as in the former voyage, *viz.* the Reſolution and the Diſcovery; the command of the former being given to Captain Cook, and of the latter to Captain Charles Clerke. The only thing in which the appointment of the Diſcovery differed from that of the Reſolution was, that the former had no marine officer on board. Every degree of attention was beſtowed, as in the former voyage, upon the proper victualling and other neceſſaries for the two ſhips; and that the inhabitants of thoſe countries which our navigator intended to viſit might derive ſome permanent benefit from the intercourſe they had with him, it was determined to ſend abroad a breed of domeſtic animals, and likewiſe a quantity of uſeful ſeeds, to be left in proper places. With this view, a bull, two cows with their calves, and ſeveral ſheep, with hay and corn for their ſubſiſtence, were taken on board; and it was likewiſe purpoſed to take in others at the Cape of Good Hope. A large aſſortment of iron tools and trinkets was alſo ſent out; and, in ſhort, every thing that could be judged proper either to conciliate the good will of the natives or to prove ſerviceable to them, was provided for the voyage, as well as every convenience for the ſhips companies. In the former voyage Captain Cook had brought along with him a native of one of the South Sea iſlands, named *Omai*, who reſided in England during the interval between the ſecond and third voyages, and was now happy at getting an opportunity of returning to his own country. Though he could by no means complain of the entertainment he had met with in England, the idea of returning home loaded with treaſure, which might enable him to make a figure among his countrymen, ſoon overcame all uneaſy ſenſations which the leaving of his Engliſh friends might excite. His majeſty had taken care to furniſh him with every thing that could poſſibly be of uſe when he came to his native country; and he had beſides received ſeveral valuable preſents from Lord Sandwich, Sir Joſeph Banks, and ſeveral ladies and gentlemen of his acquaintance; ſo that nothing was omitted which could poſſibly be done to convey, by his means, to the inhabitants of the South Sea iſlands an idea of the Britiſh power and greatneſs.

Every thing being prepared for the voyage, our navigator ſet ſail from the Nore on the 25th of June 1776; but by reaſon of ſome delay in receiving his inſtructions, did not leave Plymouth till the 12th of July. He had not been long at ſea before he began his operations for preſerving the health of his people; which were found equally efficacious in this as in the former voyage. Finding his ſtock of provender for the animals on board likely to run ſhort, he touched at Teneriffe, in order to procure a ſupply, having judged that to be a more proper place than Madeira for the purpoſe. On ſailing from thence he ran a great riſk of running upon ſome ſunk rocks on the iſland of Bonaviſta; but in this, as well as on other occaſions of danger, he behaved with the ſame judgement, coolneſs, and preſence of mind, that diſtinguiſhed him throughout the whole courſe of his life. On the 12th of Auguſt he arrived before Port Praya, in one of the Cape de Verde iſlands named *St Jago*; but not finding it neceſſary to go in there, he continued his voyage to the ſouthward. The weather now becoming gloomy and rainy, required a continuance of the methods he had already practiſed for preſerving the health of his people; and, as formerly, they were attended with the greateſt ſucceſs. In this voyage, the effect of theſe precautions was the more remarkable, as at this time the ſeams of the veſſel were opened to ſuch a degree as to admit the rain, ſo that ſcarce any perſon on board could lie dry in his bed; and all the officers in the gun-room were driven out of their cabins by the water which came through the ſides. Such was the humanity of the commander, however, that while the ſhips continued at ſea, he would not truſt the workmen over their ſides to repair the defects, though caulkers were employed in the inſide as ſoon as ſettled weather returned. On the 1ſt of September our navigators croſſed the equator, and on the 18th of October anchored in Table Bay at the Cape of Good Hope. Here they met with a violent tempeſt, the effects of which were felt both on ſea and land. It laſted three days, and the Reſolution was the only ſhip in the bay that rode out the ſtorm without dragging her anchors. On the ſhore the tents and obſervatory were deſtroyed, and the aſtronomical quadrant narrowly eſcaped irreparable damage. The Diſcovery, which had been ſome time later in ſailing from England, was driven off the coaſt, and did not arrive till the 10th of November.

While they remained in this place, a diſaſter happened which threatened the loſs of moſt of their live ſtock. The bull and two cows had been put aſhore to graze among other cattle: but captain Cook had been adviſed to keep the ſheep, 16 in number, near the tents, where they were penned in every night. Some dogs having got in among them in the night-time, killed four, and diſperſed the reſt. Six of them were recovered the next day, but the two rams and two of the fineſt ewes in the flock were miſſing. The captain applied to Baron Flettenburgh the governor; but all his endeavours were unſucceſsful, until he employed ſome of the meaneſt and loweſt of the people, fellows whoſe character was, that for a ducatoon they would cut their maſters throat, burn the houſe over his head, and bury him and his whole family in aſhes. This is mentioned as an inſtance how far the boaſted policy of the Dutch government at the Cape of Good Hope falls ſhort of its alledged perfection. After all, two of the fineſt ewes in the flock were miſſing, and never could be recovered. The captain, therefore, to repair the loſs, and to make an addition to his original ſtock, purchaſed two young bulls, two ſtone horſes, two mares, two heifers, two rams, ſeveral ewes and goats, with ſome rabbits and poultry; when, having finiſhed all his buſineſs, he ſet ſail on the 30th of November, though it was not till the 3d of December that he got clear of land. Soon after his putting to ſea, he had the miſfortune to loſe ſeveral of the goats, eſpecially the males, together with ſome ſheep; and it was with the utmoſt difficulty that the reſt of the cattle were preſerved, by reaſon of the ſhip toſſing and tumbling about in a very heavy ſea. Having explored ſome deſolate iſlands in the ſouthern ſeas, Captain Cook ſet ſail for New Zealand. During this part of the voyage, our navigators were involved in ſo thick a fog, that, according to the authors of Captain Cook's life, "they ſailed 300 leagues *in the dark*." The firſt land they afterwards reached was New Holland; where, having remained till the 30th of January 1777, they ſet ſail for New Zealand, and on the 12th of February they anchored in Queen Charlotte's Sound. Here the people were ſhy and timorous, on account of their having formerly deſtroyed 10 of Captain Furneaux's people who had been ſent aſhore to gather vegetables. The cauſe of the quarrel could not be known, as none of the party were left alive to tell the news. Lieutenant Burney, who went aſhore in queſt of them, found only ſome fragments of their bodies; from which it appeared that they had been killed and eaten by the ſavages. It was not the intention of Captain Cook, at this diſtance of time to reſent the injury; he even refuſed to put to death a chief named *Kahoora*, who as he was informed by the natives themſelves had killed Mr Rowe the commander of the party. He was, however, particularly careful that no opportunity ſhould now be given the ſavages of committing ſuch an action with impunity; and with this view a boat was never ſent on ſhore without being well armed, and the men under the command of ſuch officers as could be depended upon. The New Zealanders were no ſooner aſſured of Captain Cook's pacific diſpoſition, than they threw aſide their fears and ſuſpicions, and entered into a commercial intercourſe with the people. It would have been the leſs excuſable in Captain Cook to have revenged at this time the maſſacre of Mr Rowe's party, as he was aſſured that the quarrel originated from ſome petty thefts of the ſavages, which were too haſtily reſented on the part of the Britiſh; and had it not been for this, no miſchief would have happened.

On the 25th of February our navigator left New Zealand, taking with him, at the requeſt of Omai two boys, the eldeſt about 18 and the youngeſt about 10. Theſe were ſoon cured of their paſſion for travelling, being both violently ſea-ſick: but as it was then too late to repent, they expreſſed their grief in loud and almoſt continual lamentation; and this in a kind of ſong which ſeemed to conſiſt of the praiſes of their native country, whence they were now to be ſeparated for ever. By degrees, however, the ſea-ſickneſs abated, their lamentations became leſs frequent, and at laſt ceaſed entirely; their native country was forgotten, and they appeared to be as firmly attached to their new friends the Engliſh as if they had been born among them.

So much time was now ſpent in ſailing up and down in the Pacific Ocean, where ſeveral new iſlands were diſcovered, that Captain Cook judged it impoſſible to accompliſh any thing for this year in the high northern latitudes; for which reaſon he determined to bear away for the Friendly Iſlands, in order to ſupply himſelf with thoſe neceſſaries which he had found impoſſible to be got at any of the iſlands which he had juſt diſcovered. In his run thither ſeveral new iſlands were viſited; and in proſecuting theſe diſcoveries our navigator once more narrowly eſcaped being ſhipwrecked. The danger at this time aroſe from a low ſandy iſland, which the Reſolution was very near running upon. From this ſhe was only ſaved by the circumſtance of all the men having been accidently called upon deck to put the veſſel about, and moſt of them being at their ſtations when the danger was diſcovered. Soon after this both ſhips ſtruck upon ſome ſunk coral rocks, but happily were got off without damage.

After a ſtay of between two and three months, Captain Cook took leave of the Friendly Iſlands on the 13th of July 1777; and on the 12th of Auguſt reached Otaheite, where he introduced Omai to his country people, and whoſe reception by them is particularly related under the next article. Here the Captain found the people of Otaheite ready to engage in a war with thoſe of Eimeo; but though ſtrongly ſolicited by the former to aſſiſt them in an expedition againſt their enemies, he refuſed to take any concern in the affair, alleging, by a way of excuſe, that the people of Eimeo had never offended him. This ſeemed to ſatisfy moſt of the chiefs: but one, named *Towha*, was ſo much diſpleaſed, that Captain Cook could never regain his favour. He even threatened, that as ſoon as the Captain ſhould be gone, he would make war upon Otoo, one of the princes of theſe iſlands whom he knew to be in ſtrict friendſhip with him; but from this he was deterred by the Captain's threatening to return and chaſtiſe him if he made any ſuch attempt. As a mark of Otoo's friendſhip, he gave our navigator a canoe, which he deſired him to carry to the king of Britain, having nothing elſe, as he ſaid, worth his acceptance.

From Otaheite Captain Cook proceeded to Eimeo where, on account of ſome thefts committed by the natives he was obliged to commence hoſtilites, by burning a number of their war canoes and even ſome houſes. Theſe tranſactions gave him much concern: and the more that he had been ſo much ſolicited to make war on theſe people by his friends at Otaheite, to whoſe entreaties he had refuſed to liſten. From Eimeo he proceeded to Huaheine, where he ſaw Omai finally ſettled, and left with him the two New Zealand youths already mentioned. The youngeſt of theſe was ſo much attached to the Engliſh, that it was neceſſary to carry him out of the ſhip and put him aſhore by force. During his ſtay on this iſland, the Captain was obliged to puniſh a thief with greater ſeverity than he had ever done before, viz. by cauſing his head and beard to be ſhaved, and his ears cut off. Some other diſagreeable tranſactions took place, particularly the deſertion of two of his people, who were not recovered without the greateſt difficulty. In the courſe of his exertions for their recovery, he found it neceſſary to detain the ſon, daughter, and ſon-in-law, of the chief of an iſland named Otaha. This had almoſt produced very ſerious conſequences, the natives having formed a plot for carrying off Captain Cook himſelf, as well as Captain Clerke and Mr Gore. With regard to the commander, they were diſappointed by his own caution and vigilance; but Meſſrs Clerke and Gore were in particular danger; and it was only owing to the circumſtance of one of them having a piſtol in his hand, as they walked together on ſhore, that they were not ſeized.

Having left the Society Iſlands, and diſcovered a new group, which, in honour of his patron the Earl of Sandwich, our commander named the *Sandwich Iſles* he ſet out on the 2d of January 1778 on his voyage northward. In this he was very ſucceſsful, aſcertaining the vicinity of the continents of Aſia and America, which had never been done, or but very imperfectly, before. From theſe deſolate regions he returned to the iſland of Oonalaſhka; whence having refitted and taken in proviſions, he returned to the ſouthward, and on the 26th of November reached the Sandwich Iſlands, where he diſcovered a new one named *Mowee*, and on the 30th of the ſame month another of much larger extent, named *O-why-hee*. Seven weeks were ſpent in exploring the coaſts of this iſland; and during all this time he continued to have the moſt friendly intercourſe with the people, who however, appeared to be much more numerous and powerful than thoſe of any iſland our navigators had yet touched at. Several of the chiefs and principal people had attached themſelves greatly to the commander, and in general the people appeared to be much more honeſt in their diſpoſitions than any whom he had ever viſited. But by the time he had finiſhed his circumnavigation of the Iſland, and caſt anchor in a bay called *Karakakooa*, matters were greatly altered. An Univerſal diſpoſition to theft and plunder had now taken place; and in this it was evident that the common people were encouraged by their chiefs, who ſhared the booty with them. Still, however, no hoſtilities were commenced; the greateſt honours were paid to the commander; and, on his going aſhore he was received with ceremonies little ſhort of adoration. A vaſt quantity of hogs and other proviſions were procured for the ſhips; and on the 4th of February 1779, they left the iſland, not without moſt mganificent preſents from the chiefs and ſuch as they had never before received in any part of the world. Unluckily they met with a ſtorm on the ſixth and ſeventh of the ſame month; during which the Reſolution ſprung the head of her foremaſt in ſuch a manner that they were obliged to return to Karakakooa bay to have it repaired. As they returned, Captain Cook had an opportunity of ſhowing his humanity to the people by the relief he afforded to ſome of their canoes which had ſuffered in the ſtorm. The ſame friendly intercourſe which had formerly been held with the natives now commenced, and Captain Cook was treated with the uſual honours; but on the 13th of this month it was unhappily broken off on the following account. One of the natives being detected in ſtealing the tongs from the armourer's forge in the Diſcovery, was diſmiſſed with a pretty ſevere flogging; but this example was ſo far from being attended with any good effect, that in the afternoon another, having ſnatched up the tongs and a chiſſel, jumped over board with them and ſwam for the ſhore. The maſter and midſhipman were inſtantly diſpatched in purſuit of him; but he eſcaped on board a canoe, which paddled away ſo quickly that the cutter could not come near it. A chief named Pareah, who was at this time on board the Reſolution, underſtanding what had happened, promiſed to go aſhore and get back the ſtolen goods; but before this could be done the thief had made his eſcape into the country. Captain Cook, who was at that time aſhore, had endeavoured to intercept the canoe when it landed, but was led out of the way by ſome of the natives who pretended to be his guides. The tongs and chiſſel, however, were brought back to the maſter as he advanced to the landing place; but he being now joined by ſome of the reſt of the people in the pinnance could not be ſatisfied with the recovery of the ſtolen goods, but inſiſted upon having the thief, or the canoe which carried him, by way of repriſal. On his preparing to launch this laſt into the water, he was interrupted by Pareah, who inſiſted that it was his property, and that he ſhould not take it away. As the officer paid no regard to his remonſtrances, Pareah, who ſeems to have been a very ſtrong man, ſeized him, pinioned his arms behind, and held him faſt by the hair of the head. On this one of the ſailors ſtruck the chief with an oar, on which, quitting the officer, he inſtantly ſnatched the oar out of the man's hand, and broke it in two acroſs his knee. The Indians then attacked the ſailors with ſtones, and ſoon drove them to their boats, to which they were forced to ſwim, as they lay at ſome diſtance from the ſhore. The officers who could not ſwim retired to a ſmall rock, where they were cloſely purſued by the Indians;

and here the maſter narrowly eſcaped with his life, till Pareah returned and obliged the Indians to give over their attacks. The gentlemen, ſenſible that Pareah's preſence alone could protect them, entreated him to remain with them till they could be brought off in the boats. On his refuſal, the maſter ſet out to the place where the obſervatories had been erected, for farther aſſiſtance; but Pareah, who met him, and ſuſpected his errand, obliged him to return. In the mean time the multitude had begun to break in pieces the pinnace, after having taken every thing out of her that was looſe: on the return of Pareah, however, they were again diſperſed, and ſome of the oars reſtored, after which the gentlemen were glad to get off in ſafety. Before they reached the ſhip Pareah overtook them in a canoe, and delivered the midſhipman's cap which had been taken from him in the ſcuffle; he alſo joined noſes with them in token of friendſhip, and deſired to know whether Captain Cook would kill him on account of what had happened. They aſſured him that he would not, and made ſigns of reconciliation on their part. On this he left them, and paddled over to the town of Kavaroah; and that was the laſt time that he was ſeen by the Engliſh. In the night-time the ſentinels were much alarmed by ſhrill and melancholy ſounds from the adjacent villages, which they took to be the lamentations of the women. Next day it was found that the large cutter of the Diſcovery had been carried off in the night-time; on which Captain Cook ordered the launch and ſmall cutter to go under the command of the ſecond lieutenant, and to ly off the eaſt point of the bay in order to intercept all the canoes that might attempt to get out, and if neceſſary to fire upon them. The third lieutenant of the Reſolution was diſpatched to the weſtern part of the bay on the ſame ſervice; while the maſter was ſent in purſuit of a large double canoe already under ſail, and making the beſt of her way out of the harbour. He ſoon came up with her, and by firing a few ſhots, obliged her to run on ſhore, and the Indians to leave her. This was the canoe belonging to a chief named *Omea*, whoſe perſon was reckoned equally ſacred with that of the king, and to the neglect of ſecuring him we may attribute the ſucceeding diſaſter. Captain Cook now formed the reſolution of going in perſon to ſeize the king himſelf in his capital of Kavaroah; and as there was reaſon to ſuppoſe that he had fled, it was his deſign to ſecure the large canoes, which on that account he cauſed to be hauled up on the beach. With this view he left the ſhip about ſeven o'clock in the morning of Sunday the 14th of February, being attended by the lieutenant of marines, a ſerjeant, corporal, and ſeven private men. The crew of the pinnace, under the command of Mr Roberts, were alſo armed; and as they rowed towards the ſhore, the captain ordered the launch to leave her ſtation at the oppoſite point of the bay, in order to aſſiſt his own boat. Having landed with the mariners at the upper end of the town, the Indians flocked round him, and proſtrated themſelves before him. No ſign of hoſtility, nor even much alarm, appeared; the king's ſons waited on the commander as ſoon as he ſent for them, and by their means he was introduced to the king, who readily conſented to go on board; but in a little time the Indians began to arm themſelves with long ſpears, clubs, and daggers, and to put on thick mats which they uſe as defenſive armour. This hoſtile appearance was greatly augmented by an unlucky piece of news which was juſt now brought by a canoe, *viz.* That one of the Indian chiefs had been killed by the people in the Diſcovery's boats. On this the women, who had hitherto ſat on the beach converſing familiarly, and taking their breakfaſts, removed, and a confuſed murmur ran through the crowd. An old prieſt now appeared with a cocoa-nut in his hand, which he held out as a preſent to Captain Cook, ſinging all the while, and making a moſt troubleſome noiſe as if he meant to divert the attention of the Captain and his people from obſerving the motions of the Indians, who were now every where putting on their armour. Captain Cook beginning to think his ſituation dangerous, ordered the lieutenant of the marines to march towards the ſhore, as he himſelf did, having all the while hold of the king's hand, who very readily accompanied him, attended by his wife, two ſons, and ſeveral chiefs. The Indians made a lane for them to paſs; and as the diſtance they had to go was only about 50 or 60 yards, and the boats lay at no more than five or ſix yards diſtance from land, there was not the leaſt apprehenſion of the cataſtrophe which enſued. The king's youngeſt ſon Keowa went on board the pinnace without the leaſt heſitation, and the king was about to follow, when his wife threw her arms about his neck, and, with the aſſiſtance of two chiefs, forced him to ſit down. The Captain might now have ſafely got aboard, but did not immediately relinquiſh the deſign of taking the king along with him. Finding at laſt, however, that this could not be accompliſhed without a great deal of bloodſhed, he was on the point of giving orders for the people to reimbark, when one of the Indians threw a ſtone at him. This inſult was returned by the Captain, who had a double barrelled piece, by a diſcharge of ſmall ſhot from one of the barrels. This had little effect, as the man had a thick mat before him; and as he now brandiſhed his ſpear, the Captain knocked him down with his muſket. The king's ſon, Keowa, ſtill remained in the pinnace, and the detaining him would have been a great check upon the Indians; but unluckily Mr Roberts, who commanded the pinnace, ſet him aſhore at his own requeſt ſoon after the firſt fire. In the mean time another Indian was obſerved in the act of brandiſhing his ſpear at the commander; who thereupon was obliged to fire upon him in his own defence. Miſſing his aim, however, he killed one cloſe by his ſide; upon which the ſerjeant obſerving that he had miſſed the man he aimed at, received orders to fire alſo, which he did, and killed him on the ſpot. This repreſſed the foremoſt of the Indians, and made them fall back in a body; but they were urged on again by thoſe behind, and diſcharged a volley of ſtones among the marines, who immediately returned it by a general diſcharge of their muſkets; and this was inſtantly followed by a fire from the boats. Captain Cook expreſſed his aſtoniſhment at their firing, waved his hand to them to ceaſe, and called to the people in the boats to come nearer to receive the marines. This order was obeyed by Mr Roberts; but the lieutenant who commanded the launch, inſtead of coming nearer, put off to a greater diſtance: and by this prepoſterous conduct deprived the unfortunate commander of the only chance he had for his life: for now the Indians, exaſperated by the fire of the marines, ruſhed in upon them and drove them into the water, leaving the Captain alone upon the rock. A fire indeed was kept up by both boats; but the one was too far off, and the other crowded with the marines, ſo that they could not direct their fire with proper effect. Captain Cook was then obſerved making for the pinnace, carrying his muſket under his arm, and holding his other hand on the back-part of his head to guard it from the ſtones. An Indian was ſeen following him, but with marks of fear, as he ſtopped once or twice ſeemingly undetermined to proceed. At laſt he ſtruck the Captain on the back of the head with a club, and then precipitately retreated. The latter ſtaggered a few paces, and then fell on his hand and one knee, and dropped his muſket. Before he could recover himſelf, another Indian ſtabbed him with a dagger in the neck, though ſtill without putting an end to his life. He then fell into a pool of water knee-deep, where others crowded upon him; but ſtill he ſtruggled violently with them, got up his head, and looked towards the pinnace as if ſoliciting aſſiſtance. The boat was not above five or ſix yards diſtance; but ſuch was the confuſed and crowded ſtate of the crew, that no aſſiſtance could be given him. The Indians then got him under again, but in deeper water, though he ſtill continued to ſtruggle, and once more got his head up; but being quite ſpent, he turned towards the rock as if to ſupport himſelf by it, when a ſavage ſtruck him with a club, which probably put an end to his life, as he was never ſeen to ſtruggle any more. The ſavages hauled his lifeleſs body up on the rocks, and uſed it in the moſt barbarous manner, ſnatching the daggers out of one anothers hands, in order to have the pleaſure of mangling it. If any thing could add to the misfortune of this celebrated navigator's death, it was, that even his mangled remains were not ſaved from the hands of the barbarians. The lieutenant already mentioned, who, by his removing to a diſtance when he ought to have come on ſhore, ſeemed to have been the occaſion of his death, returned on board without making any attempt to recover his body; though it appeared from the teſtimonies of four or five midſhipmen who arrived ſoon after at the fatal ſpot, that the beach was almoſt deſerted by the Indians, they having at laſt yielded to the continual fire from the boats. The officer alleged in his own excuſe for removing at firſt from the ſhore, that he miſtook the ſignals; but be this as it will, the complaints againſt him were ſo many and ſo great, that Captain Clerke was obliged publicly to take notice of them, and to take the depoſitions of his accuſers in writing.—Theſe papers, however, were not found, and it is ſuppoſed that the Captain's bad ſtate of health had induced him to deſtroy them. After all we are informed, that, in the opinion of Captain Philips, who commanded the marines, it is very doubtful whether any effectual relief could have been given to the commander, even if no miſtake had been committed on the part of the lieutenant. The author of all the miſchief was Pareah, the chief already mentioned, who had employed people to ſteal the boat in the night-time. The king was entirely innocent both of the theft and the murder of Captain Cook; but the latter was perpetrated by ſome chiefs who were his near relations. The chief who firſt ſtruck him with a club was named *Karimans raha*, and he who ſtabbed him with the dagger was called *Nooah*. The latter, Mr Samwell, from whoſe narrative this account is taken obſerves, was ſtout and tall, had a fierce look and demeanor, and united in his perſon the two properties of ſtrength and agility more than he had ever obſerved in any other perſon.—Both of them were held in great eſtimation by their countrymen on account of the hand they had in his death.

By reaſon of the barbarous diſpoſition of the Indians, it was found impoſſible to recover Captain Cook's body after the firſt opportunity already mentioned was loſt. By dint of threats and negociations, however, ſome of the principal parts were procured with great difficulty; by which means the navigators were enabled to perform the laſt offices to their much reſpected commander. Theſe being put into a coffin, and the ſervice read over them, were committed to the deep with the uſual military honours on the 21ſt of February 1779. Soon after his death a letter was iſſued by M. de Sartine, ſecretary to the marine department of France, and ſent to all the commanders of French ſhips, importing, that Captain Cook ſhould be treated as the commander of a neutral and allied power; and that all captains of armed veſſels who might meet with him, ſhould make him acquainted with the king's orders, but at the ſame time let him know, that, on his part, he muſt refrain from hoſtilities. This humane and generous proceeding, with regard to France, originated from M. Turgot; but the thought ſeems firſt to have ſtruck Dr Franklin. Thus much at leaſt is certain, that the doctor, while ambaſſador from the United States, wrote a circular letter to the American naval commanders ſomething to the purport of that already mentioned. The Spaniards, however, acted in a very different manner, having given orders to ſeize Captain Cook if an opportunity of doing it ſhould occur, from a fooliſh idea that the knowledge of the weſtern coaſt of America, or of a northern paſſage into the Pacific Ocean, might be attended with conſequences prejudicial to their dominions in that quarter of the globe.

Captain Cook was a man of plain addreſs and appearance, but well looked, and upwards of ſix feet high. His head was ſmall, and he wore his hair, which was brown, tied behind. His face was full of expreſſion; his noſe exceedingly well ſhaped; his eyes, which were ſmall and of a brown caſt, were quick and piercing; his eye-brows prominent, which gave his countenance altogether an air of auſterity. Notwithſtanding this, it was impoſſible for any one to excel him in humanity, as is evident from the whole tenor of his behaviour both to his own people and the many ſavage nations with whom he had occaſion to interfere. This amiable property diſcovered itſelf even in the final cataſtrophe of his life; his utmoſt care being directed to the preſervation of his people, and the procuring them a ſafe retreat to their boats. And it cannot be enough lamented, that he who took ſo much

733 k

care of others, ſhould have periſhed in ſuch a miſerable manner for want of being properly ſupported by them. The perſeverance with which he purſued every object which happened to be pointed out as his duty was unequalled. Nothing ever could divert him from what he had once undertaken; and he perſevered in the midſt of dangers and difficulties which would have diſheartened perſons of very conſiderable ſtrength and firmneſs of mind. For this he was adapted by nature, having a ſtrong conſtitution, inured to labour, and capable of undergoing the greateſt hardſhips. His ſtomach bore without difficulty the coarſeſt and moſt ungrateful food; and he ſubmitted to every kind of ſelf-denial with the greateſt indifference. To this ſtrength of conſtitution he joined an invincible fortitude of mind, of which the circumnavigation of New Holland, and his voyage towards the South Pole, furniſh innumerable inſtances. He was maſter of himſelf on every trying occaſion; and the greater the emergency, the greater always appeared his calmneſs and recollection; ſo that in the moſt dangerous ſituations, after giving proper directions to his people, he could ſleep ſoundly the hours that he had allotted to himſelf. That he poſſeſſed genius in an eminent degree cannot be queſtioned: his invention was ready, and capable not only of ſuggeſting the moſt noble objects of purſuit, but the moſt proper methods of attaining them. His knowledge of his own profeſſion was unequalled; and to this he added a very conſiderable proficiency in other ſciences. In aſtronomy, he became ſo eminent, that he was at length enabled to take the lead in making the aſtronomical obſervations during the courſe of his voyages. In general learning he likewiſe attained to ſuch a proficiency as to be able to expreſs himſelf with clearneſs and propriety; and thus became reſpectable as the narrator, as well as the performer, of great actions. He was an excellent huſband and father, ſincere and ſteady in his friendſhip, and poſſeſſed of a general ſobriety and virtue of character. In converſation he was unaffected and unaſſuming; rather backward in puſhing diſcourſe, but obliging and communicative to thoſe who wiſhed for information; and he was diſtinguiſhed by a ſimplicity of manners almoſt univerſally the attendant of truly great men. With all theſe amiable qualities, the Captain was occaſionally ſubject to an haſtineſs of temper, which has been ſet forth in its utmoſt extent, if not exaggerated by ſome, though but few, who are not his friends: but even theſe, as well as others, when taking a general view of his character, are obliged to acknowledge that he was undoubtedly one of the greateſt men of his age.

Captain Cook is diſtinguiſhed as an author by an account of his ſecond voyage written by himſelf. His firſt voyage, as well as that of ſeveral other navigators, had been recorded by Dr Hawkeſworth; but on the preſent occaſion it was not judged neceſſary to have recourſe to any other than the pen of the author himſelf; and his journal, with a few occaſional alterations, and being divided into chapters, was ſufficient for the purpoſe. The ſtyle is clear, natural, and manly; and it is not improbable that even a pen of more ſtudied elegance could not have made it appear to more advantage. When it appeared, which was not till ſome time after the author had left England, the book was recommended by the accuracy and excellency of its charts, and by a numerous collection of fine engravings done from the original drawings of Mr Hodges.

We cannot conclude this article without taking ſome notice of the honours paid to our celebrated navigator after his death, both by his own countrymen and thoſe of other nations. Perhaps indeed it may be ſaid with juſtice, that foreigners hold his memory in an eſtimation unequalled even in England; a remarkable proof of which occurs in the eulogy upon him by Michael Angelo Gianetti, read in the Florentine academy on the 9th of June 1785, and publiſhed at Florence the ſame year. It is ſaid alſo, that one of the French literary academies propoſed a prize for the beſt eulogium on Captain Cook; and many poetical teſtimonies of his merit appeared in our own language. The Royal Society of London reſolved to teſtify their reſpect for him by a medal, for which purpoſe a voluntary ſubſcription was opened. A gold medal was given to ſuch of the fellows as ſubſcribed 20 guineas, and a ſilver one for thoſe who ſubſcribed ſmaller ſums; and each of the other members received one of bronze. Thoſe who ſubſcribed 20 guineas were, Sir Joſeph Banks, preſident, the Prince of Anſpach, the Duke of Montague, Lord Mulgrave, and Meſſrs Cavendiſh, Peachy, Perrin, Poli, and Shuttleworth. Many deſigns were propoſed on the occaſion; but the following was that which was actually ſtruck. On one ſide was the head of Captain Cook in profile, with this inſcription round it, JAC. COOK OCEANI INVESTIGATOR ACERRIMUS; and on the exergue, REG. SOC. LOND. SOCIO SUO. On the reverſe is a repreſentation of Britannia holding a globe, with this inſcription round her, NIL INTENTATUM NOSTRI LIQUERE; and on the exergue, AUSPICIIS GEORGII III. One of the gold medals ſtruck on this occaſion was preſented to the king, another to the queen, and a third to the prince of Wales. Another was ſent to the French king on account of the protection he had granted to the ſhips; and a ſecond to the empreſs of Ruſſia, in whoſe dominions they had been treated with every expreſſion of friendſhip and kindneſs. Both theſe great perſonages condeſcended to accept of the preſent with marks of ſatisfaction. The French king wrote a handſome letter to the Society, ſigned by himſelf, and underſigned by the Marquis de Vergennes; and the Empreſs of Ruſſia commiſſioned Count Oſterman to ſignify to Mr Fitzherbert the ſenſe ſhe had of the value of the preſent, and that ſhe had cauſed it to be depoſited in the muſeum of the Imperial Academy of Sciences. As a further teſtimony of the pleaſure ſhe derived from it, the empreſs preſented to the Royal Society a large and beautiful gold medal, containing on one ſide the effigies of herſelf, and on the other a repreſentation of the ſtatue of Peter the Great. After the general aſſignment of the medals, which took place in 1784, there being a ſurplus of money ſtill remaining, it was reſolved by the preſident and council, that an additional number of medals ſhould be thrown off, to be diſpoſed of in preſents to Mrs Cook, the Earl of Sandwich, Dr Benjamin Franklin, Dr Cooke provoſt of King's College Cambridge, and Mr Planta. At the ſame time it was agreed that Mr Aubert ſhould be allowed to have a gold medal of Captain Cook on his paying for the gold and the expence of ſtriking it, in conſideration of his intention to preſent it to the King of Poland.

During the two viſits of the ſhips at Kamtſchatka, Colonel Behm, the commandant of that province, had beſtowed, in the moſt liberal manner, every kind of aſſiſtance which it was in his power to beſtow; and ſuch was the ſenſe entertained by the lords of the admiralty of the kindneſs he had ſhowed, that they determined to make him a preſent of a magnificent piece of plate, with an inſcription expreſſive of his humane and generous conduct. The inſcription was drawn up by Dr Cooke, and afterwards ſubmitted to the opinion and correction of ſome gentlemen of the firſt eminence in claſſical taſte.

Sir Hugh Palliſer, who had all along diſplayed an uncommon reſpect and kindneſs for Captain Cook, likewiſe diſplayed his regard for his memory in a moſt eminent manner. On his eſtate in Buckinghamſhire he conſtructed a ſmall building with a pillar, containing the character of Captain Cook, which is given at the end of the introduction to the laſt voyage. This was drawn up by the Honourable Admiral Forbes, admiral of the fleet and general of the marines, to whom Captain Cook was known only by his merit and extraordinary actions.

Amidſt all theſe expreſſions of unavailing praiſe, it was not forgotten to ſhow ſome eſſential ſervice to the widow and family of our celebrated navigator. A memorial for a penſion of L.200 *per annum* was given in to the king from the commiſſioners of the admiralty, and ſigned by the Earl of Sandwich, Mr Butler, the Earl of Liſburne, Mr Penton, Lord Mulgrave, and Mr Mann. His majeſty complied with the requeſt of the memorial, and the grant was paſſed through the uſual forms with all poſſible ſpeed. By this L.200 *per annum* were ſettled on the widow during life; and L.25 a-year on each of her three ſons. After her death the L.200 was to be divided between her children, a fourth was allotted to Captain King, and the remaining fourth to Mr Bligh and the repreſentatives of Captain Clerke.

The laſt honour paid to the memory of Captain Cook was the granting a coat of arms to the family, which was done by patent on the 3d of September 1785; and of this we have the following deſcription. Azure, between the two polar ſtars: Or, a ſphere on the plane of the meridian, north pole elevated, circles of latitude for every ten degrees, and of longitude for every 15; ſhowing the Pacific Ocean between 60° and 240° weſt, bounded on one ſide by America and on the other by Aſia and New Holland; in memory of the diſcoveries made by him in that ocean, ſo very far beyond all former navigators. His track thereon is marked with red lines; and for creſt, in a wreath of the colour is an arm imbowed, veſted in the uniform of a captain of the Royal Navy. In the hand is the Union Jack, on a ſtaff proper. The arm is encircled by a wreath of palm and laurel.

Cook's Diſcoveries.

Cook's Diſcoveries. The number of countries diſcovered by Captain Cook, and which had never before been viſited by any European, is very conſiderable; but it was a remarkable property of our celebrated navigator, that, wherever he touched, every thing relative to the place was determined with ſuch accuracy and preciſion, that all former accounts ſeemed to go for nothing, and the diſcovery to belong entirely to Captain Cook. Thus it was not unuſual with him to make diſcoveries in places already well known; and thus his voyages have conveyed a vaſt fund of knowledge perfectly original. Though the accounts of the different places, therefore, at which he touched, are particularly given under their names in the order of the alphabet, we ſhall in this article endeavour to join the whole together in ſuch a manner as to give the reader ſome idea of the benefit which has accrued to ſcience from voyages attended not only with much expence and labour, but even with the loſs of the celebrated navigator's life.

1 Madeira, a volcanic iſland.

2 Luminous appearance of the ſea occaſioned by animals.

3 Vaſt number of negroes deſtroyed by the working the gold mines.

4 Beſt paſſage into the Pacific Ocean through the Straits le Maire.

5 Exceſſive ſtorms and cold in the ſouthern regions.

When he ſet out in the Endeavour in the year 1768, the firſt place touched at was Madeira. Here Mr Banks and Dr Solander, beſides ſome additions to the ſcience of botany, diſcovered undoubted marks of the iſland having a volcanic origin. On leaving this place they found it neceſſary to touch at Rio de Janeiro for proviſions; and during the run thither the commander had an opportunity of determining the cauſe of the luminous appearance of the ſea. On the 29th of October they obſerved that the water frequently emitted flaſhes like lightning, though much ſmaller; but ſuch was their frequency, that eight or ten of them were viſible almoſt at the ſame moment. This appearance they found, both at this time and afterwards, to ariſe from a ſmall kind of animal with which the water abounded. While ſtaying at Rio de Janeiro, a melancholy obſervation was made of the prodigious waſte of human lives with which the working of the Portugueſe gold mines was attended, no fewer than 40,000 negroes being annually imported for this purpoſe, none of whom, it ſeems, ſurvive the labour of the year; and our navigator was informed, that in 1766 this number was ſo far ſhort, that they were obliged to draught 20,000 more from the town of Rio itſelf. Proceeding from thence to the ſouthern coaſts of America, he had an opportunity of determining a queſtion of great importance to navigation, viz. whether, in ſailing to the Pacific Ocean, it is better to paſs through the ſtraits of Magellan, or to double Cape Horn and ſail through thoſe of Le Maire? From Captain Cook's voyage it appears, contrary to the opinion of former navigators, that the latter is the preferable paſſage. Through this he was only 33 days in coming round the land of Terra del Fuego from the eaſt entrance of the ſtrait of Le Maire till he had advanced about 12 degrees to the weſtward, and three and a half to the northward, of Magellan's ſtraits. During all this time the ſhip ſcarcely received any damage, though if he had paſſed the other way he could not have accompliſhed his paſſage in leſs than three months, beſides immenſe fatigue to his people and damage to the ſhip. In theſe ſtormy regions, however, he experienced the ſame inconveniences felt by other navigators; ſuch a ſea being met with off Cape Diego, that the ſhip frequently pitched her bowſprit under water. Here alſo the exceſſive cold and mutability of weather in theſe ſouthern regions was experienced in ſuch a manner as had nearly proved fatal to ſome of the gentlemen who ſailed along with him. Dr Solander, Mr Banks, Mr Monkhouſe the ſurgeon, and Mr Green the aſtronomer, with their attendants and ſervants, ſet out on a botanical

BRITISH MUSEUM

cal expedition while the ſhip lay at anchor in the bay of Good Succeſs. It was then the middle of ſummer, and the morning on which they ſet out was as mild and warm as it uſually is in the month of May in England: but having aſcended a mountain for the purpoſe of botanizing, they were ſupriſed by ſuch ſtorms of ſnow and hail that they could not get back that night. Dr Solander, who warned them of their danger, that people when about to periſh with cold were ſeized with a violent inclination to ſleep, was the firſt who ſeemed likely to fall a victim to it; and it was not in the power of his companions to keep him from ſitting down for that purpoſe. He was awaked in a few minutes; but during this ſhort interval his feet had become ſo much diminiſhed by the contraction of the veſſels, that his ſhoes fell off from them when he was again made to riſe.

6
Miſerable ſtate of the natives.

Even theſe dreary regions, however, are not without inhabitants, whom our voyagers juſtly concluded to be the loweſt of the human ſpecies. Indeed, conſidering the little convenience they have, it is wonderful how they can reſiſt the ſeverity of the climate, for they are almoſt without clothing; they dwell in miſerable hovels, which admit both the wind and ſnow or rain; and they have not any utenſil for dreſſing their food. Nevertheleſs, theſe miſerable creatures, as they appeared to our navigators, ſeemed to have no wiſh to poſſeſs more than they enjoyed; and they were abſolutely indifferent about every thing that was offered them, except large beads which they would take as ornaments. Hence Dr Hawkeſworth, who wrote the account of the voyage, concludes, that theſe people may be on a level with ourſelves with reſpect to the real happineſs they enjoy.

7
Iſlands diſcovered between Cape Horn and Otaheite.

On the 26th of January 1769 our navigators left Cape Horn; and from that time to the firſt of March, during which they run no leſs than 660 leagues, met with no current by which the ſhip was affected. Hence it is probable, that during all this time they had never been near any land, the currents of the ocean being uſually met with in the neighbourhood of iſlands. Several iſlands, however, were diſcovered before they reached Otaheite, on which they beſtowed the names of Lagoon Iſland, Thrum-cap, Bow Iſland, the Groups, Bird Iſland, and Chain iſland. All theſe ſeemed to be inhabited, and were covered with a moſt delightful verdure; which appeared to the greater advantage, as our navigators had for a long time ſeen no land but the dreary hills and waſtes of Terra del Fuego.

8
Tranſit of Venus obſerved.

Having arrived at Otaheite, they ſet about obſerving the tranſit of Venus over the ſun, which indeed was the main purpoſe for which the voyage had been undertaken. The anxiety which they underwent when the time of the expected phenomenon approached may eaſily be imagined, as the whole depended on the circumſtance of a clear ſky, which though more readily to be expected in that climate than one more to the northward, was ſtill a matter of uncertainty. In conſequence of ſome hints which had been given by the Earl of Morton, Captain Cook determined to ſend out two parties to different places to make the obſervations; by which means there would be a chance of ſucceſs, even if thoſe at Otaheite ſhould fail. For this purpoſe he ſent Mr Gore in the long boat to Eimeo, a neighbouring iſland, along with Mr Monkhouſe, Mr Banks, and Mr Sporing, who were furniſhed with proper inſtruments by Mr Green the aſtronomer. Meſſrs Hicks, Clerke, Pickerſgill, and Saunders, were ſent in the pinnace to a convenient ſpot to the eaſtward of the main obſervatory, where they were likewiſe ordered to make obſervations with ſuch inſtruments as they had. The day on which the tranſit happened was the 3d of June 1769, when they had the ſatisfaction to ſee the ſun riſe without a cloud; and as the weather continued equally clear, throughout the day, there was the beſt opportunity of making the obſervations in a proper manner. All of them ſaw an atmoſphere or duſky cloud round the planet, which diſturbed their obſervation, and probably cauſed them to differ from each other more conſiderably than they would otherwiſe have done. According to Mr Green, the times of ingreſs and egreſs of the planet were as follow:

Morning	h.	min.	ſec.
Firſt external contact, - -	9	25	42
Firſt internal contract, or total immerſion,	9	44	4
Afternoon			
Second internal contact, -	3	14	8
Second external contact, or end of the tranſit, - - -	3	32	10

From theſe obſervations the latitude of the obſervatory was found to be 17° 29′ 15″ S. and the longitude 149° 32′ 30″ W. of Greenwich. Several curious remarks were made both on the country itſelf and on the inhabitants.

[8]
Otahete a volcanic iſland.

Mr Banks, in an excurſion up the country, diſcovered many traces of volcanic fire; the ſtones, like thoſe of Madeira, had evidently the appearance of being burnt, and the very clay on the hills had the ſame appearance.

9
Account of the natives.

The natives, though addicted to thieving, appeared in general harmleſs and friendly, and very ready to ſupply the ſhip with neceſſaries in exchange for ſuch things as they wanted. The articles on which they ſet the greateſt value were hatchets, axes, large nails, ſpikes, looking glaſſes, and beads. They were alſo fond of fine linen, whether white or printed; but an axe of the value of half a crown would buy more proviſions than a piece of cloth of the value of 20 ſhillings. They are very fickle and inattentive; ſo that it was not poſſible to engage them to pay any regard to the worſhip of the Deity which they ſaw performed before them; nor would they attend to any explanation of it that was given them. They are not, however, deſtitute of a religion of their own; and are particularly careful of the repoſitories of the dead, which they will not allow to be violated on any account. Of this Captain Cook had an inſtance, when ſome of his people offered to take down an incloſure of one of theſe repoſitories. They were violently oppoſed by the natives, who ſent a meſſenger to acquaint them they would never ſuffer any ſuch thing; and the only inſult that was ever offered to an Engliſhman by the people of this iſland was on a ſimilar account. From Otaheite our navigators carried with them Tupia, formerly high-prieſt of the country and prime miniſter to Queen Oberea. From his practice it appeared that the prieſts of Otaheite, as well as elſewhere, take care to place themſelves a ſtep nearer the Deity than the common people, and to uſe the deceptions too frequently put in practice by ſuch mediators. While on board the Endeavour, he frequently prayed to his god *Tane* for a wind; and according to his own account never failed of ſucceſs. This, however, he took care to enſure; for he never began his prayers till he perceived the breeze already on the water, and ſo near that it muſt reach the ſhip before they could well be ended. It was obſerved likewiſe of the people of Otaheite, that they had their bards or minſtrels, who went about the country with muſical inſtruments. The band whom they ſaw at this time conſiſted of two players on flutes and three drummers; the latter accompanying the flutes with their voices. Their ſongs were made extempore, and the Engliſh themſelves were generally the ſubject.

From Otaheite our navigators ſailed towards a neighbouring iſland named *Tethuroa*; but finding it ſmall, low, and without any ſettled inhabitants, the Captain choſe rather to direct his courſe towards Huaheine and Ulietea, which he was informed were well inhabited. Theſe had never been viſited by any European ſhip; but the inhabitants, though peaceable and friendly, were very ſlow and cautious in trading, ſo that the Captain was obliged to bring out his hatchets to market; a commodity which he had hoped might have been concealed from thoſe who had never ſeen an European ſhip before. On his arrival at Ulietea he found, by the diſcourſe of Tupia, that the inhabitants of a neighbouring iſland named *Bolabola* were of ſuch a martial diſpoſition as to be the terror of thoſe of Huaheine, Ulietea, and others, inſomuch that he apprehended great danger to our navigators ſhould they touch at an iſland which the Bolabola men had lately conquered. This, however, had ſo little effect upon Captain Cook, that he not only landed on the iſland already mentioned, but took poſſeſſion, in his Majeſty's name, of Bolabola itſelf, together with Ulietea, Huaheine, and another named Otaha, which were all viſible at once.

10 Wretched appearance of the king of Bolabola.

During their ſtay here they paid a viſit to Opoony, the formidable monarch of Bolabola; whom, to their ſurpriſe, they found a feeble wretch, withered and decrepid, half blind with age, and ſo ſtupid that he ſeemed ſcarce to be poſſeſſed of a common degree of underſtanding.

11 Society Iſlands diſcovered.

About theſe iſlands they ſpent ſix weeks, beſtowing upon them the name of the *Society Iſles*, on account of their being ſo near to each other. They are ſix in number, Ulietea, Huaheine, Bolabola, Otaha, Tubai, and Maurna. The ſmaller ones in their neighbourhood are Tethuroa, Eimeo, Tapoamanao, Oatara, Opururu, Tamou, Toahoatu, and Whennuaia.

12 Oheteroa iſland diſcovered.

Leaving the Society Iſlands, which are ſituated between Lat. 16. 10. and 16. 55. S. and between 150. 57. and 152. W. from the meridian of Greenwich, they fell in with the iſland of Oheteroa, ſituated in S. Lat. 22. 27. and W. Long. 150. 47.; but this was found to be deſtitute of any harbour or ſafe anchorage, and the diſpoſition of the inhabitants ſo hoſtile that they could not by any means be conciliated, ſo that no attempts were made to land. From Tupia Captain Cook learned that there were ſeveral iſlands in the neighbourhood, which our navigator conjectured to be Boſcawen and Keppel's Iſlands, diſcovered by Captain Wallis; but without ſpending more time in exploring theſe, he ſet ſail to the ſouthward in ſearch of a continent.

13 Comet of 1769 obſerved.

Our voyagers left Oheteroa on the 15th of Auguſt 1769, and on the 30th had a view of the comet which appeared that year; its tail ſubtending on an angle of 42 degrees. This proved a new ſource of apprehenſion to Tupia, who inſtantly cried out, that as ſoon as it was ſeen at Bolabola, the people of that country would attack thoſe of Ulietea, who would undoubtedly be obliged to fly with precipitation to the mountains to ſave their lives. On the 6th of October they diſcovered land, which from its ſize, and the enormous mountains obſervable on it, was ſuppoſed by the gentlemen on board to be part of *Terra Auſtralis incognita*; but on farther examination it was found to be part of New Zealand.

14 They arrive at New Zealand.

Here the inhabitants were found to ſpeak a dialect of the language of Otaheite, ſo that they could underſtand Tupia, and he them; yet ſo extremely hoſtile were their diſpoſitions, that not the ſmalleſt intercourſe could be held with them; nor could any thing neceſſary for the ſhips be procured excepting wood: ſo that the name Captain Cook thought proper to beſtow on this part of the country was *Poverty-Bay*. By the natives it is called *Taoneroa*, and lies in S. Lat. 38. 42. and W. Long. 181. 36. During the time of his ſtay in that part of the world the Captain circumnavigated almoſt the whole country of New Zealand, which he found to conſiſt of two iſlands ſeparated from each other by a narrow ſtrait, which, from its diſcoverer, has obtained the name of *Cook's Strait*. In ſome places the diſpoſition of the inhabitants was as favourable as could be wiſhed; ſo that Dr Solander, Mr Banks, and other gentlemen, had an opportunity of exploring the country in ſome degree, with a view to diſcover its natural productions.

15 Rock of an extraordinary ſhape.

In one of theſe excurſions, as they paſſed through a valley, the hills on each ſide of which were very ſteep, they were ſuddenly ſtruck with the ſight of a very extraordinary natural curioſity. It was a rock perforated through its whole ſubſtance, ſo as to form a rude but ſtupendous arch or cavern, opening directly to the ſea. This aperture was 75 feet long, 27 broad, and 45 in height, commanded a view of the bay and the hills on the other ſide, which were ſeen through it; and opening at once on the view, produced an effect far ſuperior to any of the contrivances of art.

16 Natural products of the country.

On that part of the coaſt, which, from having obſerved a tranſit of Mercury, they named *Mercury Bay*, oyſters were found in ſuch plenty, that they might have loaded not only their boats but even their ſhip with them. They were about the ſame ſize with thoſe met with in this country; and on account of their being found in ſuch plenty, and likewiſe that the adjacent country abounds with conveniences, Captain Cook was at great pains to point out the ſituation of the place. By his obſervations, the latitude of Mercury Bay is 36° 48′ 28″ S.

Leaving this bay our commander proceeded to explore other parts of the country, which by their account ſeems to abound with rivers. Two large ones were met with in Mercury Bay; one of which, from the abundance of oyſters found at its mouth, was called *Oyſter river*; the other they named *Mangrove river*, from the number of mangrove trees growing there. A third, which they called *Thames*, was met with in that part called the Bay of iſlands, up which they ſailed 14 miles. Its banks were every where adorned with lofty trees, which they had likewiſe obſerved in other parts of the country. They were too heavy for maſts, but would make the fineſt planks imaginable; and as they reſembled the pitch pine, the timber of which is lightened by tapping, the carpenter was of opinion that they might thus be rendered more proper for maſts than any European timber. One of theſe trees meaſured 19 feet 8 inches in circumference at the height of ſix feet from the ground, and was no leſs than 89, with very little taper, to the branches, ſo that the lieutenant ſuppoſed it muſt contain 356 feet of ſolid timber. In Queen Charlotte's Sound, the country was little other than one vaſt foreſt, with plenty of excellent water; and the coaſt abounding with fiſh. As the ſhip lay at the diſtance of only a quarter of a mile from the ſhore, they were agreeably entertained with the ſinging of an infinite number of ſmall birds, which formed a melody greatly ſuperior to any thing they had ever heard before. The muſic of theſe little choriſters ſeemed to be like ſmall bells, moſt exquiſitely tuned, though probably the diſtance and intervention of the water had a conſiderable effect in heightening it. They began to ſing about two in the morning, and continued their ſong till ſun-riſe, after which they were ſilent all the day, reſembling in this reſpect the nightingales of our own country.

17 General deſcription of the country.

The time which Capt. Cook ſpent in exploring the coaſts of New Zealand was not leſs than ſix months. By his reſearches it was ſhown to conſiſt of two large iſlands, the moſt northerly of which is called *Eaheinomauwe*, and the moſt ſoutherly *Tovy*, or *Tavai Poenammoo*; though it is not certain whether the whole ſouthern iſland or only a part of it is comprehended under this name. This iſland ſeems to be barren and mountainous, but *Eaheinomauwe* has a much better appearance; and it was univerſally believed by the gentlemen on board, that all kinds of European grain, as well as garden plants and fruit, would flouriſh in the greateſt abundance and perfection; and from the vegetables found here it was concluded that the winters are not more ſevere than thoſe of England, and it was known by experience, that the ſummer was not hotter, though the heat was more equal than in this country. Here are no quadrupeds except dogs and rats; and the latter are ſo ſcarce, that they eſcaped the notice of many on board. The birds are not numerous, and the gannet is the only one of the European kind that was obſerved. The inſects are equally ſcarce; but the ſea makes abundant recompence for this ſcarcity of land animals; every creek ſwarms with fiſh, equally delicious with thoſe in this country. The foreſts are of vaſt extent, and filled with excellent timber trees, the largeſt, ſtraighteſt, and cleaneſt that Mr Cook had ever ſeen. There is here one plant which anſwers the purpoſes of both hemp and flax, and excels all other of the kind that has been met with in other parts of the world. **18 Proper place for ſettling a colony there.** If the ſettling of New Zealand therefore ſhould ever be deemed on object worthy of the attention of Great Britain, Captain Cook was of opinion, that the beſt place for eſtabliſhing a colony would be either on the banks of the Thames or in the Bay of Iſlands; each of theſe places having the advantage of an excellent harbour. Settlements might be extended, and a communication made with the inland parts of the country by means of the river; and veſſels eaſily conſtructed of the excellent timber with which the country every where abounds.

19 Account of the inhabitants.

The inhabitants of New Zealand are in a very barbarous ſtate, and have a degree of ferocity unknown to the inhabitants of the South Sea iſlands, though they ſeem to have the ſame origin. During their reſidence there, our navigators had the moſt convincing evidences of their being cannibals, and accuſtomed to devour the bodies of their ſlain enemies. Notwithſtanding theſe barbarous practices, however, they ſeemed to enjoy a ſtate of uninterrupted health. In all the viſits made to their towns, none was ever perceived who had the leaſt bodily complaint, not even the ſlighteſt eruption on the ſkin. This extraordinary degree of health was likewiſe manifeſted by the eaſe with which their wounds were healed without the ſmalleſt application, as well as by the number of old men with which the iſland abounded. Many of theſe, by the loſs of their hair and teeth, ſeemed to be extremely old, but none of them were decrepid; and though inferior in ſtrength to the young men, they came not behind them in the leaſt with regard to cheerfulneſs and vivacity. The univerſal and only drink of the New Zealanders is water.

Our navigator had now explored three-fourths of that part of the globe where the ſouthern continent was ſuppoſed to lie, without being able to find it; and his voyage had demonſtrated, that the lands ſeen by former navigators could not have been parts of ſuch a continent, though, as he had never proceeded farther to the ſouthward than 40 degrees, the arguments for it were not as yet entirely overthrown. **20 Diſcoveries at New Holland.** Mr Cook, however, did not at this time proceed farther in the ſearch of ſuch a continent, but ſailed from New Zealand to the coaſts of New Holland, where he anchored in Botany Bay on the 20th of April. Here he found a few ſavage inhabitants more barbarous and degenerate than any that had yet been obſerved. Their language was harſh and diſſonant, totally unintelligible even to Tupia; they appeared to have little curioſity, and ſet no value upon any preſent that could be made them. The moſt remarkable circumſtance in this country ſeems to be its extreme ſcarcity of water; not a ſingle ſtream of any conſequence having ever been obſerved by any navigator. Some were of opinion indeed, that Moreton's Bay, in S. Lat. 26. 56. and W. Long. 206. 28. opens into a river; though the only reaſon they had for this opinion was, that the ſea looked paler in that part than uſual, and the land at the bottom part of the bay could not be ſeen. At this time, however, the matter could not be determined by experiment, on account of the wind being contrary. The ſcarcity of water here is the more ſurpriſing, on account of the vaſt extent of the country, and likewiſe its having abundance of tolerable high hills. **21 Magnetic needle ſurpriſingly affected.** In this iſland there were found many curious plants and animals; and it was found, that in ſeveral places the magnetical needle was affected to ſuch a degree as to vary its poſition even to 30 degrees. At one time it varied no leſs than two points on being removed to the diſtance of only 14 feet. Some of the looſe ſtones being taken up and applied to the needle produced no effect; but Mr Cook was of opinion that the whole phenomenon was to be aſcribed to iron ore in ſome of the mountains, and of which traces had been already met with. This irregularity continued in ſome degree even at ſea; for when the ſhip was cloſe under Cape Upſtart, the variation of the needle in the evening of the 4th of June was 9. Eaſt, and next morning only 5. 35.; and this was in like manner accounted for from iron ore, or ſome magnetical matter below the ſurface of the ground. The great iſland has many other ſmall ones round it; ſeveral of which were viſited by our navigators. One of them named *Eagle Iſland*, ſeemed to be inhabited by a monſtrous kind of birds, the neſt of one of which meaſured no leſs than 26 feet in circumference and two feet eight inches in height; and in the Philoſophical Tranſactions, vol. xx. there is an account of one of theſe neſts ſtill larger; but the bird to which it belonged was not ſeen. That which our navigators ſaw was built of ſticks, and lay upon the ground.

22 Birds neſts of an immenſe ſize.

23 Vaſt extent of the country.

The country which goes by the name of *New Holland* is by far the largeſt iſland in the world. Its eaſtern part, called *New South Wales*, now firſt explored by Captain Cook, extends upwards of 2000 miles in length, if the coaſt were reduced to a ſtraight line. Though inhabited, as we have already ſaid, by very barbarous ſavages, their number appears to bear no proportion to the extent of their territory. The intercourſe they had with our navigators was ſo ſmall, that they could pick up but a few words of their language. As a Britiſh ſettlement, however, is now made in that country, there is no doubt that much more exact and accurate accounts will ſoon be obtained than even the diligence and attention of Captain Cook could collect on ſuch a tranſient viſit.

24 Separated by ſtraits from New Guinea.

In this voyage our navigator, beſides exploring the eaſtern part of the iſland, which had never been done before, diſcovered that it was ſeparated from the iſland of New Guinea, to which it had formerly been thought to join. The two countries are ſeparated by a ſtrait to which the commander gave the name of *Endeavour Strait*. The north entrance of this lies in S. Lat. 10. 39. and W. Long. 218. 36. the paſſage is formed by the main land and a congeries of iſlands to the north, on which our navigator beſtowed the name of *Prince of Wales's Iſlands*. Theſe are very different both in height and extent; and the Captain was of opinion that ſeveral paſſages might be found out among them. On the coaſt of New Holland oppoſite to New Guinea are found cockles of an immenſe ſize; ſome of them being as much as two men could move, and containing 20 pounds of good meat. In theſe ſeas as well as on the coaſts of Brazil, our navigators found the ſurface of the water covered with a kind of ſcum, called by the ſailors *ſea-ſpawn*. It was examined by Mr Banks and Dr Solander; but they could determine nothing farther than that it was of vegetable origin.

25 Cockles of vaſt ſize, ſea ſcum, &c.

26 Unaccountable method of the natives of letting off fires.

The natives of New Guinea were ſo hoſtile that no diſcoveries of any conſequence could be made They reſembled the New Hollanders in ſtature, and having ſhort cropped hair. Like them too they were abſolutely naked, but ſomewhat leſs black and dirty. They had a ſurpriſing method of letting off a kind of fires, exactly reſembling the flaſhes of fire-arms, but without any exploſion. It was not known in what manner this was done, as they were never near enough to make a particular obſervation. Thoſe who diſcharged them had a ſhort piece of ſtick which they ſwung ſideways from them, upon which there iſſued the fire and ſmoke juſt mentioned. This ſeems to have been intended as a defiance; for they had no effect as offenſive weapons, and others were armed with bows and arrows. The country appeared extremely pleaſant and fertile. The place at which they touched lies in S. Lat. 6. 15,

As the condition of the Endeavour was now very much ſhattered by having ſailed ſo long in theſe dangerous ſeas, the commander determined to make the beſt of his way for Batavia in order to refit. In this voyage he firſt paſſed two unknown iſlands without touching at either of them. They were ſuppoſed to belong to the Aurora iſlands; but if this be the caſe, the latter muſt be laid down at too great a diſtance from New Guinea. The Weaſel Iſles, laid down by former navigators at about 20, or 25 leagues from the coaſt of New Holland, were not ſeen; for which reaſon Mr Cook is of opinion that they are erroneouſly laid down.

Paſſing by the iſlands of Timor, Timor-Lavet, Rotta, and Seman, they next arrived at the iſland of Savu, where a ſettlement had lately been made by the Dutch. In this voyage they had the ſatisfaction of obſerving the aurora auſtralis, which here ſeemed to differ in ſome reſpects from that in the northern hemiſphere. It conſiſted of a dull reddiſh light extending about 20 degrees above the horizon; and though it varied at ſome times in extent, it was never leſs than eight or ten degrees. From this general maſs of light there ſometimes iſſued rays of a brighter colour, which vaniſhed and were renewed like thoſe of the aurora borealis, but without any of that tumultuous motion obſerved in the aurora borealis. The body of the light bore S. S. E. from the ſhip, and continued without any diminution of its brightneſs from 10 to 12 at night.

27 Aurora Auſtralis.

28 Excellent character of the inhabitants of Savu.

The middle part of the iſland of Savu lies in 10° 35′ ſouth, and 237° 30′ weſt longitude, and afforded a moſt beautiful proſpect from the ſhip. The people are remarkable for the purity of their morals, which are ſaid to be irreproachable, even on the principles of Chriſtianity. Though no man is allowed to have more than one wife, inſtances of illicit commerce betwixt the ſexes, are ſcarce known among them. Inſtances of theft are likewiſe very rare; and ſo far are they from revenging a ſuppoſed injury by murder, that when any differences ariſe among them, they are immediately and implicitly referred to the determination of the king. They will not even make it the ſubject of private debate, leſt they ſhould be provoked to reſentment and ill-nature; and the delicacy and cleanlineſs of their perſons are ſaid to be proportionable to the purity of their morals.

29 Good effects of the electrical chains in preſerving from the effects of lightening.

On the arrival of the Endeavour at Batavia, our navigator had an opportunity of obſerving the good effects of the electrical chains applied to ſhips in ſecuring them from the effects of lightening. A dreadful ſtorm of thunder happened one evening, during which the main-maſt of one of the Dutch Eaſt India-men was ſplit and carried away cloſe by the deck, the main top-maſt, and top-gallant-maſt being ſhivered to pieces. This ſhip lay ſo near the Endeavour, that the latter would probably have ſhared the ſame fate, had it not been for the conducting chain which fortunately was juſt put up. The exploſion ſhook her like an earthquake, the chain at the ſame time appearing like a line of fire. The ſtroke ſeemed to have been directed to the Dutch veſſel by an iron ſpindle at the maſt head; which practice our commander diſcommends, but ſtrongly adviſes the uſe of the electrical chain.

30 Death of Tupia.

On their landing at Batavia, Tupia was confined by ſickneſs, ſo that he appeared quite lifeleſs and dejected when put into the boat; but on his arrival at land recovered his ſpirits ſurpriſingly. The ſcene, to him ſo new and extraordinary, ſeemed to produce an effect ſimilar to what is aſcribed to enchantment. His attention was particularly engaged by the various dreſſes of the people; and being informed that at Batavia every one appeared in the dreſs of his own country, he expreſſed a deſire of likewiſe appearing in the garb of Otaheite. Having therefore been furniſhed with South Sea cloth from the ſhip, he equipped himſelf with great quickneſs and dexterity. After the firſt flow of ſpirits had ſubſided, however, he ſoon began to feel the fatal effects of the climate; and his boy Tayeto, whoſe ſpirits had been ſtill more elevated on his arrival, was attacked with an inflammation of the lungs, and in a little time fell a victim to the diſeaſe. Tupia himſelf did not long ſurvive him, and his death was not attributed entirely to the unwholeſomeneſs of the climate. Having been accuſtomed from his infancy to ſubſiſt chiefly upon vegetable food, and particularly on ripe fruit, he had ſoon contracted the diſorders incident to a ſea-life, and could ſcarce have been expected to reach England, even if the unwholeſome climate of Batavia had been out of the queſtion.

The Endeavour left Batavia on the 27th of December 1770, and on the 5th of January 1771 reached Prince's Iſland. This place had been formerly much frequented by the India ſhips, but of late entirely deſerted on account of the ſuppoſed bad quality of the water: but this our navigator has diſcovered to be a miſtake; and that though the water near the ſea is brackiſh, it may be had of excellent quality by going a little way up the country. He is of opinion that this iſland is a more proper place for ſhips to touch at than either North Iſland or New Bay, becauſe neither of theſe can afford other refreſhments which may be had at Prince's Iſland.

31 Prince's Iſland, a proper place for ſhips to touch at.

The reſt of this voyage affords little intereſting matter. The Cape of Good Hope, which was their next ſtage, has been ſo fully deſcribed by former navigators that there was little room for addition. At St Helena the commander made ſome remarks on the rigorous treatment of the ſlaves, which was repreſented as worſe than that of the Dutch either at Batavia or the Cape of Good Hope. In the account of his ſecond voyage, however, this accuſation was retracted.

32 Second voyage.

Captain Cook's ſecond voyage was undertaken in an eſpecial manner to determine finally the queſtion concerning the exiſtence of a ſouthern continent. It commenced in the year 1772; and, as in the former, he proceeded firſt to Madeira. From thence he proceeded to St Jago, one of the Cape de Verde Iſlands; where an opportunity was taken of delineating and giving ſuch a deſcription of Port Praya, and the ſupplies to be there obtained, as might be of uſe to future navigators. On the 8th of September he croſſed the line in 8° weſt longitude, and had the ſatisfaction to meet with good weather, though he had been informed that he had ſailed at an improper time of the year, in conſequence of which he would probably be becalmed. From his account, however, it appears, that though in ſome years ſuch weather may be expected, it is by no means univerſally the caſe.

33 Calms not always to be feared near the equinoctial.

34 Lnminous quality of ſea-water further determined.

In this part of the ocean he had alſo an opportunity of obſerving the cauſe of the luminous property of ſea-water, which in his former voyage had been attributed to inſects. Mr Forſter being of a different opinion, the matter was again particularly inquired into, but the reſult was entirely conformable to the former determination. Some buckets of water being drawn up from along ſide the ſhip, were found to be filled with thoſe inſects of a globular form, and about the ſize of a ſmall pin's head. No life indeed could be perceived in them; but Mr Forſter was thoroughly convinced of their being living animals when in their proper element.

35 Ice-iſlands.

Proceeding ſouthward in queſt of a continent, they fell in with Ice Iſlands in S. Lat. 50. 40. and two degrees of longitude eaſt from the Cape of Good Hope. One of theſe was ſo much concealed by the hazineſs of the weather, that it could not be ſeen at the diſtance of more than a mile. Captain Cook judged it to be about 50 feet in height, and half a mile in circumference; its ſides riſing in a perpendicular direction, and the ſea breaking againſt them with great violence. Two days after, they paſſed ſix others, ſome of which were two miles in circumference and 60 feet in height; yet ſuch was the ſtrength and violence of the waves that the ſea broke quite over them. On the 14th they were ſtopped by a vaſt field of low ice, of which they could perceive no end. In different parts of this field there were ſeen iſlands or hills of ice like thoſe already deſcribed, and ſome of the people imagined that they ſaw land over them; but upon a narrow examination this was found to be a miſtake. On getting clear of the field of ice they again fell in with looſe iſlands; and as it was a general opinion that theſe are only formed in bays and rivers, our navigators concluded that they could not be at a great diſtance from land. They were now in the latitude of 55° 40′ ſouth; and as they had ſailed for more than 30 leagues along the edge of the ice without finding any opening, the Captain determined to run 30 or 40 leagues farther to the eaſtward, in hopes of then getting to the ſouthward. If in this attempt he met with no land or other impediment, his deſign was to ſtretch behind the ice altogether, and thus determine the matter at once. In a ſhort time, however, it became evident that the field of ice along which they had ſailed ſo long did not join with any land; and the Captain now came to a reſolution of running as far to the weſt as the meridian of Cape Circumciſion. In the proſecution of this deſign he met with a very ſevere ſtorm, which was rendered the more dangerous by the pieces of looſe ice among which they were ſtill entangled, and a vaſt field of which they could not perceive the boundaries, about three miles to the northward. Of this they could not get clear without receiving ſome ſevere ſtrokes; and after all, when they arrived at the place where they ought to have found Cape Circumciſion, it could not be diſcovered; ſo that the Captain concluded that what Bouvet took for land could have been nothing but ice.

During this run the fallacy of the general opinion had been diſcovered, that the ice with which the polar regions abound has been formed in the vicinity of land.

36 Ice not always found in the vicinity of land.

It was found likewiſe, that the water produced from the melting of ice, even though formed in the ocean, was perfectly ſweet and well taſted. Of this circumſtance the Captain took advantage to ſupply himſelf with water; and gave it as his opinion, that it was the moſt expeditious method of watering he had ever known. He had likewiſe an opportunity of detecting another popular error, *viz.* that penguins, albatroſſes, and other birds of that kind, never go far from land. This indeed may be the caſe in open ſeas, but in ſuch as are covered with ice it is very different; for they then inhabit the ice iſlands, and float out with them to ſea at a great diſtance.

37 Irregularity of the magnetic needle.

When in the latitude of 49. 13. S. ſome ſigns of land were perceived; but as the wind did not admit of any ſearch being made in the direction where it was ſuppoſed to lie, the Captain proceeded in his voyage to the eaſtward. A very remarkable alteration in the direction of the needle was now perceived, and which could not be ſuppoſed owing to the vicinity of any magnetic matter, as it happened while the ſhips were far out at ſea. The circumſtance was, that when the ſun was on the ſtarboard ſide of the ſhip the variation was leaſt, but greateſt when on the oppoſite ſide. An aurora auſtralis was again obſerved, which broke out in ſpiral or circular rays, and had a beautiful appearance; but did not ſeem to have any particular direction, being conſpicuous at various times in different parts of the heavens, and diffuſing its light over the whole atmoſphere.

38 Extreme cold of the ſouthern ſeas.

The extreme cold and ſtormy weather which now began to take place, determined Captain Cook not to croſs the antarctic circle a ſecond time as he had once deſigned. His obſervations confirmed the accounts of former navigators, that the cold of the ſouthern ſeas is much more intenſe than in equal latitudes in the northern hemiſphere; but at the ſame time it ſhowed that this cold cannot be owing to the vicinity of a continent, as had formerly been imagined. On the contrary, it was now determined beyond diſpute, that if any ſuch continent exiſted in the eaſtern part of the ſouthern ocean, it muſt be confined within the latitude of 60 degrees. No farther diſcoveries therefore being practicable in higher latitudes, as the winter ſeaſon was approaching, the commander ſteered for New Zealand, where he anchored in Duſky Bay on the 25th of March, having been at Sea 117 days without once coming in ſight of land.

39 Farther account of New Zealand.

Here the time was ſpent in procuring proper refreſhments for the people, and exploring the ſea-coaſt and country for the benefit of future navigators. Nor was our commander unmindful of the inhabitants. Here he left the five geeſe which yet remained, chooſing for them a place where there were no people at the time to diſturb them; and as they had there great plenty of food, he had no doubt of their breeding, and in a ſhort time ſpreading over the country. Some days after a piece of ground was cleared by ſetting fire to the topwood, after which it was dug up and ſowed with garden ſeeds. Duſky Bay is ſituated in the weſtern iſland of New Zealand, called *Tavaipoenammoo*, which as has already been ſaid, is leſs fertile than the other. The inland part is full of rugged mountains of a vaſt height; but the ſea-coaſt is covered with trees, among which is the true ſpruce, which was found to be of great uſe. It was remarked that though a vaſt quantity of rain fell during the time of reſidence here, it was not attended with any bad effects on the health of the people; which furniſhes an additional argument of the healthineſs of the place. Duſky Bay is reckoned by Captain Cook to be the moſt proper place in New Zealand for the procuring of refreſhments, though it is attended with ſome diſagreeable circumſtances, particularly being infeſted with great numbers of black ſand-flies, which were troubleſome to an extreme degree. The natives ſeen at Duſky Bay were apparently of the ſame race with thoſe ſeen in other parts of the country, and led a wandering life, without any appearence of being united in the bonds of ſociety or friendſhip.

From Duſky Bay the Captain proceeded to Queen Charlotte's Sound, where he met with the Adventure, which had been ſeparated from the Reſolution for above 14 weeks.

40 Water ſpouts.

In his paſſage thither he had an opportunity of obſerving ſix water-ſpouts, one of which paſſed within 50 yards of the Reſolution. It has been a common opinion, that theſe meteors are diſſipated by the firing of a gun, and the Captain was ſorry he had not made the experiment; but he acknowledges, that though he had a gun ready for the purpoſe, and was near enough, his attention was ſo much engaged in viewing them, that he forgot to give the neceſſary orders.

Having planted another garden in this part of the country, and left two goats, two breeding ſows and a boar, in as private a ſituation as poſſible, that they might be for ſome time out of the reach of the natives, the Captain ſet ſail for Otaheite.

41 Diſcoveries of Captain Furneaux.

During the long abſence of the Adventure, Captain Furneaux had viſited the coaſt of New Holland, and diſcovered that there was no probability of Van Dieman's land being ſeparated from it by ſtraits: he had likewiſe found additional proofs that the natives of New Zealand were accuſtomed to eat human fleſh. Captain Cook alſo remarked with concern, that the morals of the New Zealanders were by no means mended by the viſit he had formerly paid them. At that time he looked upon the women to be more chaſte than thoſe of moſt of the nations he had viſited; but now they were ready to proſtitute themſelves for a ſpikenail, and the men to force them to ſuch an infamous traffic, whether agreeable to the inclinations of the females or not.

In the run from New Zealand to Otaheite, our commander paſſed very near the ſituation aſſigned by Captain Carteret to Pitcairn's iſland, diſcovered by him in 1767, but without being able to find it, though a ſight of it would have been uſeful for correcting its longitude as well as that of others in the neighbourhood; but there was not at preſent any time to ſpend in ſearching for it.

42 New iſlands diſcovered.

Proceeding farther on his voyage, however, he fell in with a cluſter of iſlands ſuppoſed to be the ſame diſcovered by M. Bougainville, and named by him the *Dangerous Archipelaga*. To four of theſe Captain Cook gave the names of *Reſolution, Doubtful, Furneaux,* and *Adventure Iſlands*. Reſolution Iſland is ſituated in S. Lat. 17. 24. W. Long. 141. 39. Doubtful Iſland in S. Lat. 17. 20. W. Long. 141. 38. Furneaux Iſland in S. Lat. 17. 5. W. Long.

143. 16. and Adventure Iſland in S. Lat. 17. 4. and W. Long. 144. 30.

43 Miſtake concerning the women of Otaheite corrected.

No diſcovery of any great conſequence was made at the iſland of Otaheite or thoſe in its neighbourhood, excepting that the Captain had an opportunity of correcting the opinion which till now had prevailed, of the exceſſive diſſoluteneſs and immodeſty of the women of Otaheite; and which had been enlarged upon by Dr Hawkeſworth more than ſeemed to be conſiſtent with decency. The charge, however, according to the accounts of this ſecond voyage, is far from being indiſcriminately true, even of the unmarried females of the lower claſs. Some additions were made to the knowledge of the geography of thoſe iſlands; and from Huaheine Captain Furneaux took on board his ſhip one of the natives of Ulietea named *Omai*, afterwards ſo much ſpoke of in England. Captain Cook at firſt appeared diſſatisfied with his choice of this youth, as being inferior in rank to many others, and having no particular advantage in ſhape, figure, or complexion; however he had afterwards reaſon to be better pleaſed. During the Captain's reſidence at Otaheite, he uſed his utmoſt endeavours to diſcover whether the venereal diſeaſe was endemic among them, or whether it had been imported by Europeans: but in this he could not meet with any perfectly ſatisfactory account; though it was univerſally agreed, that if it had been introduced by Europeans, it muſt have been by the French under M. Bougainville.

44 Harvey's Iſland diſcovered.

Captain Cook having left Ulietea on the 17th of September 1773, directed his courſe weſtward, with an inclination to the ſouth. In this courſe he diſcovered land in S. Lat. 19. 8. and W. Long. 158. 54. to which he gave the name of *Harvey's Iſland*. From thence he proceeded to the iſland of Middleburg, where he was treated in the moſt hoſpitable manner poſſible. To ſuch an exceſs did the people carry their generoſity, that they ſeemed to be more fond of giving away their goods than of receiving any thing for them; inſomuch that many, who had not an opportunity of coming near the boats, threw over the heads of others whole bales of cloth, and then retired without either waiting or aſking for any thing in return. From Middleburg he proceeded to Amſterdam Iſland, where the beauty and cultivation of the iſland afforded the moſt enchanting proſpect. There was not an inch of waſte ground; the roads were no wider than what was abſolutely neceſſary, and the fences not above four inches thick. Even this was not abſolutely loſt; for many of theſe contained uſeful trees or plants.

45 South Sea iſlands generally ſurrounded by coral rocks.

It is obſervable of the iſles of Middleburg and Amſterdam, as well as of moſt others in the South Sea, that they are guarded from the waves by a reef of coral rocks which extend about one hundred fathoms from the ſhore. Thus they are effectually ſecured from the encroachments of the ocean; by which they would probably ſoon be ſwallowed up, as moſt of them are mere points in compariſon of the vaſt quantity of water which ſurrounds them. Here he left a quantity of garden vegetable ſeeds and pulſe, which it was not doubted would be taken care of by the induſtrious inhabitants. In the laſt mentioned iſlands our navigators found no animals but hogs and fowls; the former being of the ſame kind with thoſe uſually ſeen in the other iſlands in the South Sea, but the latter greatly preferable, equalling thoſe of Europe in their ſize, and even preferable in reſpect of the goodneſs of their fleſh.

46 Another viſit to New Zealand.

On the 7th of October Captain Cook left the iſland of Amſterdam, with a deſign to pay another viſit to New Zealand, in order to take in wood and water for his voyage in queſt of a ſouthern continent. The day after he left Amſterdam, he fell in with the iſland of Pilſtart, formerly diſcovered by Taſman, and ſituated in S. Lat. 26′, W. Long. 175° 59′, 32 leagues diſtant from the eaſt end of Middleburg. On his arrival at New Zealand, he exerted himſelf as much as poſſible to leave a proper aſſortment of vegetables and animals for the benefit of the inhabitants. One of the firſt things he did, therefore, was to make a preſent to a chief, who had come off in a canoe, of a quantity of the moſt uſeful garden ſeeds, ſuch as cabbage, turnips, onions, carrots, parſnips, and yams; together with ſome wheat, French and kidney beans, and peaſe. With the ſame perſon he left alſo two boars, two ſows, four hens, and two cocks. This preſent, however valuable in itſelf, ſeems to have been but indifferently received; for the chief was much better ſatisfied with a ſpikenail half the length of his arm than with all the reſt; notwithſtanding which, he promiſed to take care of the ſeeds, and not to kill any of the animals. On inquiring about thoſe animals left in the country in the former part of his voyage, the Captain was informed, that the boar and one of the ſows had been ſeparated, but not killed. The other he ſaw in good condition, and very tame. The two goats, he was informed, had been killed by a native of the name of Gaubiah. The gardens had met with a better fate; all the articles being in a very flouriſhing condition, though left entirely to nature, excepting the potatoes. Captain Cook, however, ſtill determined to ſupply theſe iſlanders with uſeful animals, put on ſhore a boar, a young ſow, two cocks and two hens, which he made a preſent of to the adjacent inhabitants. Three other ſows and a boar, with two cocks and hens, he ordered to be left in the country without the knowledge of the Indians. They were carried a little way into the woods, and there left with as much food as would ſerve them for 10 or 12 days, in order to prevent them from coming down to the coaſt in queſt of it, and thus being diſcovered.

47 Voyage in queſt of a ſouthern continent.

A ſecond ſeparation with the Adventure had now taken place; notwithſtanding which, Captain Cook ſet out alone with his veſſel in queſt of a ſouthern continent; and ſuch was the confidence put in him by the ſailors, that all of them expreſſed as much ſatiſfaction and alacrity as if not only the Adventure, but ever ſo many ſhips had been in company.

On the 26th of November the Captain ſet ſail from New Zealand; and on the 12th of December began to fall in with the ice, but conſiderably farther to the ſouthward than they had met with it in the former part of his voyage; being now in the latitude of 62° 10′ S. and 172° W. Long. As they proceeded ſouthward, the number of ice iſlands increaſed prodigiouſly; and in Lat. 67° 31′ and W. Long. 142° 54′, they all at once got in among ſuch a cluſter of theſe iſlands, that it became a matter of the utmoſt difficulty and danger to keep clear of them. Finding it impoſſible, therefore, to get any farther to the ſouthward at preſent, the Captain determined to explore a conſiderable tract of ſea to the north of his preſent ſituation, and then again to ſtand to the ſouth. But in this he was ſtill unſucceſsful; no land being diſcovered either in ſailing northward, eaſtward, weſtward, or ſouthward; 48 Is ſtopped by ice. though he proceeded as far in the laſt direction as 71. 10. S. Lat. and 106. 54. W. It was now impoſſible to proceed; and the opinion of the Captain himſelf, as well as of moſt of the gentlemen on board, was, that the ice by which they were now ſtopped extended as far as the pole. As there was ſtill room, however, in parts of the ocean entirely unexplored, for very large iſlands, our Commander determined not to abandon the purſuit in which he was engaged until there ſhould not be any poſſibility of doing more; and beſides the poſſibility of making new diſcoveries, he was conſcious that many of the iſlands already diſcovered were ſo obſcurely known, that it was of conſequence to pay them a ſecond viſit. With this view he propoſed to go in queſt of Eaſter or Davis's Iſland; the ſituation of which was known with ſo little certainty, that none of the attempts lately made to diſcover it had been ſucceſsful. He next intended to get within the tropic, and then to proceed to the weſt, touching at any iſlands he might meet with, and ſettling their ſituations, until he ſhould arrive at Otaheite, where it was neceſſary for him to make ſome ſtay in order to look for the Adventure. It was part of his deſign alſo to run to the weſtern as far as Terra Auſtral del Eſpiritu Sancto, diſcovered by Quiros, and which M. Bougainville had named *The Great Cyclades*. From this land he propoſed to ſail to the ſouthward, and from thence to the eaſt between the latitude of 50° and 60°. In the execution of this deſign, he determined if poſſible to reach Cape Horn during the enſuing November, when he would have the beſt part of the ſummer before him to explore the ſouthern part of the Atlantic Ocean.

In purſuing his courſe to the northward, it had been part of his deſign to find out the land ſaid to have been diſcovered by Juan Fernandez in about the latitude of 38°; but he was ſoon convinced, that if any ſuch land exiſted, it could only be a very ſmall iſland: but the proſecution of the deſign was for ſome little time interrupted by a violent bilious diſorder by which the Cap-
49 Nutritive property of dog's fleſh. tain was attacked. In this, when he began to recover, as there was no freſh meat on board, he was obliged to have recourſe to dog's fleſh; and a favourite animal belonging to Mr Forſter was ſacrificed on the occaſion. The Captain was able to eat not only of the broth made of this, but likewiſe of the fleſh, when his ſtomach could bear nothing elſe. On the 11th of March
50 Viſits Eaſter Iſland, they arrived at Eaſter Iſland, before which time the Captain was tolerably recovered. Here they made but few diſcoveries farther than determining the ſituation of it to be in S. Lat. 27° 5′ 30″, and W. Long. 109° 46′ 20″. The iſland itſelf was found barren and deſolate, having every appearance of being lately ruined by a volcanic eruption; without either wood, fuel, or freſh water worth taking on board. The inhabitants were few in number; and the women in very ſmall proportion to the men, but remarkable for their lewdneſs. A number of gigantic ſtatues were obſerved, which had alſo been taken notice of by Commodore Roggewein, and the origin of which could not be accounted for.

On leaving Eaſter Iſland, Captain Cook was again attacked by his bilious diſorder; but happily recovered before he reached the Marqueſas, which they did
51 And the Marqueſas. on the 6th and 7th of April. One of theſe, being a new diſcovery, received the name of *Hood's Iſland*, from the young gentleman by whom it was firſt obſerved. Theſe are five in number; ſituated between 9 and 10 degrees of ſouth latitude, and between 138. 47. and 139. 13. of weſt longitude. They were diſcovered by Mendana a Spaniard; and their names are, La Magdalena, St Pedro, La Dominica, Santa Chriſtina, and Hood's Iſland. The inhabitants are, without exception, the fineſt race of people in the South Sea, ſurpaſſing all others in that part of the world in the ſymmetry of their perſons and regularity of their features. Their origin, however, from the affinity of language, was evidently the ſame with that of Otaheite. It was in St Chriſtina that our commander anchored; and he has left particular directions for finding a particular cove in Reſolution Bay in that iſland, which is the moſt convenient for procuring wood and water.

In the paſſage from the Marqueſas to Otaheite, our navigators paſſed ſeveral low and ſmall iſlands connec-
52 Iſland Tiookea. ted together by reefs of coral rocks. One of theſe, named by the inhabitants *Tiookea*, was viſited by Lieutenant Cooper. It was diſcovered and viſited by Captain Byron; and is ſituated in S. Lat. 27. 30. W. Long. 144. 56. The inhabitants are much darker in their complexions, and ſeem to be of a fiercer diſpoſition than thoſe of the neighbouring iſlands. They have the figure of a fiſh marked upon their bodies; a very proper emblem of their profeſſion, deriving their ſubſiſtence almoſt entirely from the ſea. Paſſing by St George's Iſlands, which had been alſo diſcovered and named by Captain Byron, our Commander now
53 Palliſer's Iſlands. diſcovered four others, which he named *Palliſer's Iſlands*. One of theſe is ſituated in S. Lat. 15. 26. and W. Long. 146. 20. another in S. Lat. 15. 27. and W. Long. 146. 3. They were inhabited by people reſembling thoſe of Tiookea, and like them were armed with long pikes. Here our navigator obſerved, that from W. Long. 138° to 148° or 150°, the ſea is ſo full of ſmall low iſlands, that one cannot proceed with too much caution.

54 Arrival at Otaheite. On his arrival in Otaheite, proviſions were met with in great plenty; and they were now very acceptable, by reaſon of the long time the ſhip had been at ſea without obtaining any conſiderable ſupply. Two goats which had been given by Captain Furneaux to a chief named *Otoo*, appeared to be in a very promiſing ſituation. The female had brought forth two kids, which were almoſt large enough to propagate; and as ſhe was again with kid, there was little doubt that the iſland would ſoon be ſtocked with theſe uſeful animals; though it was otherwiſe with the ſheep, all of which had died except one. On this occaſion, alſo, the Captain furniſhed the natives with cats, of which he gave away twenty; ſo that there was little danger of the ſtock of theſe animals decaying. During his reſidence at this time, he had an opportunity of making ſome computation of the number of inhabitants on the iſland, which he ſuppoſed to be no leſs than 200,000.

Cook's Diſcoveries.

55 Huaheine, Ulietea, Howe Iſland, &c.

Huaheine and Ulietea Iſlands were next viſited, but without any remarkable occurrence. From the latter our Commander ſet ſail on the 5th of June 1774; and next day came in ſight of Howe Iſland, diſcovered by Captain Wallis, and ſituated in S. Lat. 16. 46. and W. Long. 154. 8. On the 16th a new iſland, named *Palmerſtone Iſland*, was diſcovered in S. Lat. 18. 4. W. Long. 163. 10.; and, four days after, another was obſerved in S. Lat. 19. 1. W. Long. 169. 37. As it was evidently inhabited, the Captain determined to land; but found the people ſo extremely hoſtile, that no intercourſe could be had; nay, he himſelf was in danger of loſing his life by a lance thrown by one of the natives, which paſſed cloſe over his ſhoulder. From the extreme hoſtility of the people of this iſland, it was named by Captain Cook *Savage Iſland*. It is of a round ſhape, pretty high, and has deep water cloſe to the ſhore, but has no good harbour.

56 Roterdam Iſland.

Paſſing by a number of ſmall iſlands, Captain Cook next anchored at that of Anamocka or Rotterdam, diſcovered by Taſman. It is ſituated in 20. 15. S. Lat. and 174. 31. W. Long. Its form is triangular, each ſide extending about three and a half or four miles. From the north-weſt to the ſouth it is encompaſſed by a number of ſmall iſlands, ſand banks, and breakers; of which no end can be ſeen from the iſland on the northern ſide, and may poſſibly be as far extended as Amſterdam or Tongataboo. While the Captain remained on this iſland, he learned the names of more than 20 of the adjacent iſles, ſome of which were in ſight between the north-weſt and north-eaſt. Two of theſe, which lie more to the weſtward than the others, are named *Amattafoa* and *Oghao*. They are remarkable for their height; and from a great ſmoke viſible about the middle of Amattafoa, it was ſuppoſed to have a volcano. The iſland of Rotterdam, Middleburg, or Eaoowe, with Pilſtart, form a group extending about three degrees of longitude and two of latitude. The whole group was named *The Friendly Iſles* by Captain Cook, on account of the friendſhip which ſeemed to ſubſiſt among the inhabitants, and their courteous behaviour to ſtrangers. The people of Rotterdam Iſland are ſimilar to thoſe of Amſterdam; but the iſland is not in ſuch a ſtate of high cultivation as Amſterdam, nor do its fruits come to ſuch perfection. It is alſo inferior in the articles of cloth, matting, &c. which are accounted the wealth of theſe parts.

57 Suppoſed volcano.

58 New Hebrides viſited.

From Rotterdam iſland our navigator continued his courſe to the weſtward, where he firſt diſcovered a ſmall iſland in S. Lat. 19. 48. W. Long. 178. 2. It was named Turtle Iſland, from the great number of theſe animals found upon it. Sixteen days after he fell in with the cluſter of iſlands named by M. Bougainville the *Great Cyclades*. The firſt iſland on which he landed was Mallicollo, where, though the people were at firſt very hoſtile, they were ſoon conciliated, and a friendly intercourſe took place. The language of theſe people is conſiderably different from that of the other South-ſea iſlands; they are diminutive in their perſons, and of ugly features; their hair black or brown, ſhort and curling, but leſs ſoft than that of the negroes. They had no name for a dog in their language, and had never ſeen the animal; ſo that they were extremely fond of a dog and bitch of which Captain Cook made them a preſent. The harbour in this iſland, in which the ſhip came to anchor, was named Sandwich harbour, and lies on the north-eaſt ſide in S. Lat. 16. 25. 20. E. Long 167. 57. 53. It is very commodious for the carrying on any operations at land, having a good depth of water, and many other advantages.

59 Shepherd's Iſles.

The next diſcovery was that of the Group named *Shepherd's Iſles*, in honour of Dr Shepherd, Plumian profeſſor of aſtronomy at Oxford. Numbers more were every day obſerved; of which one peaked rock, named the *Monument*, was uninhabited, being apparently inacceſſible to any other creature but birds. Sandwich iſland is of conſiderable extent, and exhibits a moſt beautiful proſpect. It is ſurrounded with other ſmaller iſlands, the principal of which were named Montague and Hinchinbrook. At Erromango they found the people hoſtile and treacherous; and from a ſkirmiſh they had with them near a promontory on the north-eaſt point of the iſland, it was named *Traitor's Head*. Its ſituation is in S. Lat. 10. 43. E. Long. 169. 28.

60 Tanna Iſland.

[61] Volcano.

61 Dexterity of the inhabitants in the uſe of their lances.

From Erromango our navigator proceeded to Tanna, an iſland they had formerly diſcovered at a diſtance, and which is ſurrounded by ſome others, three of which are named *Immer*, *Footoona* or *Erronan*, and *Anatom*. At Tanna they ſtaid for ſome time, on account of their wanting ſome quantity of wood. A volcano was ſeen about the middle of this iſland, which burned with great violence, particularly in moiſt and wet weather; but notwithſtanding the friendly terms on which they were with the natives, the latter would never allow them to approach this mountain. There were ſome ſpots on the ſea coaſt which emitted an hot and ſulphureous ſmoke; the people alſo expreſſed much uneaſineſs when theſe were approached or meddled with. The port which the ſhip entered in this iſland was named *Reſolution harbour*, and is ſituated in S. Lat. 19. 32, 25. ½ E. Long. 169. 44. 35. It is a ſmall creek three quarters of a mile long, and about half as broad. It is extremely convenient, having plenty of wood and water cloſe to the ſhore. Among the vegetable productions of this iſland, there is reaſon to ſuſpect the nutmeg-tree to be one, a pigeon having been ſhot, in the craw of which was a wild nutmeg. The inhabitants are two diſtinct races of people, and ſpeak two different languages; one that of the Friendly iſlands, the other peculiar to Tanna and thoſe in the neighbourhood. The people are very expert in the uſe of their weapons; on which Mr Wales makes the following remarks: "I muſt confeſs I have often been led to think the feats which Homer repreſents his heroes as performing with their ſpears a little too much of the marvellous to be admitted in an heroic poem, I mean when confined within the ſtrait ſtays of Ariſtotle; nay, even ſo great an advocate for him as Mr Pope acknowledges them to be ſurpriſing: but ſince I have ſeen what theſe people can do with their wooden ſpears, and them badly pointed, and not of an hard nature, I have not the leaſt exception to any one paſſage in that great poet on this account. But if I ſee fewer exceptions, I can find infinitely more beauties in him, as he has, I think, ſcarcely any action, circumſtance, or deſcription of any kind whatever relating to a ſpear, which I have not ſeen and recogniſed among theſe people; as their whirling motion and whiſtling noiſe as they fly; their

Cook's Diſcoveries.

quivering motion in the ground when they fall; their meditating their aim when they were going to throw; and their ſhaking them in their hands as they go along."

The Archipelago, in which Captain Cook had now remained a conſiderable time, is ſituated between 14. 29. and 20. 4. S. Lat. and between 166. 41. and 170. 21. E. Long. extending 125 leagues in the direction of N. N. W. ¼ W. and S. S. E. ¼ E. The principal iſlands are the Peak of the Etoile, Tierra del Eſpiritu Santo, Mallicollo, St Bartholomew, the Iſle of Lepers, Aurora, Whitſuntide Iſle, Ambrym, Paoom Apee, Three Hills, Sandwich, Erromango, Tanna, Immer, and Anatom. They were firſt diſcovered in 1606 by Quiros, who ſuppoſed them to be part of a ſouthern continent; nor were they viſited from that time till the year 1768, when M. Bougainville beſtowed upon them the name of the *Great Cyclades*, as already mentioned. This gentleman, however, beſides landing in the Iſle of Lepers, only diſcovered that the country was not connected, but conſiſted of iſlands. Captain Cook examined the whole in ſuch an accurate manner, aſcertaining the ſituation of many of the iſlands, and diſcovering ſuch numbers of new ones, that he thought he had an undoubted right to impoſe a new name upon them; and therefore called them the *New Hebrides*.

62 New Caledonia diſcovered.

From the New Hebrides Captain Cook ſet ſail for New Zealand, in order to proſecute his voyage in ſearch of a ſouthern continent, but in three days diſcovered a large iſland, which he named *New Caledonia*; and which, next to new Zealand, is the largeſt in the Pacific Ocean. It lies between 19. 39. and 22. 30. S. Lat. and between 163. 37. and 167. 14. E. Long. lying N. W. ¼ W. and S. E. ¼ E, extending about 87 leagues in that direction, though its breadth does not any where exceed 10 leagues. The natives are ſtrong, active, well made, and ſeem to be a middle race between thoſe of Tanna and the friendly Iſles; and the women were more chaſte than thoſe of the iſlands farther to the eaſtward. The iſland afforded a conſiderable variety of plants for the botaniſts, and ſome excellent timber of the ſpecies of the pitch-pine, for maſts and ſpars. The wood is cloſe-grained, white, and tough; and very fit for the purpoſe. One of the ſmall iſlands ſurrounding the large one was named the *Iſle of Pines*, from the quantity of theſe trees found upon it; and another, from the number and variety of plants it afforded, had the name of *Botany Iſland*. The coaſt, however, was ſo dangerous, that our navigator, having no more time to ſpare, was obliged to leave ſome part of it unexplored, though the extent was determined, as has been already related. Mr Forſter was of opinion, that the language of this people is totally different from that of any of the other South Sea iſlands.

63 Norfolk Iſland.

Proceeding from New Caledonia, our navigator next fell in with an iſland about five leagues in circumference, and of a good height, ſituated in S. Lat. 29. 2. 30. and E. Long. 168, 16.; on which he beſtowed the name of *Norfolk Iſland*. It was entirely unhabited. Various trees and plants common at new Zealand were obſerved here, particularly the flax-plant, which is more luxuriant in this iſland than in any part of New Zealand. The chief produce of this iſland is a kind of ſpruce pine, many of the trees of which are 10 or 12 feet in circumference. The palm-cabbage likewiſe abounds here; and the coaſts are well ſtocked with excellent fiſh.

64 Arrival at Zealand;

On the 18th of October they arrived at Queen Charlotte's Sound in New Zealand; the ſituation of which was now aſcertained by Mr Wales with the utmoſt accuracy, its latitude being found 41. 5. 56. ¼ S. and its longitude 174. 25. 7. ¼ E. On examining the gardens which had been made, it was found that they were in a thriving condition, though they had been entirely neglected by the natives. Some of the cocks and hens were ſuppoſed to be ſtill in exience, as a new laid hen's egg was found, though none were ſeen.

On the 10th of November Captain Cook ſet ſail from New Zealand in ſearch of a ſouthern continent; but having traverſed a vaſt extent of ſea for 17 days, from S. Lat. 43. 0. to 55. 48. he gave up all thoughts of finding any more land in this part of the ocean, and therefore determined to ſteer directly for the weſt entrance of the ſtraits of Magellan, with a deſign of coaſting the ſouthern part of Terra del Fuego quite round Cape Horn to Le Maire's Straits. As the world had hitherto received but very imperfect accounts of this coaſt, he thought a ſurvey of it would be of more advantage to navigation and geography than any thing he could expect to meet with in a higher latitude.

65 At Terra del Fuego.

On the 17th of December he reached the coaſt of Terra del Fuego, and in three days more anchored in a place to which he gave the name of *Chriſtmas Sound*. The land appeared deſolate beyond any thing he had hitherto experienced. It ſeems to be entirely compoſed of rocky mountains without the leaſt appearance of vegetation. Theſe mountains terminate in horrid precipices, the craggy ſummits of which ſpire up to a vaſt height; ſo that ſcarcely any thing in nature can have a more barren and ſavage aſpect than the whole of the country. In the courſe of his voyage along this coaſt, he could not but obſerve, that at no time had he ever made one of ſuch length where ſo little occured of an intereſting nature. Barren and dreary, however, as the coaſt was, it was not totally deſtitute of accommodations about Chriſtmas Sound. Freſh water and wood for fuel were found about every harbour; and the country every where abounds with fowl, particularly geeſe. A conſiderable number of plants were alſo found upon it, almoſt every ſpecies of which was new to the botaniſts. In paſſing by Cape Horn, it was wiſhed to determine whether it belonged to the land of Terra del Fuego, or to a ſmall iſland ſouth from it; but this was found impracticable on account of the foggy weather and dangerous ſea. Its latitude was now determined to be 55. 58. S. and its longitude 67. 46. W. The coaſt appeared leſs dreary here than on the weſtern ſide of Terra del Fuego; for though the ſummits of ſome of the hills were rocky, the ſides and valleys ſeemed covered with a green turf and wooded in tufts.

66 Remarks on a voyage round Cape Horn.

In paſſing this cape a remark was made by the Captain, that if he were on a voyage round Cape Horn to the weſt, and not in want of wood or water, or any other thing which might make it neceſſary to put into port, he would ſail a conſiderable way to the ſouthward ſo as to be out of the reach of land altogether. By this method he would avoid the currents, whoſe force, he was of opinion, would be broken at 10 or 12 leagues diſtance from the ſhore, and farther off would be entirely deſtroyed. The extent of Terra del Fuego, and conſequently of Magellan's Straits, was found to be leſs than what is commonly laid down in maps and charts, and the coaſt, in general, leſs dangerous than has been uſually repreſented; though this muſt undoubtedly have been owing in a great meaſure to the weather, which happened to be remarkably temperate.

67 Surpriſing concord of the animals in theſe parts.

In one of the ſmall iſlands near Staten Land, and which, from their being diſcovered on new year's day, were called *New Year's Iſles*, a remarkable harmony was obſerved among the animals of different ſpecies with which theſe deſolate regions abound. The ſea-lions occupy the greateſt part of the ſea-coaſt; the bears occupy the iſland; the ſhags are poſted in the higheſt cliffs; the penguins in ſuch places as have the beſt acceſs to and from the ſea; and the other birds chooſe more retired places. Occaſionally, however, all theſe animals were ſeen to mix together like domeſtic cattle and poultry in a farm-yard, without one attempting to hurt the other in the leaſt. Even the eagles and vultures were frequently obſerved ſitting together on the hills among the ſhags, while none of the latter, either old or young, appeared to be diſturbed at their preſence. It is probable, therefore, that theſe birds of prey ſubſiſt by feeding on the carcaſes of the animals which die naturally or by various accidents, and which muſt be very numerous from the immenſe quantity exiſting on the iſland.

68 Fartherdiſcoveries in the ſouthern regions.

Our navigator now ſet out in queſt of that extenſive coaſt laid down in Mr Dalrymples's chart, and in which is marked the Gulph of St Sebaſtian; but when he came into the place where it is ſuppoſed to lie, neither land nor any certain ſigns of it could be met with. Some iſlands, however, were diſcovered, particularly Willis's iſland, in S. Lat. 54. 0. W. Long. 38. 23; another named *Bird Iſland* and *South Georgia*, ſituated between 53. 57. and 54. 57. S. Lat. and between 38. 13. and 35. 34. W. Long. All theſe were covered with ſnow and ice to a great height. Not a tree was to be ſeen, not even a ſhrub, nor were there any rivulets or ſtreams of water; the only vegetables to be met with were a coarſe ſtrong bladed graſs, wild burnet, and a kind of moſs. A conſiderable quantity of ſeals and penguins were met with, whoſe fleſh, though very coarſe, was preferred by the ſhip's company, even by Captain Cook himſelf, to the ſalt proviſions, which were now greatly decayed. The moſt ſoutherly land diſcovered by our navigator was that on which he beſtowed the name of *Southern Thule*, and which is ſituated in S. Lat. 59° 13′ 30″, W. Long. 27° 45′. This was ſtill more deſolate than South Georgia, being forſaken even by the ſeals and penguins which abounded on it. Not a ſingle herb of any kind was ſeen upon it, but vaſt high and barren mountains, the tops of ſome of which reached above the clouds; and it may be remarked, that this ſeems to be the only part of the world hitherto diſcovered, entirely unfit for the ſupport of animal life.

69 Of the exiſtence of a ſouthern continent.

Southern Thule was diſcovered on the 31ſt of January 1775; and from this to the 6th of February ſeveral other lands were diſcovered, and named *Cape Briſtol*, *Cape Montague*, *Saunder's Iſle*, *Candlemas Iſles*, and *Sandwich's Land*. With regard to this laſt, Captain Cook was undetermined whether it was a group of iſlands or part of a continent lying near the pole, as after all his diſappointments he ſtill was inclined to think that ſuch a continent has an exiſtence, on account of the vaſt quantity of ice met with in the ſouthern ſeas; and which from its great height appears to be formed in bays and gulphs of the land, and not in the ocean itſelf. The greateſt part of this ſouthern continent, however, if it has any exiſtence, muſt be within the polar circle, where the ſea is ſo incumbered with ice, that the land muſt be inacceſſible. So great is the danger in navigating theſe ſouthern ſeas, that Captain Cook aſſerts, on the moſt probable grounds in the world, that ſuch lands as lie to the ſouthward of his diſcoveries could not be explored; and that no man would ever venture farther than he had done. Thick fogs, ſnow-ſtorms, intenſe cold, and every thing that can render navigation difficult or dangerous, muſt be encountered; all which difficulties are greatly heightened by the inexpreſſible horrid aſpect of the country itſelf. It is a part of the world doomed by nature never once to feel the warmth of the ſun's rays, but be buried in everlaſting ſnow and ice. Whatever ports there may be on the coaſt, they are almoſt entirely covered with frozen ſnow of a vaſt thickneſs. If, however, any of them ſhould be ſo far open as to invite a ſhip into it, ſhe would run the riſk of being fixed there forever, or of coming out in an ice iſland. To this it may be added, that the iſlands and floats on the coaſt, the great falls from the ice-cliffs in the port, or a ſudden ſnow-ſtorm, might be attended with equally fatal effects. For theſe reaſons our commander determined to abandon the purſuit of a land whoſe exiſtence was ſo equivocal, but whoſe inutility, if it ſhould be diſcovered, was certain. One thing only remained to complete what he wiſhed to accompliſh, and that was to determine the exiſtence of Bouvet's land.

70 Voyage in queſt of Bouvet's land.

In this inquiry he ſpent 16 days; but having run for 13 of theſe directly in the latitude aſſigned to that land, and found no appearance of it or of Cape Circumciſion, he concluded that neither of them had any exiſtence, but that the navigators had been deceived by the appearance of ice iſlands. Two days more were ſpent in queſt of ſome land which had been obſerved more to the ſouthward, but with the like bad ſucceſs: after which our commander abandoned all farther thoughts of ſouthern diſcoveries, and prepared for returning to England. On his way home, however, he determined to direct his courſe in ſuch a manner as to fall in with the iſles of Denia and Marſeveen.

71 Of the iſles of Denia and Marſeveen.

Theſe are laid down in Dr Halley's variation chart in the latitude of 41. ½ S. and about 4. 0. E. from the meridian of the Cape of Good Hope. None of theſe iſlands could be found; and therefore our commander having very little time to ſpare either in ſearching for them or attempting to diſprove their exiſtence, made the beſt of his way to the Cape of Good Hope, and from thence to England. In his paſſage thither he viſited the iſles of St Helena, Aſcenſion, and Fernando de Noronha.

72 Of the uſefulneſs of diſtilling ſea-water.

An experiment was made on the uſe of the ſtill for procuring freſh water at ſea; the reſult of which was, that though the invention was uſeful upon the whole, yet it would not by any means be adviſable to truſt entirely to it. Provided indeed that there was not a ſcarcity of fuel, and that the coppers were good, as much might thus be procured as would ſupport life; but that no efforts would be ſufficient to procure the quantity neceſſary for the preſervation of health, eſpecially in hot climates. He was likewiſe convinced that nothing contributes more to the health of ſeamen than having plenty of freſh water. His laſt ſtage in this ſecond voyage before his arrival in England was at Fayal, one of the Azores iſlands: and his only deſign in ſtopping here was to give Mr Wales an opportunity of finding the rate of the watches going, that ſo he might be enabled to find the longitude of theſe iſlands with the greater certainty.

73 Third voyage.

In our commander's third voyage he touched at the iſland of Teneriffe inſtead of Madeira, looking upon the former to be a better place for procuring refreſhments; and was convinced of the juſtneſs of his conjecture by the facility with which proviſions of all kinds were obtained. 74 Viſits the Iſle of Teneriffe. The air of the country is exceedingly healthy and proper for thoſe ſubject to pulmonary complaints. This was accounted for by a gentleman of the place from the great height of the iſland, by which it was in the power of any perſon to change the temperature of the air as he pleaſed; and he expreſſed his ſurprize that phyſicians, inſtead of ſending their patients to Nice or Liſbon, did not ſend them to Teneriffe. 75 Tea ſhrub. From the ſame gentlemen it was learned, that the tea-ſhrub grows in that iſland as a common weed, which is conſtantly exterminated in large quantities. The Spaniards, however, ſometimes uſe it as tea, and aſcribe to it all the qualities of that brought from the Eaſt Indies. They give it alſo the name of tea, and ſay that it was found in the country when the iſlands were firſt diſcovered. 76 Impregnated lemon. Another botanical curioſity is the fruit called the *impregnated lemon*, which is a perfect and diſtinct lemon incloſed within another, and differing from the outer only in being a little more globular.

77 Prince Edward's Iſlands diſcovered.

From Teneriffe Captain Cook proceeded to the Cape of Good Hope, and from thence to the ſouthward, where he fell in with two iſlands, the larger of which is about 15 leagues in circuit, and the ſmaller about nine; their diſtance from one another being about five leagues. The one of theſe iſlands lies in S. Lat. 46. 53. and E. Long. 37. 46; the other in S. Lat. 46. 4. E. Long. 38. 8. As the ſhips paſſed through between them, they could not diſcern either tree or ſhrub upon any of them even with the aſſiſtance of their beſt glaſſes. The ſhore ſeemed to be bold and rocky, their internal parts full of mountains, whoſe ſides and ſummits were covered with ſnow. Theſe two, with four others, which lie from 9 to 12 degrees of longitude more to the eaſt, and nearly in the ſame latitude, had been diſcovered in the year 1772 by Captains Marion du Freſne and Crozet, two French navigators, in their paſſage from the Cape of Good Hope to the Philippines. As no names had been aſſigned to them in a chart of the Southern Ocean communicated to Captain Cook in 1775, the two larger ones were by him diſtinguiſhed by the name of *Prince Edward's Iſlands*, in honour of his Majeſty's fourth ſon: the other four, with a view to commemorate the diſcoveries, were called *Marion's* and *Crozet's Iſlands*.

78 Voyage in queſt of Kerguelen's land.

From theſe our commander ſteered to the ſouthward in ſearch of Kerguelen's land, which he had been inſtructed to touch at, in order to diſcover, if poſſible, a good harbour there. In his paſſage to it ſeveral new iſlands were diſcovered; to one which Kerguelen had given the name of the *Iſland of Rendezvous*, Captain Cook, on account of its ſhape, changed it to that of *Bligh's Cap*. It is ſituated in S. Lat. 48. 29. E. Long. 68. 40. and is a high round rock, inacceſſible to all creatures but birds. 79 Deſcription of that iſland. Next day he fell in with Kerguelen's land, at firſt thought to be a part of the ſouthern continent, but afterwards found by Kerguelen himſelf to be an iſland. The extent of it, however, was not determined either by the French navigator or by Captain Cook. The former reckons it at 200 leagues in circumference, but Captain Cook eſtimates it at much leſs. Our navigator could not get any extenſive view of it on account of the foggy weather; but as far as could be diſcovered, it was barren and deſolate, inſomuch that there was neither food nor covering for cattle of any kind, ſo that they would inevitably periſh if any were left. Even the ſea-coaſts were in a great meaſure deſtitute of fiſh; but the ſhore was covered with innumerable multitudes of ſeals, together with penguins and other birds; all of which were ſo void of fear, that any quantity whatever might be killed without any difficulty. Not a ſingle tree nor ſhrub could be ſeen, nor a piece of drift wood on the ſhore; and herbage of every kind was likewiſe very ſcarce. A prodigious quantity of the ſea-weed, called by Sir Joſeph Banks *fucus giganteus*, was found in one of the bays. The whole variety of plants found in this iſland did not exceed 16 or 18 ſpecies. The harbour in which our navigator made his longeſt ſtay on this deſolate coaſt was named *Port Palliſer*, and is ſituated in S. Lat. 49. 3. E. Long. 69. 37. In this voyage our navigator undoubtedly diſplayed ſuperior nautical abilities to thoſe of M. Kerguelen, who in two voyages to the place had never been able to bring his ſhips to anchor on any part of the coaſt.

80 Of Van Diemen's land.

From Kerguelen's land our navigator proceeded to the coaſt of New Holland, where he now touched at the ſouthern part called *Van Diemen's land*, where he anchored in Adventure Bay. Here they found plenty of wood and water, with abundance of graſs, coarſe indeed, where they went firſt aſhore, but afterwards much finer and proper for the cattle. Here, as every where elſe, the latitudes and longitudes were ſettled with the greateſt exactneſs. The bottom of Adventure Bay was found to lie in S. Lat. 43° 21′ 6″; E. Long. 147° 29′. The inhabitants viſited them in a friendly manner, but ſeemed as ſtupid and inſenſible as thoſe they had formerly ſeen. They ſeemed to be totally ignorant of the uſe of iron, and ſet no value upon any thing in the ornamental way excepting beads; nor did they ſeem to be acquainted even with the uſe of fiſh hooks. Here they found the ſtories of the ancient fauns and ſatyrs living in hollow trees realized. Some huts covered with bark, and of a moſt wretched conſtruction, were indeed found near the ſhore; but the moſt commodious habitations were afforded by the largeſt trees. Theſe had their trunks hollowed out by fire to the height of ſix or ſeven feet; and there was room enough in one of them for three or four perſons to ſit round a hearth made of clay; and it may juſtly ſeem ſurpriſing, that notwithſtanding the extreme violence offered to the vegetative powers of the tree by forming this habitation, it ſtill continued to flouriſh in conſequence of one ſide being left entire. The people, notwithſtanding their extreme barbarity, were ſuppoſed to proceed from the ſame ſtock with thoſe of the South Sea Iſlands. As in one of their viſits the natives had ſeized upon two pigs which had been brought aſhore, apparently with an intention to kill them, the commander determined to make them a preſent of theſe animals; though from their exceſſive ſtupidity and inattention there was no probability of their allowing them to propagate, if they had been put directly into their hands. To prevent this, Captain Cook ordered the two they had attempted to ſeize, being a boar and ſow, to be carried about a mile within the head of the bay, and ſaw them left by the ſide of a freſh water rivulet. He was prevented from leaving any other ſpecies by a conſideration of the barbarity of the inhabitants.

81
Viſit to New Zealand.

From New Holland our navigator proceeded to New Zealand, where he arrived on the 12th of February 1777, and anchored in Queen Charlotte's Sound. Here he was deſirous of leaving a further ſupply of animals; but the inhabitants had hitherto ſhown ſuch careleſſneſs about thoſe which had been left, that he durſt not venture to leave any other than two goats, a male and a female with kid, and two hogs, a boar and ſow. He was informed, however, that one chief had ſeveral cocks and hens in his poſſeſſion, ſo that there was ſome probability of theſe animals being allowed to multiply; and as ten or a dozen hogs had at different times been left by Captain Cook, beſides thoſe put on ſhore by Captain Furneaux, it ſeems alſo to be likely that this race of creatures will increaſe either in a wild or domeſtic ſtate, or both. The gardens had ſtill been almoſt totally neglected, and ſome of them deſtroyed. Thoſe which remained, however, produced cabbages, onions, leeks, purſlains, radiſhes, and a few potatoes. Theſe laſt had been brought from the Cape of Good Hope, and were ſo greatly meliorated by the change of ſoil, that with proper cultivation they ſeemed to bid fair for excelling thoſe of moſt other countries.

82
Extraordinary preſervation of ſome of the natives of Otaheite.

Our navigator's next courſe was towards the Iſland of Otaheite; in the run to which he diſcovered the Iſland of Mangea, ſituated in S. Lat. 22. 57. E. Long. 301. 53. From thence he proceeded to Wateoa, where Omai, now on his way home, recognized three of his countrymen, natives of the Society Iſlands, who had arrived here by the following accident. About 12 years before, 20 of the natives of Otaheite had embarked in a canoe, in order to viſit the neighbouring iſland of Ulietea. A violent ſtorm aroſe, which drove them out of their courſe, and they ſuffered incredible hardſhips by famine and fatigue, ſo that the greateſt part of them periſhed. Four men continued hanging by the ſide of the veſſel for four days after it was overſet, when they were at laſt brought within ſight of the people of this iſland. The latter immediately ſent out their canoes, and brought them aſhore, treating them afterwards with ſo much kindneſs, that the three who now ſurvived expreſſed no deſire of returning to their own country, though they had now an opportunity, but choſe rather to remain where they were. This iſland is ſituated in S. Lat. 20. 1. E. Lon. 201. 45. and is about ſix leagues in circumference. The inhabitants are ſaid to be equally amiable in their perſons and diſpoſitions.

83
Palmerſton Iſland a proper place of refreſhment, but without water.

Viſiting a ſmall iſland named *Wennooa-ete*, or *Otakootaia*, ſituated in S. Lat. 19. 15. and E. Long. 201. 37. our commander found it without inhabitants, tho' there were undoubted mark's of its being occaſionally frequented. Harvey's Iſland, which in his former voyage had been deſtitute of inhabitants, was now found to be well peopled; but the inhabitants ſhowed ſuch an hoſtile diſpoſition that no refreſhments could be procured; for which reaſon it was determined to ſteer for the Friendly Iſlands, where there was a certainty of meeting with an abundant ſupply. In his way thither he touched at Palmerſton Iſland, from a ſmall iſle near which a ſupply of 1200 cocoa nuts were obtained, beſides abundance of fiſh and birds of various kinds. Had the iſland been capable of furniſhing water, the Captain would have preferred it to any of the inhabited ones for the purpoſe of procuring refreſhments, as they could be had in any quantity without moleſtation from the petulance of the inhabitants. As water at this time happened to be a ſcarce article, our navigator was obliged to ſupply himſelf from the ſhowers which fell, and which afforded as much in an hour as he could procure by diſtillation in a month.

During the time of reſidence at the Friendly Iſlands our navigator viſited one named *Hepaee*, at which no European ſhip had ever touched before. Here he was entertained in a friendly manner, ſupplied with refreſhments, and left ſome uſeful animals; great additions were made to the geography of theſe iſlands, and many curious remarks made on the inhabitants and natural products. It was obſerved by Mr Anderſon, that the people had very proper notions of the immateriality and immortality of the human ſoul, and he thought himſelf authoriſed to aſſert, that they did not worſhip any part of the viſible creation.

84
Reception of Omai at Otaheite.

85
He is ſettled at Huaheine.

Paſſing by a ſmall iſland named *Toobouai*, about five or ſix miles in extent, and ſituated in S. Lat. 23. 25. E. Long. 210. 37. our navigator now arrived at Otaheite. Here Omai met with his relations, ſome of whom received him with apparent indifference; but his meeting with an aunt and a ſiſter was marked with expreſſions of the moſt tender regard. It was Huaheine, however, that was deſtined for the place of Omai's final reſidence, and thither the Captain repaired on purpoſe to ſettle him. The affair was conducted with great ſolemnity; and Omai brought with him a ſuitable aſſortment of preſents to the chiefs, went through a great number of religious ceremonies, and made a ſpeech, the ſubject of which had been dictated to him by Captain Cook. The reſult of the negociation was, that a ſpot of ground was aſſigned him, extending about 200 yards along the ſhore of the harbour, with a proportionable part of an adjacent hill. The carpenters of both ſhips were then employed in conſtructing an houſe for him, in which he might ſecure his European commodities. At the ſame time a garden was made for his uſe, in which were planted ſhaddocks, vines, pine-apples, melons, and ſeveral other garden vegetables. Here he met with a brother, ſiſter, and ſiſter-in-law, by whom he was very affectionately received; but it was diſcovered with concern, that none of his relations were able to protect him in caſe of any attack on his perſon or property; ſo that there was too much reaſon to fear that he would be plundered immediately on the departure of the Engliſh. To prevent this, if poſſible, Captain Cook adviſed him to conciliate the favour and engage the patronage and protection of ſome of the moſt powerful chiefs by proper preſents; at the ſame time that he himſelf took every opportunity of letting the inhabitants know that it was his intention to return to the iſland again, and if he did not find Omai in the ſame ſtate of ſecurity in which he left him, thoſe by whom he had been injured would certainly feel the weight of his reſentment. About a fortnight after leaving Huaheine, the Captain had a meſſage from Omai; in which he informed him that every thing went well, only that his goat had died in kidding, for which he deſired another might be ſent; and accompanied this requeſt with another for two axes, which were ſent along with a couple of kids, male and female.

86 Remarks on the Society Iſlands.

On taking this final leave of the Society Iſlands, Captain Cook obſerves, that it would have been far better for theſe poor people never to have known the ſuperiority of the Europeans in ſuch arts as render life comfortable, than after once being acquainted with it to be again abandoned to their original incapacity of improvement; as, if the intercourſe between them and us ſhould be wholly diſcontinued, they could not be reſtored to that happy ſtate of mediocrity in which they were found. It ſeemed to him that it was become in a manner incumbent on the Europeans to viſit theſe iſlands once in three or four years. in order to ſupply them with thoſe conveniences of which they have taught them the uſe. It is indeed to be apprehended, that by the time the iron tools which were then among them are worn out, they will have forgot the uſe of their own; as in this laſt voyage it was obſerved that the uſe of their former tools was almoſt totally aboliſhed.

87 Chriſtmas Iſland diſcovered.

Having left the Society Iſlands, Captain Cook now proceeded to the northward, croſſing the equator on the 22d and 23d of December; and on the 24th diſcovered a low uninhabited iſland about 15 or 20 leagues in circumference. Here the longitude and latitude were exactly determined by means of an eclipſe of the ſun. The weſt ſide of it where the eclipſe was obſerved, lies in N. Lat. 1. 59. E. Long. 202. 30. From the time of its diſcovery it obtained the name of *Chriſtmas Iſland*. Plenty of turtle were found upon it, and the Captain cauſed the ſeeds of the cocoa-nut, yams, and melons, to be planted.

88 Sandwich Iſles.

Proceeding ſtill to the northward, our navigator next fell in with five iſlands, to which he gave the general name of *Sandwich Iſles*, in honour of his patron. Their names in the language of the country are Woahoo, Atooi, Oneeheow, Oreehoua, and Tehoora. They are ſituated in the latitude of 21. 30. and 22. 15. North, and between 199. 20. and 201. 30. E. Long. The longitude was deduced from no fewer than 72 ſets of lunar obſervations. The largeſt of theſe iſlands is Atooi, and does not in the leaſt reſemble the other iſlands of the South Sea formerly viſited by our navigator, excepting only that it has hills near the centre, which ſlope gradually towards the ſea-ſide. The only domeſtic animals found upon it were hogs, dogs, and fowls. Captain Cook deſigned to have made the inhabitants of this iſland a preſent of ſome others; but being driven out of it by ſtreſs of weather, he was obliged to land them upon a ſmaller one named *Oneeheow*. They were a he-goat with two females, and a boar and ſow of the Engliſh breed, which is much ſuperior to that of the South-Sea Iſlands. He left alſo the ſeeds of melons, pumpkins, and onions. The ſoil of this iſland ſeemed in general to be poor: it was obſervable that the ground was covered with ſhrubs and plants, ſome of which had a more delicious fragrancy than had been experienced before. The inhabitants of theſe iſlands are much commended, notwithſtanding the horrid cuſtom of eating human fleſh. In every thing manufactured by them there is an ingenuity and neatneſs in an uncommon degree; and the elegant form and poliſh of ſome of their fiſhing-hooks could not be exceeded by an European artiſt, even aſſiſted by all his proper tools. From what was ſeen of their agriculture alſo, it appeared that they were by no means novices in that art, and that the quantity and goodneſs of their vegetable productions might with propriety be attributed as much to their ſkilful culture as to the fertility of the ſoil. The language of the Sandwich Iſles is almoſt identically the ſame with that of Otaheite.

89 American coaſt diſcovered.

Proceeding farther to the northward, our navigators diſcovered the coaſt of New Albion on the 7th of March 1778. Its appearance was very different from that of the countries with which they had hitherto been converſant. The land was full of mountains, the tops of which were covered with ſnow; while the valleys between them, and the grounds on the ſea-coaſt, high as well as low, were covered with trees, which formed a beautiful proſpect as of one vaſt foreſt. The place where they landed was ſituated in N. Lat. 44. 33. E. Long. 235. 20. At firſt the natives ſeemed to prefer iron to every other article of commerce; but at laſt they ſhowed ſuch a predilection for braſs, that ſcarcely a bit of it was left in the ſhips except what belonged to the neceſſary inſtruments. It was obſerved alſo, that theſe people were much more tenacious of their property than any of the ſavage nations that had hitherto been met with, inſomuch that they would part neither with wood, water, graſs, nor the moſt trifling article, without a compenſation, and were ſometimes very unreaſonable in their demands; with which, however, the Captain always complied as far as was in his power.

90 Nootka Sound.

The place where the Reſolution was now anchored was by our navigator called *St George's Sound*, but he afterwards underſtood that the natives gave it the name of *Nootka*. Its entrance is ſituated in the eaſt corner of Hope Bay, in N. Lat. 49. 33. E. Long. 233. 12.

91 Mildneſs of the climate.

The climate, as far as they had an opportunity of obſerving it, was much milder than that on the eaſtern coaſt of the American continent in the ſame parallel of latitude; and it was remarkable that the thermometer, even in the night, never fell lower than 42°, while in the day time it frequently roſe to 60°. The trees met with here are chiefly the Canadian pine, white cypreſs, and ſome other kinds of pine. There ſeemed to be a ſcarcity of birds, which are much haraſſed by the natives, who ornament their clothes with the feathers, and uſe the fleſh for food.

92 Natives acquainted with the uſe of metals.

The people are no ſtrangers to the uſe of metals, having iron tools in general uſe among them; and Mr Gore procured two ſilver ſpoons of a conſtruction ſimilar to what may be obſerved in ſome

Flemiſh pictures, from a native who wore them round his neck as an ornament. It is moſt probable that theſe metals have been conveyed to them by the way of Hudſon's Bay and Canada; nor is it improbable that ſome of them may have been introduced from the north-weſtern parts of Mexico.

93 Prince William's Sound.

While Captain Cook ſailed along this coaſt, he kept always at a diſtance from land when the wind blew ſtrongly upon it; whence ſeveral large gaps were left unexplored, particularly between the latitudes of 50° and 55°. The exact ſituation of the ſuppoſed ſtraits of Anian was not aſcertained, though there is not the leaſt doubt, that if he had lived to return by the ſame way in 1779, he would have examined every part with his uſual accuracy. On departing from Nootka Sound, our navigator firſt fell in with an iſland in N. Lat. 59. 49. E. Long. 216. 58. to which he gave the name of *Kay's Iſland*. Several others were diſcovered in the neighbourhood; and the ſhip came to an anchor in an inlet named by the Captain *Prince William's Sound*. Here he had an opportunity of making ſeveral obſervations on the inhabitants, as well as on the nature of the country. From every thing relative to the former, it was concluded, that the inhabitants were of the ſame race with the Eſquimaux or Greenlanders. The animals were much the ſame with thoſe met with at Nootka, and a beautiful ſkin of one animal, which ſeemed to be peculiar to the place, was offered for ſale. Mr Anderſon was inclined to think that it was the ſame to which Mr Pennant has given the name of the *caſan marmot*. The alcedo, or great king's fiſher, was found here, having very fine and bright colours. The humming-bird alſo came frequently, and flew about the ſhip while at anchor; though it is ſcarce to be ſuppoſed that it can live throughout the winter on account of the extreme cold. The water-fowl were in conſiderable plenty; and there is a ſpecies of diver which ſeemed to be peculiar to the place. Almoſt the only kinds of fiſh met with in the place were torſk and halibut. The trees were chiefly the Canadian and ſpruce pine, ſome of which were of a conſiderable height and thickneſs. The Sound is judged by Captain Cook to occupy a degree and a half of latitude and two of longitude, excluſively of its arms and branches, which were not explored. There was every reaſon to believe that the inhabitants had never been viſited by any European veſſel before; but our navigator found them in poſſeſſion not only of iron but of beads, which it is probable are conveyed to them acroſs the continent from Hudſon's Bay.

94 Cook's river.

Soon after leaving Prince William's Sound, our navigators fell in with another inlet, which it was expected would lead either to the northern ſea or to Hudſon's or Baffin's bay; but upon examination it was found to end in a large river. This was traced for 210 miles from the mouth, as high as N. Lat. 61. 30. and promiſes to vie with the moſt conſiderable ones already known, as it lies open by means of its various branches to a very conſiderable inland communication. As no name was given by our commander to this river, it was ordered by Lord Sandwich to be named *Cook's River*. The inhabitants ſeemed to be of the ſame race with thoſe of Prince William's Sound; and like them had glaſs beads and knives, they were alſo clothed in very fine furs; ſo that it ſeemed probable that a valuable fur-trade might be carried on from that country. Several attempts have accordingly been made from the Britiſh ſettlements in the Eaſt Indies to eſtabliſh a traffic of that kind; but little benefit accrued from it except to the proprietors of the firſt veſſel, her cargo having greatly lowered the price of that commodity in the Chineſe market. It muſt be obſerved, that on the weſtern ſide of the American continent, the only valuable ſkins met with are thoſe of the ſea-otter; thoſe of the other animals, eſpecially foxes and martins, being of an inferior quality to ſuch as are met with in other parts.

95 They fall in with the iſlands diſcovered by the Ruſſians.

Proceeding farther to the northward, our navigator now fell in with a race of people who had evidently been viſited by the Ruſſians, and ſeemed to have adopted from them ſome improvements in dreſs, &c. In the proſecution of this part of their voyage, it appeared that they had been providentially conveyed in the dark through a paſſage ſo dangerous, that our commander would not have ventured upon it in the day time. They were now got in among thoſe iſlands which had lately been diſcovered by Captain Beering and other Ruſſian navigators, and came to an anchor in an harbour of Oonalaſhka, ſituated in N. Lat. 53. 55. E. Long. 193. 30. Here it was remarked, that the inhabitants had as yet profited very little by their intercourſe with the Ruſſians; ſo that they did not even dreſs the fiſh they uſed for their food, but devoured them quite raw.

96 A volcano.

From Oonalaſhka our navigator proceeded again towards the continent, which he continued to trace as far as poſſible to the northward. In the latitude of 54. 48. E. Long. 195. 45. N. Lat. is a volcano of the ſhape of a perfect cone, having the crater at the very ſummit. On the coaſt farther to the north the ſoil appears very barren, producing neither tree nor ſhrub, though the lower grounds are not deſtitute of graſs and ſome other plants. To a rocky point of conſiderable height, ſituated in N. Lat. 58. 42. E. Long. 197. 36. our commander gave the name of *Cape Newnham*.

97 Cape Prince of Wales.

98 Vicinity of the continents of Aſia and America.

Here Mr Anderſon, the ſurgeon of the Reſolution, died of a conſumption under which he had laboured for more than twelve months. Soon after he had breathed his laſt, land being ſeen at a diſtance, it was named *Anderſon's Iſland*; and on the 9th of Auguſt the ſhip anchored under a point of the continent, which he named *Cape Prince of Wales*. This is remarkable for being the moſt weſterly point of the American continent hitherto known. It is ſituated in N. Lat. 65. 46. E. Long. 191. 45. It is only 39 miles diſtant from the eaſtern coaſt of Siberia; ſo that our commander had the pleaſure of aſcertaining the vicinity of the two continents to each other, which had only been imperfectly done by the Ruſſian navigators. Setting ſail from this point next day, he ſteered to the weſt and north, when he ſoon fell in with the country of the Tſchutſki, which had been explored by Beering in 1728. Here he had an opportunity of correcting M. Stœhlin's map, who had placed in theſe ſeas an imaginary iſland, on which he beſtowed the name of *Alaſchka*. Being convinced that the land he had now reached was part of the Aſiatic continent, our commander directed his courſe eaſtward, in order to fall in with that of America; and on the 17th reached the latitude of 70. 33. and E. Long. 197. 41. Here

99 The progreſs northward ſtopped by ice.

they began to perceive that brightneſs in the horizon called by mariners the *blink of the ice;* and in 70. 41. they had got quite up to it, ſo that no farther progreſs could be made. Next day they made a ſhift to get as far as 70. 44; but the ice was now as compact as a wall, and about ten or twelve feet in height. Its ſurface was extremely rugged, and farther to the northward appeared much higher. Its ſurface was covered with pools of water; and great numbers of ſea-lions lay upon it, whoſe fleſh they were now glad to uſe as food. Our commander continued to traverſe the Icy Sea till the 29th; but the obſtructions becoming every day greater and greater, it was thought proper to give over all further attempts of finding a paſſage to Europe for that year. He did not, however, omit the inveſtigation of the Aſiatic and American coaſts until he had fully aſcertained the accuracy of Captain Beering's accounts as far as he went, and corrected the errors of M. Stæhlin. Great additions were thus made to the geographical knowledge of this part of the globe, and Mr Coxe obſerves, that "it reflects no ſmall honour upon the Britiſh name, that their great navigator extended his diſcoveries much farther in one expedition, and at ſo great a diſtance from the point of his departure, than the Ruſſians accompliſhed in a long ſeries of years, and in parts belonging or contiguous to their own empire."

100 Arrival at Oonalaſhka.

An end of this celebrated navigator's diſcoveries, however, was now at hand. From Beering's ſtraits he ſailed for Oonalaſhka, where he arrived on the 2d of October, and ſtaid for ſome time in order to repair his ſhips. While the carpenters were employed in this work, one third of the people had permiſſion to go on ſhore by turns, in order to gather berries, with which the iſland abounds, and which, though now beginning to decay, were of great ſervice, in conjunction with the ſpruce-beer, to preſerve the people from the ſcurvy. Such a quantity of fiſh was likewiſe procured, as not only ſerved to ſupply the ſhips for the preſent, but likewiſe allowed a great number to be carried out to ſea; ſo that hence a conſiderable ſaving was made of the proviſions of the ſhips, which was an article of very conſiderable conſequence. On the eighth of the month our commander received a very ſingular preſent from ſome perſons unknown, by the hands of an Oonalaſhka man named *Derramouſhk.* It conſiſted of a rye-loaf, or rather a ſalmon pye in the form of a loaf, and highly ſeaſoned with pepper. This man had the like preſent for Captain Clerke, and each of them was accompanied with a note which none on board could underſtand: a few bottles of rum, with ſome wine and porter, were ſent in exchange; it being ſuppoſed that ſuch a preſent would be more acceptable than any other thing that could be ſpared. Corporal Lediard of the marines, an intelligent man, was at the ſame time directed to accompany Derramouſhk, for the purpoſe of gaining a more ſatisfactory account of the country. On the tenth of the month he returned with three Ruſſian ſeamen or furriers, who, with ſeveral others, reſided at Egooſhac, where they had a dwelling houſe, ſome ſtore-houſes, and a ſloop about 30 tons burden. One of theſe people was either maſter or mate of the veſſel, and all of them were very ſober and decent in their behaviour. The greateſt difficulty aroſe from the want of an interpreter; for which reaſon the converſation was carried on by ſigns. However, the Captain obtained a ſight of two ſea-charts, both of which he was allowed to copy. One of them included the ſea of Penſhinſk, part of the coaſt of Tartary down to the latitude of 41°; the Kurile Iſlands, and the peninſula of Kamtſchatka. The other comprehended all the diſcoveries that had been made from the time of Captain Beering to the year 1777; but theſe were found to be very trifling. Indeed our navigator was aſſured by all the Ruſſians whom he had occaſion to ſee, that they knew of no other iſlands than thoſe laid down in the charts juſt mentioned, and that none of them had ever ſeen any part of the American continent excepting what lies oppoſite to the country of the Tſchutſki. With regard to the natives of Oonalaſhka, they are to appearance the moſt inoffenſive and peaceable people in the world, not to be in a ſtate of civilization; though perhaps this may be owing in ſome meaſure to the connection they have long had with the Ruſſians. From the affinity obſerved between the language of the Eſquimaux, Greenlanders, and thoſe of Norton's Sound in N. Lat. 64. 55. there is great reaſon to believe that all thoſe nations are of the ſame extraction; and if that be the caſe, there is little reaſon to doubt that a communication by ſea exiſts between the eaſtern and weſtern ſides of the American continent; which, however, may very probably be ſhut up by ice in the winter time, or even for the moſt part throughout the year.

101 Character of the inhabitants.

102 A communication probable betwixt the eaſt and weſt coaſts of America.

103 Conſequences of Captain Cook's diſcoveries.

The return of Captain Cook to the Sandwich Iſlands, with the lamentable cataſtrophe that enſued, have been already related under the former article. We ſhall now briefly enumerate the conſequences of his diſcoveries with reſpect to the advancement of ſcience. Theſe are principally his having overthrown the hypotheſis of a ſouthern continent of immenſe extent, uſually ſpoken of under the name of *Terra auſtralis incognita;* his demonſtration of the impracticability of a northern paſſage either by Aſia or America to the Eaſt Indies; and his having eſtabliſhed a ſure method of preſerving the health of ſeamen through the longeſt ſea-voyages. It is remarked by the biſhop of Carliſle, that one great advantage reſulting from the late ſurveys of the globe, is the refutation of fanciful theories too likely to give birth to impracticable undertakings. The ingenious reveries of ſpeculative philoſophers will now be obliged to ſubmit, perhaps with reluctance, to the ſober dictates of truth and experience; nor is it only by diſcouraging future unprofitable ſearches that the late voyages are likely to be of ſervice to mankind, but likewiſe by leſſening the dangers and diſtreſſes formerly experienced in thoſe ſeas which are within the actual line of commerce and navigation.

The intereſts of ſcience, as well as of commerce, are highly indebted to the labours of our illuſtrious navigator. Before his time almoſt half the ſurface of the globe was involved in obſcurity and confuſion: but now ſuch improvements have been made, that geography has aſſumed a new face, and become in a manner a new ſcience; having attained ſuch completeneſs as to leave only ſome leſs important parts to be explored by future voyagers. Other ſciences beſides geography

have

Cook's Diſcoveries.

have been advanced at the ſame time. Nautical aſtronomy, which was in its infancy when the late voyages were undertaken, is now brought to much greater perfection; and, during Captain Cook's laſt expedition, many even of the petty officers could take the diſtance of the moon from the ſun or from a ſtar, the moſt delicate of all obſervations, with ſufficient accuracy; and the officers of ſuperior rank would have been aſhamed to have it thought that they did not know how to obſerve for, and compute, the time at ſea; a thing before hardly mentioned among ſeamen. It muſt, however, be remembered, that a great part of the merit in this reſpect is due to the board of longitude. In conſequence of the attention of that board to the important object juſt mentioned, liberal rewards have been given to mathematicians for perfecting the lunar tables and facilitating calculations; and artiſts have been amply encouraged in the conſtruction of watches, and other inſtruments better adapted to the purpoſes of navigation, than any that formerly exiſted.

A vaſt addition of knowledge has been gained with reſpect to the ebbing and flowing of the tides; the direction and force of the currents at ſea; the nature of the polarity of the needle, and the cauſe of its variations. Natural knowledge has been increaſed by experiments on the effects of gravity in different and very diſtant places; and from Captain Cook's having penetrated ſo far into the ſouthern regions, it is now aſcertained, that the phenomenon uſually called the *aurora borealis*, is not peculiar to high northern latitudes, but belongs equally to all cold climates, whether north or ſouth.

No ſcience, however, perhaps ſtands more indebted to theſe voyages than that of botany. At leaſt 1200 new ſpecies of plants have been added to thoſe formerly known; and every other department of natural hiſtory has received large additions. Beſides all this, there have been a vaſt many opportunities of obſerving human nature in its different ſituations. The iſlands viſited in the middle of the Pacific Ocean are inhabited by people, who, as far as could be obſerved, have continued unmixed with any different tribe ſince their firſt ſettlement. Hence a variety of important facts may be collected with reſpect to the attainments and deficiencies of the human race in an uncultivated ſtate, and in certain periods of ſociety. Even the curioſities brought from the newly diſcovered iſlands, and which enrich the Britiſh muſeum and the late Sir Aſhton Lever's (now Mr Parkinſon's) repoſitory, may be conſidered as a valuable acquiſition to Britain, and affording no ſmall fund of inſtruction and entertainment.

There are few inquires more generally intereſting than thoſe which relate to the migrations of the various colonies by which the different parts of the earth have been peopled. It was known in general, that the Aſiatic nation called the *Malayans* poſſeſſed in former times much the greateſt trade of the Indies, and that their ſhips frequented not only all the coaſts of Aſia, but even thoſe of Africa likewiſe, and particularly the large iſland of Madagaſcar; but that from Madagaſcar to the Marqueſas and Eaſter Iſland, that is, nearly from the eaſt ſide of Africa till we approach the weſt coaſt of America, a ſpace including almoſt half the circumference of the globe, the ſame nation of the oriental world ſhould have made their ſettlements, and founded colonies throughout almoſt every intermediate ſtage of this immenſe tract, in iſlands at amazing diſtances from the mother-continent, is an hiſtorical fact that before Captain Cook's voyages could not be known, or at leaſt but very imperfectly. This is proved, not only by a ſimilarity of manners and cuſtoms, but likewiſe by the affinity of language; and the collections of words which have been made from all the widely-diffuſed iſlands and countries viſited by Captain Cook, cannot fail to throw much light on the origin of nations, and the manner in which the earth was at firſt peopled.

Cook's Diſcoveries.

Beſides this, information has been derived concerning another family of the earth formerly very much unknown. This was the nation of the Eſquimaux or Greenlanders, who had formerly been known to exiſt only on the north-eaſtern part of the American continent. From Captain Cook's accounts, however, it appears, that theſe people now inhabit alſo the coaſts and iſlands on the weſt ſide of America oppoſite to Kamtſchatka. From theſe accounts it appears alſo, that the people we ſpeak of have extended their migrations to Norton Sound, Oonalaſhka, and Prince William's Sound; that is, nearly to the diſtance of 1500 leagues from their ſtations in Greenland and the coaſt of Labradore. Nor does this curious fact reſt merely on the evidence ariſing from the ſimilitude of manners; for it ſtands confirmed by a table of words, exhibiting ſuch an affinity of language as muſt remove every doubt from the mind of the moſt ſcrupulous inquirer.

From the full confirmation of the vicinity of the two great continents of Aſia and America, it can no longer be ſuppoſed ridiculous to believe, that the latter received its inhabitants from the former; and by the facts recently diſcovered, a degree of further evidence is added to thoſe which might formerly be derived from nature concerning the authenticity of the Moſaic accounts. It is not indeed to be doubted, that the inſpired writings will ſtand the teſt of the moſt rigorous inveſtigation; nor will it ever be found, that true philoſophy and Divine Revelation can militate againſt each other. The rational friends of religion are ſo far from dreading the ſpirit of inquiry, that they wiſh for nothing more than a candid and impartial examination of the ſubject, according to all the lights which the improved reaſon and enlarged ſcience of man can afford.

Another good effect of the voyage of Captain Cook is, that they have excited in other nations a zeal for ſimilar undertakings. By order of the French government, Meſſrs de la Peyrouſe and de Langle ſailed from Breſt in Auguſt 1785, in the frigates Bouſſole and Aſtroloobe, on an enterprize, the purpoſe of which was to improve geography, aſtronomy, natural hiſtory, and philoſophy, and to collect an account of the cuſtoms and manners of different nations. For the more effectual proſecution of the deſign, ſeveral gentlemen were appointed to go out upon the voyage, who were known to excel in different kinds of literature. The officers of the Bouſſole were men of the beſt information and firmeſt reſolution; and the crew contained a number of artificers in various branches of mechanics. Marine watches, &c. were provided, and M. Dagelet the aſtronomer was particularly directed to make obſervations with M. Condamine's invariable pendulum, to determine the differences in gravity, and to aſcertain the true proportion of the equatorial to the polar diameter of the earth. It has likewiſe been made evident, that notwithſtanding all that has been done by Captain Cook, there is ſtill room for a farther inveſtigation of the geography of the northern parts of the world. The object accordingly was taken up by the Empreſs of Ruſſia, who committed the care of the enterpriſe to Captain Billings an Engliſhman in her majeſty's ſervice. We ſhall only make one obſervation more concerning the benefits likely to accrue from the voyages of Captain Cook, and that is relative to the ſettlement in Botany Bay. Whatever may be ſuppoſed to accrue to the nation itſelf from this ſettlement, it muſt undoubtedly give the higheſt ſatisfaction to every friend to humanity to be informed, that thus a number of unhappy wretches will be effectually prevented from returning to their former ſcenes of temptation and guilt, which may open to them the means of induſtrious ſubſiſtence and moral reformation. If the ſettlement be conducted with wiſdom and prudence, indeed it is hard to ſay what beneficial conſequences may be derived from it, or to what height it may ariſe. Rome, the greateſt empire the world ever ſaw, proceeded from an origin little, if at all, ſuperior to Botany Bay. For an account of this ſettlement ſee the article *New-Holland*.

One other object remains only farther to be conſidered with regard to theſe voyages, and that is the advantages which may reſult from them to the diſcovered people. Here, however, it may perhaps be difficult to ſettle matters with preciſion. From the preceding accounts, it muſt be evident that the intentions of Captain Cook were in the higheſt degree benevolent; and if at any time the people were the ſufferers, it muſt have been through their own fault. In one inſtance indeed it might be otherwiſe, and that is with reſpect to the venereal diſeaſe. The evidence in this caſe cannot be altogether ſatisfactory. Mr Samwell, who ſucceeded Mr Anderſon as ſurgeon of the Reſolution, has endeavoured to ſhow, that the natives of the lately explored parts of the world, and eſpecially of the Sandwich iſlands, were not injured by the Engliſh; and it was the conſtant care and ſolicitude of Captain Cook to prevent any infection from being communicated to the people where he came. But whether he was univerſally ſucceſsful in this reſpect or not, it is evident that the late voyages were undertaken with a view exceedingly different from thoſe of former times. The horrid cruelties of the Spaniſh conquerors of America cannot be remembered without concern for the cauſe of religion and human nature; but to undertake expeditions with a deſign of civilizing the world, and meliorating its condition, is certainly a noble object. From the long continued intercourſe betwixt Britain and the South Sea iſlands, there cannot be any doubt that ſome degree of knowledge muſt already have been communicated to them. Their ſtock of ideas muſt naturally be enlarged by the number of uncommon obſervations which have been preſented to them, and new materials furniſhed for the exerciſe of their rational faculties. A conſiderable addition muſt be made to their immediate comfort and enjoyment by the introduction of uſeful animals and vegetables; and if the only benefit they ſhould ever receive from Britain ſhould be the having obtained freſh means of ſubſiſtence, this of itſelf muſt be conſidered as a valuable acquiſition. Greater conſequences, however, may ſoon be expected. The connection formed with theſe people may be conſidered as the firſt ſtep towards their improvement; and thus the bleſſings of civilization may be ſpread among the various tribes of Indians in the Pacific Ocean, which in time may prepare them for holding an honourable place among the nations of the earth.

104
Account of Captain Clerke's voyage.

As a ſupplement to this account of the diſcoveries made by Captain Cook himſelf, we ſhall here ſubjoin a narrative of the ſubſequent part of the voyage by Captains Clerk, &c. until the return of the ſhips to England. At the time of Captain Cook's death, the great point of a north-weſt paſſage remained in ſome meaſure to be ſtill determined: for though, by the event of the former attempt, it had been rendered highly improbable that they ſhould ſucceed in this, it was ſtill reſolved to try whether or not, at certain ſeaſons of the year, the ice might not be more open than they had hitherto found it. The firſt object that naturally occured, however, was the recovery of Captain Cook's body; for which Mr King was of opinion that ſome vigorous meaſure ought inſtantly to be purſued. His motives for this, beſides the perſonal regard he had for the Captain, were to abate the confidence which muſt be ſuppoſed to enſue on the part of the natives, which would probably incline them to dangerous attempts; and this the more particularly, as they had hitherto diſcovered much leſs fear of the fire-arms than other ſavage nations were accuſtomed to do. Mr Samwell alſo takes notice of the intrepidity of the natives in this reſpect; but aſcribes it, in the firſt inſtance, to ignorance of their effects; and in the next, to a notion, that as the effects of theſe arms were occaſioned by fire, they might be counteracted by water. For this purpoſe they dipped their war mats in water; but finding themſelves equally vulnerable after this method had been purſued, they became more timid and cautious.

105
Methods taken for the recovery of Captain Cook's body.

As matters ſtood at preſent, there was even reaſon to dread the conſequences of a general attack upon the ſhips; and therefore Mr King was the more confirmed in his opinion of the neceſſity of doing ſomething to convince them of the prowefs of their adverſaries. In theſe apprehenſions he was ſeconded by the opinion of the greater part of the officers on board; and nothing ſeemed more likely to encourage the iſlanders to make the attempt than an appearance of being inclined to an accommodation, which they would certainly attribute to weakneſs or fear. Captain Clerke, however, and thoſe who were in favour of conciliatory meaſures, urged, that the miſchief was already irreparable; that the natives, by reaſon of their former friendſhip, had a ſtrong claim to the regard of the Engliſh; and that the more particularly, as the late calamitous accident did not appear to have taken its riſe from any premeditated deſign: they urged alſo the ignorance of the king concerning the theft, and the miſtake of the iſlanders who had armed themſelves on a ſuppoſition that ſome attempt would be made to carry off the king. To all this was added, that the ſhips were in want of refreſhments, particularly water; that the Reſolution's foremaſt would require ſeven or eight days before it could be properly repaired; and as the ſpring was faſt advancing, the ſpeedy proſecution of the voyage to the northward ought now to be the only object; that a vindictive conteſt with the natives might not only juſtify an imputation of needleſs cruelty, but would occaſion great delay in the equipment of the ſhips.

In conſequence of the prevalence of theſe ſentiments lenient meaſures were adopted, though the behaviour of the natives continued to be very inſolent. A great body ſtill kept poſſeſſion of the ſhore; many of whom came off in their canoes within piſtol-ſhot of the ſhips, and provoking the people by every kind of inſult and defiance. A train of negociations for Captain Cook's body took place; in which the natives ſhowed the moſt hoſtile and treacherous diſpoſition, and, as afterwards appeared, had cut the fleſh from the bones and burnt it. A piece of about ten pounds weight was brought by two natives at the hazard of their lives, who gave information that the reſt had been burnt, and that the bones were in the poſſeſſion of the king and ſome of the principal chiefs. Information was given, at the ſame time, that the chiefs were very deſirous of war in order to revenge the death of their countrymen.

106 His remains at laſt obtained.

Thus it appeared that the pacific plan had anſwered no good purpoſe. No ſatisfactory anſwer had been given to the demands made of the bodies of the ſlain; nor was any progreſs made in the great work intended, viz, a reconciliation with the natives; they ſtill remained on ſhore in an hoſtile poſture, as if determined to oppoſe any endeavours that might be made by the people to land; at the ſame time that a landing was become abſolutely neceſſary, in order to complete the ſtock of water. Had this ſpiritleſs conduct been perſiſted in, there is not the leaſt doubt that neither this purpoſe nor any other could have been effected. The inſolence of the natives became every day greater and greater; inſomuch that one of them had the audacity to come within muſket-ſhot of the Reſolution, and, after throwing ſeveral ſtones, waved Captain Cook's hat over his head, while his countrymen on ſhore were exulting and encouraging his audacity. By this inſult the people were ſo highly enraged, that, coming on the quarter-deck in a body, they begged that they might no longer be obliged to put up with ſuch reiterated provocation, but might be allowed to make uſe of the firſt opportunity of revenging the death of their Captain. The neceſſity of more vigorous meaſures, therefore, being now apparent, a few diſcharges of the great guns, with the burning of a village and ſome other acts of ſeverity, at laſt produced the mangled remains of Captain Cook. They were wrapped up in a bundle, in which were found both his hands entire, which were eaſily known by a ſcar in one of them dividing the fore-finger from the thumb the whole length of the metacarpal bone. Along with theſe was the ſkull, but with the ſcalp ſeparated from it, and the bones of the face wanting; the ſcalp, with the ears adhering to it, and the hair cut ſhort; the bones of both the arms, with the ſkin of the fore-arms hanging to them; the bones of the thighs and legs joined together, but without the feet. The ligaments of the joints were obſerved to be entire; the whole ſhowing evident marks of having been in the fire, except the hands, which had the fleſh remaining upon them, and were cut in ſeveral places and crammed with ſalt, moſt probably for the purpoſe of preſerving them. The ſkull was not fractured; but the ſcalp had a cut in the back part of it. The lower jaw and feet were wanting, having been ſeized by different chiefs.

107 Unſucceſsful attempts to make farther diſcoveries.

Having accompliſhed the purpoſes of their ſtay in this place, Captain Clerke ſet ſail from Karakakooa bay in O-why-hee towards Mowee, with a deſign to explore the coaſt of that iſland more fully than had been done, but were unable to accompliſh their purpoſe: nor indeed was it in their power to accompliſh any diſcovery of conſequence among theſe iſlands. The only intelligence worth mentioning which they were able to procure was, that wars had enſued about the property of the goats which were left by Captain Cook on the iſland of Oneehow, as has been already mentioned, and that during the conteſt all theſe poor animals, who had already begun to multiply, were deſtroyed; ſo that the benevolent attempts of our illuſtrious navigator in favour of theſe iſlanders had proved abortive.

108 Their favourable reception at Kamtſchatka.

On quitting the iſland of Oneehow our navigators ſet ſail for another named Modoopapappa, which they were aſſured by the natives lay within five hours ſailing of Tahoora, a ſmall iſland in the neighbourhood of Oneehow. In this they proved unſucceſsful; on which it was determined to ſteer for the coaſt of Kamtſchatka. In the paſſage thither they arrived at that place where de Gama is ſaid to have diſcovered a great extent of land; but of this they could diſcover no appearance. This imaginary continent is ſaid to have been diſcovered by a navigator called *John de Gama*, but who ſeems alſo to have been imaginary, as no perſon can find out either the country where he lived or the time when he made the diſcovery. We are informed by Muller, that the firſt account of it was publiſhed by Texeira in a chart in 1649, who places it between the latitude of 44 and 45 degrees, and about 160° E. Long. and calls it "land ſeen by John de Gama, in a voyage from China to New Spain." By the French geographers it is removed five degrees farther to the eaſt. When they arrived at Kamtſchatka they were entertained in the moſt hoſpitable manner, and furniſhed with every thing that could be procured in that deſart and barren region. "In this wretched extremity of the earth (ſays the narrator of the voyage), beyond conception barbarous and inhoſpitable, out of the reach of civilization, bound and barricadoed with ice, and covered with ſummer ſnow, we experienced the tendereſt feelings of humanity, joined to a nobleneſs of mind and elevation of ſentiment which would have done honour to any clime or nation." From Major Behm, in particular they received ſo many and ſo great obligations, that an handſome acknowledgement was made him by the Royal Society, as has been already obſerved. Even the ſailors were ſo ſtruck with his gratitude, that they voluntarily requeſted that their allowance of grog might be with-held, in order to compliment the garriſon of Bolcheretſk with the ſpirits; ſaying, that they knew brandy was extremely ſcarce in that country, the ſoldiers on ſhore having offered four roubles a bottle for it. The officers, however, would not allow them to ſuffer by their generoſity in this inclement country and ſeaſon of the year (the month of March not being yet expired); but, in room of the ſmall quantity of brandy which Major Behm conſented to accept, ſubſtituted an equal quantity of rum.

109 Tſchutſki ſubmit to the Empreſs.

It is worth obſerving, that the kindneſs with which the empreſs had ordered the Britiſh navigators to be treated in this part of her dominions were amply rewarded, even with no leſs than the addition of a new kingdom to the Ruſſian empire, which hitherto her arms had not been able to ſubdue. Among the northern Aſiatics none had been able to maintain their independence except the Tſchutſki, who inhabit the north-eaſtern extremity of the continent. No attempt to ſubdue theſe people had been made ſince the year 1750, when the Ruſſian forces had at laſt been obliged to retreat, after having loſt their commanding officer. The Ruſſians afterwards removed their frontier fortreſs from the river Anadyr to the Ingiga, which runs into the northern extremity of the ſea of Okotſk, and gives its name to a gulf to the weſt of the ſea of Penſhinſk. On the day that Captains Clerke and Gore arrived at Bolcharetſk, Major Behm received diſpatches from this fort, acquainting him that a party of the Tſchutſki had been there with voluntary offers of friendſhip and a tribute. That on aſking the reaſon of ſuch an unexpected alteration in their ſentiments they had acquainted his people, that two large Ruſſians boats had viſited them towards the end of the preceding ſummer; that they had been ſhown the greateſt kindneſs by the people who were in them, and had entered into a league of amity with them; and that, in conſequence of this, they came to the Ruſſian fort in order to ſettle a treaty upon terms agreeable to both nations. This incident had occaſioned much ſpeculation, and could never have been underſtood without the aſſiſtance of thoſe who were now preſent; the large *Ruſſian boats* having been in truth no other than the Reſolution and Diſcovery, under Captains Cook and Clerke.

110 Vaſt quantity of fiſh.

About the middle of May the ſnow began to melt very faſt in this unhoſpitable region, and the ſhips being now on their paſſage northward, met with an excellent opportunity of ſupplying themſelves with fiſh. The beach was cleared of ice on the 15th of the month; from which time vaſt quantities came in from every quarter. Major Behm had ordered all the Kamtſchadales to employ themſelves in the ſervice of the Engliſh ſhips; ſo that often they found it impoſſible to take on board the quantities that were ſent. They chiefly conſiſted of herrings, trout, flat fiſh, and cod. Theſe fiſh were here found in ſuch plenty, that once the people of the Diſcovery ſurrounded ſuch an amazing quantity with the ſeine, that they were obliged to throw out a very conſiderable number, leſt the net ſhould have been broken to pieces; and the cargo was ſtill ſo abundant, that, beſides having a ſtock for immediate uſe, they filled as many caſks as they could conveniently ſpare for ſalting; and after ſending on board the Reſolution a tolerable quantity for the ſame purpoſe, they left behind ſeveral buſhels upon the beach

111 Spirituous liquors pernicious in the ſea-ſcurvy.

While they remained in this country an opportunity offered of obſerving the pernicious effects of ſpirituous liquors in producing the ſea-ſcurvy. All the Ruſſian ſoldiers were in a greater or leſſer degree afflicted with that diſorder, ſome of them being in the laſt ſtage of it: and it was particularly obſerved that a ſerjeant, with whom the people had kept up a moſt friendly intercourſe, had, *in the courſe of a few days*, brought upon himſelf the moſt alarming ſcorbutic ſymptoms, by drinking too freely of the liquors with which he had been preſented by the Engliſh. Captain Clerke ſoon relieved them, by putting them under the care of the ſurgeons of the ſhips, and ſupplying them with ſour-krout and malt for ſweet wort. In conſequence of this a ſurpriſing alteration was ſoon obſerved in the figures of moſt of them; and their ſpeedy recovery was principally attributed to the ſweet wort.

112 Eruption of a volcano.

On the 12th of June they began to proceed northward along the coaſt of Kamtſchatka, and three days after had an opportunity of obſerving an eruption of one of the volcanoes of that peninſula. On the 15th, before day light, they were ſurpriſed with a rumbling noiſe like diſtant thunder; and when the day appeared, found the decks and ſides of the ſhips covered near an inch thick with fine duſt like emery. The air was at the ſame time loaded and obſcured with this ſubſtance; and in the neighbourhood of the volcano itſelf, it was ſo thick that the body of the hill could not be diſcovered. The exploſions became more loud at 12 o'clock and during the afternoon, being ſucceeded by ſhowers of cinders, generally of the ſize of peaſe, though ſome were as large as hazzle-nuts. Along with theſe there alſo fell ſome ſmall ſtones which had undergone no alteration from the action of the fire. In the evening there were dreadful claps of thunder with bright flaſhes of lightning, which, with the darkneſs of the ſky, and the ſulphureous ſmell of the air, produced a moſt awful and tremendous effect. The ſhips were at this time about 24 miles diſtant from the volcano; and it appeared that the volcanic ſhower had been carried to a ſtill greater diſtance, as they next day found the bottom of the ſea to conſiſt of ſuch ſmall ſtones as had fallen upon the decks of the ſhips. The mountain was ſtill obſerved to be in a ſtate of eruption on the 18th.

113 Voyage to the northward.

For ſome time Captain Clerke kept the coaſt of Kamtſchatka in view, with a deſign to make an accurate ſurvey of it; but in this he was diſappointed by foggy and ſqually weather; however, he determined the poſition of ſome remarkable promontories, and at laſt finding the ſeaſon too far advanced to accompliſh his deſign, ſet ſail for Beering's Straits, chiefly with a view to aſcertain the ſituation of the projecting points of the coaſt.

On the 3d of July our navigators came in ſight of the iſland of St Lawrence, and another which was ſuppoſed to lie between it and Anderſon's iſland. The latter being entirely unknown to Captain Clerke, he was inclined to have approached it, but was unable to effect his purpoſe. All theſe iſlands, as well as the coaſt of the Tſchutſki on the continent, were covered with ſnow, and had a diſmal appearance.

In the preceding year Captain Cook had determined the ſituation of the Iſlands of St Diomede to be in 65° 48′ latitude; but now being ſomewhat at a loſs to reconcile this with the poſition of the continent, they ſtood for ſome time over to the latter, till fully convinced of the accuracy of the former obſervations. At this time they approached within two or three leagues of the eaſtern cape of Aſia, which is an elevated round head of land extending about five miles from north to ſouth, and forms a peninſula connected with the continent by a narrow iſthmus of low land. It has a bold ſhore, and three lofty detached ſpiral rocks are ſeen off its northern part. It was ſtill encompaſſed with ice, and is covered with ſnow. Here they found a ſtrong current ſetting to the northward, which at noon had occaſioned an error in the computation of the latitude of no leſs than 20 miles. A ſimilar effect had been obſerved the preceding year in paſſing this ſtrait. On ſteering to the north-eaſt the weather cleared up, ſo that they had a view of the eaſtern cape of Aſia, Cape Prince of Wales on the weſtern coaſt of America, with a remarkable peaked hill on the latter, and the two iſlands of St Diomede lying between them. Here they met with great numbers of very ſmall hawks, having a compreſſed bill rather large in proportion to the body; the colour dark brown, or rather black, the breaſt whitiſh, and towards the abdomen of a reddiſh hue.

114 Are ſtopped by the ice.

On the 6th of July at 12 o'clock, the ſhips were in N. Lat. 67. 0. E. Long. 191. 6. when having already paſſed many large pieces of ice, and obſerved that in ſeveral places it adhered to the continent of Aſia, they were ſuddenly ſtopped about three in the afternoon by an extenſive body, which ſtretched towards the weſt. By this their hopes of reaching any higher latitude than what had been attained laſt year were conſiderably diminiſhed; but finding the courſe obſtructed on the Aſiatic ſide, they proceeded to the north-eaſtward, in order to explore the continent of America, between the latitude of 68° and 69°; which had laſt year been found impracticable on account of the foggy weather: but in this alſo they were partly diſappointed; for on the 7th, about ſix in the morning, they met with another large body of ice ſtretching from north-weſt to ſouth-eaſt; but not long afterwards, the horizon becoming clear, they had a view of the American coaſt at the diſtance of about ten leagues, extending from north-eaſt by eaſt to eaſt, and lying between N. Lat. 68° and 68° 20′. As the ice was not very high, the view extended a great way over it, ſo that they could perceive it exhibiting a compact ſolid ſurface, and apparently adhering to the land. Soon after the weather became hazy, ſo that they loſt ſight of the land; and it being impoſſible to get nearer, they continued to ſteer northward cloſe by the ſide of the ice. This courſe was continued till next morning, during which time the ſhips paſſed ſome drift-wood; but the morning following, the wind ſhifting to the north, they were obliged to ſtand to the weſtward. At two in the afternoon they were again cloſe to an immenſe expanſe of ice; which from the maſt-head ſeemed to conſiſt of very large compact bodies, united towards the exterior edge, tho' in the interior parts ſome pieces floated in the water; it extended from weſt ſouth-weſt to north-eaſt by north. There was now a neceſſity for ſteering towards the ſouth, as the ſtrong northerly winds had drifted down ſuch numbers of looſe pieces, that they had encompaſſed the ſhips for ſome time, and it was impoſſible to avoid very ſevere ſtrokes while ſailing among them. Thus, however, they reached the latitude of 69. 12. and E. Long. 188. 5.; but having now ſailed almoſt 40 leagues to the weſt along the edge of the ice without perceiving any opening, Captain Clerke determined to bear away ſouth by eaſt, the only quarter which was clear at preſent, and to wait till the ſeaſon was ſomewhat farther advanced before any further attempts were made. The intermediate time he propoſed to employ in ſurveying the bay of St Lawrence, and the coaſt ſituated to the ſouthward of it; as it muſt be a great ſatisfaction to have an harbour ſo near in caſe of the ſhips receiving any damage from the ice; and the Captain was alſo deſirous of paying another viſit to the Tſchutſki, eſpecially in conſequence of the accounts of them that had been given by Major Behm.

115 Remarkable affection of the ſea-horſes towards their young.

In this navigation they killed ſeveral ſea-horſes, and had an opportunity of obſerving the ſtrength of parental affection in thoſe monſtrous animals. On the approach of the boats towards the ice, all of them took their young ones under their fins, and attempted to make their eſcape with them into the ſea. Some, whoſe cubs were killed or wounded, and left floating upon the ſurface of the water, roſe again, and carried them down, ſometimes juſt as they were on the point of being taken into the boat; and could be traced bearing them to a conſiderable diſtance through the water, which was ſtained with their blood. They were afterwards obſerved bringing them at intervals above the ſurface, and again plunging under its ſurface with an horrid bellowing; and one female, whoſe young one had been killed and taken on board, became ſo furious, that ſhe ſtruck her tuſks through the bottom of the cutter.

116 The ſhips finally ſtopped by ice.

Our navigators ſtill found themſelves diſappointed in their attempts. On approaching the coaſt of the Tſchutſki they met with a large and compact body of ice, extending to the north-eaſt, ſouth-weſt, and ſouth-eaſt, as far as the eye could reach; ſo that they were again obliged to ſail back to the northward. Here alſo their courſe was ſoon ſtopped; for, on the 13th, being in N. Lat. 69. 37. and about the middle of the channel between the two continents, they once more fell in with a compact body of ice, of which they could perceive no limit. Captain Clerke therefore determined to make a final attempt on the coaſt of America, the paſſage northward having been found laſt year practicable much farther on that than the Aſiatic ſide. Thus they attained the latitude of 70. 8. at the diſtance, as was ſuppoſed, of 25 leagues from the coaſt of America; and ſome days after got about three minutes farther to the northward, about the diſtance of ſeven or eight leagues from the Icy Cape. This, however, was the utmoſt limit of the voyage to the north-eaſt; and they were ſoon obliged to relinquiſh all hopes of proceeding farther on the American ſide. Another effort was ſtill reſolved on to try the practicability of a north-weſt paſſage; and for this purpoſe our navigators altered their direction on the 21ſt of July, paſſing through a great quantity of looſe ice. About ten at night the main body was diſcovered at a very ſmall diſtance, ſo that they were obliged to proceed to the ſouthward.

117 Dangerous ſituation of the Diſcovery.

During this perilous navigation, the Diſcovery, after having almoſt got clear out from the ice, became ſo entangled by ſeveral large pieces, that her progreſs was ſtopped, and ſhe immediately dropped to leeward, falling broadſide foremoſt on the edge of a conſiderable body of ice, on which ſhe ſtruck with violence, there being an open ſea to windward. At length the maſs was either broken or moved ſo far, that the crew had an opportunity of making an effort to eſcape. But unluckily, before the ſhip gathered way ſufficient to be under command, ſhe fell to leeward a ſecond time upon another

other piece of ice; and the ſwell rendering it unſafe to lie to windward, and finding no proſpect of getting clear, they puſhed into a ſmall opening, and made the veſſel faſt to the ice with hooks. Here the Reſolution for ſome time loſt ſight of her conſort, which occaſioned no ſmall uneaſineſs in both veſſels; but at length, on a change of wind, the Diſcovery, ſetting all her ſails, forced a paſſage, though not without loſing a conſiderable part of her ſheathing, and becoming very leaky by reaſon of the blows ſhe had received.

Thus the two veſſels continued to make every effort to penetrate through the immenſe quantities of ice with which thoſe ſeas are filled winter and ſummer, but without ſucceſs. Captain Clerke therefore finding that it was impoſſible either to get to the northward, or even to reach the Aſiatic continent, the ſhips being alſo greatly damaged, determined to proceed ſouthward to the bay of Awatſka, on the Kamtſchadale coaſt, to refit, and afterwards take a ſurvey of the coaſts of Japan before the winter ſhould ſet in.

118
Of the extent of the Aſiatic continent to the northward.

During this navigation, two general concluſions were adopted relative to the extent of the Aſiatic coaſt in oppoſition to the opinion of Mr Muller. One is, that the promontory, called the *Eaſt Cape*, is in reality the moſt eaſterly point of Aſia; and that no part of that quarter of the globle extends farther than the longitude of 190° 22′ E. The other concluſion is, that the latitude of the moſt north-eaſterly point of Aſia does not exceed 70° N. but is rather ſomewhat below it. As the preſent diſcoveries, however, were terminated on the Aſiatic ſide in the 69th dgree of latitude, the probable direction of the coaſt afterwards can only be conjectured. The only ſources of knowledge in this caſe are the Ruſſian charts and journals; and theſe in general are ſo defective and contradictory, that the particulars of their real diſcoveries can ſcarce be collected. Hence the Ruſſian geographers are greatly divided in their opinions concerning the extent and figure of the peninſula of the Tſcutſki. Mr Muller, in a map publiſhed in 1754, ſuppoſes it to extend north-eaſt as far as the latitude of 75°, and E. Long. 19°, ending in a round cape which he calls *Tſchukotſkoi Noſs*. To the ſouthward of this cape he ſuppoſes the coaſt to form a bay to the weſt, bounded in the latitude of 67° 18′ by Serdze Kamen, the moſt northerly point obſerved by Beering in his expedition in 1728. A new form is given to the whole peninſula in a map publiſhed by the academy at Peterſburg in 1776. Here its moſt north-eaſterly extremity is placed in N. Lat. 73°, E. Long. 178° 30′; and its moſt eaſterly point in N. Lat. 65°, E. Long. 189° 30′. All the other maps vary between theſe two ſituations; and the only thing in which all of them agree is the poſition of the eaſt cape in N. Lat. 66°. The form of the coaſt, however, is very erroneous in the map publiſhed by the academy, and may be entirely diſregarded. In Mr Muller's map, the northern part of the coaſt has ſome reſemblance to that laid down in Captain Cook's and Clerke's ſurvey, as far as the latter extends; only that Mr Muller does not make it trend ſufficiently to the weſt, but ſuppoſes it to recede only five degrees of longitude between the latitudes of 66° and 69°; whereas it really recedes almoſt ten.

We muſt next examine Mr Muller's authority for ſuppoſing the coaſt to bend round to the north and north-eaſt in ſuch a manner as to form a large promontory.—Mr Coxe, whoſe accurate reſearches into this matter muſt give great weight to his opinion, thinks, that the extremity of the promontory was never doubled by any perſon except Deſhneff and his party; who ſailed, in the year 1648, from the river Kovyma, and are imagined to have got round to the river Anadyr. The account of this voyage, however, gives no geographical delineation of the coaſt, ſo that its figure muſt be determined by other circumſtances; and from theſe it evidently appears, that the Tſchukotſkoi Noſs of Deſhneff is in reality the Eaſt Cape of Captain Cook. Speaking of this Noſs, he ſays, that a perſon, with a favourable wind, may ſail from the iſthmus to the Anadyr in three days and three nights. This agrees entirely with the ſituation of the Eaſt Cape, which is about 120 leagues from the mouth of the river Anadyr; and there being no other iſthmus to the north between that and the latitude of 69°, it ſeems evident, that by this deſcription he certainly means either the Eaſt Cape or ſome other ſituated to the ſouthward of it. In another place he ſays, that oppoſite to the iſthmus there are two iſlands, upon which ſome of the Tſchutſki nation were obſerved, having pieces of the teeth of ſea-horſes fixed in their lips; and this exactly coincides with the two iſlands that lie to the ſouth eaſt of the Eaſt Cape. Our navigators indeed did not obſerve any inhabitants upon theſe iſlands; but it is by no means improbable, that ſome of thoſe from the American coaſt, whom the above deſcription perfectly ſuits, might have accidentally been there at the time, and been miſtaken for a tribe of Tſchutſki.

Other circumſtances, though leſs deciſive than thoſe juſt mentioned, concur in the ſame proof. Deſhneff ſays, that in ſailing from the Kovyma to the Anadyr, a great promontory, which projects far into the ſea, muſt be doubled; and that this promontory extends between north and north-eaſt. From theſe expreſſions, perhaps, Mr Muller was induced to repreſent the country of the Tſchutſki in the form we find in his map; but if he had been acquainted with the poſition of the Eaſt Cape as determined by Captain Cook, and the ſtriking agreement between that and the promontory or iſthmus in the circumſtances abovementioned, it is moſt probable that he would not have deemed theſe expreſſions of ſufficient weight to authoriſe his extending the north-eaſtern extremity of Aſia either as far to the north or to the eaſt as he has done.

Another authority uſed by Mr Muller ſeems to have been the depoſition of the Coſſac Popoff, taken at the Anadirſkoi Oſtrog in 1711. Popoff was ſent by land, in company with ſeveral others, to demand tribute of the independent Tſchutſki tribes, who inhabited the country about the Noſs. In the account of this journey, the diſtance betwixt Anadirſk and Tſchukotſkoi Noſs is repreſented as a journey of ten weeks with loaded rein-deer. From ſuch a vague account, indeed, we can judge but very little; but as the diſtance between the Eaſt Cape and Anadirſk does not exceed 200 leagues, and conſequently might be accompliſhed in the ſpace abovementioned at the rate of 12 or 14 miles a-day, we cannot reckon Popoff's account of its ſituation inconſiſtent with the ſuppoſition of its being the Eaſt Cape. It may likewiſe be obſerved, that Popoff's rout lay along the foot of a rock named *Matkol*, ſituated at the bottom of a ſpacious gulf, which Muller ſuppoſes to have been the bay he lays down between the latitudes of 66° and 72°; and he accordingly places the rock Matkol in the centre of it: but it ſeems more probable, that it might be a part of the gulf of Anadyr, which they would undoubtedly paſs in their journey towards the Eaſt Cape.

But what ſeems to put the matter beyond all doubt, and to prove that the cape which Popoff viſited cannot be to the northward of 69° Lat. is that part of his depoſition which relates to an iſland lying off the Noſs, from whence the oppoſite coaſt might be diſcerned; for as the oppoſite continents, in the latitude of 69°, diverge ſo far as to be upwards of 100 leagues diſtant, it is highly improbable that the Aſiatic coaſt ſhould again trend eaſtward in ſuch a manner as to come almoſt in ſight of that of America. As an additional proof of the poſition in queſtion, we may obſerve, that the Tſchukotſkoi Noſs is conſtantly laid down as dividing the ſea of Kovyma from that of Anadyr; which could not poſſibly be the caſe if any large cape had projected to the north-eaſt in the higher latitudes.

The next queſtion to be determined is, to what degree of latitude the northern coaſt of Aſia extends before it inclines directly weſtward? Captain Cook was always ſtrongly inclined to believe, that the northern coaſt of this continent, from the Indigirka eaſtward, has hitherto been uſually laid down above two degrees to the northward of its true ſituation; for which reaſon, and on the authority of a map that was in his poſſeſſion, as well as from intelligence received at Oonalaſhka, he placed the mouth of the Kovyma in the latitude of 68 degrees. Should he be right in his conjecture, it is probable that the coaſt of Aſia does not any where extend beyond the latitude of 70 degrees before it trends to the weſt; and conſequently our navigators muſt have been only one degree from its northern extremity. This ſeems to be confirmed by the ſilence of the Ruſſian navigators concerning any extent of continent to the northward of Shelatſkoi Noſs; nor do they mention any remarkable promontory, except the Eaſt Cape, between the Anadyr and the Kovyma. Another particular which Deſhneff relates may perhaps be deemed a farther confirmation of this opinion, *viz.* that he met with no obſtruction from ice in ſailing round the north-eaſtern extremity of Aſia; though he adds, that this ſea is not at all times ſo free of it, which indeed appears evidently to be the caſe. That part of the continent which lies between Cape North and the mouth of the Kovyma is about 125 leagues in extent. A third part of this ſpace, from Kovyma eaſtward, was explored in the year 1723 by Feodot Amoſſoff, who informed Mr Muller that its direction was eaſterly. Since that time it has been ſurveyed with ſome accuracy by Shalauroff whoſe chart makes it trend north-eaſt-by-eaſt as far as Shelatſkoi Noſs, which he places at the diſtance of about 43 leagues eaſt of the Kovyma. The ſpace therefore between the Noſs and Cape North, ſomewhat more than 80 leagues, is the only part of the Ruſſian dominions now remaining unexplored. But if the Kovyma be erroneouſly laid down in point of longitude as well as latitude, a ſuppoſition far from being improbable, the extent of the undiſcovered coaſt will be conſiderably diminiſhed. The following are the reaſons why it may be ſuppoſed that the mouth of the Kovyma is placed too far to the weſtward in the Ruſſian charts: 1. Becauſe the accounts that have been given of the navigation of the Frozen Ocean from that river round the north-eaſtern extremity of Aſia to the Gulf of Anadyr, do not agree with the ſuppoſed diſtance between thoſe places. 2. Becauſe the diſtance from the Anadyr to the Kovyma over land is by ſome Ruſſian travellers repreſented as a journey of no very great length, and eaſily performed. 3. Becauſe the coaſt from the Shelatſkoi Noſs of Shalauroff appears to trend directly ſouth-eaſt towards the Eaſt Cape. From all which it may be inferred, with ſome degree of probability, that only 60 miles of the northern Aſiatic coaſt remain to be explored.

119 Impracticability of a north-weſt or north-eaſt paſſage into the Pacific Ocean.

With regard to a north-weſt paſſage from the Atlantic into the Pacific Ocean, it is highly probable that no ſuch thing exiſts to the ſouthward of the 56th degree of latitude. If, in reality, it exiſts any where, it muſt certainly be either through Baffin's Bay, or by the north of Greenland in the weſtern hemiſphere, or in the eaſtern through the frozen ſea to the north of Siberia; ſo that in whichever continent it is ſeated the navigator muſt paſs through Beering's Straits. All that remains now to be conſidered therefore is, the impracticability of penetrating into the Atlantic Ocean through theſe ſtraits. From the voyages of our navigators it appears, that the ſea to the northward of Beering's Straits is more free from ice in Auguſt than in July, and perhaps may be ſtill more ſo in ſome part of September. But after the autumnal equinox, the length of the day diminiſhes ſo faſt that no farther thaw can be expected; and it would be unreaſonable to attribute ſo great an effect to the warmth of the laſt fortnight of September as to imagine it capable of diſperſing the ice from the moſt northern parts of the American coaſt. Even admitting this to be poſſible, it muſt at leaſt be allowed that it would be highly imprudent to endeavour to avoid the Icy Cape, by running to the known parts of Baffin's Bay, a diſtance of about 1260 miles, in ſo ſhort a time as that paſſage can be ſuppoſed to be open. On the ſide of Aſia there appears ſtill leſs probability of ſucceſs, as appears from the teſtimony of the Ruſſian as well as the Engliſh navigators. The voyage of Deſhneff indeed proves the poſſibility of circumnavigating the north-eaſtern extremity of Aſia; but even this affords a very ſlender foundation to hope for any great benefit, as no perſon beſides himſelf appears to have ſucceeded in the attempt, though more than a century and an half has now elapſed ſince the time of his voyage. But even ſuppoſing that, in ſome very favourable ſeaſon, this cape might be doubled, ſtill the Cape of Taimura remains, extending as far as the 78th degree of latitude, and round which none pretend ever to have ſailed.

Theſe arguments ſeem concluſive againſt any expectation of a north-weſt or north-eaſt paſſage to the Eaſt Indies, unleſs on the ſuppoſition of an open ſea very near the polar regions. The probability of getting into the polar ſeas is conſidered under the article POLE; and indeed from what has already been advanced muſt appear very little. Waving this ſubject therefore at preſent, we ſhall return to the remarks made by our navigators during their ſecond voyage.

120 Remarks during the voyage of Captain Clerke towards the Icy Sea.

In this they did little more than confirm what had been obſerved during the firſt; for it never was in their power to approach the continent of Aſia in any higher latitude than 67°, nor that of America in any part, excepting a few leagues, between 68° and 68° 20′, which they had not ſeen before. In both years the ice was met with ſooner on the Aſiatic than the American coaſt; but in 1779 they met with it in lower latitudes than in 1778. As they proceeded northward, the ice was found univerſally more compact and ſolid, though they were aſcertained at the ſame time that the greateſt part of what they met with was moveable. Its height on a medium was eſtimated at eight or ten feet; though ſome of the higheſt might be about 16 or 18. The currents were generally at the rate of one mile in the hour, and more generally ſet from the ſouth-weſt than from any other quarter. Their force, however, was ſo inconſiderable, whatever their direction might be, that no concluſion could poſſibly be drawn from them concerning the exiſtence or nonexiſtence of a northern paſſage. With regard to the temperature of the weather, July was found much colder than Auguſt. In the former, the thermometer was once at 28°, and very frequently at 30°; whereas during the laſt year it was very uncommon in Auguſt to have it as low as the freezing point. High winds were experienced in both ſeaſons, all of which blew from the ſouth-weſt. The air was foggy whenever the weather became calm; but the fogs were obſerved to accompany ſoutherly winds much more than others.

The ſtraits, in the neareſt approach of the continents to each other, in the latitude of 66°, are about 13 leagues over; beyond which they diverge to N. E. by E. and W. N. W.; ſo that in the latitude of 69°, their diſtance from each other is about 300 miles. A great reſemblance is obſerved betwixt the continents on both ſides of the ſtraits. Both are deſtitute of wood; the ſhores are low, with mountains further inland, riſing to a great height. The ſoundings in the mid-way between them were from 29 to 30 fathoms, gradually decreaſing as either continent was approached; with this difference, however, that the water was ſomewhat ſhallower on the coaſt of America than that of Aſia, at an equal diſtance from land. The bottom, towards the middle, was a ſoft ſlimy mud; and near either ſhore was a browniſh ſand intermixed with a few ſhells and ſmall fragments of bones. There was but little tide or current, and what there was came from the weſt.

121 Death of Captain Clerke. See *Clerke*.

Before the ſhips could reach the peninſula of Kamtſchatka, Captain Clerke expired: in conſequence of which the command devolved upon Mr King, Captain Gore being now the ſuperior officer. On the return to Kamtſchatka, Captain Clerke was buried in the ſpot on which a church was to be erected; it having been his own deſire to be interred in the church.

122 Return to Kamtſchatka, with a deſcription of the Bay of Awatſka.

By the time they arrived at this peninſula, the face of the country was greatly improved; the fields being covered with the moſt lively verdure, and every plant in the moſt flouriſhing ſtate. The eruption of the volcano which they had obſerved on their laſt departure from Kamtſchatka, had done little or no damage notwithſtanding its voilence. Several ſtones had fallen about the ſize of a gooſe's egg, but none larger. At this viſit it was obſerved by our navigators, that the complexions of the Ruſſians ſeemed to be much more unhealthy and ſallow that when they ſaw them formerly; and the Ruſſians made the ſame obſervation upon the complexions of their gueſts. As no certain cauſe for this alteration could be perceived, the blame was by both parties laid on the verdure of the country; which, by contraſting itſelf with the colour of the people, made the latter appear to diſadvantage.

Having repaired as well as they could the damages ſuſtained by the ſhips among the ice, our navigators now began to proceed on their voyage ſouthward; but the ſhattered condition of their veſſels, with the little time they had now to ſpare on voyages of diſcovery, after having been ſo long at ſea, now rendered them much leſs ſucceſsful than formerly. Before leaving the peninſula, however, they took care to give ſuch a deſcription of the bay of Awatſka as muſt be of great ſervice to future navigators. This bay lies in 52. 51. N. Lat. and 158. 48. E. Long. in the bight of another bay formed by Cape Gavareea to the ſouth, and Cheeponſkoi Noſs to the north. The latter of theſe bears from the former N. E. by N. and is 32 leagues diſtant. From Cape Gavareea to the entrance of Awatſka bay the coaſt takes a northerly direction, and extends about 11 leagues. It conſiſts of a chain of ragged cliffs and rocks, and in many parts preſents an appearance of bays or inlets; but on a nearer view, low grounds were perceived by which the headlands were connected. From the entrance of Awatſka bay, Cheeponſkoi Noſs bears E. N. E. diſtant 17 leagues. The ſhore on this ſide is flat and low, with hills behind gradually riſing to a conſiderable height. The latitude of Cape Gavareea is 52. 21. By this remarkable difference of the land on both ſides the Cape, navigators may be directed in their courſe towards it from the ſouthward. When they approach it from the northward, Cheeponſkoi Noſs becomes very conſpicuous; it being a high projecting headland, and united to the continent by a large extent of level ground lower than the Noſs; and preſents the ſame appearance whether viewed from the north or ſouth. Should the weather happen to be ſufficiently clear to admit a view of the mountains both on the ſea coaſt and in the neighbourhood, the ſituation of Awatſka bay may be known by the two high ones to the ſouth of it. That neareſt the bay is in the form of a ſugar loaf, the other flat at top and not quite ſo high. Three very conſpicuous mountains appear on the north ſide of the bay; of which that to the weſt appears to be the higheſt; the next, being a volcano, is readily known by the ſmoke which it emits; the third is the moſt northerly, and might properly be called a cluſter of mountains as it preſents ſeveral flat tops to view. When got within the capes, the entrance of the bay of Awatſka to the north is pointed out by a lighthouſe on a perpendicular head-land. Many ſunken rocks lie to the eaſtward of this head land, ſtretching two or three miles into the ſea; and which with a moderate ſea or ſwell will always ſhow themſelves. A ſmall round iſland lies four miles to the ſouth of the entrance, principally compoſed of high pointed rocks, one of which is very remarkable. The entrance into the bay is at firſt about three miles wide, and one and an half in the narroweſt part; the length is four miles in a north-weſt direction. Within the mouth is a noble baſon about 25 miles in circumference; in which are the harbours of Rakoweera to the eaſt, Tarcinſka to the weſt, and St Peter and St Paul to the north.

123 Account of the voyage from the time of leaving Kamtſchatka.

On leaving Kamtſchatka, it was unanimouſly judged improper to make any attempt to navigate the ſeas between the continent of Aſia and Japan. Inſtead of this, it was propoſed to ſteer to the eaſtward of that iſland, and in the way thither to ſail along the Kuriles; examining particularly thoſe that are ſituated neareſt to the northern coaſt of Japan, which are ſaid to be conſiderable, and neither ſubject to the Ruſſians nor Japaneſe. In caſe they ſhould have the good fortune to meet with ſome ſecure and commodious harbours in any of theſe iſlands, it was ſuppoſed that they might prove of conſiderable importance, as convenient places of ſhelter for ſubſequent navigators, who might be employed in exploring the ſeas as the means of producing a commercial intercourſe among the adjacent dominions of the two abovementioned empires. The next object was to take a ſurvey of the coaſts of the iſlands of Japan; after which they deſigned to ſail for the coaſt of China as far north as poſſible, and then ſail along it ſouthward to Macao.

In purſuance of this plan, they ſailed along the coaſt of Kamtſchatka, till they came to the ſouthern point called *Cape Lopatka*, whoſe ſituation they determined to be in Lat. 51. 0. E. Long. 156. 45. To the north-weſt they obſerved a very lofty mountain whoſe ſummit was loſt in the clouds; and the ſame inſtant the firſt of the Kurile iſlands, named *Shoomſka*, made its appearance in the direction of weſt, half ſouth. The paſſage betwixt the ſouthern extremity of Cape Lopatka and the iſland of Shoomſka, though only one league in breadth, is extremely dangerous, both on account of the rapidity of the tides, and of the ſunk rocks which lie off the Cape. In the courſe of this voyage, they had occaſion to obſerve, that a violent ſwell from the north-eaſt frequently took place, though the wind had been for ſome time in the weſtern quarter; a circumſtance for which they ſeem to have been altogether unable to account.

The tempeſtuous weather which now occurred, prevented any diſcoveries from being made among the Kurile iſles; however, they again ſailed over the ſpace aſſigned to the land of De Gama, without being able to find it; and from comparing ſeveral accounts of the Ruſſian navigators with one another, it was judged extremely probable, that the land of Jeſo, ſo frequently laid down in former maps, is no other than the moſt ſoutherly of the Kurile Iſles. On coming in view of the coaſt of Japan, they had the mortification to find that they could not approach the land by reaſon of the tempeſtuous weather and bad ſtate of the ſhips; the coaſts of theſe iſlands being extremely dangerous. Paſſing from thence in queſt of the Baſhee Iſlands, they found amazing quantities of pumice-ſtone floating in the ſea; ſo that they ſeemed inclined to believe, with Mr Muller, that if there had formerly been any part of the continent, or large iſland, called the *Land of Jeſo*, it muſt have diſappeared in a volcanic convulſion; which alſo muſt have been the caſe with that called the *Company's Land* and *Staten Iſland*. Though they had not the good fortune to find the Baſhee Iſlands, they diſcovered one in 24. 48. N. Lat. 141. 20. E. Long. which from its appearance, and the ſulphureous ſmell emitted by it, they named *Sulphur Iſland*. After this nothing remarkable occurred till their arrival at Canton in China, where having ſtaid for ſome time in order to put their ſhips in repair, they at laſt ſet ſail for Britain; but through ſtreſs of weather were driven as far north as Stromneſs in Orkney. From thence Captain Gore ſent a diſpatch to the Lords of the Admiralty to inform them of his arrival; and on the 4th of October 1780 the ſhips reached the Nore, after an abſence of 4 years 2 months and 22 days.

COOKERY, the art of preparing and dreſſing victuals for the table: An art, in its ſimpleſt and ordinary modes, ſufficiently familiar to every houſekeeper, and, in its luxurious refinements, too copiouſly detailed in manuals and directories publiſhed for the purpoſe to require any enlargement here, were it even a topic that at all deſerved conſideration in a work of this nature.

COOLERS, in medicine, thoſe remedies which produce an immediate ſenſe of cold, being ſuch as have their parts in leſs motion than thoſe of the organs of feeling; as fruits and all acid liquors. Or they are ſuch as, by a particular viſcidity or groſſneſs of parts, give the animal fluids a greater conſiſtency than they had before, and conſequently retard their motion, having leſs of that inteſtine force on which their heat depends: of this ſort are cucumbers and all ſubſtances producing viſcidity.

COOM, a term applied to the ſoot that gathers over an oven's mouth; alſo for that black, greaſy ſubſtance, which works out of the wheels of carriages.

COOMB, or Comb, *of Corn*, a dry meaſure containing 4 buſhels, or half a quarter.

COOP, in huſbandry, a tumbrel or cart incloſed with boards, and uſed to carry dung, grains, &c.

Coop is alſo the name of a pen, or encloſed place, where lambs, poultry, &c. are ſhut up in order to be fed.

COOPER, a tradeſman who makes caſks, tubs, and barrels, for holding liquors or other commodities. Every cuſtom-houſe and exciſe office in Britain has an officer called *King's cooper;* and every ſhip of burden has a cooper on board.

Cooper (Anthony-Aſhley), firſt earl of Shafteſbury, a moſt able ſtateſman, was the ſon of Sir John Cooper, Bart. of Rockborn in Hampſhire, and was born in 1621. He was elected member for Tewkeſbury at 19 years of age, in the ſhort parliament that met April 13. 1640. He ſeems to have been well affected to the king's ſervice at the beginning of the civil wars; for he repaired to the king at Oxford with offers of aſſiſtance: but prince Maurice breaking articles to a town in Dorſetſhire that he had got to receive him, furniſhed him with a pretence for going over to the parliament, from which he accepted a commiſſion. When Richard Cromwell was depoſed, and the Rump come again into power, they nominated Sir Anthony one of their council of ſtate, and a commiſſioner for managing the army. At that very time he had engaged in a ſecret correſpondence for reſtoring Charles II. and, upon the king's coming over, was ſworn of his privy council. He was one of the commiſſioners for the trial of the regicides; was ſoon after made chancellor of the exchequer, then a commiſſioner of the treaſury; in 1672 was created earl of Shafteſbury; and ſoon after was raiſed to the poſt of lord chancellor. He filled this office with great ability and integrity; and though the ſhort time he was at the helm was in a tempeſtuous ſeaſon, it is doing him juſtice to ſay, nothing could either diſtract or affright him. The great ſeal was taken from him in 1673, 12 months after his receiving it; but, though out of office, he ſtill made a diſtinguiſhed figure in parliament, for it was not in his nature to remain inactive. He drew upon himſelf the implacable hatred of the duke of York, by ſteadily promoting, if not originally inventing, the famous project of an excluſion-bill. When his enemies came into power, he found it neceſſary to conſult his ſafety by retiring into Holland, where he died ſix weeks after his arrival, in 1683. While his great abilities are confeſſed by all, it has been his misfortune to have his hiſtory recorded by his enemies, who ſtudied to render him odious. Butler has given a very ſevere character of him in his Hudibras.

COOPER (Anthony Aſhley), earl of Shafteſbury, was ſon of Anthony earl of Shafteſbury, and grandſon of Anthony firſt earl of Shafteſbury, lord high chancellor of England. He was born in 1671, at Exeter-houſe in London, where his grandfather lived, who from the time of his birth conceived ſo great an affection for him, that he undertook the care of his education; and he made ſo good a progreſs in learning, that he could read with eaſe both the Latin and Greek languages when only 11 years old. In 1683, his father carried him to the ſchool at Wincheſter, where he was often inſulted on his grandfather's account, whoſe memory was odious to the zealots for deſpotic power: he therefore prevailed with his father to conſent to his deſire of going abroad. After three years ſtay abroad, he returned to England in 1689, and was offered a ſeat in parliament in ſome of thoſe boroughs where his family had an intereſt. But this offer he did not now accept, that he might not be interrupted in the courſe of his ſtudies, which he proſecuted five years more with great vigour and ſucceſs; till, on Sir John Trenchard's death, he was elected burgeſs for Pool. Soon after his coming into parliament, he had an opportunity given him of expreſſing that ſpirit of liberty by which he uniformly directed his conduct on all occaſions. It was the bringing in and promoting "the act for regulating trials in caſes of high treaſon." But the fatigues of attending the houſe of commons, in a few years ſo impaired his health, that he was obliged to decline coming again into parliament after the diſſolution in 1698. He then went to Holland, where the converſation of Mr Bayle, Mr le Clerc, and ſeveral other learned and ingenious men, induced him to reſide a twelvemonth. During this time, there was printed at London, in 8vo. an imperfect edition of lord Aſhley's Inquiry concerning Virtue. It had been ſurreptitiouſly taken from a rough draught, ſketched when he was no more than 20 years of age. His lordſhip, who was greatly chagrined at this event, immediately brought up the impreſſion before many books were ſold, and ſet about completing the treatiſe, as it afterwards appeared in the ſecond volume of the Characteriſtics. Soon after lord Aſhley's return to England, he became, by the deceaſe of his father, earl of Shafteſbury. But his own private affairs hindered him from attending the houſe of lords till the ſecond year of his peerage, when he was very earneſt to ſupport king William's meaſures, who was at that time projecting the grand alliance. So much was he in favour with king William, that he had the offer of ſecretary of ſtate; but his declining conſtitution would not allow him to accept it. Though he was diſabled from engaging in buſineſs, the king conſulted him on matters of very high importance; and it is pretty well know that he had the greateſt ſhare in compoſing that celebrated laſt ſpeech of king William, December 31. 1701. On Queen Anne's acceſſion to the throne, he returned to his retired manner of life, being no longer adviſed with concerning the public; and was then removed from the vice-admiralty of Dorſet, which had been in the family for three generations. In 1703, he made a ſecond journey to Holland, and returned to England the year following. The French prophets, ſoon after this, having by their enthuſiaſtic extravagancies made a great noiſe throughout the nation, and, among different opinions, ſome adviſing a proſecution, the lord Shafteſbury apprehended that ſuch meaſures tended rather to inflame than to cure the diſeaſe. This was the origin of his Letter concerning Enthuſiaſm, which he ſent to lord Somers, then preſident of the council; and which, being approved of by that nobleman and other gentlemen to whom it was ſhown, was publiſhed in 1708, tho' without the name of the author, or that of the perſon to whom it was addreſſed. His Moraliſt, a philoſophical Rhapſody, being a recital of certain converſations on natural and moral ſubjects, appeared in Jan. 1709; and in the May following his *Senſus Communis*, an Eſſay upon the Freedom of Wit and Humour, in a letter to a Friend. It was in the ſame year that he entered into the marriage ſtate with Mrs Jane Ewer, the youngeſt daughter of Thomas Ewer, Eſq; of Lee in Hertfordſhire. By this lady, to whom his lordſhip was related, he had an only ſon, Anthony the late Earl of Shafteſbury. In 1710, his Soliloquy, or Advice to an Author, was publiſhed at London in 8vo. While he was thus employing himſelf in literary compoſition, his health declined ſo faſt, that it was recommended to him to ſeek aſſiſtance from a warmer climate. Accordingly, in July 1711, he ſet out for Naples, and purſuing his journey by way of France, was obliged to paſs through the Duke of Berwick's army, which at that time lay encamped near the borders of Piedmont. Here he was entertained by that famous general in the moſt friendly manner, and every aſſiſtance was given him to conduct him in ſafety to the Duke of Savoy's dominions. Our noble author's removal to Italy was of no ſervice to the re-eſtabliſhment of his health; for after having reſided at Naples about a year and a half, he departed this life on the 4th of February, O. S. 1712-13, in the 42d year of his age. The only pieces which he finiſhed after he came to this city, were the Judgment of Hercules, and the Letter concerning Deſign, which laſt was added to that impreſſion of the Characteriſtics which appeared in 1732. It was in 1711 that the firſt edition was publiſhed of all the Characteriſtics together, and in the order in which they now ſtand. But this publication not being entirely to his lordſhip's ſatiſfaction, he chiefly employed the latter part of his life in preparing his writings for a more elegant edition; which was given to the world in 1713, ſoon after his deceaſe. The ſeveral prints that were then firſt in-

interſperſed through the volumes were all invented by himſelf, and deſigned under his immediate inſpection; and for this purpoſe he was at the pains of drawing up a moſt accurate ſet of inſtructions, the manuſcript of which is ſtill preſerved in the family. That no miſtakes might be committed, the Earl did not leave to any other hands ſo much as the drudgery of correcting the preſs. In the three volumes of the Characteriſtics of Men, Manners, Opinions, and Times, he completed the whole of his works which he intended for the public eye. Not long before his death he had formed a ſcheme of writing a diſcourſe on painting, ſculpture, and the other arts of deſign, which, if he had lived to have finiſhed it, might have proved a very pleaſing and uſeful work, as he had a fine taſte in ſubjects of that kind: but his premature deceaſe prevented his making any great progreſs in the undertaking. The Earl of Shafteſbury had an eſteem for the works of the beſt Engliſh divines; one remarkable inſtance of which was diſplayed in his writing a Preface to a volume of Dr Whichcot's Sermons, publiſhed in 1698. Copies of theſe ſermons had been taken in ſhort-hand, as they were delivered from the pulpit; and the Earl had ſo high an opinion of them, that he not only introduced them to the world by his Preface, but had them printed under his own particular inſpection. In his Letters to a Young Man at the Univerſity, he ſpeaks of Biſhop Burnet and Dr Hoadly in terms of great applauſe, and has done juſtice to the merits of Tillotſon, Barrow, Chillingworth, and Hammond, as the chief pillars of the church againſt fanaticiſm. But whatever regard his lordſhip might have for ſome of the divines, it was to the writings of antiquity that his admiration was principally directed. Theſe were the conſtant objects of his ſtudy, and from them he formed his ſyſtem of philoſophy, which was of the civil, ſocial, and theiſtic kind.

Of Lord Shafteſbury's character as a writer, different repreſentations have been given. As one of his greateſt admirers may be mentioned Lord Monboddo; who, ſpeaking of his Rhapſodiſt in particular, does not heſitate to pronounce it not only the beſt dialogue in Engliſh, out of all degree of compariſon, but the ſublimeſt philoſophy; and if we will join with it the Inquiry, the completeſt ſyſtem both of morality and theology that we have in our language, and, at the ſame time, of the greateſt beauty and elegance for the ſtyle and compoſition.

Even ſeveral of the authors who have diſtinguiſhed themſelves by their direct oppoſition to many of the ſentiments which occur in the Characteriſtics, have nevertheleſs mixed no ſmall degree of applauſe with their cenſures. “I have again peruſed, with freſh pleaſure and freſh concern (ſays Mr Balguy, in his Letter to a Deiſt), the volumes of Characteriſtics—I heartily wiſh the noble author had been as unprejudiced in writing as I was in reading. If he had, I am perſuaded his readers would have found double pleaſure and double inſtruction. It ſeems to me, that his lordſhip had little or no temptation to purſue any ſingularities of opinion by way of diſtinction. His fine genius would ſufficiently have diſtinguiſhed him from vulgar authors in the high road of truth and good ſenſe; on which account his deviations ſeem the more to be lamented. The purity and politeneſs of his ſtyle, and the delicacy of his ſentiments, are and muſt be acknowledged by all readers of taſte and ſincerity. But nevertheleſs, as his beauties are not eaſy to be overlooked, ſo neither are his blemiſhes. His works appear to be ſtained with ſo many groſs errors, and his fine thoughts are ſo often mingled with abſurdities, that however we may be charmed with the one, we are forced to condemn the other.” Mr Balguy hath farther obſerved, with regard to the Inquiry concerning Virtue, which is the immediate object of his animadverſion, that though he cannot agree in every particular contained in it, he finds little more to do than to tell how much he admires it; and that he thinks it indeed, in the main, a performance ſo juſt and exact as to deſerve higher praiſes than he is able to give it.

Dr Brown, in his Eſſay on the Characteriſtics, obſerves, that the Earl of Shafteſbury hath in that performance mingled beauties and blots, faults and excellencies, with a liberal and unſparing hand. At the ſame time, the Doctor applauds that generous ſpirit of freedom which ſhines throughout the whole. Another direct antagoniſt of the Earl of Shafteſbury, Dr Leland, has obſerved, that no impartial man will deny him the praiſe of a fine genius. “The quality of the writer (continues the Doctor), his lively and beautiful imagination, the delicacy of taſte he hath ſhown in many inſtances, and the graces and embelliſhments of his ſtyle, though perhaps ſometimes too affected, have procured him many admirers. To which may be added his refined ſentiments on the beauty and excellency of virtue, and that he hath often ſpoken honourably of a juſt and good Providence, which miniſters and governs the whole in the beſt manner; and hath ſtrongly aſſerted, in oppoſition to Mr Hobbes, the natural difference between good and evil; and that man was originally formed for ſociety, and the exerciſe of mutual kindneſs and benevolence; and not only ſo, but for religion and piety too. Theſe things have very much prejudiced many perſons in his favour, and prepared them for receiving, almoſt implicitly, whatever he hath advanced.” Dr Johnſon, as we are informed by Sir John Hawkings, bore no good-will to Lord Shafteſbury; “neither did he ſeem at all to reliſh the cant of the Shafteſburian ſchool, nor inclined to admit the pretenſions of thoſe who profeſſed it, to taſtes and perceptions which are not common to all men; a taſte in morals, in poetry, and proſe writing, in painting, in ſculpture, in muſic, in architecture, and in government! A taſte that cenſured every production, and induced them to reprobate every effort of genius that fell ſhort of their own capricious ſtandard.”

Biog, Brit. vol. iv.

The grand point in which our noble author has rendered himſelf juſtly obnoxious to the friends of religion, is his having interſperſed through the Characteriſtics a number of inſinuations that appear to be unfavourable to the cauſe of revelation. There have not, however, been wanting many among his admirers, who have thought that he ought not to be reckoned among the deiſtical writers. The author of Animadverſions upon Dr Brown's three Eſſays on the Characteriſtics obſerves, that it is “imprudent, to ſay no worſe, in ſome ſincere advocates for Chriſtianity, to reject the friendly advice and aſſiſtance of ſo maſterly a writer as the Lord Shafteſbury, and to give him up to the deiſts as a patron of infidelity.” But it is matter of fact, and not conſiderations of prudence or imprudence, that muſt determine the queſtion. In ſupport of his Lordſhip's having been a believer in our holy religion, may be alleged, his Preface to Whichcot's Sermons, and his Letters to a Student at the Univerſity: in both which works he conſtantly expreſſes himſelf in ſuch language as ſeems to indicate that he was really a Chriſtian. And with regard to the Letters it may be remarked, that they were written in 1707, 1708, and 1709, not many years before his lordſhip's death. Nevertheleſs, there are in the Characteriſtics ſo many ſceptical paſſages, that he muſt be conſidered as having been a doubter at leaſt, if not an abſolute diſbeliever, with reſpect to revelation. But if he muſt be ranked amongſt the deiſts, we agree with the obſervation of one of his biographers, that he is a very different deiſt from numbers who have appeared in that character; his general principles being much leſs exceptionable.

The ſtyle of Lord Shafteſbury's compoſitions is alſo a point upon which various and contradictory ſentiments have been entertained. But for the fulleſt and moſt judicious criticiſm that has appeared upon that ſubject, we may refer the reader to Dr Blair's Lectures on Rhetoric and Belles Lettres, Vol. I. p. 192, 193, 207, 208, 234, 263, and 396—398.

Cooper (Samuel), a very eminent Engliſh miniature painter, born in 1609, and bred under the care of his uncle John Hoſkins. He derived, however, his principle excellence from a ſtudy of the works of Van Dyck, in whoſe time he lived; inſomuch that he was commonly ſtyled "Van Dyck in little." His pencil was chiefly confined to the head, in which, with all its dependencies, eſpecially the hair, he was inimitable; but if he deſcended lower, his incorrectneſs was notorious. He died in 1672; and his pieces are univerſally admired all over Europe, ſelling for incredible prices.—He had a brother, Alexander, likewiſe a good miniature painter, who became limner to Chriſtina queen of Sweden.

Cooper (Thomas), a pious and learned prelate in the reign of queen Elizabeth, was born at Oxford about the year 1517. He was educated in the ſchool adjoining to Magdalene college, of which he was a choriſter; where alſo, in 1539, he was elected probationer, and fellow in the following year. About the year 1546, quitting his fellowſhip, he applied himſelf to the ſtudy of phyſic, in 1556 took the degree of bachelor in that faculty, and practiſed as phyſician at Oxford. Being inclined to the Proteſtant religion, probably this was only a prudent ſuſpenſion of his final intentions during the Popiſh reign of queen Mary: for, on the acceſſion of Elizabeth, he reſumed the ſtudy of divinity; became a celebrated preacher, was made dean of Chriſt-church and vice chancellor of the univerſity, having accumulated the degrees of bachelor and doctor in divinity. In 1569 he was made dean of Glouceſter; and, the year following, biſhop of Lincoln: whence, in 1584, he was tranſlated to the ſee of Wincheſter; in which city he died on the 29th of April 1594, and was buried in the cathedral there, on the ſouth ſide of the choir. The ſeveral writers who have mentioned Dr Cooper, unanimouſly give him the character of an eloquent preacher, a learned divine, and a good man. He had the miſfortune while at Oxford to marry a lady whoſe gallantries became notorious: nevertheleſs he would not be divorced from her; knowing that he could not live without a wife, he did not chooſe "to charge his conſcience with the ſcandal of a ſecond marriage."—He wrote, 1. The Epitome of Chronicles from the 17th year after Chriſt to 1540, and thence after to 1560. 2. Theſaurus linguæ Romanæ et Britannicæ. This dictionary, which is an improvement upon Elyot's, was much admired by queen Elizabeth, who thence forward determined to promote the author. 3. A brief expoſition of ſuch chapters of the Old Teſtament as uſually are read in the church, at common prayer, on Sundays throughout the year. 4. An admonition to the people of England. 5. Sermons.

Cooper (John-Gilbert), a polite writer of the preſent age, was born in 1723; and was deſcended from an ancient family in the county of Nottingham, whoſe fortune was injured in the laſt century by their attachment to the principles of monarchy. He reſided at Thurgarton priory in Nottinghamſhire, which was granted by King Henry VIII. to William Cooper, one of his anceſtors. This manſion Mr Cooper inherited from his father, who in 1739 was high-ſheriff of the county; and tranſmitted it to his ſon, who filled the ſame reſpectable office in 1783. After paſſing through Weſtminſter ſchool under Dr John Nicoll, along with the late Lord Albemarle, Lord Buckinghamſhire, Major Johnſon, Mr George Aſhby, and many other eminent and ingenious men, he became in 1743 a Fellow-Commoner of Trinity-college, Cambridge, and reſided there two or three years; but quitted the univerſity on his marrige with Suſanna the daughter of William Wrighte, Eſq; ſon to the Lord Keeper of that name, and Recorder of Leiceſter 1729—1763. In the year 1745 he commenced author by the publication of The Power of Harmony, a poem in 4to; and in 1746 and 1747 he produced ſeveral Eſſays and Poems under the ſignature of Philalethes, in a periodical work called The Muſeum, publiſhed by Mr Dodſley. In the ſame year he came forward as an author, with his name, by a work which received much aſſiſtance from his friend the Reverend John Jackſon of Leiceſter, who communicated ſeveral learned notes, in which he contrived to manifeſt his diſlike to his formidable antagoniſt Mr Warburton. It was intitled The Life of Socrates, collected from the Memorabilia of Xenophon and the Dialogues of Plato, and illuſtrated farther by Ariſtotle, Diodorus Siculus, Cicero, Proclus, Apuleius, Maximus Tyrius, Boëthius, Diogenes Laërtius, Aulus Gellius, and others, 1749, 8vo. In this work Mr Cooper gave evident marks of ſuperior genius; warm, impetuous, and impatient of reſtraint. In 1754, Mr Cooper publiſhed his Letters on Taſte, 8vo; an elegant little volume, on which no ſmall ſhare of his reputation is founded; and in 1755, The Tomb of Shakeſpeare, a Viſion, 4to; a decent performance, but in which there is more of wit and application than of nature or genius. In 1756 he aſſiſted Mr Moore, by writing ſome numbers of The World; and attempted to rouſe the indignation of his countrymen againſt the Heſſians, at that juncture brought over to defend the nation, in a poem called The Genius of Britain, addreſſed to Mr Pitt. In 1758, he publiſhed Epiſtles to the Great, from Ariſtippus in Retirement, 4to; and The Call of Ariſtippus, Epiſtle IV. to Mark Akenſide, M. D. Alſo, A Father's Advice to his Son, in 4to.

In the Annual Regiſter of the ſame year is his Tranſlation of An Epiſtle from the King of Pruſſia to Monſieur Voltaire. In 1759, he publiſhed Ver Vert; or, the Nunnery Parrot; an Heroic Poem, in four cantos; inſcribed to the Abbeſs of D***; tranſlated from the French of Monſieur Greſſet, 4to; reprinted in the firſt volume of Dilly's Repoſitory, 1777; and, in 1764, Poems on ſeveral Subjects, by the Author of the Life of Socrates; with a prefatory Advertiſement by Mr Dodſley. In this little volume were included all the ſeparate poetical pieces which have been already mentioned, excepting Ver Vert, which is a ſprightly compoſition. Mr Cooper died at his father's houſe in May-Fair, after a long and excruciating illneſs ariſing from the ſtone, April 14. 1769

CO-ORDINATE, ſomething of equal order, rank, or degree, with another.

COOT, in ornithology. See FULICA.

COOTWICH (John), doctor of laws, was born at Utrecht, and ſpent great part of his life in travelling. He publiſhed in Latin, in 1619, an account of his journey from Jeruſalem and from Syria; which is very ſcarce and in high eſteem. Time of his death uncertain.

COPAIBA, or *Balſam of* COPAIBA, a liquid reſinous juice, flowing from inciſions made in the trunk of the copaifera balſamum. See the following article. This juice is clear and tranſparent, of a whitiſh or pale yellowiſh colour, an agreeable ſmell, and a bitteriſh pungent taſte. It is uſually about the conſiſtence of oil, or a little thicker: when long kept, it becomes nearly as thick as honey, retaining its clearneſs; but has not been obſerved to grow dry or ſolid, as moſt of the other reſinous juices do. We ſometimes meet with a thick ſort of balſam of copaiba, which is not at all tranſparent, or much leſs ſo than the foregoing, and generally has a portion of turbid watery liquor at the bottom. This ſort is probably either adultered by the mixture of other ſubſtances, or has been extracted by coction from the bark and branches of the tree: its ſmell and taſte are much leſs pleaſant than thoſe of the genuine balſam. Pure balſam of copaiba diſſolves entirely in rectified ſpirit, eſpecially if the menſtruum be previouſly alkalized: the ſolution has a very fragrant ſmell. Diſtilled with water, it yields a large quantity of a limpid eſſential oil; and in a ſtrong heat, without addition, a blue oil.

The balſam of copaiba is an uſeful corroborating detergent medicine, accompanied with a degree of irritation. It ſtrengthens the nervous ſyſtem, tends to looſen the belly, in large doſes proves purgative, promotes urine, and cleanſes and heals exulcerations in the urinary paſſages, which it is ſuppoſed to perform more effectually than any of the other balſams. Fuller obſerves, that it gives the urine an intenſely bitter taſte, but not a violet ſmell as the turpentines do.

This balſam has been principally celebrated in gleets and the fluor albus, and externally as a vulnerary. The author abovementioned recommends it likewiſe in dyſenteries, in ſcorbutic cachexies, in diſeaſes of the breaſt and lungs, and in an acrimonious or putreſcent ſtate of the juices: he ſays, he has known very dangerous coughs, which manifeſtly threatened a conſumption, cured by the uſe of this balſam alone; and that, notwithſtanding its being hot and bitter, it has good effects even in hectic caſes. Moſt phyſicians ſeem now, however, to conſider balſams and reſins too ſtimulant to be ventured on in phthiſical affections.

The doſe of this medicine rarely exceeds 20 or 30 drops, though ſome direct 60 or more. It may be conveniently taken in the form of elæoſaccharum, or in that of an emulſion, into which it may be reduced by triturating it with almonds, or rather with a thick mucilage of gum-arabic, till they are well incorporated, and then gradually adding a proper quantity of water.

COPAIFERA, in botany: A genus of the monogynia order, belonging to the decandria claſs of plants; and in the natural method ranking under thoſe of which the order is doubtful. There is no calyx; there are four petals; the legumen ovate; one ſeed with an arillus or coat reſembling a berry. We know but of one ſpecies, the balſamum, being that which yields the copaiba balſam mentioned in the preceding article. This trees grow near a village called *Ayapel*, in the province of Antiochi, in the Spaniſh Weſt Indies about ten days journey from Carthagena. There are great numbers of theſe trees in the woods about this village, which grow to the height of 50 or 60 feet. Some of theſe trees do not yield any of the balſam; thoſe which do, are diſtinguiſhed by a ridge which runs along their trunks. Theſe trees are wounded in the centre, and they place calabaſh ſhells, or ſome other veſſels, to the wounded part to receive the balſam, which will all flow out in a ſhort time. One of theſe trees will yield five or ſix gallons of balſam: but tho' they will thrive well after being tapped, yet they never afford any more balſam.

COPAL, improperly called *gum copal*, is a gum of the reſinous kind brought from New Spain, being the concrete juice of a tree * which grows in theſe parts. It comes to us in irregular maſſes, ſome of which are tranſparent, and of different ſhades as to colour, from a light yellow to a deep brown. Some pieces are whitiſh and ſemitranſparent. To the ſmell it is more agreeable than frankincenſe: but hath neither the ſolubility in water common to gums, nor in ſpirit of wine common to reſins, at leaſt in any conſiderable degree. By theſe properties it reſembles amber; which has induced ſome to think it a mineral bitumen reſembling that ſubſtance. In diſtillation it yields an oil, which like mineral petrolea is indiſſoluble in ſpirit of wine. Copal itſelf is ſoluble in the eſſential oils, particularly in that of lavender, but not eaſily in the expreſſed ones. It may, however, be diſſolved in linſeed oil by digeſtion, with a heat very little leſs than is ſufficient to boil or decompoſe the oil. This ſolution, diluted with ſpirit of turpentine, forms a beautiful tranſparent varniſh, which when properly applied, and ſlowly dried, is very hard and durable. This varniſh is applied to ſnuff-boxes, tea-boards, and other utenſils. It preſerves and gives luſtre to paintings, and greatly reſtores the decayed colours of old pictures, by filling up the cracks and rendering the ſurfaces capable of reflecting light more uniformly.

COPARCENARY, the ſhare or quota of a coparcener.

COPARCENERS, (from *con* and *particeps*, "partner;"), or PARCENERS; ſuch as have equal portions in the inheritance of their anceſtor.

---

* *Rhus Copallinum.*

Coparceners are ſo either by law or cuſtom. Coparceners by law, are the iſſue female; which, in default of a male heir, come equally to the lands of their anceſtor. Coparceners by cuſtom, are thoſe who, by ſome peculiar cuſtom of the country, challenge equal parts in ſuch lands; as in Kent, by the cuſtom of gavelkind. The crown of England is not ſubject to coparcenary.

COPE, an eccleſiaſtical ornament, uſually worn by chanters and ſubchanters, when they officiate in ſolemnity. It reaches from the ſhoulders to the feet. The ancients called it *pluviale*.—The word is alſo uſed for the roof or covering of a houſe, &c.

Cope is alſo the name of an ancient cuſtom or tribute due to the king or lord of the ſoil, out of the lead-mines in ſome part of Derbyſhire, England; of which Manlove ſaith thus:

Egreſs and regreſs to the king's highway,
The miners have; and *lot* and *cope* they pay:
The thirteenth diſh of ore within their mine,
To the lord, for *lot*, they pay at meaſuring time;
Sixpence a load for *cope* the lord demands,
And that is paid to the *burghmaſter's* hands.

This word by doomſday-book, as Mr Hagar hath interpreted it, ſignifies a hill: and *cope* is taken for the ſupreme cover, as the *cope of heaven*.

COPEL. See Cupel.

COPENHAGEN, the capital of the kingdom of Denmark, ſituated on the eaſtern ſhore of the iſland of Zealand, upon a fine bay of the Baltic ſea, not far from the ſtrait called the *Sound*. E. Long. 13. 0. N. Lat. 55. 30.

The preciſe date of the foundation of this city is diſputed; but the moſt probable account is, that it took its riſe from a caſtle built on the ſpot in the year 1168, as a protection againſt the pirates which at that time ſwarmed in the Baltic. The conveniency of the ſituation, and the ſecurity afforded by the caſtle, ſoon induced a number of the inhabitants of Zealand to reſort thither: but it was not diſtinguiſhed by the royal reſidence until 1443, during the reign of Chriſtopher of Bavaria; ſince which period it has been gradually enlarged and beautified, and is become the capital of Denmark.

Copenhagen is the beſt built city of the north; for although Peterſburgh excels it in ſuperb edifices, yet, as it contains no wooden houſes, it does not diſplay that ſtriking contraſt of meanneſs and magnificence, but in general exhibits a more equable and uniform appearance. The town is ſurrounded towards the land with regular ramparts and baſtions, a broad ditch full of water, and a few outworks: its circumference meaſures between four and five miles. The ſtreets are well paved, with a foot-way on each ſide, but too narrow and inconvenient for general uſe. The greateſt part of the buildings are of brick; and a few are of free-ſtone brought from Germany. The houſes of the nobility are in general ſplendid, and conſtructed in the Italian ſtyle of architecture: the palace, which was erected by Chriſtian VI. is a large pile of building; the front is of ſtone, and the wings of brick ſtuccoed; the ſuite of apartments is princely; but the external appearance is more grand than elegant.

The buſy ſpirit of commerce is viſible in this city, which contains about 80,000 inhabitants. The haven is always crowded with merchant ſhips; and the ſtreets are interſected by broad canals, which bring the merchandize cloſe to the warehouſes that line the quays. This city owes its principal beauty to a dreadful fire in 1728, that deſtroyed five churches and 67 ſtreets, which have been ſince rebuilt in the modern ſtyle. The new part of the town, raiſed by the late King Frederic V. is extremely beautiful, ſcarcely inferior to Bath. It conſiſts of an octagon, containing four uniform and elegant buildings of hewn ſtone, and of four broad ſtreets leading to it in oppoſite directions. In the middle of the area ſtands an equeſtrian ſtatue of Frederic V. in bronze, as big as life, which coſt 80,000l. The Royal Muſeum, or Cabinet of Rarities, merits the attention of travellers. This collection, which was begun by Frederic III. is depoſited in eight apartments, and ranged in the following order: animals, ſhells, minerals, paintings, antiquities, medals, dreſſes, arms and implements of the Laplanders.

Part of Copenhagen, which is called *Chriſtianſhaſen*, is built upon the Iſle of Amak, which generally attracts the curioſity of foreigners; (ſee Amak). From this place, to which the main city is joined by a bridge, the markets are ſupplied with fowl, beef, mutton, veniſon, corn, and culinary vegetables, which are produced here in the greateſt abundance.

COPERNICAN, in general, ſomething belonging to Copernicus. Hence,

Copernican Syſtem or *Hypotheſis*, that ſyſtem of the world, wherein the ſun is ſuppoſed to reſt in the centre, and the planets, with the earth, to move in ellipſes round him. See Copernicus.

COPERNICUS (Nicolaus), an eminent aſtronomer, was born at Thorn in Pruſſia, Jan. 10. 1472. He was taught the Latin and Greek languages at home; and afterwards ſent to Cracovia, where he ſtudied philoſophy and phyſic. His genius in the mean time was naturally turned to mathematics, which he purſued through all its various branches. He ſet out for Italy when he was 23 years of age; but ſtaid at Bononia ſome time, for the ſake of being with the celebrated aſtronomer of that place, Dominicus Maria; whoſe converſation, however, and company, he affected, not ſo much as a learner, as an aſſiſtant to him in making his obſervations. From thence he paſſed to Rome, where he was no ſooner arrived than he was conſidered as not inferior to the famous Regiomontanus; and acquired in ſhort ſo great a reputation, that he was choſen profeſſor of mathematics, which he taught for a long time with great applauſe. He alſo made ſome aſtronomical obſervations there about the year 1500. Returning to his own country ſome years after, he began to apply his vaſt knowledge in mathematics to correct the ſyſtem of aſtronomy which then prevailed. He ſet himſelf to collect all the books which had been written by philoſophers and aſtronomers, and to examine all the various hypotheſes they had invented for the ſolution of the celeſtial phenomena; to try if a more ſymmetrical order and conſtitution of the parts of the world could not be diſcovered, and a more juſt and exquiſite harmony in its motions eſtabliſhed, than what the aſtronomers of theſe times ſo eaſily admitted. But of all their hypotheſes none pleaſed him ſo well as the Pythagorean, which made the ſun to be the centre of the ſyſtem, and ſuppoſed the earth to move not only round the ſun, but round its own axis alſo. He thought he diſcerned much beautiful order and proportion in this; and that all that embarraſſment and perplexity from epicycles and excentrics, which attended the Ptolemaic hypotheſis, would here be entirely removed.

This ſyſtem, then, he began to conſider, and to write upon, when he was about 35 years of age. He employed himſelf in contemplating the phenomena carefully; in making mathematical calculations; in examining the obſervations of the ancients, and in making new ones of his own; and after more than 20 years chiefly ſpent in this manner, he brought his ſcheme to perfection, and eſtabliſhed that ſyſtem of the world which goes by his name, and is now univerſally received, (ſee Astronomy, n° 22.) His ſyſtem, however, was then looked upon as a moſt dangerous hereſy: for which he was thrown into priſon by Pope Urban VIII. and not ſuffered to come out till he had recanted his opinion; that is, till he had renounced the teſtimony of his ſenſes. He died the 24th of May 1543, in the 70th year of his age.

This extraordinary man had been made canon of Worms by his mother's brother, Lucas Wazelrodius, who was biſhop of that place. He was not only the greateſt of aſtronomers, but a perfect maſter of the Greek and Latin tongues; to all which he joined the greateſt piety and innocence of manners.

Copernicus, the name of an aſtronomical inſtrument invented by Mr Whiſton, to exhibit the motion and phenomena of the planets, both primary and ſecondary. It is built upon the Copernican ſyſtem, and for that reaſon called by his name.

COPHTI, Cophts, or Copti, a name given to the Chriſtians of Egypt, who are of the ſect of Jacobites.

The critics are extremely divided about the origin and orthography of the word; ſome write it Cophti, others Cophtites, Cophtitæ, Copts, &c. Scaliger derives the name from Coptos, an anciently celebrated town of Egypt, the metropolis of the Thebaid. Kircher refutes this opinion, and maintains, that the word originally ſignifies "cut" and "circumſcribed;" and was given theſe people by the Mahometans, by way of reproach, becauſe of their practice of circumciſing: but P. Sollier, another Jeſuit, refutes this opinion. Scaliger afterwards changed his opinion, and derived the word from Αιγυπτος, the ancient name of Egypt, by retrenching the firſt ſyllable: but this opinion, too, P. Sollier diſputes. John de Leo and others ſay, that the Egyptians anciently called their country *Elchibth*, or *Cibth*, from Cibth their firſt king, whence Cophtite, &c. others ſay from Cobtim ſecond king of Egypt. Vanſleb derives the word Copht from Copt ſon of Miſraim, grandſon of Noah. All theſe etymologies P. Sollier rejects, on this principle, that were they true, the Egyptians ought all equally to be called *Cophti*; whereas, in effect, none but the Chriſtians, and among thoſe none but the Jacobites, bear the name, the Melchites not being comprehended under it. Hence he chooſes to derive the word from the name *Jacobite*, retrenching the firſt ſyllable; whence, Cobite, Cobea, Copta, and Cophta.

The Cophts have a patriarch who reſides at Cairo, but he takes his title from Alexandria; he has no archbiſhop under him, but 11 or 12 biſhops. The reſt of the clergy, whether ſecular or regular, is compoſed of the orders of St Anthony, St Paul, and St Macarius, who have each their monaſteries. Beſides the orders of prieſts, deacons, and ſubdeacons, the Cophts have likewiſe archimandrites, the dignity whereof they confer with all the prayers and ceremonies of a ſtrict ordination. This makes a conſiderable difference among the prieſts; and beſides the rank and authority it gives them with regard to the religious, it comprehends the degree and functions of archprieſts. By a cuſtom of 600 years ſtanding, if a prieſt elected biſhop be not already archimandrite, that dignity muſt be conferred on him before epiſcopal ordination. The ſecond perſon among the clergy, after the patriarch, is the titular patriarch of Jeruſalem, who alſo reſides at Cairo, becauſe of the few Cophts at Jeruſalem; he is, in effect, little more than the biſhop of Cairo: only he goes to Jeruſalem every Eaſter, and viſits ſome other places in Paleſtine near Egypt, which own his juriſdiction. To him belongs the government of the Cophtic church, during the vacancy of the patriarchal ſee.

To be elected patriarch, it is neceſſary the perſon have lived all his life in continence: it is he confers the biſhoprics. To be elected biſhop, the perſon muſt be in the celibate; or, if he have been married, it muſt not be above once. The prieſts and inferior miniſters are allowed to be married before ordination; but are not obliged to it, as Ludolphus erroneouſly obſerves. They have a great number of deacons, and even confer the dignity frequently on children. None but the loweſt rank among the people commence eccleſiaſtics; whence ariſes the exceſſive ignorance found among them: yet the reſpect of the laity towards the clergy is very extraordinary. Their office is longer than the Roman office, and never changes in any thing: they have three liturgies, which they vary occaſionally.

The monaſtic life is in great eſteem among the Cophts: to be admitted into it, there is always required the conſent of the biſhop. The religious Cophts make a vow of perpetual chaſtity; renounce the world, and live with great auſterity in deſerts: they are obliged to ſleep in their clothes and their girdle, on a mat ſtretched on the ground; and to proſtrate themſelves every evening 150 times, with their face and breaſt on the ground. They are all, both men and women, of the loweſt claſs of the people; and live on alms. The nunneries are properly hoſpitals; and few enter but widows reduced to beggary.

F. Roderic reduces the errors and opinions of the Cophts to the following heads: 1. That they put away their wives, and eſpouſe others while the firſt are living. 2. That they have ſeven ſacraments; viz. baptiſm, the euchariſt, confirmation, ordination, faith, faſting, and prayer. 3. That they deny the Holy Spirit to proceed from the Son. 4. That they only allow of three œcumenical councils; that of Nice, Conſtantinople, and Epheſus. 5. That they only allow of one nature, will, and operation, in Jeſus Chriſt, after the union of the humanity with the divinity. For their errors in diſcipline, they may be reduced, 1. To the practice of circumciſing their children before baptiſm, which has obtained among them from the 12th century. 2. To their ordaining deacons at five years of age.

3. To their allowing of marriage in the ſecond degree.
4. To their forbearing to eat blood: to which ſome add their belief of a baptiſm by fire, which they confer by applying a hot iron to their forehead or cheeks. —Others palliate theſe errors, and ſhow that many of them are rather abuſes of particular perſons than doctrines of the ſect. This ſeems to be the caſe with regard to their polygamy, eating of blood, marrying in the ſecond degree, and the baptiſm of fire: for circumciſion, it is not practiſed as a ceremony of religion, nor as of any divine appointment, but merely as a cuſtom which they derive from the Iſhmaelites; and which, perhaps, may have had its origin from a view to health and decency in thoſe hot countries.

The Cophts, at different times, have made ſeveral re-unions with the Latins; but always in appearance only, and under ſome neceſſity of their affairs. In the time of Pope Paul IV. a Syrian was diſpatched to Rome from the Patriarch of Alexandria, with letters to that pope; wherein he acknowledged his authority, and promiſed obedience; deſiring a perſon might be diſpatched to Alexandria, to treat about a re-union of his church to that of Rome: purſuant to which, Pius IV. ſucceſſor to Paul, choſe F. Roderic, a Jeſuit, whom he diſpatched in 1561, in quality of apoſtolical nuncio. But the Jeſuit, upon a conference with two Cophts deputed for that purpoſe by the patriarch, was made to know, that the titles of father of fathers, paſtor of paſtors, and maſter of all churches, which the patriarch had beſtowed on the pope in his letters, were no more than mere matters of civility and compliment; and that it was in this manner the patriarch uſed to write to his friends: they added, that ſince the council of Chalcedon, and the eſtabliſhment of ſeveral patriarchs independent of one another, each was chief and maſter of his own church. This was the anſwer the patriarch gave the pope, after he had received a ſum of money remitted to him from Rome, by the hands of the Venetian conſul.

COPHTIC, or **Coptic**, the language of the Cophts, the ancient language of the Egyptians, mixed with a great deal of Greek, the characters it is written in being all Greek. It has a form and conſtruction peculiar to itſelf: it has no inflections of the nouns or verbs; but expreſſes number, caſe, gender, perſon, mood, tenſe, and poſſeſſive pronouns, by letters and particles prefixed.

F. Kircher is the firſt who publiſhed a grammar and vocabulary of the Cophtic. There is not known any book extant in the Cophtic, except tranſlations of the Holy Scriptures, or of eccleſiaſtical offices; or others that have relation thereto, as dictionaries, &c.

The ancient Cophtic is now no longer found but in books; the language now uſed throughout the country is Arabic. The old Cophtic, which Kircher maintains to be a mother-tongue, and independent of all others, had been much altered by the Greek: for beſides that it has borrowed all its characters from the Greek, with a very little variation, a great number of the words are pure Greek. Voſſius, indeed, aſſerts, that there was no Cophtic language till after Egypt became ſubject to the Arabs. The language, according to him, is a mixture of Greek and Arabic: the very name thereof not being in the world till after the Arabs were maſters of the country. But this, M. Simon obſerves, proves nothing; except that what was anciently called *Egyptian*, has ſince by the Arabs been called *Cophtic*, by a corruption of ſpeech. There are, it is true, Arabic words in the Cophtic; yet this by no means proves but that there was a language before that time, either Cophtic or Egyptian. Pietro de la Valle obſerves, that the Cophts have entirely loſt their ancient tongue; that it is now no longer underſtood among them; that they have nothing extant therein but ſome ſacred books; and that they ſtill ſay maſs in it.

All their other books have been tranſlated into Arabic, which is their vulgar tongue; and this has occaſioned the originals to be loſt: it is added, that they rehearſe the epiſtles and goſpels in the maſs twice; once in Arabic and once in Cophtic. Indeed, if we believe F. Vanſleb, the Cophts ſay the maſs in Arabic, all but the epiſtles and goſpels, which they rehearſe both in that and Cophtic.

Cophtic Bible. See Bible.

Cophtic Liturgies are three; one attributed to Baſil, another to St Gregory, and the third to Cyril: they are tranſlated into Arabic for the uſe of the prieſts and people.

COPIATA, under the weſtern empire, a grave-digger. In the firſt ages of the church there were clerks deſtined for this employment. In the year 357, Conſtantine made a law in favour of the prieſts copiatæ, *i. e.* of thoſe who had the care of interments; whereby he exempts them from the luſtral contribution which all other traders paid. It was under him alſo that they firſt began to be called *copiatæ*, q. d. clerks deſtined for bodily labour, from κοπος, or κοπτω, *ſcindo, cædo, ferio*, "I cut, beat," &c. Before that time they were called *decani* and *lecticarii*; perhaps becauſe they were divided by decads or tens, each whereof had a bier or litter for the carriage of the dead bodies. Their place among the clerks was the next in order before the chantors.

COPING *of a wall*, the top or cover of a wall, made ſloping to carry off the water.

Coping over, in carpentry, a ſort of hanging over, not ſquare to its upright, but bevelling on its under ſide till it end in an edge.

COPIST, in diplomatic ſcience, ſignifies a tranſcriber or copier of deeds, books, &c.

COPPA, in law, a cop or cock of graſs, hay, or corn, divided into titheable portions; as the tenth cock, &c. This word in ſtrictneſs denotes the gathering or laying up the corn in cops or heaps, as the method is for barley or oats, &c. not bound up, that it may be the more fairly and juſtly tithed: and in Kent in England they ſtill retain the word, a *cop* or *cap* of hay, ſtraw, &c.

COPPEL. See Cupel.

COPPER, the fineſt of the imperfect metals, called by the alchemiſts *Venus*, on account of its facility of uniting with a great number of different metallic ſubſtances. Its colour, when pure, is pale red, and its ſpecific gravity from 8.7 to 9.3, which depends not only on its degree of purity, but alſo on its condenſation by hammering. The ſpecific gravity of Japan copper is to water as 9000 to 1000; but that of the Swediſh kinds only 8784 or 8843.---The colour, when clean, is very brilliant, but it is extremely liable to tarniſh. It has a diſagreeable ſmell, very perceptible on friction or on being heated: its taſte is ſtiptic and nauſeous, but leſs perceptible than that of iron. Its tenacity, ductility, and hardneſs, are very conſiderable, and its elaſticity ſuperior to that of any other metal except ſteel. From this laſt quality maſſes of the metal emit a loud and laſting ſound when ſtruck; and this more eſpecially when caſt into a proper form, viz. ſuch an one as may make the metal vibrate in the moſt ſimple manner poſſible. Thus, if caſt into the hollow form of a bell, without any cracks or imperfections, an uniform tone will be produced by it; or at leaſt the tones produced by a ſtroke will conſiſt of a ſingle predominant one, and of others that have an agreement with it. When broken by often bending backward and forward, it appears internally of a dull red colour without any brightneſs, and of a fine granulated texture; not ill reſembling, as Cramer obſerves, ſome kinds of earthen ware. It continues malleable in a red heat, and in this ſtate extends much more eaſily than when cold; but has not that valuable quality of iron, by which two pieces cohere together when heated to a great degree. In a heat far below ignition, the ſurface of a piece of poliſhed copper becomes covered with various ranges of priſmatic colours; the red of each order being neareſt to the end which has been moſt heated. Reduced to a fine powder, or even to filings, and thrown acroſs a flame, it produces blue or green colours, whence its uſe in fireworks. It requires a fierce heat to melt it; leſs, according to Mr Wedgewood, than gold or ſilver*, but more according to ſome other metallurgiſts.—It is remarkably impatient of moiſture when in a ſtate of fuſion, and the contact even of a very ſmall quantity of water will cauſe a vaſt maſs of melted metal to be thrown about with incredible violence, to the imminent danger not only of the byſtanders but even of the ſtrongeſt furnaces and buildings. Effects of this kind are ſaid to have been produced by ſo ſlight a cauſe as the workman ſpitting in a furnace full of melted copper.

Copper is found in the bowels of the earth in the following ſtates.

1
Native copper.

I. Native copper, having the red colour, the malleability, and all the other properties of the metal. It is diſtinguiſhed, ſays Mr Fourcroy, into two kinds; copper of the firſt formation, and copper of the ſecond formation or cementation. The copper of the firſt formation is diſperſed in laminæ or fibres, in gangue almoſt always quartzoſe; ſome of its cryſtals reſemble a kind of vegetation, but other ſpecimens are in maſſes or grains. Copper of cementation is commonly in grains or ſuperficial laminæ, on ſtones or on iron: this laſt appears to have been depoſited in waters containing vitriol of copper which has been precipitated by iron.

2
Where found.

Native copper is found in many places of Europe; particularly in various parts of Scotland, England, and Wales; at St Bell in Lyons; at Norberg in Sweden, and Newſol in Hungary. It it is alſo to be met with in ſeveral parts of America.—Mr Kirwan ſays, it is met with either of its own peculiar colour or blackiſh or grey; and that either in grains or in large ſhapeleſs ſolid lumps; in a foliated, capillary, or arboreſcent form, or cryſtallized in quadrangular pyramids, in or on clay, chiſtus, quartz, fluors zeolytes, &c. He accounts for its origin by ſuppoſing it to have been originally precipitated by iron from waters which held it in ſolution, which is the pureſt ſort: but in many caſes it could not have been produced in that manner; and then this ſort is never very pure, but mixed with gold, ſilver, or iron, or with ſulphur; which laſt combination is called *black copper*.

Native copper is found in very conſiderable quantities at Cape Lizard in Cornwall: it is formed into threads or branches, and lies in veins of ſome thickneſs, contained in blackiſh ſerpentine mixed with browniſh red, and covered externally with a greeniſh nephrites, partly adherent to it and partly looſe. Native copper, in large lumps, has alſo been found in the ſame rocks: but a more conſiderable quantity is found at Huel Virgin in the ſame county. Here it ſhoots into various branches and in various directions: the pieces ſeem to be formed of ſmall rhomboidal cryſtals interſperſed with quartz, the impreſſions of which are to be ſeen in the copper itſelf; from whence we might conclude that the quartz exiſted before the metal. Some of theſe lumps of native copper have been found in this ſpot that weighed from 20 to 30 pounds; and in the month of March 1785 there were no leſs than 28 millions of pounds of rich copper ore extracted from this mine. At a place called *Catarrach*, contiguous to Huel Virgin, ſome cryſtallized native copper has been found, with the tranſparent vitreous copper ore, to be afterwards mentioned, cryſtallized in octahedrons of a ruby colour; though the latter now begins to be very ſcarce. Near this place alſo a compact native copper is found in lumps of a ſpherical form; the copper either ſtill in its metallic form, or beginning to be transformed into red copper-glaſs, imbedded in decayed granite. Native copper of a tender and moſs-like form, united to vitreous ruby copper ore, cryſtallized in rhombs, is found in the clifts of the mountains compoſed of killas, near Poldry.—An indurated iron-clay has lately been found under the ſurface of the ſea in the Faro iſles, in which there is ſcattered a zeolite with native copper.

3
Different ores mineralized with fixed air.

II. Mineralized by fixed air; of which there are ſeveral varieties. 1. Red copper, or hepatic ore of copper. This is known by its red duſky colour, ſimilar to that of the ſcales beat off from copper by hammering. It is ſeldom met with, and then is generally mixed with native copper and mountain green. Sometimes it is cryſtallized in octahedrons or ſilky fibres, and is called *flowers of copper*. Mr Kirwan ſays, that it is ſometimes met with in a looſe form, and generally called *copper ochre;* but is uſually of a moderate hardneſs, though brittle; ſometimes cryſtallized and tranſparent, either in a capillary form, or in cubes, priſms, or pyramids; it effervesces with acids, and is found in Scotland, England, and Germany. According to Mr Fontana, 100 parts of it contain 73 of copper, 26 of fixed air, and one of water. Mr Kirwan diſtinguiſhes the hepatic ore as being of a brown colour. It "contains a variable proportion of iron or pyrites, and ſometimes ſulphurated copper; and hence affords from 20 to 50 *per cent.* of copper. It is often *irideſcent*" (we ſuppoſe ſhowing the colours of the rainbow). 2. Earthy copper, mountain-green, green chryſocolla or malachite. The laſt, according to Mr Kirwan, looks like green jaſper, but leſs hard, and does not ſtrike fire with ſteel, is of a radiated or equable texture, generally of an oval form, and the ſize of an egg, but ſometimes forming capillary filaments. Mutchenbrook fixes its ſpecific gravity from 3.5 to 3.994. It is ſometimes mixed with calcareous earth and gypſum. According to Mr Fontana, 100 parts of the pureſt ſort contain 75 of copper and 25 of aerial acid and water. Mountain green is generally found in a looſe and friable ſtate, rarely cryſtallized and indurated, often mixed with calcareous earth, iron, and ſome arſenic. An hundred parts of the pureſt kind contain 72 of copper, 22 of aerial acid, and 6 of water.

---

* See Chemiſtry, n° 104.

4 Mountain green.

A compact green copper ore, like malachite, mixed with grey copper ore, and likewiſe green velvet-like copper in the form of bunches, are found at Huel Virgin in Cornwall. At Carrarach, in the ſame county, is found alſo an amorphous green copper ore, on a decayed granite; and at St Menan, the ſame is found ſtratified betwixt quartz, and covered with a browniſh iron. Cronſtedt informs us, that both the green and blue colours of copper ores depend on a menſtruum, and therefore may be often edulcorated or waſhed away. In Saalfield they find alſo a ſort of green, ſomewhat indurated, calcareous ſubſtance, containing copper: this, when broken, looks fat, and ſomewhat ſhining; but, upon the whole, it reſembles a jaſper. It is there very improperly called a *green copper glaſs-ore*. Good copper is made of it; and, with a phlogiſtic ſubſtance, without being uſtulated, it forms a kind of bell-metal fit for being employed for that purpoſe.

5 Malachite.

The malachite, according to Mr Fourcroy, is frequently found in Siberia, compoſing beds, ſome of which repreſent nipples of various magnitudes. Some ſpecimens are compoſed of needles, converging towards a common centre. The grain of malachite is ſufficiently hard to take a fine poliſh, and is therefore formed into toys of different kinds; but as it is frequently porous and full of unequal cavities, the ſolid pieces of a certain ſize are reckoned valuable. The ſtrata in which it is found are often of different ſhades of green. The mountain green is a true ochre of copper, of a more or leſs deep green, not heavy, and unequally diſtributed on its gangue: it appears to be combined with the cretaceous acid. There are two varieties beſides the malachite, *viz.* the ſimple mountain green, and that which is cryſtallized, or the ſilky copper ore of China. It is common in the Hartz, and likewiſe in China. It is very pure, and cryſtallized in long ſilky bundles of conſiderable ſolidity. To theſe three ſtates, ſays Mr Fourcroy, we may add a beautiful green ſand, brought by M. Dombey from Peru, which appears to be a calx of this metal mixed with ſand, and containing a ſmall quantity of muriatic acid.

6 Mountain blue, or blue chryſocolla.

3. The third variety of this ſpecies is the mountain-blue, or blue chryſocolla. This, according to M. Fourcroy, is a calx of copper of a deep blue colour, ſometimes regularly formed in rhomboidal priſmatic cryſtals of a fine blue, in which caſe it is called azure of copper. “All theſe calces of copper (ſays he) appear to have been precipitated from vitriolic ſolutions of copper, by the intermedium of calcareous earths through which the waters have tranſuded. M. Sage conſiders theſe blue copper ores as combinations of copper with the volatile alkali; from which he aſſirms that they differ only in their degree of ſolubility; he likewiſe thinks that the malachites is produced from this blue, which he calls tranſparent azure copper ore; but moſt mineralogiſts are of a different opinion.” Mr Kirwan tells us, that 100 parts of this ore contain about 69 of copper, 29 of aerial acid, and 2 of water. Mr Morveau, in the Memoirs of the Academy of Dijon for 1782, has ſhown that the calces of copper ore determined to a blue rather than a green colour, by a greater proportion of phlogiſton.

7 Turquoiſe and lapis armenus.

III. Cupreous ſtones. Theſe are the *turquoiſe* and *lapis armenus*. The former of theſe is improperly called a ſtone, being the tooth of an animal penetrated by the blue calx of copper. It loſes its colour when heated; is opaque, of a lamellar texture, and ſuſceptible of a fine poliſh; its ſpecific gravity from 2.5 to 2.908; ſome are of a deep blue, ſome more white, and become deeper when heated. They are found in Perſia and in Languedoc in France; the copper may be extracted from them by diſtilled vinegar. Reaumur informs us, Mem. Par. 1715, that nitrous acid will not diſſolve the Perſian turquoiſe, though it will that of France. The lapis armenus has calcareous earth or gypſum for its baſe; whence it ſometimes efferveſces with acids and ſometimes not. It is uſed in painting, when ground to a fine powder, under the name of BICE. To theſe Mr Fourcroy adds “copper mineralized by the muriatic acid and united to clay.” This ore has been confounded with talc; and it was expoſed to ſale at Paris, in the year 1784, under the name of green mica. It conſiſts of ſmall beautifully green cryſtals, or ſmall brilliant ſcales. It was diſcovered by Mr Forſter in the mines of John Georgenſtadt; the green cupreous ſand of Peru already mentioned, perhaps belongs to the ſame claſs.

8 Copper mineralized by ſulphur.

IV. Copper mineralized by ſulphur, with ſcarce any iron, improperly called vitreous copper ore. This is of a deep violet grey, greeniſh brown, or liver colour; melting with a very gentle heat, ponderous, ſometimes flexible, and always yielding to the knife. When broken it appears of a bright golden colour. It is ſometimes found out in ſhapeleſs maſſes, ſometimes regularly cryſtallized; is much more fuſible than pure copper, and has a ſpecific gravity from 4.81 to 5.338. It is found in mines of other copper ores, in limeſtone, ſpar, quartz, mica, and clay: it is the richeſt of all the copper ores; affording from 80 to 90 *per cent.* of copper, 10 or 12 of ſulphur, and a ſmall proportion of iron.

9 With a large proportion of iron.

V. Copper mineralized by ſulphur with a large proportion of iron, azure copper ore; does not differ from the preceding but in the quantity of iron it contains, which ſometimes amounts to 50 *per cent.* It yields 50 or 60 pounds of copper *per* hundred, the reſt being ſulphur. The leſs iron this ore contains, the richer it is in copper; and it has by many been confounded with indurated mountain blue.

10 Yellow copper ore, or yellow pyrites.

VI. Copper mineralized by ſulphur, with much iron, the yellow copper ore, or yellow pyrites. The colour of this is yellow, or yellow mixed with red or green, or variegated like a pigeon's neck; it is inferior in hardneſs to the other pyrites, not readily giving fire with ſteel as they do. It is ſometimes found cryſtallized, and ſometimes in ſhapeleſs maſſes; its ſpecific gravity is about 4.16. It occurs both in ſeparate maſſes and embodied in ſtones, being the moſt common of all the copper ores. The cryſtallized kind affords leaſt metal, containing only from 4 to 8 *per cent.* the remainder being chiefly iron. It is generally reddiſh, and is in fact only a martial pyrites with a ſmall portion of copper; the greeniſh yellow contains moſt ſulphur, and from 15 to 20 *per cent.* of copper; the pure yellow contains moſt copper, viz. from 20 to 30 *per cent.* "The cupreous pyrites (ſays M. Fourcroy) often preſent very brilliant blue or violet colours at their ſurface, which are produced by the decompoſition of their principles: they are then called *chatoyant* ores of copper, or ores reſembling the peacock's tail: they commonly contain a large quantity of ſulphur, a ſmall quantity of iron, and are not rich in copper; ſuch are the ores of Derbyſhire in England, ſome of thoſe of St Bell in Lyons, and many ores of Alſatia, ſuch as thoſe of Caulenbach and Feldens."

11 Arſenical or grey copper ore. VII. Copper united to ſulphur, arſenic, iron, and a ſmall quantity of ſilver. This is called arſenical or grey copper ore, and is of a white, grey, or brown colour; of moderate hardneſs, very brittle, ſometimes cryſtallized, and often of an indeterminate figure. It is very difficult of fuſion, and more ponderous than the former. It contains from 35 to 60 *per cent.* of copper; the brown is the richeſt in copper; the white or grey contains moſt arſenic; and if the ſilver it contains exceed 1 or 2 *per cent.* it is called grey ſilver ore. It is found embodied in all ſorts of ſtones, and mixed with other copper ores, as well as with the ores of other metals.

A great variety of ſulphurated copper ores is to be met with in the mines of Cornwall, viz. a whitiſh-grey ore cryſtallized in ſmall triangular and quadrangular pyramids, with truncated points, is found along with the ſolid copper ore at Poldice and Dolcoth; but the richeſt are the ſolid grey ones found in various places; ſome of which may be cut with a knife like the ſoft vitreous ſilver ore. The moſt remarkable of the yellow ores is the ſtalactitical ore, of an hemiſpherical form, called *run-yellow-copper*, often variegated with different colours. A compact red glaſſy copper ore, covered with mountain green, or green copper, and with calciform copper of a vermillion red colour, is found in cryſtallized quartz, mixed with tender green mica. We alſo meet with an *olive-green-coloured* copper ore which is arſenical, and cryſtallized into tender ſpiculæ of about three lines long, ſtanding up ſtraight, either ſingle or faſciculated, or radiated, found on the granitical mountain at Carrarach. Theſe cryſtals melt before the blow-pipe with an arſenical ſmoke, and afterwards melt, forming a button of a grey colour, which, on being melted again with borax, ſoon produces a very pure copper. Another kind of arſenical cupreous cryſtals are likewiſe met with in the form of green cubes run together, with ſmooth and ſhining ſurfaces, upon grey copper ore, in a maſs of cryſtallized compact quartz, with various cryſtals in itſelf; and greatly reſembling ſmall cubes of fluor.

12 Brown or blendoſe copper ore. VIII. Copper mineralized by ſulphur and arſenic with zinc and iron; brown or blendoſe copper-ore. Mr Monnet found this ore only at Catherineberg in Bohemia; it is brown, granulated, and very hard, and contains from 18 to 30 *per cent.* of copper.

This kind of ore may be analyſed in the liquid way by ſolution in nitrous acid, and precipitation of the copper by iron. The iron and zinc are precipitated by the Pruſſian alkali; the precipitate is then calcined and rediſſolved in nitrous acid, and the ſolution evaporated to dryneſs. The iron being thus dephlogiſticated, becomes inſoluble in the nitrous acid, but the calx of zinc is rediſſolved, and again precipitated by the Pruſſian alkali. An hundred grains of this precipitate are equivalent to 20 of zinc in its metallic ſtate; and 100 grains of dephlogiſticated iron are equivalent to 73¼ of iron in its metallic ſtate.

13 Slaty copper ore. IX. Argillaceous ſchiſtoſe, or ſlaty copper ore, ſeems to conſiſt of the vitreous copper ore intimately combined with ſchiſtus, and not barely diſperſed through it in viſible particles: it is of a brown or black colour, lamellar texture, and very heavy; affording from 6 to 10 *per cent.* of copper, and is of difficult fuſion, unleſs limeſtone be added. It contains a little bitumen, calcareous earth, and iron.

14 Bituminous ore. X. Bituminous copper ore is a kind of pitcoal found in Sweden. It burns with little or no flame, but leaves aſhes from which copper is extracted.

15 Black copper ore. XI. Black copper ore, of the colour of pitch. Mr Gellert denominates it copper ore, in ſcoriæ: it is a reſiduum of the decompoſition of the yellow and grey copper ores which contain neither ſulphur nor arſenic, and approaches to the ſtate of malachite; it has a black ſhining appearance like pitch.

16 Antimonial ore. XII. Copper united to ſulphur and arſenic containing antimony, or antimonial copper ore, is mentioned by Mr Sage in his Elements of Mineralogy. It is grey, and bright in its fracture like antimony, and contains from 14 to 20 *per cent.* of metal.

XIII. Copper diſſolved by the vitriolic acid. In the year 1673, Dr Brown viſited a famous copper-mine at Hern-grundt, about ſeven Engliſh miles from Newſol in the Upper Hungary; and he informs us, that there he ſaw two ſprings, called the *Old* and *New Ziment*, which turned iron to copper, as it is vulgarly ſaid. But the caſe is, that the iron is diſſolved by the vitriolic acid of this ſpring-water, and the copper is precipitated in its metallic form in the place of the iron. It has been the cuſtom in Germany for ſome centuries to collect the copper contained in theſe waters, by filling with them ſome pits made purpoſely for this operation. Old iron is thrown in, and being diſſolved by the acid, is ſuſpended in the Water, whilſt the copper is precipitated: the mud being raked out, is melted afterwards in a furnace, and a very fine copper is produced: from 100 tons of iron, 84 and ſometimes 90 tons of fine copper is thus produced.

But although this method of obtaining copper has been long practiſed in Germany, yet it is but of late years, ſays Biſhop Watſon (p. 238. of the firſt volume of his Eſſays), that any ſucceſsful attempts of this kind have been made either in England or Ireland. In this laſt, at leaſt, it was quite owing to an accident. There are the very celebrated copper-mines at Arklow, in the county of Wicklow in Ireland; and from theſe mines iſſues a great quantity of water, ſtrongly impregnated with vitriol of copper. One of the workmen having accidentally left an iron ſhovel in this water, he found it ſome weeks after ſo incruſted with a coat of copper, that it was thought to be changed into copper.

The proprietors of the mines in purſuance of this hint, made proper pits and receptacles for the water; and have obtained, by means of ſoft iron bars put into them, ſuch quantities of copper, that theſe ſtreams are now of as much conſequence as the mines themſelves. One ton of iron produces near two tons of copper mud; and each ton of mud produces, when melted, 16 hundred weight of copper, which ſells for L. 10 Sterling a ton more than the copper which is fluxed from the ore.

There is in the iſle of Angleſey, on the coaſt of North Wales, a mountain called *Paris*, which abounds in copper-ore, the bed of ore being above 40 feet in thickneſs. The leſſees of this mine annually raiſe from ſix to ſeven thouſand tons of merchantable ore, and daily employ above 40 furnaces in ſmelting it. This ore contains a great quantity of ſulphur, which muſt be ſeparated by roaſting before it can be fluxed into copper. The phlogiſton, with part of the vitriolic acid, is diſperſed into the air by the force of the fire; another part of the acid attacks and diſſolves ſuch a quantity of the copper, that the water in which the roaſted ore is waſhed (by means of old iron immerſed in it according to the German method) produces great quantities of fine copper, ſo that the proprietors have there obtained in one year near 100 tons of the copper precipitated from this water.

If this water was afterwards evaporated, it would yield green vitriol or vitriolated iron, at nearly the rate of 200 tons of vitriol for each hundred ton of iron at leaſt; which, at the rate of L. 3 Sterling *per* ton, might perhaps produce very good profit to the undertakers, if any ſhould ſettle ſuch a manufacture there.

Beſides the celebrated copper-mines at Arklow in the county of Wicklow in Ireland, there are no leſs than ſeventeen different places in Britain in which copper-mines are found, as mentioned by Dr Campbell in the 2d vol. p. 44. of his *Political Survey of Britain*. Theſe are Cardiganſhire, Cheſhire, Cornwall, Cumberland, Derbyſhire, Devonſhire, Lancaſhire, Iſle of Man, Northumberland, Shropſhire, Somerſetſhire, Staffordſhire, Yorkſhire, Wales, Warwickſhire, Weſtmoreland, and North Britain: ſome that are worked at this time give ſuch large products of this metal, that the opening more copper-mines in the iſland would probably affect the copper-trade of Europe in a very conſiderable manner. The Ecton mine, in the eſtate of the Duke of Devonſhire, on the frontiers of Derbyſhire, but properly ſituated in the county of Staffordſhire, produces at leaſt 300 tons of copper *per annum*. That of the mountain called *Paris*, in the iſland of Angleſey, whoſe bed of ore is about 40 feet in thickneſs, produces about 1500 tons of copper in the year; and the copper-mines of Cornwall produce no leſs than 4000 tons in the ſame period. Mr Jars, who viſited theſe mines in the year 1770, found, upon calculation, that the annual produce of theſe mines amounted to L. 140,000 Sterling; and M. H. Klaproth, in his Obſervations on the Foſſils of Cornwall, juſt publiſhed (in 1787), aſſerts that this account is not an exaggerated one.

Copper is purified with leſs difficulty than iron; and its goodneſs is judged of by the bright redneſs of its colour.

17
Copper cryſtallizes when cooling.

The impurity of copper proceeds from the mixture of heterogeneous ſubſtances that are alloyed with it, on account of being naturally contained in the copper-ores. Iron and arſenic are the chief of theſe natural mixtures. The copper-ores of variegated colours, the white copper-ores, and generally thoſe mineralized by ſulphur, contain a greater proportion of iron; whilſt the blue and green copper-ores commonly produce a purer metal, being free, for the moſt part, of any conſiderable ferruginous mixture. The great aim, therefore, of the metallurgiſt muſt be directed to ſeparate theſe mixtures from the copper, beginning by the proper examination of the ore, and by aſcertaining the proportion of ſulphur that may be required to ſcorify the quantity of iron there contained. The ore ſhould always be roaſted by a ſlow fire, in a cloſe furnace, which contributes the beſt towards ſcorifying the ferruginous and heterogeneous mixtures; and the ſame operation muſt be repeated after the ſecond and third fuſion of the metal, till its grain becomes of an homogeneous fine texture. The mixture of ſulphureous pyrites in the fuſion of the metal contributes towards obtaining this object; if their quality be choſen according to the quantity of ſulphur wanting. But in the ſecond, third, and following operations, only pure ſulphur ſhould be added, to ſcorify the remainder of the iron that is ſtill intermixed with the copper. This ſhould be done when the metal is already well fuſed; covering it immediately with a proper quantity of charcoal, and ſeparating the ſcoria or droſs formed on the ſurface of the fuſed metal.

The copper extracted from thoſe mines Near Newſol, in Upper Hungary, is ſaid to be uſually melted 14 times before it is fit for uſe. Theſe are the greateſt copper mines in all Hungary. There are, however, other mines, whoſe copper requires far leſs fuſions to be well purified. The above was the proceſs of Mr Delius, director of the mines of Bannat near Temeſware in Hungary, propoſed by him to the imperial board of the Auſtrian mines.

18
Burns with a green flame when melted.

19
Particular deſcription of the cryſtals.

Pure copper allowed to cool ſlowly will form itſelf into regular cryſtallizations, which the Abbe Mongaz deſcribes as quadrangular pyramids, ſometimes ſolid, and ſometimes compoſed of other ſimilar ſmall pyramids laterally adhering. When heated it becomes coloured on its ſurface, nearly in the ſame manner as ſteel; the colours are blue, yellow, and laſtly violet; it does not melt but by a violent white heat, though much inferior to that which melts iron. When in a ſtate of fuſion it appears covered with a green flame, which the filings of the metal likewiſe produce when projected through flame; and hence are uſed in fireworks, as has been already remarked. The cryſtallization of the metal abovementioned is beſt perceived by ſuffering the metal to cool ſlowly; and after the ſurface is become congealed, the fluid portion being poured off, the remaining ſolid part is found to be cryſtallized in pyramids, which are more regular and large in proportion as the fuſion has been more complete and cooling more gradual. The pyramids, according to Fourcroy, are quadrangular, and appear to be formed of a great number of octahedrons inſerted into one another.

20 How the calx is obtained.

21 The ſcoriæ partly reduced without addition.

another. When heated with exceſs of air, this metal burns at its ſurface, and is converted into a calx of a dark red colour, in proportion as it abſorbs the baſe of the dephlogiſticated part of the atmoſphere. The calx may be eaſily obtained by heating a ball of copper red-hot, the form of which cauſes the calx to ſcale off; and the ſame effect takes place when red-hot copper is quenched in cold water; the ſeparation of the calx being promoted by the ſudden contraction of the metal. This calx is called the ſcales of copper, and may be further calcined till it becomes of a deep brown; after which, by violent heat, it may be melted into a blackiſh or deep reddiſh brown maſs. The ſcoriæ may partly be reduced without any additional phlogiſton; for the founders, who buy them of the copperſmiths, take no other trouble with them than that of throwing them into large crucibles on the melted copper, with which they incorporate by fuſion; and the ſame method is made uſe of to melt the filings. The calx of copper appears to poſſeſs ſome ſaline properties, but its nature has not yet been aſcertained.

22 Copper ruſts by expoſure to the air, but without any corroſion of its internal parts.

23 Patina, a name for the ruſt of copper on medals.

Copper calcines when expoſed to the air, and is converted into a green ruſt or calx, which is in ſome degree ſoluble in water, and communicates a taſte as well as pernicious qualities to it. It is remarkable, however, that this ruſt does not corrode the internal parts like that of iron, but is confined to the ſurface; and thus, inſtead of deſtroying, contributes, for a long time at leaſt, to the preſervation of the metal. This is particularly obſervable in the antique medals and ſtatues, which are very well preſerved under a covering of ruſt. The antiquarians call this cruſt *patina*, and put a high value upon the pieces of antiquity covered with it; but the Italians and others have got a method of imitating this cruſt, and thus there is great danger of being deceived.

24 Qualities of this metal when taken into the human body.

Copper, when taken into the human body, acts as a violent emetic, and has been generally accounted poiſonous, though lately received with ſome applauſe into the materia medica as a tonic. The pernicious qualities, however, and very diſagreeable taſte which it certainly communicates on ſome occaſions, render it highly neceſſary to obſerve ſome cautions in the uſe of this metal, of which ſo many kitchen utenſils are made. Beſides an exact attention to cleanlineſs, it is altogether improper to let any fluid remain in a copper veſſel till it be cold; for copper is much more calcinable in the cold than when heated. Mr Fourcroy explains this by ſuppoſing the calcination to be produced by water in a ſtate of extreme diviſion: as long, therefore, as the fluid is boiling and the veſſel hot, the aqueous vapour does not adhere to its ſurface; but when the veſſel is cold, the drops of water which adhere to its ſides calcine it, and reduce it to a green calx. The air and the cretaceous acid (fixed air,) he ſays, alſo contribute greatly to this calcination: for by diſtilling the ruſt of copper fixed air has been obtained.

25 Of the tinning of copper.

In order to prevent the pernicious effects of copper, the veſſels made of it are uſually covered with tin in the inſide. To tin copper-veſſels, they are firſt ſcraped clean and bright; after which they are rubbed with ſal ammoniac to clean them more perfectly. They are then heated and ſprinkled with powdered reſin, which prevents the ſurface of the copper from being calcined; after which the melted tin is poured on and ſpread about. It is, however, juſtly complained, that the tinning of copper-veſſels is not ſufficient to defend them from the action of the air, moiſture, and ſaline ſubſtances: becauſe theſe veſſels, even when well tinned, are obſerved to be ſubject to ruſt. This might poſſibly be remedied by a thicker covering of tin; and a manufacture of this kind was ſome time ago eſtabliſhed at Edinburgh, though it does not appear to have much attracted the notice of the public; which, however, is no objection to the uſefulneſs of the invention. The method employed was to make the ſurface of the copper very rough, with a machine contrived for that purpoſe, and the tin put upon it in this ſituation; after which the copper was hammered ſmooth as before. Mr Fourcroy objects to this thicker covering of tin, that there "is reaſon to fear that a degree of heat ſuperior to that of boiling water, to which theſe veſſels are often expoſed, would melt the tin and leave the ſurface of the copper uncovered." This objection is ſurely void of foundation: for as long as there remains any liquid in the veſſel, the tin will not melt though the heat were applied to it directly without any intervention of copper; and if a dry heat were applied, a thin covering of tin would be ſtill leſs able to reſiſt it than a thick one. Our author, however, obſerves, that to prevent this accident the tin may be alloyed with iron, ſilver, or platina, to diminiſh its fuſibility, and render it capable of being applied in thicker ſtrata on the copper. Alloys of this kind, he tells us, are already uſed in ſeveral manufactures.

26 Very ſmall quantity of tin required for this purpoſe.

27 Beſt kind of tin ought to be employed.

28 Zinc recommended inſtead of tin.

The very ſmall quantity of tin required to cover the ſurface of the copper is ſurpriſing; a veſſel of 9 inches in diameter and 3¼ inches in depth, being found to gain no more than 21 grains by this operation. This ſmall quantity is nevertheleſs ſufficient to prevent the dangers which might ariſe from the uſe of copper-veſſels, provided care be taken not to allow ſubſtances capable of diſſolving the tin to remain too long in them; but more eſpecially that the tin be frequently renewed, as the friction, heat, and action of ſpoons, with which the included ſubſtances are ſtirred, very ſoon deſtroy it. There is likewiſe another cauſe of apprehenſion, according to our author, viz. that the tin is often alloyed with lead, even to the quantity of one-fourth of its weight; in which caſe the latter may exert its miſchevious influence, eſpecially as it is known that lead is eaſily ſoluble in fatty ſubſtances. To prevent this ſophiſtication, he is of opinion that government ſhould take ſufficient care that the braziers be not deceived in the tin they purchaſe, and that they may not employ any but the Malacca or Banca tin, in the ſtate it is received from the Eaſt Indies, without having been alloyed or melted by the pewterers. A better method, however, ſeems to be that propoſed by M. Folie of Rouen, to uſe veſſels of forged iron covered over on the inſide with zinc, which, he ſays, have already been uſed with advantage by certain perſons; and it were to be wiſhed that its uſe might become more general.

29 Various mixtures of copper with other metals.

Copper is alſo uſed in mixture with other metals, particularly tin and zinc, in enamel-painting, dyeing, &c. Mixed with tin in conſiderable quantity, it produces BELL-METAL; with a ſmaller proportion BRONZE; with zinc it forms BRASS, PINCHBECK, or SIMILOR, MANHEIM GOLD, &c. according to the proportion; it being always obſervable, that the compounds moſt nearly reſembling gold in colour have the leaſt ductility and are moſt brittle. See theſe articles, and CHEMISTRY-*Index*.

30 Of its effects as a poiſon.

With regard to the poiſonous qualities of copper when taken into the body, much leſs danger ſeems to ariſe than from thoſe of arſenic, on account of its eaſy ſolubility; nor indeed have we met with any well authenticated inſtance of a perſon who has died in conſequence of ſwallowing even verdigriſe itſelf. In one caſe, where an unlucky boy had ſwallowed ſome bits of this ſubſtance thrown out of a chemiſt's laboratory, the ſymptoms were only violent ſickneſs and vomiting, from which he recovered by drinking warm water largely; and probably nothing elſe would be requiſite in any caſe, though Mr Fourcroy adviſes *emetics*, abundance of water, liver of ſulphur, alkalis, &c. The uſe of emetics in ſuch a caſe, however, ſeems altogether ſuperfluous; ſince verdigriſe, in the quantity of a grain or a grain and a half, has been ordered by ſome medical writers in the caſe of poiſon ſwallowed otherwiſe, as the emetic moſt quick in its operation that could be thought of.

COPPERAS, a name given to the factitious green vitriol. See CHEMISTRY-*Index*.

COPPERPLATE. See ENGRAVING.

COPPICE, or COPSE, a little wood, conſiſting of under-woods, or ſuch as may be raiſed either by ſowing or planting.

COPTOS (anc. geog.), a famous trading town of the Thebais, inhabited by Egyptians and Arabs, ſome diſtance from the Nile; others place it in a ſmall iſland in the Nile, on which, however, it had a port. Here Iſis, on hearing of the death of Oſiris, cut one of her locks and put on mourning; and hence the name *Coptos*, ſignifying privation. A proof this of the antiquity of the place. And for this reaſon the Iſiaci, or prieſts of Iſis, were bald, according to Juvenal.

COPULATION, the act of generation, or the congreſs of the male and female, otherwiſe called *coition*. See GENERATION.

COPY, in a law ſenſe, a tranſcript of a writing or inſtrument, made for the uſe and ſatisfaction of ſome of the parties concerned, or in order to preſerve the memory thereof.

COPY is alſo uſed for an imitation of any original work; particularly a painting, draught, figure, &c.

COPY, among printers, denotes the manuſcript or original of a book given to print from.

Copy-Hold, a tenure for which a tenant has nothing to ſhow but the copy of the rolls made by the ſteward of the lord's court.

It is called a baſe tenure; becauſe the tenant holds the land at the will of the lord. However, it is not ſimply at the will of the lord, but according to the cuſtom of the manor by which ſuch eſtate is deſcendible, and the tenant's heirs may inherit it; and a copy-holder, ſo long as he does his ſervices, and does not break the cuſtom, cannot be ejected by the lord; and if he be, he ſhall have treſpaſs againſt him. See the articles TENURE and VILLENAGE.

Copy-Holder, one who is admitted tenant of lands or tenements within a manor, which time out of mind, by uſe and cuſtom of the manor, have been demiſable, and demiſed to ſuch as will take them in fee-ſimple or fee-tail, for life, years, or at will, according to the cuſtom of the manor by copy of court-roll; but is generally where the tenant has ſuch eſtate either in fee or for three lives.

Copy-Right, the right which an author may be ſuppoſed to have in his own original literary compoſitions; ſo that no other perſon, without his leave, may publiſh or make profit of the copies. When a man by the exertion of his rational powers has produced an original work, he has clearly a right to diſpoſe of that identical work, as he pleaſes; and any attempt to take it from him, or vary the diſpoſition he has made of it, is an invaſion of his right of property. Now the identity of a literary compoſition conſiſts intirely in the ſentiment and the language; the ſame conceptions, clothed in the ſame words, muſt neceſſarily be the ſame compoſition: and whatever method be taken of conveying that compoſition to the ear, or to the eye of another, by recital, by writing, or by printing, in any number of copies, or at any period of time, it is always the identical work of the author which is ſo conveyed; and no other man (it hath been thought) can have a right to convey or transfer it without his conſent, either tacitly or expreſsly given. This conſent may perhaps be tacitly given when an author permits his work to be publiſhed without any reſerve of right, and without ſtamping on it any marks of ownerſhip: it is then a preſent to the public, like the building of a church, or the laying out a new highway: but in caſe of a bargain for a ſingle impreſſion, or a total ſale or gift of the copyright; in the one caſe the reverſion hath been thought to continue in the original proprietor; in the other the whole property, with its excluſive rights, to be perpetually transferred to the grantee. On the other hand, it is urged, that though the excluſive right of the manuſcript and all which it contains, belongs undoubtedly to the owner before it is printed or publiſhed; yet from the inſtant of publication, the excluſive right of an author or his aſſigns to the ſole communication of his ideas immediately vaniſhes and evaporates; as being a right of too ſubtile and unſubſtantial a nature to become the ſubject of property at the common law, and only capable of being guarded by poſitive ſtatute and ſpecial proviſions of the magiſtrate.

The Roman law adjudged, that if one man wrote any thing, though ever ſo elegantly, on the paper or parchment of another, the writing ſhould belong to the original owner of the materials on which it was written: meaning certainly nothing more thereby than the mere mechanical operation of writing, for which it directed the ſcribe to receive a ſatisfaction; eſpecially as, in works of genius and invention, ſuch as a picture painted on another man's canvas, the ſame law gave the canvas to the painter. We find no other mention in the law of any property in the works of the underſtanding, though the ſale of literary copies, for the purpoſes of recital or multiplication, is certainly as ancient as the times of Terence, Martial, and Statius. Neither in Britain hath there been (till very lately) any final determination upon the right of authors at the common law. It was determined in the caſe *Miller v. Taylor* in *B. R. Paſch.* 9 Geo. III. 1769, that an excluſive copy-right in authors ſubſiſted by the common law. But afterwards, in the caſe of *Donaldſon v. Becket*, before the houſe of lords, which was finally determined 22d February 1774, it was held that no copy-right ſubſiſts in authors, after the expiration of the ſeveral terms created by the ſtatute 8 Ann c. 19. This ſtatute declares, that the author and his aſſigns ſhall have the whole liberty of printing and reprinting his works for the term of 14 years, and no longer; and alſo protects that property by additional penalties and forfeitures; directing farther, that if at the end of that term the author himſelf be living, the right ſhall then return to him for another term of the ſame duration.——Copy Right in this Country is put on a ſimilar footing, by Act of Congreſs of May 31, 1790.

COQUES (Gonzalo), an eſteemed painter of portraits and converſations, was born at Antwerp in 1618, and was a diſciple of the old David Ryckaert; under whoſe direction he applied himſelf diligently to cultivate thoſe promiſing talents which he poſſeſſed; not only by practiſing the beſt rules adminiſtered to him by his inſtructor, but alſo by ſtudying nature with ſingular attention.—He was a great admirer of Vandyck; and fixing on the manner of that great artiſt as his model, had the happineſs of ſo far ſucceeding, that next to him he was eſteemed equal to any other painter of his time.—In the ſchool of Ryckaert he had been accuſtomed to paint converſations, and he frequently compoſed ſubjects of fancy like Teniers, Oſtade, and his maſter; and by that habit, he introduced a very agreeable ſtyle of portrait painting, in a kind of hiſtorical converſations, which ſeemed much more acceptable to perſons of taſte than the general manner of painting portraits, and procured him great reputation and riches. In that way he compoſed ſeveral fine pictures for king Charles I. and likewiſe ſeveral for the archduke Leopold, and the prince of Orange; which latter prince, as a mark of reſpect, preſented Coques with a rich gold chain, and a gold medal on which the buſt of that prince was impreſſed. He died in 1684.—He had an excellent pencil; his portraits were well deſigned, with eaſy natural attitudes; he diſpoſed the figures in his compoſition ſo as to avoid confuſion or embarraſſment; he gave an extraordinary clearneſs of colour to his heads and hands; and his touch was free, firm, and broad, a circumſtance very uncommon in works of a ſmall ſize.

COQUIMBO, a port-town of Chili, in South America, ſituated at the mouth of a river of the ſame name, which diſcharges itſelf into the Pacific ocean. W. Long. 75. 10. S. Lat. 30. 0.

COR CAROLI, in aſtronomy, an extraconſtellated ſtar in the northern hemiſphere, ſituated between the *coma Berenices*, and *urſa major;* ſo called by Dr Halley in honour of king Charles.

Cor Hydræ, a fixed ſtar of the firſt magnitude, in the conſtellation of hydra.

Cor Leonis, in aſtronomy, a fixed ſtar of the firſt magnitude, in the conſtellation Leo.

Cor-meille, a noted plant, common in the Highlands of Scotland. Its roots dried are the ſupport of the highlanders in long journeys, amidſt the barren hills deſtitute of ſupports of life; and a ſmall quantity, like the alimentary powders, will for a long time repel the attacks of hunger. Infuſed in liquor it is an agreeable beverage, and like the Nepenthe of the Greeks, exhilarates the mind. From the ſimilitude of ſound in the name, it ſeems to be the ſame with chara, the root diſcovered by the ſoldiers of Cæſar at Dyrrhachium, which ſteeped in milk was ſuch a relief to the famiſhed army. Or we may reaſonably believe it to have been the Caledonian food deſcribed by Dio, of which the quantity of a bean would prevent both hunger and thirſt: and this, ſays the hiſtorian, they have ready for all occaſions.

CORACIAS, the ROLLER, in ornithology; a genus of birds of the order of picæ, the characters of which are: The bill is ſtraight, bending towards the tip, with the edges cultrated: the noſtrils are narrow and naked; the legs for the moſt part ſhort; the toes placed three before and one behind, and divided to their origin. This genus is not confined to one ſpot of the globe, as one or other of the different ſpecies may be met with in all the four quarters of it.

1. The garrula, or garrulous roller, is about the ſize of a jay; the bill black, and at the baſe beſet with briſtles, but do not cover the noſtrils: the head, neck, breaſt, and belly, are of a light bluiſh green; back and ſcapulars, reddiſh brown; coverts on the ridge of the wing rich blue, beneath them pale green; upper part and tips of the quills duſky; the lower parts of a fine deep blue; rump, of this laſt colour: tail forked, of a light blue; the outer feather tipped with black above, and beneath with deep blue, as is the caſe with ſuch part of the quill feathers as is black above; the other tail feathers are dull green: the legs are ſhort, and of a dirty yellow. Mr Pennant obſerves that theſe birds are frequent in ſeveral parts of Europe, in moſt parts of which it is a bird of paſſage. Mention is made of them in Sweden and Denmark on the one hand, and as far as Africa on the other; not that they are found in all the parts between, nor in the ſame plenty. Willoughby tells us, that in Germany, Sicily, and Malta, they are ſo common as to be ſold in the markets, and in poulterers ſhops. Adanſon ſays, that it "comes to reſide for ſome months of the ſummer in the ſouthern parts of Europe, and goes back to ſpend the remainder of the year in Senegal," having ſhot one on board the ſhip, on its paſſage, in April. Friſch obſerves, that it makes its neſt in woods, where there is birch; that it does not come to its colour till the ſecond year; flies in troops in autumn; often ſeen in tilled grounds, with rooks and other birds, ſearching for worms, ſmall ſeeds, and roots. Its fleſh taſtes like that of a turtle. It is ſaid alſo ſometimes to make the neſt in holes in the ground, in one of which neſts two eggs were found. The neſt is generally filthy, from the young evacuating their excrements therein; whence by ſome it was ſaid to make the neſt of excrements. We are told in the Britiſh Zoology, that it has been twice ſhot in England, and is remarkable for making a chattering noiſe, whence its name.

Plate CXLIX.

2. The blue-ſtriped roller is in length eight inches; the bill three quarters of an inch long, bent at the tip, and of a black colour: the irides are red: the general colour of the plumage deep blue-black, daſhed with ſtreaks of greeniſh blue: the tail and legs are black. It inhabits New Caledonia.

3. The Chineſe roller is of the ſize of a jay: The bill and irides are red: the head, hind part of the neck, back, rump, and upper tail coverts, are green: through the eyes on each ſide is a black ſtripe: the under parts of the body, from chin to vent, are yellowiſh white, tinged with green; but the thighs are grey: the wing coverts are olive brown; quills the ſame, with a mixture of cheſnut in ſome; and others, neareſt the body, tipped with white: the tail is five inches in length, and wedge-ſhaped, the outer feathers ſhortening by degrees like that of a magpie; all of them are more or leſs green, verging to black near the ends; the tips of all are white: the legs and claws are of a pale red, and longer than in other rollers. It inhabits China, and is called at Canton *Sauta-hoang*. It is not very common.

There are 13 other ſpecies enumerated by ornithologiſts; though many of them doubtful, and ſuppoſed to be only varieties.

CORACO-BRACHIALIS, in anatomy, the name of a muſcle in the arm, ſerving to raiſe it upwards.

CORACOIDES, in anatomy, a ſmall ſharp proceſs of the ſcapula. See ANATOMY, n° 47.

CORACOMANTES, in antiquity, perſons who foretold events from their obſervations on crows.

CORALLINA, or CORAL, in zoology, a genus belonging to the order of vermes zoophyta. The trunk is radicated, jointed, and calcareous. The ſpecies are eight, diſtinguiſhed by the form of their branches, and are found in the ocean adhering to ſtones, bones, ſhells, &c. The corals were formerly believed to be vegetable ſubſtances hardened by the air; but are now known to be compoſed of congeries of animals, which are even endued with the faculty of moving ſpontaneouſly.

The iſlands in the South-ſea are moſtly coral rocks covered over with earth. The little creatures, which have ſcarce ſenſation enough to diſtinguiſh them from plants, build up a rocky ſtructure from the bottom of that ſea, too deep to be meaſured by human art, till it reaches the ſurface. Some of theſe coralline iſlands appear to be of a much older date than others; particularly the Friendly iſlands: and it is probable that as theſe ſubmarine works are continually going on, new iſlands may by that means frequently be produced.

M. de Peyſſonnel of Marſeilles, in conſequence of a ſeries of experiments and obſervations from about the year 1720 to 1750, ſeems to have been the firſt who threw a proper light upon the nature and production of coral and ſimilar marine ſubſtances. Thoſe bodies, which the count de Marſigli imagined to be flowers, this ingenious naturaliſt diſcovered to be inſects inhabiting the coral; for upon taking branches of it out of the water, the flowers, which proceeded from a number of white points anſwering to the holes that pierced the bark, and the radiation of which reſembled the flower of the olive-tree, entered into the bark and diſappeared; but upon being again reſtored to the water, they were ſome hours after perceptible. Theſe flowers ſpread on white paper loſt their tranſparency, and became red as they dried. The holes in the bark correſpond to ſmall cavities upon the ſubſtance of the coral; and when the bark is removed, there may be ſeen an infinite quantity of little tubes connecting the bark with the inner ſubſtance, beſides a great number of ſmall glands adhering to them; and from theſe tubes and glands the milky juice of coral iſſues forth: the holes in the bark are the openings through which the inſects that form theſe ſubſtances for their habitation come forth; and thoſe cavities which are partly in the bark and partly in the ſubſtance, are the cells which they inhabit. The organs of the animal are contained in the tubes, and the glandules are the extremities of its feet, and the milky liquor is the blood and juice of the animal, which are more or leſs abundant in proportion to its health and vigour. When the inſects are dead, they corrupt, and communicate to the water the ſmell of putrid fiſh. This juice or liquor runs along the furrows perceived upon the proper ſubſtance or body of coral, and ſtopping by little and little becomes fixed and hard, and is changed into ſtone: and being ſtopped in the bark, cauſes the coral to increaſe proportionably and in every direction. In forming coral, and other marine productions of this claſs, the animal labours like thoſe of the teſtaceous kind, each according to his ſpecies; and their productions vary according to their ſeveral forms, magnitudes, and colours.

The coral inſect, or polype, M. Peyſſonnel obſerves, expands itſelf in water, and contracts itſelf in air, or when it is touched with the hand in water, or acid liquors are poured upon it: and he actually ſaw theſe inſects move their claws or legs, and expand themſelves, when the ſea-water containing coral was placed near the fire, and keep them in their expanded ſtate when ſeparated from the coral in boiling water. Broken branches of coral have been obſerved to faſten themſelves to other branches, and have continued to grow; and this is the caſe when they are connected with detached pieces of rock and other ſubſtances, from which no nouriſhment could be derived. The coral inſects in their cells, not having been injured, continue their operations; and as they draw no nouriſhment from the ſtone of the coral, they are able to increaſe in a detached and ſeparate ſtate. Coral was found to be equally red in the ſea as out of it; and it was more ſhining when juſt taken out of the water than even when it is poliſhed; and the bark by being dried becomes ſomewhat pale. M. Peyſſonnel found that it grows in different directions, ſometimes perpendicularly downwards, ſometimes horizontally, and ſometimes upwards; and in the caverns of the ſea, open to every expoſure.

This ſyſtem was little regarded, though firſt communicated to the Academy of Sciences at Paris in 1727, till Mr Trembley's diſcovery of the freſh-water polype; but ſince that time it has been confirmed by the obſervations of M. Bernard de Juſſieu on the ſea-coaſts of Normandy, and thoſe of M. de Reaumur near Rochelle. M. Donati of Turin has alſo adopted the ſame hypotheſis, viz. that coral is a maſs of animals of the polype kind; and inſtead of repreſenting the polype beds and cells which they contain as the work of polypes, he thinks it more juſt to ſay, that coral and other coralline bodies have the ſame relation to the polypes united to them, that there is between the ſhell of a ſnail and the ſnail itſelf, or the bones of an animal and the animal itſelf.

The ſame ſyſtem has alſo been excellently illuſtrated and eſtabliſhed by Mr Ellis, in anſwer to the objections of Dr Baſter of Zealand, and Dr Pallas of Berlin, who ſtill refer corallines to the vegetable kingdom.

There are properly but three kinds of coral; red, white, and black: the black is the rareſt, and moſt eſteemed; but the red was formerly uſed in medicine. It muſt be choſen thick, ſmooth, and ſhining, and of a beautiful red, not covered with any tartareous matter. However, this ſubſtance is now ſcarce ever preſcribed by any intelligent practitioner.

When coral is newly taken up out of the ſea, the ſmall protuberances on its ſurface are ſoft, and yield, on being preſſed, a milky juice which efferveſces with acids. The cortical part with which the coral is all over covered is not near ſo compact as the internal, and may eaſily be taken off whilſt freſh; and from this part it is uſually freed before it comes to the market. The greateſt coral trade is in Genoa and Leghorn. The ſmall ſprigs unfit for ornamental uſes are in the ſhops levigated into a ſubtile powder; which, however, has no medicinal virtues ſuperior to the common teſtacea. Coral is not unfrequently imitated by artificial compoſitions, ſome of which are made to reſemble it exactly; but the abuſe may be diſcovered by fire, the counterfeit not affording the alkaline earth which is afforded by the genuine coral. The colouring ingredients in the artificial coral are cinnabar and minium, both of which are eaſily diſcovered. The natural coral ſeems to receive its colour from iron; for ſpirit of vitriol acquires from it a ferruginous taſte; and on calcining the coral, ſome particles are found among the aſhes that are attracted by the magnet. Sixteen ounces of coral, according to Neumann, when diſtilled in an open fire, yield about ſix ſcruples and an half of volatile alkaline ſpirit, with two or three grains of an empyreumatic oil: from the caput mortuum calcined, five ſcruples and a half of fixed ſalt may be extracted. In former times, many extraordinary virtues were expected from this ſubſtance, on account of its fine red colour; and therefore a great number of methods were tried to extract this colour by means of ſpirit of wine. None of theſe, however, ſucceeded. A red colour was indeed ſometimes obtained, but it turned out the ſame whether any coral was uſed in the operation or not. In ſome of theſe proceſſes, however, the coral loſes its colour. One method of making the tincture is by diſſolving a pound of ſugar in a little water, and then adding half a pound of wax. A pound of coral boiled in this mixture loſes its redneſs, but is found to be unaltered in other reſpects. In order to prepare the tincture, the wax and ſugar muſt be diſſolved in ſpirit of wine.

CORAL Fishery. Red coral is found in the Mediterranean, on the ſhores of Provence, from Cape de la Couronne to that of St Tropez; about the iſles of Majorca and Minorca; on the ſouth of Sicily; on the coaſts of Africa; and, laſtly, in the Ethiopic ocean, about cape Negro. The divers ſay, that the little branches are found only in the caverns whoſe ſituation is parallel to the earth's ſurface, and open to the ſouth. The manner of fiſhing being nearly the ſame where ever coral is found, it will ſuffice to inſtance the method uſed at the baſtion of France, under the direction of the company eſtabliſhed at Marſeilles for that fiſhery. Seven or eight men go in a boat commanded by the patron or proprietor; and when the net is thrown by the caſter, the reſt work the veſſel, and help to draw the net in. The net is compoſed of two rafters of wood tied croſs-wiſe, with leads fixed to them: to theſe they faſten a quantity of hemp twiſted looſely round, and intermingled with ſome large netting. This inſtrument is let down where they think there is coral, and pulled up again when the coral is ſtrongly intangled in the hemp and netting. For this purpoſe, ſix boats are ſometimes required; and if in hauling in, the rope happens to break, the fiſhermen run the hazard of being loſt. Before the fiſhers go to ſea, they agree for the price of the coral, which is ſometimes more, ſometimes leſs, a pound; and they engage, on pain of corporal puniſhment, that neither they nor their crew ſhall embezzle any, but deliver the whole to the proprietors. When the fiſhery is ended, which amounts one year with another to twenty-five quintals for each boat, it is divided into thirteen parts; of which the proprietor hath four, the caſters two, and the other ſix men one each, the thirteenth belongs to the company for payment of the boat furniſhed them.

Coral-Stone, a name for a kind of red and white agate which breaks in veins, and is found in Italy and ſome parts of Saxony. That of Rochlitz in Saxony is the moſt celebrated, and is found in globules which have a kind of cruſt about them.

CORALLINES, in natural hiſtory, were formerly reckoned a genus of plants, and Mr Tournefort enumerates 36 ſpecies of them; but in the Linnæan ſyſtem they belong to the claſs of zoophytes, and are defined by modern naturaliſts to be ſubmarine plant-like bodies, that conſiſt of many ſlender finely divided and jointed branches, reſembling ſome ſpecies of moſs; or animals growing in the form of plants, having their ſtems fixed to other bodies: theſe ſtems are compoſed of capillary tubes, whoſe extremities paſs through a calcareous cruſt, and open into pores on the ſurface. The branches are often jointed, and always ſubdivided into ſmaller branches, which are either looſe and unconnected, or joined as if they were glued together. They are diſtinguiſhed from plants by their texture and hardneſs: they alſo yield in diſtillation a conſiderable quantity of volatile ſalt; and their ſmell, in burning, reſembles that of burnt horns and other animal ſubſtances. Many of the corallines ſeem to conſiſt of a ſingle tube, containing a ſingle parent animal. Every branch emitted contains an offſpring of this parent dependant upon it, and yet capable of producing its like in the emiſſion of a new branch. Others conſiſt of many ſuch tubes united, riſing up together, and encircling the deſerted tubes of their progenitors, whoſe exuviæ become the ſubſtratum of a riſing generation. Mr Ellis diſtributes corallines into the *veſiculated*, *tubular*, *celliferous*, and *articulated* kinds.

Veſiculated corallines are diſtinguiſhed by their horny hollow ramifications: moſt of them are furniſhed with little denticles on their branches, like leaves on moſſes; and at certain ſeaſons of the year they are furniſhed with ſmall bodies like bladders, proceeding from their ſtems and branches, and differing in form according to the different ſpecies. Their colour, when dry, is of a yellowiſh or pale brown, and their nature is elaſtic. They are found adhering to rocks, ſhells, and fucuſes, by ſmall root-like tubes: they recover their form in water, after having been dried; and when put into vinegar, they cauſe no efferveſcence. See Plate CXLVII. fig. 1. where *a* repreſents the ſea-tamariſk in its natural ſize, and A in which the denticles are magnified. Fig. 2. *b*, B, is the ſea-cypreſs; fig. 3. *c d*, CD, the ſmall climbing coralline with well ſhaped cups.

Tubular corallines are compoſed of a number of ſimple tubes, growing up nearly together; or of ſuch branched ones as have neither denticles nor veſicles. Theſe are horny and elaſtic like the former, and recover their original form in water. Some of them appear wrinkled like the wind-pipe, and others like the inteſtines of ſmall animals. See fig. 4, E.

Celliferous corallines are thoſe which appear, when magnified, to be fine thin cells, the habitations of ſmall animals connected together, and diſpoſed in a variety of elegant forms like branches. Theſe efferveſce with acids. See fig. 5, F f, with part (G H) magnified.

Plate CXLVIII.

Articulated corallines conſiſt of ſhort pieces of a ſtony or cretaceous brittle matter, whoſe ſurface is covered with pores or cells, which are joined by a tough, membranous, flexile ſubſtance, compoſed of many ſmall tubes of the like nature compacted together. The ſtony part is ſoluble in vinegar, and the other part remains entire. *a*, A, (fig. 6.) is the coralline of the ſhops. It is fixed to rocks and ſhells by ſtony joints, which, as they riſe, are united to others by extremely fine and ſlender tubes: Theſe may be diſcovered by a good eye, or a common magnifier. As the ſtems extend themſelves, they become pennated by ſide-branches which come out oppoſite to each other, and are jointed in the ſame manner: the joints of this ſpecies are like the upper part of an inverted cone, but a little compreſſed: The whole ſurface is covered over with very minute circular-ſhaped cells like pores; ſee B, and B 1, where they are higher magnified. B 2, ſhows a croſs ſection highly magnified. If a branch of this coralline is put into vinegar, theſe cells are diſſolved with the whole cretaceous ſurface; inſtead of which there appear rows of minute ramifications, which ſeem to have communicated with each of theſe cells. Upon ſome ſpecimens of this coralline, we may obſerve little ſmall figures like ſeed-veſſels, with which the branches frequently terminate: They are alſo found on the ſides, as may be ſeen at A, where they are magnified.—When a branch is rendered ſoft by being ſteeped in vinegar, there may be ſqueezed out from the little knobs at the ends and ſides, ſmall twiſted figures, like thoſe at A 1, which are magnified higher at A 2.—We frequently find this coralline of different colours, as red, green, aſh, and white; but all of it, by being expoſed to the ſun and air on the ſhore, becomes white.

The ancients have ſaid great things of the virtues of the common coralline. Dioſcorides preſcribes it for mitigating the pain of the gout, and for preventing ſtagnations of the humours in any part; he ſays nothing of its virtues againſt worms, which are what we alone eſteem it for. We give it in powder from 10 grains to a ſcruple or half a dram twice a day in theſe caſes, and that with a conſiderable good effect.

Beſides the above, Mr Ellis enumerates other genera of marine productions; as the keratophyta, eſchara, ſponges, and alcyonium; all which are the neſts or matrices of ſea-animals. See POLYPE. The laſt claſs of marine bodies is formed like funguſes of various figures, and with different ſorts of covering: ſome having a gritty, and ſome a callous ſkin, with a ſpongy ſubſtance in the inſide: other ſpecies are of a fleſhy ſubſtance.

CORALLODENDRON, in botany. See ERYTHRINA.

CORALLOIDES (FRUTICES.) See ESCHARA and KERATOPHYTA.

CORAM (Captain Thomas), an Engliſh gentleman remarkably diſtinguiſhed by his humanity, was born about the year 1668, and ſpent the early part of his life in the ſtation of maſter of a veſſel trading to the colonies. Afterwards reſiding in the eaſtern part of the metropolis, among ſeafaring people, where buſineſs often obliged him to come early into the city and return late, he frequently ſaw young children expoſed in the ſtreets through the indigence or cruelty of their parents. This excited his compaſſion, and induced him to project the foundation of an hoſpital for foundlings. In this humane deſign he laboured with indefatigable diligence for ſeventeen years; and by his application procured a number of the nobility and gentry to patronize and carry the ſcheme into execution, and at length obtained the royal charter for it. He was alſo highly inſtrumental in promoting the trade of America, by procuring a bounty upon naval ſtores imported from the colonies. He was likewiſe eminently concerned in ſetting on foot the colonies of Georgia and Nova Scotia. His laſt charitable deſign, in which he lived to make ſome progreſs, was a ſcheme for uniting the North American Indians more cloſely to the Britiſh intereſt, by an eſtabliſhment for the education of Indian girls. In ſhort, he ſpent the greateſt part of life in labouring for the public, and experienced a fate too common in thoſe who devote their talents to ſuch laudable purpoſes; being at laſt indebted for ſubſiſtence to the voluntary ſubſcriptions of ſome public-ſpirited perſons, at the head of whom was the late Frederic Prince of Wales. Captain Coran died in 1751: and was interred, at his own deſire, in a vault under the chapel of the Foundling Hoſpital.

CORAN, or ALCORAN. See ALCORAN.

CORAX, in ornithology, the trivial name of a ſpecies of CORVUS.

CORANICH, among the Scotch and Iriſh, the cuſtom of ſinging at funerals, anciently prevalent in thoſe countries, and ſtill practiſed in ſeveral parts. Of this cuſtom Mr Pennant gives the following account. "I had not the fortune to be preſent at any in North Britain: but formerly aſſiſted at one in the ſouth of Ireland, where it was performed in the fulneſs of horror. The cries are called by the Iriſh the *ulogohne* and *hullulu*; two words very expreſſive of the ſound uttered on theſe occaſions; and being of Celtic ſtock, etymologiſts would ſwear to be the origin of the ολολυγων of the Greeks and *ululatus* of the Latins. Virgil is very fond of uſing the laſt whenever any of his females are diſtreſſed; as are others of the Roman poets, and generally on occaſions ſimilar to this. It was my fortune

to arrive at a certain town in Kerry at the time that a perſon of ſome diſtinction departed this life: my curioſity led me to the houſe, where the funeral ſeemed conducted in the pureſt claſſical form.

Quodcunque aſpiceret luctus, gemituſque ſonabant,
Formaque non taciti funeris intus erat.

In ſhort, the *conclamatio* was ſet up by the friends in the ſame manner as Virgil deſcribes that conſequential of Dido's death;

Lamentis, gemituque, & femineo ululatu
Tecta fremunt.

Immediately after this followed another ceremony, fully deſcribed by Cambden in his account of the manners of the ancient Iriſh; the earneſt expoſtulations and reproaches given to the deceaſed for quitting this world, where ſhe enjoyed ſo many bleſſings, ſo good a huſband, and ſuch fine children. This cuſtom is alſo of great antiquity, for Euryalus's mother makes the ſame addreſs to her dead ſon.

——————— *Tune illa ſenectæ*
Sera meæ requiem? potuiſti relinquere ſolam,
Crudelis?

But when the time approached for carrying out the corps, the cry was redoubled,

Tremulis ululatibus æthera complent;

a numerous band of females waiting in the outer court to attend the hearſe, and to pay in chorus the laſt tribute of their voices. The habit of this ſorrowing train, and the neglect of their perſons, were admirably ſuited to the occaſion; their robes were black and flowing, reſembling the ancient Palla; their feet naked, the hair long and diſhevelled: I might truly ſay,

Ut qui conducti plorant in funera, dicunt
Et faciunt prope plura dolentibus exanimo.

The corpſe was carried ſlowly along the verge of a moſt beautiful lake, the ululatus was continued, and the whole proceſſion ended among the venerable ruins of an old abbey."

CORBAN, in Jewiſh antiquity, were thoſe offerings which had life, in oppoſition to the *minchah*, or thoſe which had not. It is derived from the word *karab*, which ſignifies "to approach;" becauſe the victims were brought to the door of the tabernacle. The corban were always looked upon as the moſt ſacred offerings. The Jews are reproached with defeating, by means of the corban, the precept of the fifth commandment, which enjoins the reſpect due to parents. For when a child had no mind to relieve the wants of his father or mother, he would ſay to them, "It is a gift (*corban*) by whatſoever thou mighteſt be profited by me;" *i. e.* "I have devoted that to God which you aſk of me, and it is no longer mine to give."

Corban is alſo a ceremony which the Mahometans perform at the foot of mount Arrarat in Arabia, near Mecca. It conſiſts in killing a great number of ſheep, and diſtributing them among the poor.

CORBEILS, in fortification, little baſkets, about a foot and a half high, eight inches wide at the bottom and twelve at the top; which being filled with earth, are frequently ſet one againſt another upon the parapet or elſewhere; leaving certain port-holes, from whence to fire upon the enemy under covert without being ſeen by them.

CORBEL, in architecture, the repreſentation of a baſket, ſometimes ſeen on the heads of carytides. The word is alſo uſed for the vaſe, or tambour, of the Corinthian column; ſo called from its reſemblance of a baſket, or becauſe it was firſt formed on the model of a baſket.

Corbel, or *Corbil*, is alſo uſed, in building, for a ſhort piece of timber placed in a wall, with its end ſticking out ſix or eight inches, as occaſion ſerves, in manner of a ſhouldering-piece. The under part of the end thus ſticking out is ſometimes cut into the form of a boultin; ſometimes of an ogee, and ſometimes of a face, &c. according to the workman's fancy, the upper ſide being plain and flat.

Corbel is alſo uſed by ſome architects for a niche or hollow left in walls for images, figures, or ſtatues to ſtand in.

CORBET (Richard), biſhop of Norwich, and an eminent poet, was born at Ewell in Surry, toward the latter end of the 16th century; and educated at Oxford, where he was eſteemed one of the moſt celebrated wits of the univerſity. Entering into holy orders, he became a popular preacher, and was made chaplain to King James I.: when, after ſeveral preferments in the church, he was, in 1629, made biſhop of Oxford; and, in 1632, was tranſlated to the ſee of Norwich. He was very hoſpitable, and always a generous encourager of public deſigns. He died in 1635. There have been ſeveral editions of his poems publiſhed under the title of *Poemata Stromata*.

CORBEY, a town of Picardy in France, with a famous abbey of Benedictine monks. It is ſeated on the river Somme, 10 miles eaſt of Amiens, and 75 north of Paris. E. Long. 2. 35. N. Lat. 49. 55.

CORCELET, in natural hiſtory, that part of the fly-claſs which is analogous in its ſituation to the breaſt in other animals. Many have called it the breaſt in theſe alſo, but improperly; becauſe the breaſt of other animals is the place of the lungs and trachea, but theſe organs are in the fly-claſs diſtributed through the whole body. The wings are affixed to this part of the fly-claſs; and there are ſome diſtinctions of great conſequence in regard to the arrangement and diſtribution of thoſe animals into genera. Some flies have a double corcelet, or one divided into two parts; and this is the caſe of the fly produced from the formica leo, which therefore does not carry its only diſtinction in the figure of its antennæ. One pair of the legs of this fly are attached to the firſt or anterior corcelet, which is alſo capable of moving on the other.

The corcelets of ſome flies are alſo much more elevated than thoſe of others; and in ſome this elevation is carried ſo far, that the head is forced by it to be bent downward, and the creature is plainly made hump-backed by it. The great kind, and the *tipulæ*, furniſh inſtances of this elevated and hump-backed *corcelet*.

A ſeries of flies of two wings are known by a very particular armament which they carry on the corcelet, uſually called their *breaſt*. This conſiſts of two long, ſlender, ſharp-pointed prickles, which are immoveable in their inſertions, and ſeem meant as offenſive or defenſive weapons; but in what manner they are uſed it is not eaſily to be determined.

All theſe flies are produced from long water-worms with open and funnel-faſhioned tails, or furniſhed with their aperture for reſpiration at the hinder extremity. There are three known ſpecies of this ſort of fly, with armed corcelets, which differ much in ſize, but are all produced of worms of this kind. The largeſt of theſe flies are produced from the largeſt and longeſt worm, and are ſomething longer than the bee. The ſmalleſt are produced of worms very ſmall and ſlender, and are themſelves extremely minute: and the third kind is of a middle ſize between theſe, and produced from a proportionably ſmaller worm than that of the firſt, and proportionably larger than that of the ſecond ſpecies.

All theſe ſpecies have their wings but little diſtinguiſhable at their firſt production from the ſhell; they appear indeed only like two ſlender filaments laid acroſs their bodies: but they quickly ſhow, that in this ſtate they were only very nicely folded together; and ſoon expand, and ſhow their full extent and proportion.

When firſt produced from the ſhell, theſe flies are of a pale green colour. The under part of their belly in many continues green, but in the greater number it becomes of a pale dead brown. Some of them have the outſide of their bodies of a deep brown, approaching to black, with lines of a dead brown between the commiſſures of the rings. The back of ſome others has only a blackiſh brown band, which runs ſtraight down from the corcelet to the end of the body, the whole body beſide being of a dead brown. The corcelet in theſe flies is brown, and the prickles are yellowiſh near their inſertions, but nearly black at their points. They have three of the ſmall gloſſy eyes diſpoſed in the ſhape of a triangle on the back part of their head; and their reticular eyes are brown, and at ſome diſtance from one another.

CORCHORUS, in botany: A genus of the monogynia order, belonging to the polyandria claſs of plants; and in the natural method ranking under the 37th order, *Columneæ*. The corolla is pentapetalous; the calyx pentaphyllous and deciduous; and the capſule many-valved and many-celled.

There are eight ſpecies; of which the moſt remarkable is the olitorius, an annual, and a native of Aſia, Africa, and America. It riſes with a round, ſtriated, upright, branched ſtalk, to near two feet, which is furniſhed with leaves differing in ſhape; ſome being oval, ſome cut off ſtraight at their baſe, and others almoſt heart-ſhaped. They are of a deep green colour, and have a few teeth on the margins of their baſe, that end in briſtly, reflexed, purpliſh filaments. The flowers come out at the ſides of the branches oppoſite to the leaves. They ſtand ſingly on very ſhort peduncles; are compoſed of five ſmall yellow petals, and a great number of ſtamina ſurrounding an oblong germen, which becomes a long, rough, ſharp-pointed capſule, opening in four parts, each filled with greeniſh angular ſeeds.—This plant is ſown by the Jews about Aleppo, and is therefore called *Jews mallow*. The leaves are a favourite ſallad among theſe people, and they boil and eat them with their meat.

CORCULUM, a diminutive from *cor*, "the heart," little heart; the eſſence of a ſeed, and principle of life of the future plant, attached to and contained within the lobes. It conſiſts of two parts, termed by Linnæus PLUMULA and ROSTELLUM. The former is the *radicula* of Grew and other naturaliſts. The corculum is in fact the embryo of the future vegetable; and is attached by two trunks of veſſels to the lobes at their union. The firſt of its two parts mounts upward, and becomes the trunk. The other ſtrikes into the ground, and is the rudiment of the root. The lobes and heart of the ſeed are diſtinctly viſible in the bean, and other ſeeds of that claſs, eſpecially after remaining ſome time in water or earth.

The principle of life is ſeated either at the ſummit or baſe of the ſeed. From this circumſtance are conſtructed the two firſt claſſes in Cæſalpinus's method, containing trees and ſhrubs only.

CORCYRA (anc. geog.), an iſland in the Ionian Sea, oppoſite to Theſprotia, a diſtrict of Epirus, called *Scheria* and *Phæacia* by Homer. In Callimachus it is called *Drepane*; its moſt ancient name, according to the Scholiaſt, from the curvity of its figure. Famous for the ſhipwreck of Ulyſſes and the gardens of Alcinous. Now *Corſu*.

CORCYRA, a cognominal town of the iſland; formerly powerful, and capable of coping with mighty ſtates; ſituated about the middle of the eaſt ſide of the iſland, called *The Town of the Pheacians* by Homer. Now *Corſu*, from the Κορυφω of the middle age, the name of the citadel. It was a colony of Corinthians; *Corcyræi*, the people. E. Long 19. 48. Lat. 39. 50.

CORCYRA Nigra, an iſland in the Adriatic, on the coaſt of Dalmatia (Pliny); called *Melæna* by the Greeks, to diſtinguiſh it from the iſland in the Ionian Sea. The epithet *Nigra* was added, from its woods of tall trees with which it is almoſt covered. Now *Curzola*.

CORD, or CHORD, an aſſemblage of ſeveral threads of hemp, cabled or twiſted together by means of a wheel. See CORDAGE. The word comes from the Greek χορδη, which properly ſignifies an inteſtine or gut, of which chords may be made. See CHORD.

Magical CHORD, an inſtrument in great uſe among the Laplanders, and by them ſuppoſed to be endued with a number of virtues. It is a cord or rope with three knots tied in it. They uſe many magical rites and ceremonies in the tying of this cord; and, when thus prepared, it is ſuppoſed to have power over the winds; and they will ſell, by means of it, a good wind, or at leaſt the promiſe of one, to a ſhip. If they untie only one of theſe knots, a moderate gale ſucceeds; if two, it is much ſtronger; and if three, a ſtorm is ſure to follow.

CORD of Wood, a certain quantity of wood for burning, ſo called becauſe formerly meaſured with a chord. The dimenſions of a ſtatute cord of wood are eight feet long, four feet high, and four feet broad.

CORD-Wood, is new wood, and ſuch as, when brought by water, comes on board a veſſel, in oppoſition to that which is floated.

CORDAGE, a term uſed in general for all ſorts of cord, whether ſmall, middling, or great. See ROPE.

The naval cordage of the earlier ages was in all probability only thongs of leather. Theſe primitive ropes were retained by the Caledonians in the third century. The nations to the north of the Baltic had them in the ninth or tenth centuries: and the inhabitants of the weſtern iſles of Scotland make uſe of them at preſent; cutting the ſkin of a ſeal, or the raw and ſalted hide of a cow, into long pieces, and faſtening the plough to their horſes with them, or even twiſting them into ſtrong ropes of 20 or 30 fathoms length.

But theſe, in the ſouth of Britain, and on the continent, were early ſuperſeded by the uſe of iron chains. The very maritime and commercial nation of the Veneti, that were ſo intimately connected with the Belgæ of Britain, uſed iron chains for their cables in the days of Cæſar. But in the more diſtant and refined countries of the ſouth, both thongs and theſe had long given place to the uſe of vegetable threads, and the arts of combining them into ſtrength. In this manner the Greeks appear to have uſed the common ruſhes of their country, and the Carthaginians the ſpartum or broom of Spain. And as all the cordage of the Romans was made of theſe materials at their laſt deſcent on Britain, ſo the art of manufacturing them would neceſſarily be introduced with the Roman ſettlements among the Britons. Under the direction of Roman artiſts their thongs of leather would naturally be laid aſide; and the junci, or ruſhes of the plains, worked up into cordage. And what remarkably coincides with this opinion is, that the remains of old cables and ropes are ſtill diſtinguiſhed among the Britiſh ſailors by name of *old junk*.

The nations of Roman Britain, and the tribes of Caledonia and Ireland, had inherited, from their earlieſt anceſtors, many of the ruder arts of navigation. Their ſhips were large open boats, framed of light timbers ribbed with hurdles and lined with hides. Theſe were furniſhed with maſts and ſails. The latter were formed of hides, as the tackle was of thongs. They were actually of hides among the Veneti as late as the days of Cæſar; and they were never furled, but only bound to the maſt. But theſe ſlight ſea-boats and their rude furniture, would ſoon be diſmiſſed by the provincials for the more ſubſtantial veſſels and more artificial ſails of the Romans. The Roman ſails, which were compoſed of flax in the days of Agricola, were afterwards made of hemp; and our own are therefore denominated *cannabis* or *canvas* by our mariners at preſent. And about the ſame period aſſuredly did the junk of the Britiſh cordage give way to the ſame materials; the uſe of hempen ropes upon land, and of hempen nets for hunting, being very common among the Romans in the firſt century.

CORDATED, an appellation frequently given by naturaliſts to things ſomewhat reſembling a heart.

CORDED, in heraldry. A croſs corded, ſome authors take for a croſs wound or wrenched about with cords: others, with more probability, take it for a croſs made of two pieces of cord.

CORDELERAS, mountains of South America, otherwiſe called ANDES.

CORDELIER, a Franciſcan, or religious of the order of St Francis. The Cordeliers are clothed in thick grey cloth, with a little cowl, a chaperon, and cloak, of the ſame; having a girdle of rope or cord tied with three knots: whence the name.—They are otherwiſe called *Minor Friars*, their original name. The denomination *Cordelier* is ſaid to have been firſt given them in the war of St Louis againſt the infidels; wherein the Friars Minor having repulſed the barbarians, and that king having inquired their name, it was anſwered, they were people *cordeliez*, "tied with ropes." The Cordeliers are to a man profeſſed Scotiſts.

CORDEMOI (Geral de), a learned philoſopher and hiſtorian, born at Paris, made himſelf known to M. Boſſuet, who placed him about the dauphin in the quality of reader. He inſtructed that young prince with great aſſiduity; and in 1675 was received into the French academy. He wrote a general hiſtory of France during the firſt races of the French kings, in 2 vols; and ſix diſcourſes on the Diſtinction between Body and Soul, which were printed together in 1702 quarto. He died in 1684. M. Cordemoi followed the principles of Deſcartes.

CORDIA, in botany: A genus of the monogynia order, belonging to the pentandria claſs of plants; and in the natural method ranking under the 41ſt order, *Aſperifoliæ*. The corolla is funnel-ſhaped; the ſtyle dichotomous or divided into two threads, and each of theſe divided into other two.

There are five ſpecies, of which the principal are the myxa and ſebeſtena. 1. The myxa, or Aſſyrian plum, grows wild in Aſſyria and Egypt, and alſo on the coaſt of Malabar. It riſes to the height of a middling plum-tree; and its branches are furniſhed with oval, woolly leaves, ſtanding without order. The flowers are produced in bunches; are white, and conſiſt of one tubular petal, and a like calyx, nearly of an equal length, and both are cut into five parts at their brims. In their centre are five very ſmall ſtamina, and one ſlender ſtyle crowned with an obtuſe ſtigma. The germen is roundiſh, and ſwells to a plum of the ſame form, and about the ſize of a damſon, of a dark brown colour, a ſweet taſte, and very glutinous. Theſe plums were formerly kept in the ſhops; and were accounted good for obtunding acrimony, and thereby ſtopping defluxions of rheum upon the lungs: but at preſent they are little uſed for theſe purpoſes. In ſome parts of Turkey they cultivate this tree in great abundance, not only for the ſake of the fruit to eat, but to make birdlime of, which is a vaſt article of trade in a town called *Seid*.—2. The ſebeſtena, or rough-leaved ſebeſten, grows naturally in both the Indies, and ſends forth ſeveral ſhrubby ſtalks eight or ten feet high. The young leaves are ſerated, but the full grown ones are not. They are of an oblong-oval form, rough, of a deep green on the upper ſide, and ſtand alternately on ſhort footſtalks. The flowers terminate the branches in large cluſters, are nearly of the ſhape and colour of thoſe of the marvel of Peru, and make a moſt beautiful appearance. Each has five ſtamina and one bifid ſtyle. The plums are much of the ſhape of thoſe of the myxa, and are eaten in the ſame manner. The fruit of this tree is leſs valuable than the wood, a ſmall piece of which thrown upon a clear fire will perfume a room with a moſt agreeable odour.

CORDIAL, in medicine, whatever raiſes the ſpirits, and gives them a ſudden ſtrength and cheerfulneſs; as wine, ſpirits, the effluvia of flowers, fruit, and many other ſubſtances.

CORDON, in fortification, a row of ſtones, made round on the outſide, and ſet between the wall of the fortreſs which lies aſlope, and the parapet which ſtands perpendicular, after ſuch a manner, that this difference may not be offenſive to the eye; whence the cordons ſerve only as an ornament, ranging round about the place, being only uſed in fortifications of ſtone-work; for in thoſe made with earth the void ſpace is filled up with pointed ſtakes.

CORDUBA (anc. geog.), an illuſtrious city of Bætica, on the right or north ſide of the Bætis. Built by Marcellus, according to Strabo; but which Marcellus, is not ſo clear. It was the firſt colony ſent into thoſe parts by the Romans; and ſurnamed *Patricia*, becauſe at firſt inhabited by principal men, both of the Romans and natives. It is mentioned by Sil. Italicus in the ſecond Punic war; and hence it is probable the firſt Marcellus was the founder, and not the Marcellus engaged in the civil war between Cæſar and Pompey. It was famous for the birth of the two Senecas and of Lucan (Martial), and for its rich produce in oil (Statius, Martial). Still retaining its name a little altered. W. Long. 5. Lat. 37. 45.

CORDOUA, or **CORDOVA**, a city of Andaluſia in Spain, ſituated on the river Guadalquiver, in a very extenſive plain. The circumference is large; but it is not peopled in proportion to its extent, for there are a great many orchards and gardens within the walls. There are many ſuperb ſtructures, palaces, churches, and religious houſes; particularly the cathedral, which is very magnificent: it was formerly a moſque when the Moors poſſeſſed the town; for which reaſon it ſtill retains the name of *Mezquita*, which has the ſame meaning. This cathedral is very rich in plate, four of the ſilver candleſticks coſt L. 850 a-piece. The revenue of the ſee amounts to L. 3500 *per annum*; but as the biſhops cannot deviſe by will, all they die poſſeſſed of eſcheats to the crown. The ſquare called the *Plaza Major* is ſurrounded with very fine houſes, under which are piazzas. The trade is flouriſhing on account of the river; and conſiſts of wine, ſilk, and Cordovian leather. In the neighbourhood of this place are a vaſt number of orange and lemon trees, which renders their fruits exceeding cheap. The beſt horſes in Spain come from hence.

Cordova was the ancient *Corduba* mentioned in the preceding article. After the fall of the Roman empire, it was ſubjected to the dominion of the Goths; but in the eight century it was raiſed by the Mooriſh princes to a ſtate of ſplendor unequalled in any other part of the world. In the year 755, Abdoulrahman, only heir-male of the Ommiad line, having paſſed over from Africa at the head of a few deſperate followers, found means to raiſe a rebellion in Spain; when, after a battle fought on the banks of the Guadalquiver, in which he overthrew the lieutenant of the Abaſſid Caliph of Damaſcus, he became king of all the Mooriſh poſſeſſions in the ſouth of Spain, and in 759 fixed his royal reſidence at Cordova. Then began thoſe flouriſhing ages of Arabian gallantry and magnificence which rendered the Moors of Spain ſuperior to all their cotemporaries in arts and arms, and made Cordova one of the moſt ſplendid cities of the world. Agriculture and commerce proſpered under the happy ſway of this hero; and the face of the country was changed from a ſcene of deſolation, which the long wars and harſh government of the viceroys had brought on, into a moſt populous flouriſhing ſtate, exceeding in riches, number of inhabitants, activity, and induſtry, any prior or ſubſequent era of the Spaniſh hiſtory. He added new fortifications to the town, built himſelf a magnificent palace with delicious gardens, laid cauſeways through the marſhes, made excellent roads to open ready communication between the great towns, and in 786 began the great moſque, which he did not live to finiſh.

During the courſe of two centuries, this court continued to be the reſort of all profeſſors of the polite arts, and of ſuch as valued themſelves upon their military and knightly accompliſhments; while the reſt of Europe was buried in ignorance, debaſed by brutality of manners, or diſtracted by ſuperſtitious diſputes. England, weakened by its heptarchy, was too inconſiderable even to be mentioned in the political hiſtory of the times: France, though it had a gleam of reputation under Charlemagne, was ſtill a barbarous unpoliſhed nation: and Italy was in utter confuſion; the frequent revolutions and change of maſters rendering it impoſſible for learning, or any thing good, to acquire a permanent footing in ſo unſtable a ſoil: Greece, though ſtill in poſſeſſion of the arts and luxury of ancient Rome, had loſt all vigour, and ſeemed abſorbed in the moſt futile of all purſuits; *viz.* that of ſcholaſtic argument and religious ſubtilties.

The reſidence of the Ommiad Caliphs was long conſpicuous for its ſupreme magnificence, and the crowds of learned men who were allured to it by the protection offered by its ſovereigns, the beauty of the country, the wholeſomeneſs of the climate, and the variety of pleaſures that returned inceſſantly in one enchanting round.

Cordova became the centre of politeneſs, induſtry, and genius. Tilts and tournaments, with other coſtly ſhows, were long the darling paſtimes of a wealthy happy people; and this was the only kingdom in the weſt where geometry, aſtronomy, and phyſic, were regularly ſtudied and practiſed. Muſic was no leſs honoured; for we find, that in 844 a famous muſician called *Ali Zeriab* came to ſettle at Cordova, and formed ſeveral pupils, who were ſuppoſed to equal the moſt celebrated performers that were ever known even in the Eaſt. That architecture was greatly encouraged, we need no other proof than the great and expenſive fabrics undertaken and completed by many of theſe Spaniſh monarchs. Whatever faults may be juſtly condemned in their manner by the connoiſſeur, accuſtomed to the chaſte noble graces of the Grecian proportions, certainly nobody can behold what remains of theſe Mooriſh edifices, without being ſtrongly impreſſed with a high idea of the genius of the artiſts, as well as the grandeur of the prince who carried their plans into execution.

The ſultans not only gave the moſt diſtinguiſhed protection to arts and ſciences, and to the perſons learned in any of them, but were themſelves eminently verſed in various branches of knowledge. Alkehem II. collected ſo immenſe a quantity of manuſcripts, that before the end of his reign the royal library contained no leſs than 600,000 volumes, of which the very catalogue filled 40 huge folios. The univerſity of Cordova was founded by him, and under ſuch favourable auſpices roſe to the higheſt pitch of celebrity.

Abdoulrahman was ſucceeded by his ſon Hiſſem, whoſe paſſion for glory and architecture was not in the leaſt inferior to that of his father. He put the finiſhing hand to the moſque, which the plunder of the ſouthern provinces of France enabled him to complete in the courſe of a few years. The bridge over the Guadalquiver was a work of Hiſſem's after his own plan.

Alkahem ſucceeded Hiſſem.

Abdoulrahman II. was alſo paſſionately fond of building. He was the firſt that brought the ſupplies of water to Cordova by means of leaden pipes laid upon aqueducts of ſtone. The quantity was ſo conſiderable, that every part of the palace, the moſques, baths, ſquares, and public edifices, had all of them their fountains conſtantly playing. A great many of theſe works ſtill ſubſiſt. He paved the whole city, and erected ſeveral moſques.

After him reigned Mahomet Almundar, Abdallah, and Abdoulrahman III. who ſurpaſſed all his predeceſſors in ſplendor, riches, and expence. His ſubjects vied with each other in profuſion and magnificence. This monarch was ſucceeded by his ſon Alkahem II. who left a minor to ſucceed him, and the kingdom to be governed by a famous viſir, Mahomet Abenamir, ſirnamed *Almanzor*, or "the defender," from his great victories and wiſe conduct. His deſcendents inherited from him the viſirſhip, and a power as abſolute as if they had been caliphs, until the weakneſs of the ſovereigns encouraged, and the inſolence of the miniſters provoked, the grandees to diſturb the ſtate with their jealouſies and diſſenſions. Theſe broils occaſioned ſuch a ſeries of civil wars and anarchy, as overthrew the thone of Cordova and deſtroyed the whole race of Abdoulrahman. Thus the glorious edifice, founded by the valour and prudence of that conqueror, and cemented by ſimilar virtues in many of his ſucceſſors, ſunk into nothing as ſoon as the ſceptre devolved upon weak enervated princes, whoſe indolence and incapacity transferred the management of every thing to a viſir. Many petty kingdoms ſprang up out of the ruins of this mighty empire; and the Chriſtians ſoon found opportunities of deſtroying, by ſeparate attacks, that tremendous power, which when united had proved an overmatch for their utmoſt force.

New Cordova, a conſiderable town of South America, in the province of Tucuman, with a biſhop's ſee, 175 miles from St Jago. W. Long. 62. 5. S. Lat. 32. 10.

CORDUAN, a famous pharos or light-houſe of France, in Guienne, at the mouth of the river Girond. The architecture is extremely fine; and is placed there to hinder veſſels from running on the ſand banks at the mouth of the river. W. Long. 1. 9. N. Lat 45. 36.

CORDUS (Valerius), a learned botaniſt, was the ſon of Ericius Cordus, a phyſician and poet of Germany. Having learnt the languages, he applied himſelf to the ſtudy of botany; in the proſecution of which, he examined the mountains of Germany, and travelled into Italy; but being wounded in the leg by the kick of a horſe, died at Rome in 1544. He wrote Remarks on Dioſcorides, and other works.

CORDWAINERS, or CORDINERS, the term whereby the ſtatutes denominate *ſhoemakers*. The word is formed from the French *cordonnier*, which Menage derives from *cordouan*, a kind of leather brought from Cordoua, whereof they formerly made the upper-leathers of their ſhoes. Others derive it from *corde*, "rope," becauſe anciently ſhoes were made of cords; as they ſtill are in ſome parts of Spain, under the name of *alpargates*. But the former etymology is better warranted: for, in effect, the French workmen who prepare the corduas are ſtill called *cordouanniers*.

In Paris they have two pious ſocieties under the titles of *freres cordonniers*, "brothers ſhoemakers," eſtabliſhed by authority towards the middle of the 17th century; the one under the protection of St Criſpin*, the other of St Criſpianus, two ſaints who had formerly honoured the profeſſion. They live in community, and under fixed ſtatutes and officers; by which they are directed both in their ſpiritual and ſecular concerns. The produce of their ſhoes goes into a common ſtock, to furniſh neceſſaries for their ſupport; the reſt to be diſtributed among the poor.

*See *Criſpin*.

COREA, a peninſula lying to the north-eaſt of China, between 99 and 109 degrees of E. Long. and between 32 and 46 N. Lat. It is divided into eight provinces, which contain 40 cities of the 1ſt rank, 51 of the 2d, and 70 of the 3d. The capital of the whole is Hanching, where the king reſides. The Jeſuits ſay, the people are well made, of a ſweet and tractable diſpoſition, and fond of learning, muſic, and dancing, and in general reſemble the Chineſe. Their houſes are mean, being covered with thatch; and they have no beds but lie on the floor. They have little ſilk, and therefore make uſe of linen-cloth in its room. Their trade conſiſts in white paper, pencils, gingſeng, gold, ſilver, iron, yellow varniſh, fowls whoſe tails are three feet long, horſes no more than three feet in height, ſable-ſkins, caſtor, and mineral ſalt. In general it is a fertile country, though abounding in mountains. It is tributary to China.

Mr Groſier relates an obſervation concerning the natural hiſtory of Corea, which, in his opinion, furniſhes a new proof of the revolutions which the ſurface of our globe has undergone. An ancient Chineſe book aſſerts, that the city where Kipe, the king of Corea, eſtabliſhed his court, was built in a place which forms at preſent a part of the territories of *Yong-ping-ſou*, a city of the firſt claſs in the province of Petcheli. "If this (ſays he) be admitted as a fact, we may from thence conclude that theſe territories formerly belonged to Corea; and that the gulf of Lax-tong, which at preſent ſeparates this kingdom from the province of Petcheli, did not then exiſt, and that it has been formed ſince; for it is not probable that a ſovereign would have fixed his reſidence without the boundaries of his kingdom, or in a place where he was ſeparated from it by a wide and extenſive ſea. This conjecture is confirmed by certain facts admitted by the Chineſe. Thus when *Yu*, ſurnamed the *Great*, undertook to drain and carry off the waters which had inundated the low grounds of ſeveral provinces, he began by the river Hoang-ho, the overflowing of which cauſed the greateſt devaſtation. He went in ſearch of its ſource to the boſom of Tartary, from whence he directed its courſe acroſs the provinces of Chan-ſi, Chen-ſi, Honan, and Petcheli. Towards its mouth, in order to weaken the rapidity of its waters, he divided them into nine channels, through which he cauſed this river diſcharge itſelf into the eaſtern ſea near the mountain of *Kie-che-chan*, which then formed a promontory. Since that time to the preſent, that is about 3950 years, the river Hoang-ho has departed ſo much from its ancient courſe, that its mouth at preſent is about ſix degrees farther ſouth. We muſt alſo remark, that the mountain Kie-che-chan, which was formerly united to the main land of Yong-ping-fou, ſtands at preſent in the ſea at the diſtance of about 50 leagues to the ſouth of that city. If the ſea has been able to cover with its waters that extent of territory which at preſent forms part of the gulph of Lea-tong, may we not be allowed to ſuppoſe that like inundations may have formed ſucceſſively the whole of that gulph, the ancient exiſtence of which ſeems ſo ill to agree with the reſidence of the kings of Corea in the territories of Yong-ping-fou? It is true, the Chineſe hiſtory makes no mention of ſo conſiderable a phyſical revolution; but it is equally ſilent with regard to the 500 *lys* (50 leagues) extent of ground which is at preſent covered by the ſea beyond the mountains of Kie-che-chan. Beſides, of all the changes which the ſurface of our globe experiences, thoſe only are mentioned in hiſtory which happen ſuddenly, and which conſequently make more impreſſion on the minds of men.

Corea chiefly produces wheat, rice, and ginſeng, with a kind of palm-tree, which yields a gum capable of producing a yellow varniſh little inferior to gilding. Hence alſo are exported caſtor and ſable ſkins; alſo gold, ſilver, iron, and foſſil ſalt; a kind of ſmall bruſhes for painting, made of the hair of a wolf's tail, are likewiſe manufactured here, which are exported to China and highly eſteemed there. The ſea-coaſts abound in fiſh, and great numbers of whales are found there every year towards the north-eaſt. Several of theſe, it is ſaid, have in their bodies the harpoons of the French and Dutch, from whom they have eſcaped in the northern extremities of Europe; which ſeems to indicate a paſſage from the European into the Aſiatic ſeas round the continents of Europe and Aſia.

A conſiderable quantity of the paper of Corea is annually imported into China; indeed the tribute due to the emperor is partly paid with it every year. It is made of cotton, and is as ſtrong as cloth, being written upon with a ſmall hair-bruſh or pencil; but muſt be done over with alum-water before it can be written upon in the European manner. It is not purchaſed by the Chineſe for writing, but for filling up the ſquares of their ſaſh-windows; becauſe, when oiled, it reſiſts the wind and rain better than that of China. It is uſed likewiſe as wrapping paper; and is ſerviceable to the taylors, who rub it between their hands until it becomes as ſoft and flexible as the fineſt cotton cloth, inſtead of which it is often employed in lining clothes. It has alſo this ſingular property, that if it be too thick for the purpoſe intended, it may be eaſily ſplit into two or three leaves, each of which are even ſtronger than the beſt paper of China

The Coreans are well made, ingenious, brave, and tractable; are fond of dancing, and ſhow great docility in acquiring the ſciences, to which they apply with great ardour and honour in a particular manner. The northern Coreans are larger ſized and more robuſt than thoſe of the ſouth; have a taſte for arms, and become excellent ſoldiers. Their arms are croſs-bows and long ſabres. Men of learning are diſtinguiſhed from other claſſes of people by two plumes of feathers in their caps; and when merchants preſent the Coreans with any books for ſale, they dreſs themſelves in their richeſt attire, and burn perfumes before they treat concerning the price.

The Coreans mourn three years, as in China, for a father or mother: but the time of mourning for a brother is confined to three months. Their dead are not interred until three years after their deceaſe: and when the ceremony of interment is performed, they place around the tomb the clothes, chariot, and horſes of the deceaſed, with whatever elſe he ſhowed the greateſt fondneſs for while alive; all which they leave to be carried off by the aſſiſtants. Their houſes, as in China, conſiſt only of one ſtory, and are very ill built; in the country being compoſed of earth, and in cities generally of brick, but all thatched with ſtraw: the walls of their cities are conſtructed after the Chineſe manner, with ſquare turrets, battlements and arched gates. Their writing, dreſs, religious ceremonies, and creed, as well as the greater part of their cuſtoms, are borrowed from the Chineſe. Their women, however, are leſs confined, and have the liberty of appearing in public with the other ſex, for which they are often ridiculed by their neighbours. They differ from the Chineſe alſo in their ceremonies of marriage, and in the manner of contracting it; the parties in this country taking the liberty to chooſe for themſelves, without conſulting the inclination of their parents, or ſuffering them to throw any obſtacles in their way.

COREIA, in antiquity, a feſtival in honour of Proſerpine, named *Core*, Κορη, which in the Moloſſian dialect ſignifies a beautiful woman.

CORELLI (Arcangelo), the famous Italian muſician and compoſer, a native of Fuſignano, in the territory of Bologna, was born in 1653. He entertained an early propenſity to the violin; and as he advanced in years, laboured inceſſantly in the practice of that inſtrument. About the year 1672, his curioſity led him to viſit Paris, probably with a view to attend the improvements which were making in muſic under the influence of cardinal Mazarine, and in conſequence of the eſtabliſhment of a royal academy: but notwithſtanding the character which he brought with him, he was driven back to Rome by Lully, whoſe jealous temper could not brook ſo formidable a rival as this illuſtrious Italian. In the year 1680 he viſited Germany, and met with a reception ſuitable to his merit from moſt of the German princes, particularly the elector of Bavaria; in whoſe ſervice he was retained and continued for ſome time. After about five years ſtay abroad, he returned again to Rome, and there purſued his ſtudies with great aſſiduity.

The proficiency of Corelli on his favourite inſtrument the violin was ſo great, that the fame of it reached throughout Europe. The ſtyle of his performance was learned, elegant, and pathetic; and his tone firm and even. Mr Geminiani, who was well acquainted with, and had ſtudied it, was uſed to reſemble it to a ſweet trumpet. A perſon who had heard him perform ſays, that, whilſt he was playing on the violin, it was uſual for his countenance to be diſtorted, his eyes to become as red as fire, and his eye-balls to roll as in an agony.

Corelli was highly favoured by that great patron of poetry and muſic, cardinal Ottoboni. Creſcembini ſays, that he regulated the muſical academy held at the palace of his eminence every Monday afternoon. Here it was that Mr Handel became acquainted with him; and in this academy a ſerenata of Mr Handel, entitled, *Il Trionfo del Tempo*, was performed, the overture to which was in a ſtyle ſo new and ſingular, that Corelli was confounded in his firſt attempt to play it.

During the reſidence of Corelli at Rome, beſides thoſe of his own country, many perſons were ambitious of becoming his diſciples, and learning the practice on the violin from the greateſt maſter of that inſtrument the world had then heard of. Of theſe it is ſaid the late lord Edgecumbe was one; and that the fine mezzotinto print of Corelli by Smith was ſcraped from a picture painted by Mr Hugh Howard at Rome for that nobleman.

Corelli died at Rome in 1713; and was buried in the church of the Rotunda, otherwiſe called the Pantheon, in the firſt chapel, on the left hand of the entrance. Over the place of his interment is a ſepulchral monument to his honour, with a marble buſt thereon, erected at the expence of Philip-William, count palatine of the Rhine, under the care and direction of cardinal Ottoboni.

For many years after his deceaſe, this excellent muſician was commemorated by a ſolemn muſical performance in the Pantheon, on the anniverſary of his death. In the year 1730 an eminent maſter, now living, was preſent at that ſolemnity, who relates that at it the third and eighth of his concertos were performed by a numerous band, among whom were many who had been the pupils of the author. He adds, that theſe two pieces were performed in a ſlow, diſtinct, and firm manner, without graces, and juſt as they are wrote; and from hence concludes, that this was the manner in which they were played by the author himſelf.

He died poſſeſſed of about 6000 l. ſterling. He was a paſſionate admirer of pictures, and lived in an uninterrupted friendſhip with Carlo Cignani and Carlo Maret: theſe two eminent painters were rivals for his favour; and for a ſeries of years preſented him at times with pictures, as well of other maſters as of their own painting. The conſequence was, that Corelli became poſſeſſed of a large and valuable collection of original paintings; all which, together with the ſum abovementioned, he bequeathed to his dear friend and patron cardinal Ottoboni, who, reſerving the pictures to himſelf, generouſly diſtributed the reſt of the effects among the relations of the teſtator.

Corelli is ſaid to have been remarkable for the mildneſs of his temper and the modeſty of his deportment: nevertheleſs, he was not inſenſible of the reſpect due to his ſkill and exquiſite performance. Cibber, in the Apology for his Life, p. 340. relates, that when he was playing a ſolo at cardinal Ottoboni's, he diſcovered the cardinal and another perſon engaged in diſcourſe, upon which he laid down his inſtrument; and being aſked the reaſon, gave for anſwer, that he feared the muſic interrupted their converſation.

The compoſitions of Corelli are celebrated for the harmony reſulting from the union of all the parts; but the fineneſs of the airs is another diſtinguiſhing characteriſtic of them: the allemand in the 10th ſolo is as remarkable for ſpirit and force, as that in the 11th is for its enchanting delicacy: his jigs are in a ſtyle peculiarly his own; and that in the 5th ſolo was never equalled. In the gavot movements in the 2d and 4th operas, the melody is diſtributed with great judgment among the ſeveral parts. In his minutes alone he ſeems to fail; Bononcini, Mr Handel, and Giuſeppe Martini, have excelled him in this kind of airs.

It is ſaid there is in every nation a ſtyle both in ſpeaking and writing, which never becomes obſolete; a certain mode of phraſeology, ſo conſonant and congenial to the analogy and principles of its reſpective language, as to remain ſettled and unaltered. This, but with much greater latitude, may be ſaid of muſic, and accordingly it may be obſerved of the compoſitions of Corelli, not only that they are equally intelligible to the learned and unlearned, but that the impreſſions made by them have been found to be as durable in general. His muſic is the language of nature; and, for a ſeries of years, all that heard it became ſenſible of its effects: of this there cannot be a ſtronger proof than that, amidſt all the innovations which the love of change had introduced, it continued to be performed, and was heard with delight in churches, in theatres, at public ſolemnities and feſtivities, in all the cities of Europe for near 40 years. Men remembered, and would refer to paſſages in it as to a claſſic author; and even at this day, the maſters of the ſcience do not heſitate to pronounce of the compoſitions of Corelli, that, of fine harmony and elegant modulation, they are the moſt perfect exemplars.

COREOPSIS, TICKSEEDED SUNFLOWER: A genus of the polygamia fruſtanea order, belonging to the ſyngeneſia claſs of plants; and in the natural method ranking under the 49th order, *Compoſitæ*. The receptacle is paleaceous; the pappus two-horned; the calyx erect and polyphyllous, ſurrounded with patent radiated leaflets at the baſe. There are 11 ſpecies, moſt of them herbaceous perennials. They are very flowery, and riſe from three to eight feet ſtature; terminated by cluſters of compound radiated flowers of a yellow colour. They have all perennial fibrous roots, and annual ſtalks, which riſe in the ſpring, flower from July to October, and decay to the root in November. The flowers are all ſhaped like ſun-flowers, but ſmaller, and are very ornamental. They are eaſily propagated by ſlipping or dividing the roots in autumn, when the ſtalks decay; planting the ſlips at once where they are to remain; after which they will require no farther trouble than to be kept free from weeds, and have the decayed ſtalks cut annually in autumn.

CORFE-CASTLE, a borough-town in Dorſetſhire in England. It takes its name from a ſtrong caſtle, belonging to the crown, that ſtood there, but is now ruined. It ſends two members to parliament. W. Long. 2. 8. N. Lat. 50. 33.

CORFU, an iſland in the Ionian ſea, at the mouth of the gulph of Venice, formerly called *Corcyra* and *Phæacia*, famous for the gardens of Alcinous. It belongs at preſent to the Venetians; and forms the bulwark of Chriſtendom againſt the Turks, who have often attempted to reduce it, but without ſucceſs. It is well fortified, and has 50 caſtles; and the number of the inhabitants is ſaid to be about 50,000. The inhabitants are of the Greek church; and the Venetians ſend them a governor and magiſtrates, which are changed every two years. The ſoil is very fruitful, and produces a great deal of wine, olives, and ſeveral other fruits, particularly figs, which are exceedingly good. The chief city is likewiſe called *Corfu*; ſee the following article.

CORFU, a city of the iſland of that name, belonging to the Venetians. It is a large place, ſtrongly fortified and defended by a garriſon of about 10,000 men; which, however, in the opinion of a late traveller, do not appear adequate to the extent of the fortifications. A number of very excellent braſs and iron cannon are mounted on the different forts, which, he obſerves, are ſo divided, that it would take treble the number of their garriſon to defend them. However, the republic of Venice is generally at peace with the different European nations, and the ancient power of the Turks being much decayed, they have little to apprehend; tho' to prevent any ſudden ſurpriſe, the Venetians keep a formidable ſquadron in the harbour of Corfu, and the works have been much improved by Major General Paterſon.—In the late war they had with the Turks, this town was attacked by an army of 80,000 men, and attempted to be ſtormed ſeveral times by the enemy; but the garriſon, which conſiſted of 12,000 men under the command of Count Schulenburg, made ſo brave and gallant a defence, that they always repulſed them, and obliged them to raiſe the ſiege, and abandon the place with conſiderable loſs. For this piece of ſervice the republic has cauſed a magnificent ſtatue to be erected in memory of the Count, with an elegant Latin inſcription, ſetting forth the many eminent ſervices of his military atchievements. The circumference of the city is about four miles; the number of inhabitants on the whole iſland are computed at about 50,000, the greateſt part of whom are Greeks.

This iſland is the reſidence of the governor-general, whoſe juriſdiction extends over all the iſlands ſubject to the republic of Venice, in the Levant ſeas, and is conſidered as one of the greateſt honours they can confer on a ſubject. He is always a nobleman of the firſt rank, and has his appointment for three years only, in which time he makes a tolerable addition to his fortune, and on his return to Venice is generally advanced to the honours of the ſenate. In the city are many handſome Greek churches, the principal of which is that of St Speridione, or the cathedral: It is embelliſhed with ſome excellent paintings, and moſt ſuperbly ornamented. The body of the ſaint from whom it was named, is preſerved entire in a rich ſhrine within the church. The Greeks are moſt of them ſuch fanatics as to be continually offering their devotions at this ſhrine, believing that through the interceſſion of the ſaint they will obtain all their wants; and that by offerings of money their ſins will be forgiven them; by which means the church has amaſſed an immenſe treaſure. The relic of the ſaint is depoſited in a ſilver coffin, richly decorated with precious ſtones. It is in an amazing ſtate of preſervation; he having died in the iſland of Cyprus upwards of 700 years ago; and after remaining 400 years there, was tranſported to this place. Beſides the grand fleet, the Venetians have another of galleys, that are manned by convicts whoſe crimes are not of ſuch a nature as to merit death. The chief diverſions of this place in the winter are operas; they have always a company of comedians for the ſeaſon from Naples. In the ſummer they paſs their time in walking upon the ramparts: few except the governor and great officers of ſtate are permitted to keep carriages. The Corfu people perfectly reſemble the Zanteots in their manners (ſee ZANTE); though it muſt be obſerved in praiſe of the former, that aſſaſſinations are uncommon among them, their laws being too ſevere to permit ſuch practices with impunity. E. Long. 19. 48. N. Lat. 39. 50.

CORIA, a town of Spain, in the kingdom of Leon and province of Eſtremadura, towards the confines of Portugal, with a biſhop's ſee. It is ſeated on a little river called *Alagon*, in a very fertile plain. There is nothing remarkable but the cathedral church, except at a little diſtance a river without a bridge, and a bridge without a river. This was cauſed by an earthquake, which turned the river another way. W. Long. 6. 46. N. Lat. 39. 59.

CORIANDRUM, CORIANDER: A genus of the digynia order, belonging to the pentandria claſs of plants; and in the natural method ranking under the 45th order, *Umbellatæ*. The corolla is radiated; the petals inflexed-emarginated; the involucrum univerſal and monophyllous; the partial involucra halved; the fruit ſpherical. There are only two ſpecies, both of them herbaceous annuals, the leaves of which are uſeful for the kitchen, and the ſeeds for medicine. Both ſpecies have divided ſmall leaves, ſomewhat reſembling parſley: but there is but one ſpecies generally cultivated; namely, the *ſativum*. This hath a ſmall fibrous white root, crowned by many parted leaves, having broadiſh ſegments; and in the centre an upright, round, branchy ſtalk, two feet high, having all the branches terminated by umbels of flowers, which are ſucceeded by globular fruit. It is propagated by ſeed, which when a good crop is wanted, ought to be ſown in March, either in drills a foot aſunder, or by broadcaſt, and then raked in. When the plants are an inch or two high, they ſhould be hoed to ſix or eight inches diſtance. The ſeeds when freſh have a ſtrong diſagreeable ſmell, which improves by drying, and becomes ſufficiently grateful: they are recommended as carminative and ſtomachic. They are alſo much uſed by the brewers both in England and Holland, to give a flavour to their ſtrongeſt beer. The ancients had a notion, that the juice of coriander would deprive people of their ſenſes, and even of life. The leaves are ſometimes uſed for culinary purpoſes in ſoups, and as an ingredient in ſalads; but as they are of a fetid ſmell, they are held in no great eſteem in this country.

CORIARIA, the *Tanner's* or *myrtle-leafed* SUMACH: A genus of the decandria order, belonging to the diœcia claſs of plants; and in the natural method ranking under the 54th order, *Miſcellaneæ*. The male calyx is pentaphyllous; the corolla pentapetalous, very like the calyx, and united with it; the antheræ bipartite. The female calyx is pentaphyllous; the corolla like that of the male; the ſtyles five, ſeeds five, covered with a like number of ſucculent petals, forming altogether the reſemblance of a berry. There are two ſpecies, the myrtifolia and the fœmina. They are both natives of the ſouth of France, but the former is moſt commonly cultivated in Britain. It is a pretty ornamental plant, with a ſhrubby pithy brown ſtem, cloſely branching from the bottom, and forms a buſhy head three or four feet over, thickly garniſhed with oblong, pointed, bright green leaves, having ſmall ſpikes of whitiſh flowers at the ends of the branches. It is eaſily propagated by ſuckers from the root, which it affords plentifully, and may be taken off with fibres every autumn or winter. It may alſo be propagated by layers in autumn, which will take root in a year. It is much uſed in the ſouth of France, where it naturally grows, for tanning of leather, whence its name of *tanner's ſumach*. It alſo dyes a beautiful black colour. The berries are dangerous, and when eaten generally occaſion vertigoes and epilepſies. The old leaves have the ſame effect upon cattle that eat them, but the young leaves are innocent.

CORIDOR, or **CORRIDOR**, in fortification, a road or way along the edge of the ditch, without-ſide: encompaſſing the whole fortification. The word comes from the Italian *coridore*, or the Spaniſh *coridor*.

It is alſo called the *covert-way;* becauſe covered with a glacis, or eſplanade, ſerving it as a parapet. The coridor is about 20 yards broad.

CORIDOR is alſo uſed in architecture, for a gallery or long iſle around a building, leading to ſeveral chambers at a diſtance from each other, ſometimes wholly incloſed, and ſometimes open on one ſide.

CORINNA, a Grecian lady, celebrated for her beauty and poetic talents, was born at Theſſa a city of Bœotio, and was the diſciple of Myrtis another Grecian lady. Her verſes were ſo eſteemed by the Greeks that they gave her the name of the *lyric muſe*. She lived in the time of Pindar, about 495 years before Chriſt; and is ſaid to have gained the prize of lyric poetry from that Poet: but Pauſanias obſerves that her beauty made the judges partial.

CORINTH, a celebrated city of antiquity, for ſome time the moſt illuſtrious of all the Greek cities. It is ſaid to have been founded 1514 years before Chriſt, by Siſyphus the ſon of Eolus, and grandfather of Ulyſſes. Various reaſons are given for its name, but moſt authors derive it from *Corinthus* the ſon of Pelops. It was ſituated in the ſouth part of the Iſthmus which joins the Peloponneſus, now the Morea, to the continent. It conſiſted of a citadel built upon an eminence, and thence named *Acrocorinthus;* beſides which it had two maritime towns ſubject to it, named *Lecheum* and *Cenchrea*. The whole ſtate extended ſcarce half a degree in length or breadth; but ſo advantageouſly were the abovementioned ports ſituated, that they might have gained the Corinthians a ſuperiority, if not a command, over all Greece, had not their advantageous ſituation inclined them to commerce rather than war. For their citadel was almoſt impregnable; and, commanding both the Ionian and Ægean ſeas, they could eaſily cut off all communication from one half of Greece with the other; for which reaſon this city was called one of the fetters of Greece.

But as the genius of the Corinthians led them to commerce rather than martial exploits, their city became the fineſt in all Greece. It was adorned with the moſt ſumptuous buildings, as temples, palaces, theatres, porticoes, &c. all of them enriched with a beautiful kind of columns, which from the city were called *Corinthian*. But though the Corinthians ſeldom or never engaged in a war with a view of enlarging, but rather of defending, their little ſtate, they did not forget to cultivate a good diſcipline both in time of peace and of war. Hence many brave and experienced generals have been furniſhed by Corinth to the other Grecian cities, and it was not uncommon for the latter to prefer a Corinthian general to any of their own.

This city continued to preſerve its liberty till the year before Chriſt 146, when it was pillaged and burnt by the Romans. It was at that time the ſtrongeſt place in the world; but the inhabitants were ſo diſheartened by a preceding defeat, and the death of their general, that they had not preſence of mind enough even to ſhut their gates. The Roman conſul, Mummius, was ſo much ſurpriſed at this, that at firſt he could ſcarce believe it; but afterwards fearing an ambuſcade, he advanced with all poſſible caution. As he met with no reſiſtance, his ſoldiers had nothing to do but deſtroy the few inhabitants who had not fled, and plunder the city. Such of the men as had ſtaid, were all put to the ſword, and the women were ſold for ſlaves. After this the city was ranſacked by the greedy ſoldiers, and the ſpoils of it are ſaid to have been immenſe. There were more veſſels of all ſorts of metal, more fine pictures, and ſtatues done by the greateſt maſters in Corinth, than in any other city in the world. All the princes of Europe and Aſia, who had any taſte in painting and ſculpture, furniſhed themſelves here with their richeſt moveables: here were caſt the fineſt ſtatues for temples and palaces, and all the liberal arts brought to their greateſt perfection. Many ineſtimable pieces of the moſt famous painters and ſtatuaries fell into the hands of the ignorant ſoldiers, who either deſtroyed them or parted with them for a trifle. Polybius the hiſtorian was an eye-witneſs to this barbariſm of the Romans. He had the mortification to ſee two of them playing at dice on a famous picture of Ariſtides, which was accounted one of the wonders of the world. The piece was a Bacchus, ſo exquiſitely done, that it was proverbially ſaid of any extraordinary performance, "It is as well done as the *Bacchus of Ariſtides*." This maſterly piece of painting, however, the ſoldiers willingly exchanged for a more convenient table to play upon: but when the ſpoils of Corinth were put up to ſale, Attalus king of Pergamus offered for it 600,000 ſeſterces, near L. 5000 ſterling. Mummius was ſurpriſed at ſuch a high price offered for a picture, and imagined there muſt be ſome magical virtue it. He therefore interpoſed his authority, and carried it to Rome, notwithſtanding the complaints of Attalus. Here this famous picture was lodged in the temple of Ceres, where it was at laſt deſtroyed by fire, together with the temple. Another extraordinary inſtance of the ſtupidity of Mummius is, that when the pictures were put on board the tranſports, he told the maſters of the veſſels very ſeriouſly, that if any of the things were either loſt or ſpoiled, he would oblige them to find others at their own coſt; as if any other pieces could have ſupplied the loſs of thoſe ineſtimable originals, done by the greateſt maſters in Greece. When the city was thoroughly pillaged, fire was ſet to all the corners of it at the ſame time. The flames grew more violent as they drew near the centre, and at laſt uniting there made one prodigious conflagration. At this time the famous metalline mixture is ſaid to have been made, which could never afterwards be imitated by art. The gold, ſilver, and braſs, which the Corinthians had concealed, were melted, and ran down the ſtreets in ſtreams, and when the flames were extinguiſhed, a new metal was found, compoſed of ſeveral different ones, and greatly eſteemed in after ages.

The town lay deſolate until Julius Cæſar ſettled there a Roman colony; when, in moving the rubbiſh and digging, many vaſes were found of braſs or earth finely emboſſed. The price given for theſe curioſities excited induſtry in the new inhabitants. They left no burying-place unexamined; and Rome, it is ſaid, was filled with the furniture of the ſepulchres of Corinth.

Strabo was at Corinth ſoon after its reſtoration by the Romans. He deſcribes the ſite as follows. "A lofty mountain, in perpendicular height as much as three ſtadia and a half (near half a mile), the aſcent 30 ſtadia (3¾ miles), ends in a pointed ſummit called *Acrocorinthus*. Of this the portion to the north is the moſt ſteep; beneath which lies the city on a level area, at the foot of the Acrocorinthus. The circuit of the city alone has been 40 ſtadia (5 miles), and as much of it as was unſheltered by the mountain has been walled about. Within the incloſure was comprehended alſo the Acrocorinthus, where the mountain was capable of receiving a wall; and as we aſcended, the veſtiges were plain; ſo that the whole circumference exceeded 85 ſtadia (near 11 miles). On the other ſides the mountain is leſs ſteep, but riſes very high, and is viſible all around. Upon the ſummit is a ſmall temple of Venus; and below it the ſpring Pirene, which does not overflow, but is always full of pellucid and potable water. They ſay it unites with ſome other hidden veins, and forms the ſpring at the mountain foot, running into the city, and affording a ſufficient ſupply for the uſe of the inhabitants. In the city is plenty of wells, and in the Acrocorinthus, as they ſay, for we did not ſee any. There they relate the winged horſe Pegaſus was taken as he was drinking, by Bellerophon. Below Pirene is the Siſyphéum, ſome temple or palace of white ſtone, the remains not inconſiderable. From the ſummit is beheld to the north Parnaſſus and Helicon, lofty mountains covered with ſnow; and below both, to the weſt, the Criſſean gulph bounded by Phocis, by Bœotia and the Megaris, and by Corinthia and Sicyonia oppoſite to Phocis. Beyond all theſe are the mountains called the *Oneian*, ſtretching as far as Bœotia and Cithæron from the Scironian rocks on the road to Attica." Strabo ſaw likewiſe Cleonæ from thence. Cenchreæ was then a village. Lechæum had ſome inhabitants.

New Corinth had flouriſhed 217 years when it was viſited by Pauſanias. It had then a few antiquities, many temples and ſtatues, eſpecially about the Agora or market place, and ſeveral baths. The emperor Hadrian introduced water from a famous ſpring at Stymphalus in Arcadia; and it had various fountains alike copious and ornamental. The ſtream of one iſſued from a dolphin, on which was a brazen Neptune; of another, from the hoof of Pegaſus, on whom Bellerophon was mounted. On the right hand, coming along the road leading from the market-place toward Sicyon, was the Odéum and the theatre, by which was a temple of Minerva. The old Gymnaſium was at a diſtance. Going from the market-place toward Lechæum was a gate, on which were placed Phæton and the Sun in gilded chariots. Pirene entered a fountain of white marble, from which the current paſſed in an open channel. They ſuppoſed the metal called *Corinthian braſs* to have been immerged while red hot in this water. On the way up to the Acrocorinthus were temples, ſtatues, and altars; and the gate next Tenea, a village with a temple of Apollo ſixty ſtadia, or ſeven miles and a half diſtant, on the road to Mycenæ. At Lechæum was a temple and a brazen image of Neptune. At Cenchreæ were temples; and by the way from the city a grove of cypreſs-trees, ſepulchres, and monuments. Oppoſite was *the Bath of Helen*, water tepid and ſalt, flowing plentifully from a rock into the ſea. Mummius had ruined the theatre of Corinth, and the munificence of the great Athenian Atticus Herodes was diſplayed in an edifice with a roof inferior to few of the moſt celebrated ſtructures in Greece.

The Roman colony was reſerved to ſuffer the ſame calamity as the Greek city, and from a conqueror more terrible than Mummius, Alaric the ſavage deſtroyer of Athens and univerſal Greece. In a country haraſſed with frequent wars, as the Peloponneſus has ſince been, the Acrocorinthus was a poſt too conſequential to be neglected. It was beſieged and taken in 1459 by Mahomet II.; the deſpots or lords of the Morea, brothers of the Greek emperor who was killed in defending Conſtantinople, refuſing payment of the arrears of the tribute, which had been impoſed by Sultan Morat, in 1447. The country became ſubject to the Turks, except ſuch maritime places as were in the poſſeſſion of the Venetians; and many of the principal inhabitants were carried away to Conſtantinople. Corinth, with the Morea, was yielded to the republic at the concluſion of the war in 1698, and again by it to the Turks in 1715.

Corinth retains its old name, and is of conſiderable extent, ſtanding on high ground, beneath the Acrocorinthus, with an eaſy deſcent toward the gulph of Lepanto; the houſes ſcattered or in parcels, except in the Bazar or market-place. Cypreſſes, among which tower the domes of moſques, with corn-fields, and gardens of lemon and orange-trees, are interſperſed. The air is reputed bad in ſummer, and in autumn exceedingly unhealthy. Wheler relates, that from the top of the Acrocorinthus or Citadel, he enjoyed one of the moſt agreeable proſpects which this world can afford. He gueſſed the walls to be about two miles in compaſs, incloſing moſques, with houſes and churches moſtly in ruins. An hour was conſumed in going up on horſeback. It was a mile to the foot of the hill, and from thence the way was very ſteep, with many traverſes. The families living below were much infeſted by corſairs, and on every alarm flocked up to the caſtle.

According to Dr Chandler, Corinth has preſerved but few monuments of its Greek or Roman citizens. The chief remains, he informs us, are at the ſouthweſt corner of the town, and above the bazar or market; 11 columns ſupporting their architraves, of the Doric order, fluted, and wanting in height near half the common proportion to the diameter. Within them, toward the weſtern end, is one taller, though not entire, which it is likely contributed to ſuſtain the roof. They have been found to be ſtone, not marble; and appear brown, perhaps from a cruſt formed on the outſide. The ruin he judges to be of very remote antiquity, and a portion of a fabric erected not only before the Greek city was deſtroyed, but before the Doric order had attained to maturity. He ſuſpects it to have been the Siſyphéum mentioned by Strabo. North of the Bazar ſtands a large maſs of brick-work, a remnant, it may be conjectured, of a bath or of the Gymnaſium.

The inhabitants are moſt of them Chriſtians of the Greek church, who are allowed liberty of conſcience by the Turks. E. Long. 28. 13. N. Lat. 38. 14.

CORINTH, (the iſthmus of), in the Morea, is a neck of land which joins the Morea to Greece, and reaches from the gulph of Lepanto to that of Egina. Julius Cæſar, Caligula, and Nero, attempted to cut a channel through it, but in vain; and they therefore afterwards built a wall acroſs it, which they called *Hexamilium*, becauſe it was ſix miles in length. This was demoliſhed by Amurat II. and afterwards rebuilt by the Venetians, but was levelled a ſecond time by Mahomet II.

CORINTHIAN, in general, denotes ſomething belonging to Corinth: thus we ſay, Corinthian braſs, Corinthian order, &c.

CORINTHIAN *Braſs*. See BRASS and CORINTH.

CORINTHIAN Order, in architecture, the fourth order of architecture, according to Scamozzi; but Mr Le Clerc makes it the fifth, being the moſt noble and delicate of all the other five. See ARCHITECTURE, nº 47.

CORIO (Bernardine), an hiſtorian, born of an illuſtrious family at Milan, in the year 1460. He was ſecretary of ſtate to that duchy; and the Duke of Lavis Storza appointed him to write the hiſtory of Milan. He died in 1500. The beſt edition of his hiſtory is that of 1503, in folio. It is printed in Italian, and is very ſcarce.

CORIOLANUS (C. Marcius), a famous Roman captain, took Corioli a town of the Volſci, whence he had his ſurname: at laſt, diſguſting the people, he was baniſhed Rome by the tribune Decius. He went to the Volſci, and, perſuading them to take up arms againſt the Romans, they encamped within four miles of the city. He would not liſten to propoſals of peace till he was prevailed upon by his wife Veturia, and his mother Volumnia, who were followed by all the Roman ladies in tears. He was put to death by the Volſci as a traitor that had made them quit their conqueſt: upon which the Roman ladies went into mourning; and in the ſame place where his blood was ſpilled there was a temple conſecrated to Feminine Virtue.

CORIS, in botany: A genus of the monogynia order, belonging to the pentandria claſs of plants; and in the natural method ranking with thoſe of which the order is doubtful. The corolla is monopetalous and irregular; the calyx prickly; the capſule quinquevalved ſuperior. There is only one ſpecies, *viz.* the monſpelienſis, or blue maritime coris. There are two varieties of this plant, one with a red, and the other with a white flower; but theſe are only accidental, and ariſe from the ſame ſeeds. They grow wild about Montpelier, and in moſt places in the ſouth of France: they ſeldom grow above ſix inches high, and ſpread near the ſurface of the ground like heath; and in June, when they are full of flowers, make a very pretty appearance. They may be propagated by ſowing their ſeeds in a bed of freſh earth, and afterwards removing the young plants, ſome into pots, and others into a warm border. They generally bear our winter colds well enough, but ſevere froſts will ſometimes deſtroy them; for which reaſon it is proper to keep ſome of them in pots, which ſhould be put under a hot-bed frame in winter. As they ſeldom produce good ſeeds in this country, they may, in want of theſe, be propagated by ſlips and cuttings, which will take root if planted on a very gentle hot-bed, ſhaded from the ſun, and duly watered.

CORIS is alſo uſed in the Eaſt-Indies for a kind of ſhells which paſs for money.

CORISPERMUM, TICKSEED: A genus of the digynia order, belonging to the monandria claſs of plants; and in the natural method ranking under the 12th order, *Holoraceæ*. There is no calyx; two petals, and one oval naked ſeed. There are two ſpecies; but none of them are remarkable for their beauty or any other quality.

CORITANI, (anc. geog.) a people of Britain, occupying widely the inland parts, as Northampton, Leiceſter, Rutland, Lincoln, Nottingham, and Derby ſhires, (Camden).

CORK, the bark of a tree of the ſame name, a ſpecies of Quercus. See QUERCUS.

To take off the bark they make an inciſion from the top to the bottom of the tree, and at each extremity another round the tree, perpendicular to the firſt. When ſtripped from the tree, which does not therefore die, the bark is piled up in a pond or ditch, and loaded with heavy ſtones to flatten it, and reduce it into tables: hence it is taken to be dried; and when ſufficiently dry, put in bales for carriage. If care be not taken to ſtrip the bark, it ſplits and peels off itſelf; being puſhed up by another bark formed underneath.

The bark of cork, as well as the acorn, are of ſome uſe in medicine; being both reputed aſtringents, after being burnt and powdered when uſed externally; but the chief employ of the former is, to put in ſhoes, ſlippers, &c. and to ſtop bottles. The Spaniards burn it to make that kind of light black we call *Spaniſh black*, uſed by painters. Cups made of cork, are ſaid by ſome to be good for hectical perſons to drink out of. The Egyptains made coffins of cork; which being lined with a reſinous compoſition, preſerved dead bodies uncorrupted. The Spaniards line ſtone-walls with it, which not only renders them very warm, but corrects the moiſture of the air.

Foſſil-Cork, a name given to a kind of ſtone. It ſeems to be a ſpecies of amianthus, conſiſting of flexible fibres looſely interwoven, and ſomewhat reſembling vegetable cork. It is the lighteſt of all ſtones; by fire it is fuſible, and forms a black glaſs. It poſſeſſes the general qualities of amianthus. See that article.

Cork, in Latin *comitatus Corcagienſis*, a county of the province of Munſter in Ireland. It is the moſt populous and conſiderable county of the kingdom next to that of Dublin; containing near a million of acres, and being divided into 15 baronies. It is bounded on the north-eaſt by the county of Waterford; on the weſt by Kerry; by Limeric on the north; and by the ſea on the ſouth and ſouth-eaſt. Including Deſmond it is 85 miles in length and 50 in breadth; but is very unequal both ways. Though a conſiderable part of the country is boggy, mountainous, and barren; yet by the induſtry of the inhabitants it is pretty well cultivated and improved, and contains ſeveral good towns and harbours.

Cork, a city of Ireland, and capital of the county of that name. It is an epiſcopal ſee; and is the largeſt and moſt populous of any in the kingdom, Dublin alone excepted. It is ſituated on the river Lee, 15 miles from its mouth. It is a place of great trade, the harbour here being one of the fineſt in the world. Though ſmaller veſſels can come up to the key, yet the larger generally ride at a place called *Paſſage*. This city, together with its liberties, makes a county. It was built, or rather fortified, by the Danes, in the ninth century. The greateſt part of it ſtands on a marſhy iſland ſurrounded by the river Lee, which alſo runs through the city, and divides it into ſeveral canals. On this account ſome have thought the air very moiſt and unwholeſome. Complaints have alſo been made againſt the water as impure; but, from comparing the bills of mortality with thoſe of other cities, it appears that the city of Cork is far from being unhealthy. This hath been accounted for from the influx of the tide, by which a ſtagnation of air is prevented. The firſt charter of Cork was beſtowed by Henry III. and afterwards ratified by Edward I. Edward II. and Edward III. Edward IV. granted a new charter; and the city received many favours from the ſucceeding monarchs. King James I. gave the citizens a new and ample charter; and king Charles I. what is called the Great Charter, by which, among others, a clauſe in king James's charter was enforced, making this city a county of itſelf. The ſee of Cork is reputed worth L. 2700 a-year. The chapter conſiſts of a dean, chanter, chancellor, treaſurer, archdeacon, and twelve prebendaries. The church is dedicated to St Barr or Finbarr; and the dioceſe is divided into five deaneries. There is very little to be found in ancient writers concerning the foundation of the Cathedral of Cork; yet it is generally aſcribed to St Barr in the ſeventh century. Many of its biſhops have been great benefactors to it. Through length of time, the church became quite ruinous; but it hath lately been completely rebuilt, and is now an elegant modern ſtructure. To defray the expence, the parliament laid a tax on all coals conſumed in the city of Cork. The deanery is reputed to be worth L. 400 a-year.

Cork is much improved and enlarged, ſeveral broad ſtreets have been lately added, by filling up the canals that formerly ran through them, and are now built up with elegant houſes; the parade is very ſpacious, and is adorned with an equeſtrian ſtatue of king George II. It hath the largeſt export in the kingdom, particularly of beef, hides, tallow, butter, fiſh, and other proviſions. It is partly ſituated on ſeveral iſlands, formed by the river Lee, which are banked and quayed in, ſomewhat like the towns in Holland; and partly on riſing grounds, on the north and ſouth ſides of the river. The earl of Marlborough beſieged and took it from king James's army in 1690; when the duke of Grafton, who ſerved as a volunteer, was ſlain in an attack. It contains about 8600 houſes, and upwards of 70,000 inhabitants. It hath twelve companies of foot quartered in the barracks. Beſides a ſtately cathedral, built from the foundation, between 1725 and 1735, by the produce of a duty upon coals, as above noticed, it is adorned with ſeveral handſome pariſh churches. It has alſo an elegant exchange for the merchants, a new and beautiful cuſtom-houſe, a town-hall, ſeveral fine hoſpitals, and various other public ſtructures. The city poſſeſſes an annual revenue of about 1300l. out of which the mayor enjoys for his ſalary and the ſupport of his dignity 500l. The wealth and grandure of Cork ariſe from its capacious and commodious haven, where almoſt any number of ſhips may lie with eaſe and ſafety. According to ſome accounts, when there has been no war, 1200 veſſels have reſorted hither in a year. Ships from England, bound to all parts of the Weſt Indies, take in here a great part of their proviſions; and on the ſame account the haven of Cork is viſited by thoſe alſo of moſt other nations. The ſlaughtering ſeaſon continues from the month of Auguſt to the latter end of January; in which ſpace it has been computed, that they kill and cure ſeldom fewer than 100,000 head of black cattle. The reſt of their exports conſiſt of butter, candles, hides, raw and tanned, linen cloth, pork, calves, lambs, and rabbit-ſkins, tallow, wool for England, linen and woollen yarn, and worſted. The merchants of Cork carry on a very extenſive trade to almoſt all parts of the known world; ſo that their commerce is annually increaſing. The produce of the cuſtoms ſome years ſince exceeded 60,000l. and the number of ſhips that they employ is double to what it was forty years ago. The only thing that ſeemed to be wanting to the ſecurity of the port of Cork was ſupplied in the earl of Cheſterfield's memorable adminiſtration, by building a fort on the great iſland, to command the entrance of the haven. The outlets of Cork are cheerful and pleaſant. The country around the city, on both ſides of the river, is hilly and pictureſque; and the harbour called the *Cove*, is one of the beſt in the world; the entrance is ſafe, and the whole navy of England might ride in it, ſecure from every wind that blows. Ships of burden, however, are obliged to unload at Paſſage, five miles and a half from Cork, the channel not admitting veſſels of above 150 tons.

Cork Jacket, or *Waiſtcoat*, is an invention of one Mr Dubourg, a gentleman very fond of ſwimming, but ſubject to the cramp, which led him to conſider of ſome method by which he might enjoy his favourite diverſion with ſafety. The waiſtcoat is compoſed of four pieces of cork, two for the breaſts and two for the back; each pretty near in length and breadth to the quarters of a waiſtcoat without flaps;

the whole is covered with coarſe canvas, with two holes to put the arms through: there is a ſpace left between the two back-pieces, and the ſame betwixt each back and breaſt-piece, that they may ſit the eaſier to the body. Thus the waiſtcoat is only open before, and may be faſtened on the wearer with ſtrings, or, if it ſhould be thought more ſecure, with buckles and leather ſtraps. This waiſtcoat does not weigh above 12 ounces, and may be made up for about 5 or 6 ſhillings expence. Mr Dubourg tried his waiſtcoat in the Thames, and found that it not only ſupported him on the water, but that two men could not ſink him, tho' they uſed their utmoſt efforts for that purpoſe. If thoſe who uſe the ſea occaſionally, and eſpecially thoſe who are obliged to be almoſt conſtantly there, were to have thoſe waiſtcoats, it would be next to impoſſible that they ſhould be drowned. It would alſo be of vaſt ſervice to thoſe that, for the ſake of health, bathe in the ſea; and even the moſt delicate and timorous young lady might by the help of one of theſe jackets venture into a rough ſea. See *Air-Jacket, and Bamboo-Habit*.

CORMANDEL. See Coromamdel.

COR-MASS, the name of a grand proceſſion, ſaid to have been eſtabliſhed at Dunkirk during the dominion of Charles V. and renewed on St John's day, the twenty-fourth of June. After the celebration of high maſs, the proceſſion, conſiſting of the ſeveral tradeſmen of the town, begins. Each perſon has a burning taper of wax in his hand; and after each company comes a pageant, followed by the patron-ſaint, uſually of ſolid ſilver, richly wrought and adorned. The companies are followed by muſic; and after the muſicians, the friars in the habits of their order, the ſecular prieſts, and then the abbot magnificently adorned and preceded by the hoſt. Machines likewiſe of various fantaſtical forms and devices, and as variouſly accoutred, form a part of the ſhow on this occaſion: which is deſcribed as one of the moſt ſuperb and magnificent in the world, by an eye-witneſs, in 1735.

CORMORANT, a corruption of corvorant, in ornithology. See Pelicanus.

CORN, in country affairs, the grain or ſeeds of plants ſeparated from the ſpica or ear, and uſed for making bread.

There are ſeveral ſpecies, of corn, ſuch as wheat, rye, and barley, millet and rice, oats, maize and lentils, peaſe, and a number of other kinds; each of which has its uſefulneſs and propriety.

Europe, in every part of it; Egypt, and ſome othe cantons of Africa, particularly the coaſts of Barbary; and ſome parts of America cultivated by the Europeans, particularly New England, New France, and Acadia; are the places which produce corn. Other countries have maize and rice in lieu of it; and ſome parts of America, both in the iſlands and continents, ſimple roots, ſuch as potatoes and manioc.—Egypt was anciently the moſt fertile of all other countries in corn; as appears both from ſacred and profane hiſtory. It furniſhed a good part of the people ſubject to the Roman empire, and was called the *dry nurſe of Rome and Italy*. Britain, France, and Poland, ſeem now in the place of Egypt, and with their ſuperfluities ſupport a good part of Europe.

For the firſt diſcovery and culture of corn, authors are much divided: the common opinion is, that in the firſt ages men lived on the ſpontaneous fruits of the earth; as acorns, and the nut or maſt produced by the beech; which, they ſay, took its name *ſagus*, from the Greek φαγω, *I eat*. It is added, that they had not either the uſe of corn, nor the art of prepiring or making it eatable.

Ceres has the credit of being the firſt that ſhowed the uſe of corn, on which account ſhe was placed among the gods; others give the honour to Triptolemus; others ſhare it between the two, making Ceres the firſt diſcoverer, and Triptolemus the firſt planter and cultivator of corn. Diodorus Siculus aſcribes the whole to Iſis; on which Polydore Virgil obſerves, he does not differ from the reſt; Iſis and Ceres being, in reality, the ſame. The Athenians pretend it was among them the art began; and the Cretans or Candiots, Sicilians, and Egyptians, lay claim to the ſame. Some think the title of the Sicilians beſt ſupported, that being the country of Ceres: and authors add, ſhe did not teach the ſecret to the Athenians, till ſhe had firſt inſtructed her own countrymen. Others ſay, Ceres paſſed firſt into Attica, thence into Crete, and, laſt of all, into Sicily: many of the learned, however, maintain it was in Egypt the art of cultivating corn firſt began; and it is certain there was corn in Egypt and the Eaſt long before the time of Ceres.

Corn is very different from fruits, with reſpect to the manner of its preſervation; and is capable of being preſerved in public granaries for preſſing occaſions, and of being kept for ſeveral centuries.—A little time after the ſiege of Mentz, under Henry II. of France, in the year 1578, the duc d'Eſpernon laid up vaſt ſtores of corn in the citadel; which was preſerved in good plight to the year 1707, when the French king and his retinue paſſing that way, eat bread baked thereof.

The chief thing that contributes to the preſervation of corn is, a cruſt which forms on its ſurface, by the germination of the grain next underneath, to the thickneſs of an inch and a half. On that at Mentz people walked, without it giving the leaſt way. At Sedan was a granary cut in a rock, wherein a heap of corn was preſerved a hundred and ten years: it was covered with a cruſt a foot thick.

For the preſervation of corn, the firſt method is to let it remain in the ſpike; the expedient that was for conveying it to the iſlands and provinces of America. The inhabitants of thoſe countries ſave it in the ear, and raiſe it to maturity by that precaution: but this method of preſerving it is attended with ſeveral inconveniencies in Britain; corn is apt to rot or ſprout, if any the leaſt moiſture is in the heap; the rats likewiſe infeſt it, and the want of ſtraw alſo obliges us to ſeparate the grain from the ear. The ſecond is to turn out and winnow it frequently; or to pour it through a trough or mill-hopper, from one floor to another; being thus moved and aired every 15 days, for the firſt 6 months, it will require leſs labour for the future, if lodged in a dry place; but if through neglect, mites ſhould be allowed to ſlide into the heap, they will ſoon reduce the corn to a heap of duſt: this muſt be avoided by moving the corn anew, and rubbing the places adjacent with oils and herbs, whoſe ſtrong odour may chace them away; for which garlic and dwarf-elder are very effectual: they may likewiſe be expoſed to the open ſun, which immediately kills them. When the corn has been preſerved from all impurities for the ſpace of two years, and has exhaled all its fires, it may be kept for 50 or even 100 years, by lodging it in pits covered with ſtrong planks, cloſely joined together: but the ſafer way is to cover the heap with quicklime, which ſhould be diſſolved by ſprinkling it over with a ſmall quantity of water; this cauſes the grains to ſhoot to the depth of two or three fingers; and incloſes them within an incruſtation, as abovementioned, through which neither air nor inſects can penetrate.

Indian Corn or maize. See Zea.

Corn-Butterfly, method of deſtroying it. See Agriculture, n° 80.

Corn-Crake. See Rallus.

Corn-Mill, a water-engine for grinding of corn. See Mechanics.

CORNS, in ſurgery, hard excreſcences, conſiſting of indurations of the ſkin ariſing on the toes, and ſometimes on the ſides of the feet, where they are much expoſed to the preſſure of the ſhoes. By degrees they preſs themſelves farther down between the muſcular fibres on theſe parts, and by their irritation occaſion extreme pain. Many cures have been preſcribed, but the total removal of them is always found to be attended with great difficulty. It has been recommended to ſoften them with plaſters, and then to pull them up by the roots, to apply cauſtic, &c. A piece of raw beef laid on by way of plaſter, and frequently ſhifted, is alſo ſaid to be effectual; but the beſt cure is to bathe them frequently in warm water, and pare away as much as poſſible of the indurated ſkin without drawing blood.

Corn, in farriery. See Farriery.

CORNAGE, an ancient tenure, the ſervice whereof was to blow a horn when any invaſion of the Scots was perceived. This tenure was very frequent in the northern counties near the Picts wall; but by ſtat. 12. Car. II. all tenures are converted into free and common ſocage.—An old rental calls cornage, *newtgeldt*, q. d. *neat-geld*. Lord Coke ſays, in old books it is called *horngeld*.

CORNARISTS, in eccleſiaſtical hiſtory, the diſciples of Theodore Cornhert, an enthuſiaſtic ſecretary of the ſtates of Holland. He wrote at the ſame time againſt the Catholics, Lutherans, and Calviniſts. He maintained that every religious communion needed reformation; but he added, that no perſon had a right to engage in accompliſhing it, without a miſſion ſupported by miracles. He was alſo of opinion, that a perſon might be a good Chriſtian without being a member of any viſible church.

CORNARIUS, or Haguenbot, (John), a celebrated German phyſician, born at Zwickow in Saxony. His preceptor made him change his name of Haguenbot to that of Cornarius, under which he is moſt known. At 20 years of age he taught grammar, and explained the Greek and Latin poets and orators to his ſcholars; and at 23 was licentiate in medicine. He found fault with moſt of the remedies provided by the apothecaries; and obſerving, that the greateſt part of the phyſicians taught their pupils only what is to be found in Avicenna, Raſis, and the other Arabian phyſicians, he carefully ſought for the writings of the beſt phyſicians of Greece, and employed about 15 years in tranſlating them into Latin, eſpecially the works of Hippocrates, Aetius, Eginetes, and a part of thoſe of Galen. Meanwhile he practiſed phyſic with reputation at Zwickow, Francfort, Marpurg, Nordhauſen, and Gena, where he died of an apoplexy in 1558, aged 58. He alſo wrote ſome medicinal treatiſes; publiſhed editions of ſome poems of the ancients on medicine and botany; and tranſlated ſome of the works of the fathers, particularly thoſe of Baſil, and a part of thoſe of Epiphanius.

CORNARO (Lewis), a Venetian of noble extraction, memorable for having lived healthful and active to above 100 years of age by a rigid courſe of temperance. By the ill conduct of ſome of his relations he was deprived of the dignity of a noble Venetian; and ſeeing himſelf excluded from all employments under the republic, he ſettled at Padua. In his youth he was of a weak conſtitution; and by irregular indulgence reduced himſelf, at about 40 years of age, to the brink of the grave, under a complication of diſorders; at which extremity he was told that he had no other chance for his life, but by becoming ſober and temperate. Being wiſe enough to adopt this wholeſome council, he reduced himſelf to a regimen of which there are very few examples. He allowed himſelf no more than 12 ounces of food and 14 ounces of liquor each day; which became ſo habitual to him, that when he was above 70 years of age, the experiment of adding two ounces to each by the advice of his friends, had like to have proved fatal to him. At 83, he wrote a treatiſe which has been tranſlated into Engliſh, and often printed, intitled, *Sure and certain Methods of attaining a Long and Healthful Life*; in which he relates his own ſtory, and extols temperance to a degree of enthuſiaſm. At length, the yolk of an egg became ſufficient for a meal, and ſometimes for two, until he died with much eaſe and compoſure in 1566. The writer of the Spectator, n° 195. confirms the fact from the authority of the Venetian ambaſſador at that time, who was a deſcendant of the Cornaro family.

CORNAVII (Ptolemy), a people of Britain, beginning in the very heart of the iſland, and extending to Cheſter. Now *Warwick*, *Worceſter*, *Salop*, *Stafford* ſhires, and *Cheſhire* (Camden).

CORNEA tunica, in anatomy, the ſecond coat of the eye; ſo called from its ſubſtance reſembling the horn of a lantern, in Latin *cornu*. See Anatomy, n° 142.

CORNEILLE (Peter), a celebrated French poet, was born at Rouen in the year 1606. He was brought up to the bar, which he attended for ſome little time; but formed with a genius too elevated for ſuch a profeſſion, and having no turn for buſineſs, he ſoon deſerted it. An affair of gallantry occaſioned his writing his firſt piece, intitled *Melite*; which had prodigious ſucceſs. Encouraged by the applauſe of the public, he wrote the Cid, and the other tragedies that have immortalized his name. In his dramatic works he diſcovers a majeſty, a ſtrength and elevation of genius, ſcarce to be found in any other of the French poets; and, like the immortal Shakeſpeare, ſeems better acquainted with nature than with the rules of critics. Corneille was received into the French academy in 1647, and died dean of that academy in 1684, aged 73. Beſides his dramatic pieces, he wrote a tranſlation, in French verſe, of the "Imitation of Jeſus Chriſt," &c. The beſt edition of his works is that of 1682, in 4 vols 12mo.

Corneille (Thomas), brother of the former, was a member of the French academy and of that of inſcriptions. He diſcovered in his youth a great inclination to poetry; and at length publiſhed ſeveral dramatic pieces in 5 vols 12mo, ſome of which were applauded by the public, and acted with ſucceſs. He alſo wrote, 1. A tranſlation of Ovid's Metamorphoſes, and of ſome of Ovid's Epiſtles; 2. Remarks on Vauglas; 3. A Dictionary of Arts, 2 vols folio; and, 4. An univerſal, geographical, and hiſtorical Dictionary, in 3 vols folio.

Corneille (Michael), a celebrated painter, was born at Paris in the year 1642; and was inſtructed by his father, who was himſelf a painter of great merit. Having gained a prize at the academy, young Corneille obtained a penſion from Louis XIV.; and was ſent to Rome, where that prince had founded a ſchool for young artiſts of genius. Having ſtudied there ſome time, he gave up his penſion, and applied to the antique with great care. He is ſaid to have equalled Carache in drawing, but in colouring he was deficient. Upon his return from Rome, he was choſen profeſſor in the academy of Paris; and was employed by the above prince in all the great works he was carrying on at Verſailles and Trianon, where are ſtill to be ſeen ſome noble efforts of his genius.

CORNEL-TREE, in botany. See Cornus.

CORNELIA, daughter of Scipio Africanus, was the mother of Tiberius and Caius Gracchus. She was courted by a king, but ſhe preferred being the wife of a Roman citizen to that of a monarch. Her virtues have been deſervedly commended, as well as the wholeſome principles ſhe inculcated in her two ſons. When a Campanian lady made once a ſhow of her jewels at Cornelia's houſe, and entreated her to favour her with a ſight of her own, Cornelia produced her two ſons, ſaying, "Theſe are the only jewels of which I can boaſt."

***Cornelia** Lex, de civitate*, was enacted, in the year of Rome 670, by L. Corn. Sylla. It confirmed the Sulpician law, and required that the citizens of the eight newly elected tribes ſhould be divided among the 35 ancient tribes.—Another, *de judiciis*, in 673, by the ſame. It ordained, that the prætor ſhould always obſerve the ſame invariable method in judicial proceedings, and that the proceſs ſhould not depend upon his will.—Another, *de ſumptibus*, by the ſame. It limited the expences which generally attended funerals.—Another, *de religione*, by the ſame, in 677. It reſtored to the college of prieſts the privilege of chooſing the prieſts, which by the Domitian law had been lodged in the hands of the people.—Another, *de municipiis*, by the ſame; which revoked all the privileges which had been ſome time before granted to the ſeveral towns that had aſſiſted Marius and Cinna in the civil wars.—Another, *de magiſtratibus*, by the ſame; which gave the power of bearing honours, and being promoted before the legal age, to thoſe who had followed the intereſt of Sylla; while the ſons and partizans of his enemies, who had been proſcribed, were deprived of the privilege of ſtanding for any office in the ſtate.—Another, *de magiſtratibus*, by the ſame, in 673. It ordained, that no perſon ſhould exerciſe the ſame office within ten years diſtance, or be inveſted with two different magiſtracies in one year.—Another, *de magiſtratibus*, by the ſame, in 673. It diveſted the tribunes of the privilege of making laws, interfering, holding aſſemblies, and receiving appeals. All ſuch as had been tribunes were incapable of holding any other office in the ſtate by that law.—Another, *de majeſtate*, by the ſame in 670. It made it treaſon to lend an army out of a province, or engage in a war without orders, to influence the ſoldiers to ſpare or ranſom a captive general of the enemy, to pardon the leaders of robbers or pirates, or for the abſence of a Roman citizen to a foreign court without previous leave. The puniſhment was *aquæ & ignis interdictio*.—Another by the ſame. It gave the power to a man accuſed of murder, either by poiſon, weapons, or falſe accuſations, and the ſetting fire to buildings, to chooſe whether the jury that tried him ſhould give their verdict *clam* or *palam, viva voce* or by ballot. Another by the ſame; which made it *aquæ & ignis interdictio* to ſuch as were guilty of forgery, concealing and altering of wills, corruption, falſe accuſations, and the debaſing or counterfeiting of the public coin. All ſuch as were acceſſary to this offence were deemed as guilty as the offender.—Another, *de pecuniis repetundis*; by which a man convicted of peculation or extortion in the provinces was condemned to ſuffer the *aquæ & ignis interdictio*.—Another by the ſame; which gave the power to ſuch as were ſent into the provinces with any government, of retaining their command and appointment without a renewal of it by the ſenate, as was before obſerved.—Another by the ſame; which ordained, that the lands of proſcribed perſons ſhould be common, eſpecially thoſe about Volaterræ and Feſulæ in Etruria, which Sylla divided among his ſoldiers.—Another by C. Cornelius tribune of the people, in 686. It ordained, that no perſon ſhould be exempted from any law according to the general cuſtom, unleſs 200 ſenators were preſent in the ſenate; and no perſon thus exempted could hinder the bill of his exemption from being carried to the people for their concurrence.—Another by Naſſica, in 582, to make war againſt Perſeus, ſon of Philip king of Macedonia, if he did not give proper ſatisfaction to the Roman people.

CORNELIAN. See Carnelian.

CORNER, in a general ſenſe, the ſame with Angle.

CORNET, in the military art of the ancients, an inſtrument much in the nature of a trumpet; which when it only ſounded, the enſigns were to march alone without the ſoldiers; whereas, when the trumpet only ſounded, the ſoldiers were to move without the enſigns. The cornets and buccinæ ſounded the charge and retreat; and the cornets and trumpets ſounded during the courſe of the battle. See Plate CL.

Cornet, in modern military œconomy, denotes an officer in the cavarly who bears the enſign or colours of a troop.

The cornet is the third officer in the company, and commands in the abſence of the captain and leutenant.

He takes his title from his enſign, which is ſquare; and is ſuppoſed to be called by that name from *cornu*, becauſe placed on the wings, which form a kind of points or horns of the army.—Others derive the name from *coronet*; alleging, that it was the ancient cuſtom for theſe officers to wear coronets or garlands on their heads.

CORNEUS, the name by which Linnæus calls a kind of tin-ore, found in black columns, with irregular ſides, and terminating in priſms.

CORNICHE, CORNISH, or CORNICE, in architecture, the uppermoſt member of the entablature of a column as that which crowns the order. See ARCHITECTURE, Chap. I. and the Plates.

CORNICHE, is alſo uſed, in general, for all little projectures in maſonry or joinery, even where there are no columns, as the corniche of a chimney, beaufet, &c.

CORNICHE-Ring, a piece of ordnance, is that next from the muzzle-ring, backward.

CORNICULARIUS, in antiquity, an officer in the Roman army, whoſe buſineſs was to aid and aſſiſt the military tribune in quality of a lieutenant.

The *cornicularii* went the rounds in lieu of the tribune, viſited the watch, and were nearly what the aids major are in the French army.

The denomination *cornicularius* was given them from a little horn, called *corniculum*, which they uſed in giving orders to the ſoldiers: though Salmaſius derives it from *corniculum*, the creſt of an head-piece; it being an obſervation of Pliny, that they wore iron or braſs horns on their helmets; and that theſe were called *cornicula*.

In the *Notitia Imperii* we find a kind of ſecretary or regiſter of the ſame name. His buſineſs was to attend the judge, and enter down his ſentences and deciſions. The critics derive the word, in this ſenſe, from *corniculum*, a little horn to put ink in.

CORNICULUM (anc. geog.), a town of the Sabines, to the eaſt of Cruſtumerium, towards the Anio. It was burnt down by Tarquin; but reſtored again, after the expulſion of the kings, (Florus). Now in ruins, called *il Monte Gennaro*, (Holſtenius).

CORNISH DIAMOND, a name given by many people to the cryſtals found in digging the mines of tin in Cornwal. See CORNWAL, p. 462. col. 2.

CORNIX, in ornithology, the trivial name of a ſpecies of CORVUS.

CORNU. See HORN.

CORNU Ammonis, in natural hiſtory, foſſile ſhells, called alſo *ſerpent-ſtones*, or *ſnake-ſtones*.

They are found of all ſizes, from the breadth of a ſixpence, to more than two feet in diameter; ſome of them rounded, others greatly compreſſed, and lodged in different ſtrata of ſtones and clays; ſome again are ſmooth, and others ridged in different manners, their ſtriæ and ridges being either ſtraight, irregularly crooked, or undulated. See *SNAKE-Stone*.

CORNU Cervi. See HARTSHORN.

CORNUCOPIA, among the ancient poets, a horn out of which proceeded plenty of all things; by a particular privilege which Jupiter granted his nurſe, ſuppoſed to be the goat Amalthea. The fable is thus interrupted: That in Lybia there is a little territory ſhaped not unlike a bullock's horn, exceeding fertile, given by king Ammon to his daughter Amalthea, whom the poets feign to have been Jupiter's nurſe.

In architecture and ſculpture, the cornucopia, or horn of plenty, is repreſented under the figure of a large horn, out of which iſſue fruits, flowers, &c. On medals, F. Joubert obſerves, the cornucopia is given to all deities.

CORNUCOPIÆ, in botany: A genus of the digynia order, belonging to the triandria claſs of plants; and in the natural method ranking under the 4th order, *Gramina*. The involucrum is monophyllous, funnel-ſhaped, crenated, and multiflorous; the calyx bivalved; corolla one valved.

CORNUS, CORNEL-TREE, CORNELIAN CHERRY, or DOG-WOOD: A genus of the monogynia order, belonging to the tetrandria claſs of plants; and in the natural method ranking under the 47th order, *Stellatæ*. The involucrum is moſt frequently tetraphyllous; the petals above the receptacle of the fruit four; the fruit itſelf a bilocular kernel.

Species. Of this genus there are five ſpecies; the moſt remarkable are the following. 1. The mas, or cornelian cherry-tree, hath an upright tree-ſtem, riſing 20 feet high, branching, and forming a large head, garniſhed with oblong leaves, and ſmall umbels of yellowiſh-green flowers at the ſides and ends of the branches, appearing early in the ſpring, and ſucceeded by ſmall, red, cherry-like, eatable, acid, fruit. 2. The ſanguinea, bloody-twig, or common dogwood: hath an upright tree-ſtem, branching 10 or 12 feet high, having blood-red ſhoots, garniſhed with oblong pointed nervous leaves two inches long; and all the branches terminated by umbellate white flowers ſucceeded by black berries: of this there is a kind with variegated leaves. 3. The florida, or Virginian dogwood, hath a tree-ſtem branching 12 or 15 feet high, and fine red ſhoots garniſhed with large heart-ſhaped leaves; and the branches terminated by umbellate white flowers, having a large involucrum ſucceeded by dark red berries. Of this ſpecies there are ſeveral varieties, chiefly diſtinguiſhed by the colour of their berries, which are red, white, or blue.

Culture. All the ſpecies may be propagated by ſeeds, which ought to be ſown in autumn, otherwiſe they will lie a year in the ground. When the plants come up, they ſhould be duly watered in dry weather, and kept clean from weeds. The following autumn they may be tranſplanted into the nurſery; and having remained there two or three years, they may then be removed to the places where they are to remain. They may alſo be propagated by ſuckers, of which they produce great plenty, or by laying down the young branches.

CORNUTIA, in botany: A genus of the angioſpermia order, belonging to the didynamia claſs of plants; and in the natural method ranking under the 40th order, *Perſonatæ*. The calyx is quinquedentated; the ſtamina larger than the corolla; the ſtyle very long; the berry monoſpermous. There is but one ſpecies, *viz*. the pyramidata, with a blue pyramidal flower, and hoary leaves. It grows plentifully in ſeveral of the iſlands of the Weſt Indies, alſo at Campeachy, and at La Vera Cruz. It riſes to the height of 10 or 12 feet, with rude branches, the leaves being placed oppoſite. The flowers are produced in ſpikes at the end of the branches, and are of a fine blue colour. They uſually appear in autumn, and will ſometimes remain in beauty for two months or more. It is propagated either by ſeeds or cuttings, and makes a fine appearance in the ſtove; but is too tender to bear the open air in this country.

CORNWAL, the moſt weſterly county of England, bounded by the Engliſh channel on the ſouth, St George's channel on the weſt, the Briſtol channel on the north, and on the eaſt by the river Tamar, which ſeparates it from Devonſhire. Its name is ſuppoſed by ſome to be compounded of *carn*, ſignifying "a rock" in the Britiſh language, and *Gauls*, or *Waules*, the name the Saxons gave to the Britons. Others, however, think it is derived from the Latin *cornu*, or the Britiſh *kern*, "a horn;" on account of its running out into the ſea ſomewhat in the form of a horn. Hither the ancient Britons (as well as in Wales) retired on the intruſion of the Saxons, where they oppoſed their further conqueſts. In this part of the iſland they formed a kingdom that exiſted for many years after, under different princes, amongſt whom were Ambroſius Aurelius, and the juſtly celebrated Arthur; nor were they ſubdued till the middle the 7th century, from which time Cornwal was conſidered as ſubject to the Weſt Saxon kings, who begun their ſovereignty in 519, and continued it till 828, under 18 ſovereigns, the laſt of whom was the great Egbert, who ſubdued all the others; and by uniting them, formed the kingdom of England, when this country was included in the county of Devon, then the 9th diviſion; and that accounts for Alfred's not mentioning Cornwal, which on forming the circuits after the Norman conqueſt, is included in the weſtern circuit. In 1337, Edward III. erected it into a dukedom, and inveſted with it *Edward the Black Prince*. But this, according to the expreſs words of the grant, is limited to the firſt-born ſon and heir, on which account Richard II. was created duke of Cornwal by charter. So was Henry V. by his father Henry IV. Henry IV. delivered the duchy to his ſon prince Edward, and Edward IV. created his ſon Edward V. duke of Cornwal, as did Henry VII. his ſon, afterwards Henry VIII. upon the death of his elder brother Arthur. James I. created his ſon Henry duke of Cornwal, which title on his deceaſe came to his brother Charles. The eldeſt ſons of ſucceeding kings have enjoyed this title by inheritance. Theſe not only appoint the ſheriff, but all writs, deeds, &c. are in their name, and not in the king's; and they have alſo peculiar royalties and prerogative diſtinct from the crown, for which they appoint the officers. This county is 80 miles long, 40 broad, and 250 in circumference; containing 960,000 acres, and 126,000 inhabitants. It is divided into 9 hundreds; has 27 market towns, *viz.* Launceſton, Truro, Falmouth, Helſton, Saltaſh, Bodmyn, St Ives, Tregony, Camelford, Fowey, St Germains, Penryn, Callington, St Auſtle, Eaſt Looe, Padſtow, St Colomb, Penſance, Grampound, Leſkard, Leſtwithiel, St Mawes, St Michael, Newport, Market Jew, Stratton, and Redruth; 1230 villages, 161 pariſhes, 89 vicarages, provides 640 men to the militia, and pays 8 parts of the land-tax. Its chief rivers are the Tamer, Fale, Cober, Looe, Camel, Fowe, Haile, Lemara, Kenſe, and Aire. Its principal capes or head-lands are the Land's-end, the Lizard, Cape Cornwal, Deadman's-head, Rame-head, &c. and a cluſter of iſlands, 145 in number, called the *Scilly Iſles*, ſuppoſed formerly to have been joined to the main land, though now 30 miles diſtant; abounding with antiquities, particularly druidical.

As Cornwal is ſurrounded by the ſea on all ſides except the eaſt, its climate is ſomewhat different from that of the other parts of Britain. The reaſons of this difference will be eaſily underſtood from what is obſerved concerning the climate of America. The ſummers in Cornwal are leſs hot, and the winters leſs cold than in other parts of England, and the ſpring and harveſt are obſerved to be more backward. High and ſudden winds are alſo more common in this than in other counties of England. The county is rocky and mountainous; but the mountains are rich in metals, eſpecially tin and copper. The valleys are very pleaſant and fertile, yielding great plenty both of corn and paſture. The lands near the ſea-coaſt are manured and fertilized with ſea-weed, and a kind of ſand formed by the particles of broken ſhells as they are daſhed againſt each other by the ſea. Cattle of all ſorts are ſmaller here than in the other counties of England; and the wool of the ſheep, which are moſtly without horns, is very fine, and the fleſh, both of them and of the black cattle, extremely delicate. The county is well ſupplied with fiſh from the ſea and the many rivers with which it is watered. The moſt noted of the ſea-fiſh is the pilchard; of which prodigious quantities are caught from July to November, and exported to different parts, eſpecially to Spain. It is ſaid that a million have been ſometimes taken at a ſingle draught. The natives are remarkable for their ſtrength and activity, as well as their dexterity in wreſtling, in which exerciſe the Corniſh hug is highly extolled.

This county abounds in mines of different metals and ſemimetals; but the principal produce is tin. The Phenicians early viſited theſe coaſts for this article, ſome think 400 or 450 years before Chriſt; and the mines continued to be wrought with various ſucceſs at different periods. In the time of king John they appear to have yielded no great emolument; the right of working them being wholly in the king as earl of Cornwal, and the mines farmed by the Jews for 100 marks; and according to this proportion the 10th of it, L.6. 13s. 4d. is at this day paid by the crown to the biſhop of Exeter In the time of Richard king of the Romans and earl of Cornwal, the tin-mines were immenſely rich, the Jews being farmed out to him by his brother Henry III. what intereſt they had was at his diſpoſal. The Spaniſh tin-mines being ſtopped by the Moors, and none diſcovered in Germany, the Malabar coaſt, or the Spaniſh Weſt Indies, Cornwal and its earls had all the trade of Europe for it. The Jews being baniſhed the kingdom, 18 Edw. I. they were again neglected till the gentlemen of Blackmore, lords of ſeven tithings beſt ſtored at that time with tin, obtained of Edmund earl of Cornwal, ſon of Richard king of the Romans, a charter under his own ſeal, with more explicit grants of privileges, courts, pleas, parliaments, and the toll-tin or $\frac{1}{17}$th of all the tin raiſed. At this time too the right of bounding or dividing tin-grounds into ſeparate partitions for the encouragement of ſearching for it ſeems to have been firſt appointed, or at leaſt adjuſted. This charter was confirmed 33 Edward I. and the Corniſh ſeparated from the Devonſhire tinners. Their laws, particularly recited in Plowden's Commentaries, p. 237, were further explained, 50 Edw. III. confirmed and enlarged by parliament, 8 Rich. II. 3 Ed. IV. 1 Ed. VI. 1 and 2 P. and M. and 2 Eliz. and the whole ſociety divided into four parts under one general warden, to do juſtice in law and equity, from whoſe ſentence lies an appeal to the duke of Cornwal in council, or for want of a duke of Cornwall to the crown. The lord-warden appoints a vice-warden to determine all ſtannary diſputes every month: he alſo conſtitutes four ſtewards, one for each of the precincts before mentioned, who hold their courts every three weeks, and decide by juries of ſix perſons, with an appeal reſerved to the vice-warden, lord warden, and lord of the prince's council. In difficult caſes the lord-warden, by commiſſion, iſſues his precept to the four principal towns of the ſtannary diſtricts, who each chooſe ſix members, and theſe twenty-four ſtannators conſtitute the parliament of tinners. Each ſtannator chooſes an aſſiſtant, making a kind of ſtanding council in a different apartment to give information to the prince. Whatever is enacted by the body of tinners muſt be ſigned by the ſtannators, the lord-warden, or his deputy, and by the duke or the king, and thenceforward has with regard to tin affairs all the authority of an act of the whole legiſlature. Five towns are appointed in the moſt convenient parts of the country for the tinners to bring their tin to every quarter of a year. Theſe are Leſkard, Leſtwithiel, Truro, Helſton, and Penſance, the laſt added by Charles II. for the conveniency of the weſtern tinners. In the time of Henry VIII. there were but two coinages, at Midſummer and Michaelmas: two more at Chriſtmas and Lady-day were added, for which the tinners pay an acknowledgement called *Poſt groats*, or 4 *d.* for every hundred of white tin then coined. The officers appointed by the duke aſſay it; and if well purified ſtamp it by a hammer with the duchy ſeal, the arms of Richard earl of Cornwal, a lion rampant G. crowned O. within a bordure of bezants S.; and this is a permiſſion to the coiner to ſell, and is called *coining the tin*. Every hundred of white tin ſo coined pays to the duke 4s. The tin of the whole county, which, in Carew's time, in the laſt century, amounted to 30 or 40,000 l. yearly, has for 24 years laſt paſt amounted one year with another to L. 180,000 or 190,000 ſterling. Of this the duke of Cornwal receives for his 4s. duty on every hundred of white tin above L. 10,000 yearly: the bounders or proprietors of the ſoil about ⅙th at a medium clear, or about L. 30,000 yearly; the remainder goes to the adventures in the mine, who are at all the charge of working. Tin is found collected and fixed in lodes and floors, or in grains and bunches in the natural rock, or looſe and detached in ſingle ſeparate ſtones called *ſhodes* or *ſtreams*, or in a continued courſe of ſuch ſtones called the *beuheyl* or *living ſtream*, or in an arenaceous pulverized ſtate. It is moſt eaſily diſcovered by tracing the lodes by the ſcattered fragments of them called *ſhodes*, by leave of the lord of the ſoil or the bounder. The tin being divided among the lords and adventurers, is ſtamped and worked at the mill; and being thus dreſſed is carried under the name of *black tin* to the melting-houſe, where it is melted by Welſh pit-coal, and poured into blocks of 320lb. weight, and carried to the coinage town. Mundic, a ſcarce metal or mineral ore, of a white, braſſy, or brown colour, is found in large quantities, intermixed with tin, copper, and lead, and ſometimes by itſelf. Iron ore is found in Cornwal, but the working it does not anſwer. There is no richer copper, nor a greater variety any where than in this county. Silver, if really found here in the reigns of Edward I. and II. has been rarely found ſince, nor do the lead-mines anſwer. Very late diſcoveries have proved that Cornwal has more gold than was formerly imagined. What is called the *Corniſh diamond* is a figured cryſtal generally hexagonal and pyramidical, or columnar, or both, of a fine clear water, and of all the baſtard diamonds in Britain eſteemed the beſt, and ſome of different colours, black, yellow, &c. The clearer theſe are, the better they will bear engraving for ſeals.

In privileges and language Cornwal ſeems to be another kingdom. By 21 Elizabeth it was ordered that all duty on Corniſh cloth exported ſhould be remitted to every Engliſhman within the duchy of Cornwal. This was firſt granted by the black prince, in conſideration of their paying 4s. for the coinage of every hundred of tin: whereas Devonſhire pays no more than 8d. They have alſo by grant from Richard earl of Cornwal, confirmed 45 Henry III. freedom to take ſand out of the ſea and carry it through the country for manure; whereupon in the following reign, on an inquiſition made, we find a complaint that Saltaſh had lately taken 12s. yearly for each barge that carried ſand up the Tamar; whereas nothing ought to be demanded. They ſtill continue this ancient method of improving their land, carrying it ten miles up into the country, and great part of the way on horſes backs. Mr Ray ſuppoſes the virtue of this ſand depends chiefly on the ſalt mixed with it, which is ſo copious that in many places ſalt is boiled up out of a lixivium made of the ſea ſand; and the reaſon why ſand when it has lain long in the ſun and wind proves leſs enriching and uſeful is, that the dews and rain evaporate great part of its ſalt. They had likewiſe a privilege of trading to all parts of the world, granted them by Charles I. in recompence of their loyalty.

The number of boroughs in this ſmall county was ſurpriſingly increaſed by Edward VI. who added ſeven to the original ſix, Mary two, Elizabeth ſix, making in all 21, ſending 40 members beſides the county two. Eight of theſe boroughs had an immediate or remote connection with the demeſne lands of the duchy; the reſt belonged to religious houſes, or powerful families, or were old boroughs, which had legal immunities granted to them by their princes or lords.

The Corniſh language is a dialect of that which till the Saxons came in was common to all Britain, and more anciently to Ireland and Gaul; but the inhabitants of the iſland being diſperſed before thoſe conqueſts, and driven into Wales and Cornwal, and thence into Bretagne, the ſame language, for want of frequent intercourſe, became differently pronounced and written, and in different degrees mixed with dif-

ferent

ferent languages. Hence came the Welſh, the Corniſh, and the Armoric dialects, whoſe radicals are ſo much alike that they are known and admitted by the inhabitants of either country; but the grammar ſo varied that they cannot converſe. The Corniſh is reckoned the moſt pleaſing of the three. It was ſpoken ſo generally down to the reign of Henry VIII. that Dr John Moreman, vicar of Mynhinet, is ſaid to have been the firſt who taught his pariſhioners the Lord's prayer, the creed, and ten commandments in Engliſh, and at the Reformation the natives deſired the ſervice in Engliſh. The older people in ſome pariſhes retained their original language to the middle of the laſt century: and the laſt ſermon was preached in it in 1678. When Mr Ray was there, 1662, he could find but one perſon who could write this language; and it is now ſo nearly extinct, that Mr Barrington, in 1768, could only find one old woman who could ſcold in it, and ſhe is ſince dead.

CORODY. See REVENUE.

COROLLA, among botaniſts, the moſt conſpicuous part of a flower, ſurrounding the organs of generation, and compoſed of one or more flower-leaves, moſt commonly called *petals* to diſtinguiſh them from the leaves of the plant; according as there is one, two, or three of theſe petals, the corolla is ſaid to be monopetalous, dipetalous, tripetalous, &c.

COROLLARY is a conſequence drawn from ſomething already advanced or demonſtrated: thus, it being demonſtrated that a triangle which has two equal ſides, has alſo two angles equal: this corollary will follow, that a triangle which has three ſides equal, has alſo its three angles equal.

COROLLISTÆ, a name by which Linnæus diſtinguiſhes thoſe ſyſtematic botaniſts who have arranged vegetables from the regularity, figure, number, and other circumſtances, of the petals, or beautiful coloured leaves of the flower. The beſt ſyſtems of this kind are thoſe of Rivinus and Tournefort. The former proceeds upon the regularity and number of the petals; the latter, with much more certainty, on their regularity and figure.

COROLLULA, a term uſed by botaniſts to expreſs the little partial flowers which make up the compound ones.

COROMANDEL, the eaſtern coaſt of the peninſula on this ſide the Ganges in Aſia. It is bounded on the north by Golconda, on the eaſt by the bay of Bengal, on the ſouth by Madura, and on the weſt by Biſnagar. This coaſt ſo much reſembles that of Orixa, that the Abbé Raynal chooſes to conſider them as one, and gives to both the general name of *Coromandel*. Here an exceſſive heat reigns from the beginning of May to the end of October. It begins at nine in the morning, and continues till nine in the evening. During the night it is allayed by a ſea-breeze from the ſouth-eaſt; and moſt commonly this refreſhing gale begins at three in the afternoon. The air is leſs inflamed during the reſt of the year, though in all ſeaſons it is very hot. It rains almoſt continually during the months of November and December. This immenſe tract is covered with a parched ſand for the extent of two miles, and ſometimes only one mile along the coaſt.

This country was at firſt neglected by the Europeans for many reaſons. It was ſeparated by inacceſſible mountains from Malabar, where theſe bold adventurers endeavoured to ſettle themſelves. Spices and aromatics, which were the principal objects of their attention, were not to be found there. In ſhort, civil diſſentions had baniſhed from it tranquillity, ſecurity, and induſtry. At that period the empire of Biſnagar, to which this vaſt country was ſubject, was falling to ruin. The governments of Viſapour, the Carnatic, Golconda, and Orixa, threw off their dependence, and aſſumed the title of kings. Thoſe of Madura, Tanjore, Myſore, Gingi, and ſome others, likewiſe uſurped the ſovereign authority, though they retained their ancient title of *Naick*. This revolution had juſt happened when the Europeans appeared on the coaſt of Coromandel. The foreign trade was at that time inconſiderable; it conſiſted only of diamonds from Golconda, which were carried to Calicut and Surat, and from thence to Ormus or Suez, whence they were circulated through all Europe and Aſia. Maſſulipatan, the richeſt and moſt populous city of theſe countries, was the only market that was known for linens; they were purchaſed at a great fair annually holden there by the Arabian and Malayan veſſels that frequented that bay, and by caravans arrived from diſtant parts. The linens were exported to the ſame places with the diamonds. The fondneſs for the manufactures of Coromandel which began to prevail here, inſpired all the European nations trading to the Indian ſeas with the reſolution of forming ſettlements there. They were not diſcouraged either by the difficulty of conveying goods from the inland parts of the country, where there was no navigable river; by the total want of harbours, where the ſea at one ſeaſon of the year is not navigable; by the barrenneſs of the coaſts, for the moſt part uncultivated and uninhabited; nor by the tyranny and fluctuating ſtate of the government. They thought that ſilver would be induſtriouſly ſought after; that Pegu would furniſh timber for building, and Bengal corn for ſubſiſtence; that a proſperous voyage of nine months would be more than ſufficient to complete their ladings; and that by fortifying themſelves they ſhould be ſecure againſt the attacks of the weak tyrants that oppreſſed theſe countries.

The firſt European colonies were eſtabliſhed near the ſhore. Some of them obtained a ſettlement by force; moſt of them were formed with the conſent of the ſovereigns; and all were confined to a very narrow tract of land. The boundaries of each were marked out by a hedge of thorny plants, which was their only defence. In proceſs of time fortifications were raiſed; and the ſecurity derived from them, added to the lenity of the government, ſoon increaſed the number of coloniſts. The ſplendor and independence of theſe ſettlements ſeveral times raiſed the jealouſy of the princes in whoſe dominions they were formed; but their attempts to demoliſh them proved abortive. Each colony increaſed in proſperity in proportion to the riches and the wiſdom of the nation that founded it. None of the companies that exerciſed an excluſive privilege beyond the Cape of Good Hope had any concern in the trade of diamonds. This was always left to private merchants, and by degrees fell entirely into the hands of the Engliſh, or the Jews and Armenians that lived under their protection. At preſent this grand object of luxury and induſtry is much reduced. The revolutions that have happened in Indoſtan have prevented people from reſorting to theſe rich mines; and the anarchy in which this unhappy country is plunged, leaves no room to hope that they will be again attended to. The whole of the commerical operations on the coaſt of Coromandel is confined to the purchaſe of cottons. The manufacturing of the white cottons bought there, differs ſo little from the Britiſh, that it would be neither intereſting nor inſtructive to enter into a minute deſcription of it The proceſs uſed in making their printed cottons, which was at firſt ſervilely followed in Europe, has ſince been rendered more ſimple, and brought to greater perfection by the manufacturers. The painted cottons which are bought there, have not yet been attempted to be imitated. Nature has not given to Europeans the wild fruits and drugs neceſſary for the compoſition of thoſe bright and indelible colours which conſtitute the principal merit of the Indian manufactures; nor has ſhe furniſhed them with the waters that ſerve to fix them. The Indians do not univerſally obſerve the ſame method in painting their cottons; either becauſe there are ſome niceties peculiar to certain provinces, or becauſe different ſoils produce different drugs for the ſame uſes. We ſhould tire the patience of our readers were we to trace the ſlow and painful progreſs of the Indians in the art of painting their cottons. It is natural to believe that they owe it to length of time, rather than to the fertility of their genius. What ſeems to authoriſe this conjecture is, that they have ſtopped in their improvements, and have not advanced a ſingle ſtep in the arts for many ages; whereas the Europeans have proceeded with amazing rapidity. From the rapid advances of the arts in the United States we may ſoon expect to ſee that branch flouriſh in this country. Indeed, were we to conſider only the want of invention in the Indian, we ſhould be tempted to believe, that, from time immemorial, they have received the arts they cultivate from ſome more induſtrious nation; but when it is remembered that theſe arts have a peculiar dependence on the materials, gums, colours, and productions of India, we cannot but be convinced that they are natives of that country. It may appear ſomewhat ſurpriſing that cottons painted with all ſorts of colours ſhould be ſold at ſo moderate a price, that they are almoſt as cheap as thoſe that have only two or three. But it muſt be obſerved, that the merchants of the country ſell to all the companies a large quantity of cottons at a time; and that the demand for cottons painted with various colours makes but a ſmall article in their aſſortments, as they are not much eſteemed in Europe.

Though cottons of all ſorts are in ſome degree manufactured through the whole country of Indoſtan, which extends from Cape Comorin to the banks of the Ganges; it is obſervable, that the fine ſorts are made in the eaſtern part, the common ones in the centre, and the coarſe ones in the moſt weſtern parts. Manufactures are eſtabliſhed in the European colonies, and upon the coaſt: they are more frequent at the diſtance of five or ſix leagues from the ſea, where cotton is more cultivated, and proviſions are cheaper. The purchaſes made there are carried 30 or 40 leagues farther in the country. The Indian merchants ſettled in the European factories have always the management of this buſineſs. The quantity and quality of the goods wanted are ſettled with theſe people: the price is fixed according to the patterns: and at the time a contract is made, a third or a fourth part of the money agreed on is advanced. This arrangement is owing to the neceſſity theſe merchants themſelves are under of advancing money to the workmen by the partners or agents who are diſperſed through the whole country: of keeping a watchful eye upon them for fear of loſing what they have advanced; and of gradually leſſening the ſum, by calling for the cottons as faſt as they are worked off. Without theſe precautions, nothing could be depended on in an oppreſſive government, where the weaver cannot work on his own account, either becauſe his circumſtances will not permit, or becauſe he dares not venture to diſcover them for fear of exactions. The companies that have either ſucceſs or good management, conſtantly keep the ſtock for one year in advance in their ſettlements. By this method they are ſure of having the quantity of goods they have occaſion for, and of the quality they chooſe, at the moſt convenient time; not to mention that their workmen, and their merchants, who are kept in conſtant employment, never leave them. Such nations as want money and credit cannot begin their mercantile operations till the arrival of their ſhips. They have only five or ſix months at moſt to execute the orders ſent from Europe. The goods are manufactured and examined in haſte; and they are even obliged to take ſuch as are known to be bad, and would be rejected at any other time. The neceſſity they are under of completing their cargoes, and fitting out their veſſels before hurricanes come on, leaves no room for nicety of inſpection. It would be a miſtake to imagine that the country agents could be prevailed upon to order goods to be made on their account, in hopes of ſelling them with a reaſonable advantage to the company with whom they are engaged. For, beſides that the generality of them are not rich enough to embark in ſo large an undertaking, they would not be certain of finding their account in it. If the company that employ them ſhould be hindered by unforeſeen accidents from ſending the uſual number of ſhips, theſe merchants would have no vent for their commodities. The Indians, the form of whoſe dreſs requires different breadths and lengths from thoſe of the cottons fabricated for our uſe, would not purchaſe them; and the other European companies would be provided, or certain of being provided with whatever the extent of their trade required, and their money enabled them to purchaſe. The plan of procuring loans, which was contrived to remedy this inconvenience, never has, nor can be uſeful. It has been a cuſtom, time immemorial, in Indoſtan, for every citizen who borrows money, to give a written inſtrument to his creditor. This deed is of no force in a court of judicature, unleſs it is ſigned by three witneſſes, and bears the day of the month and the year when it was made, with the rate of intereſt agreed upon by the parties. If the borrower fails to fulfil his engagements, he may be arreſted by the lender himſelf. He is never impriſoned, becauſe there is no fear of his making his eſcape. He would not even eat, without obtaining leave of his creditor. The Indians make a three-fold diviſion of intereſt: one kind they call *vice;* another neither *vice* nor *virtue;* and a third, they ſay, is *virtue.* The firſt is four *per cent.* a month; the ſecond two; and the third one. The laſt is, in their opinion, an act of beneficence that only belongs to the moſt heroic minds. Yet, though the Europeans, who are forced to borrow, meet with this treatment, it is plain they cannot avail themſelves of the indulgence without being involved in ruin.

The foreign trade of Coromandel is not in the hands of the natives. In the weſtern part, indeed, there are Mohammedans known by the name of *Chalias,* who, at Naour and Porto-Nuovo, ſend out ſhips to Acken, Merguy, Siam, and the eaſtern coaſt. Beſides veſſels of conſiderable burden employed in theſe voyages, they have ſmaller embarkations for the coaſting trade for Ceylon and the pearl fiſhery. The Indians of Maſſulipatan turn their attention another way. They import from Bengal white callicoes, which they dye or print, and ſell them again at the places from whence they had them, at 35 or 40 *per cent.* advantage. Excepting theſe tranſactions, which are of very little conſequence, the whole trade is veſted in the Europeans, who have no partners but a few Banians and Armenians ſettled in their colonies. The quantity of callicoes exported from Coromandel to the different ports of India, may be computed at 3500 bales. Of theſe the French carry 800 to Malabar, Mocha, and the iſle of France; the Engliſh, 1200 to Bombay, Malabar, Sumatra, and the Philippine Iſlands; and the Dutch 1500 to their different ſettlements. Except 500 bales deſtined for Manila, each of the value of 100 guineas, the others are of ſuch an ordinary kind that they do not exceed 30 guineas at prime coſt; ſo that the whole number of bales do not amount to more than about L. 150,000.

Coromandel furniſhes Europe with 9500 bales: 800 of which are brought by the Danes, 2500 by the French, 3000 by the Engliſh, and 3200 by the Dutch. A conſiderable part of theſe callicoes are dyed blue, or ſtriped blue and red for the African trade. The others are fine muſlins, printed callicoes, and handkerchiefs from Maſſulipatan, or Paliacate. It is proved by experience that each of theſe bales coſts only about L. 42 Sterling; conſequently they ought to bring in to the manufactory where they are wrought near L. 360,000. The payments are not entirely made in ſpecie, either in Europe or Aſia; we give in exchange, cloths, iron, lead, copper, coral, and ſome other articles of leſs value. On the other hand, Aſia pays with ſpices, pepper, rice, ſugar, corn, and dates. All theſe articles taken together may amount to about L. 210,000; and from this calculation it follows, that Coromandel receives annually from Europe about L. 300,000 in money. The Britiſh, who have acquired the ſame ſuperiority on this coaſt that they have elſewhere, have formed on it ſeveral ſettlements.

CORONA, among anatomiſts, denotes that edge of the glans penis where the preputium begins.

CORONA, or *Halo,* in optics, a luminous circle, ſurrounding the ſun, the moon, the planets, or fixed ſtars. Sometimes theſe circles are white, and ſometimes coloured, like the rainbow. Sometimes one only is viſible, and ſometimes ſeveral concentric coronas make their appearance at the ſame time. Thoſe which have been ſeen about Sirius and Jupiter were never more than three, four, or five degrees in diameter; thoſe which ſurround the moon are, alſo, ſometimes no more than three or five degrees; but theſe, as well as thoſe which ſurround the ſun, are of very different magnitudes, *viz.* of 12° 0′, 22° 35′, 30° 0′, 38° 0′, 41° 2′, 45° 0′, 46° 24′, 47° 0′, and 90°, or even larger than this. Their diameters alſo ſometimes vary during the time of obſervation, and the breadths both of the coloured and white circles are very different, *viz.* of 2, 4, or 7 degrees.

The colours of theſe coronas are more dilute than thoſe of the rainbow; and they are in a different order, according to their ſize. In thoſe which Newton obſerved in 1692, they were in the following order, reckoning from the inſide. In the innermoſt were blue, white, and red; in the middle were purple, blue, green, yellow, and pale red; in the outermoſt, pale blue and pale red. Mr Huygens obſerved red next the ſun, and a pale blue outwards. Sometimes they are red on the inſide and white on the outſide. M. Weidler obſerved one that was yellow on the inſide and white on the outſide. In France, one was obſerved in 1683, the middle of which was white; after which followed a border of red; next to it was blue, then green, and the outermoſt circle was a bright red. In 1728, one was ſeen of a pale red outwardly, then followed yellow, and then green, terminated by a white.

Theſe coronas are very frequent. In Holland, M. Muſchenbroeck ſays, 50 may be ſeen in the day-time, almoſt every year; but they are difficult to be obſerved, except the eye be ſo ſituated, that not the body of the ſun, but only the neighbouring parts of the heavens can be ſeen. Mr Middleton ſays, that this phenomenon is very frequent in North America; for that there is generally one or two about the ſun every week, and as many about the moon every month. Halos round the ſun are very frequent in Ruſſia. M. Æpinus ſays, that from the 23d of April 1758, to the 20th of September, he himſelf had obſerved no leſs than 26, and that he has ſometimes ſeen twice as many in the ſame ſpace of time.

Coronas may be produced by placing a lighted candle in the midſt of ſteam in cold weather. Alſo, if glaſs windows be breathed upon, and the flame of a candle be placed ſome feet from it, while the ſpectator is alſo at the diſtance of ſome feet from another part of a window, the flame will be ſurrounded with a coloured halo. And if a candle be placed behind a glaſs receiver, when air is admitted into the vacuum within it, at a certain degree of denſity, the vapour with which it is loaded will make a coloured halo round the flame. This was obſerved by Otto Guericke. In December 1756, M. Muſchenbroeck obſerved, that when the glaſs windows of his room were covered with a thin plate of ice on the inſide, the moon appearing through it was ſurrounded with a large and variouſly coloured halo; and, opening the window, he found that it aroſe intirely from that thin plate of ice, for none was ſeen except through it.

Similar, in ſome reſpects, to the halo, was the remarkable appearance which M. Bouguer deſcribes, as obſerved by himſelf and his companions on the top of Mount Pichinca, in the Cordilleras. When the ſun was juſt riſing behind them, ſo as to appear white, each of them ſaw his own ſhadow projected upon it, and no other. The diſtance was ſuch, that all the parts of the ſhadow were eaſily diſtinguiſhable, as the arms, the leg, and the head; but what ſurpriſed them moſt was, that the head was adorned with a kind of glory, conſiſting of three or four ſmall concentric crowns, of a very lively colour, each exhibiting all the varieties of the primary rainbow, and having the circle of red on the outſide. The intervals between theſe circles continued equal, though the diameters of them all were conſtantly changing. The laſt of them was very faint, and at a conſiderable diſtance was another great white circle, which ſurrounded the whole. As near as M. Bouguer could compute, the diameter of the firſt of theſe circles was about $5\frac{1}{2}$ degrees, that of the ſecond 11, that of the third 17, and ſo on; but the diameter of the white circle was about 76 degrees. This phenomenon never appeared but in a cloud conſiſting of frozen particles, and never in drops of rain like the rainbow. When the ſun was not in the horizon, only part of the white circle was viſible, as M. Bouguer frequently obſerved afterwards.

Similar alſo to this curious appearance was one that was obſerved by Dr M'Fait in Scotland. This gentleman obſerved a rainbow round his ſhadow in the miſt, when he was upon an eminence above it. In this ſituation the whole country round ſeemed, as it were, buried under a vaſt deluge, and nothing but the tops of diſtant hills appeared here and there above the flood; ſo that a man would think of diving down into it with a kind of horror. In thoſe upper regions the air, he ſays, is at that time very pure and agreeable to breathe in. At another time he obſerved a double range of colours round his ſhadow in theſe circumſtances. The colours of the outermoſt range were broad and very diſtinct, and every where about two feet diſtant from the ſhadow. Then there was a darkiſh interval, and after that another narrower range of colours, cloſely ſurrounding the ſhadow, which was very much contracted. This perſon ſeems to think that theſe ranges of colours are cauſed by the inflection of the rays of light, the ſame that occaſioned the ring of light which ſurrounds the ſhadows of all bodies, obſerved by M. Maraldi, and this author*. But the prodigious variety with which theſe appearances are exhibited ſeems to ſhow that many of them do not reſult from the general laws of reflexion, refraction, or inflection, belonging to tranſparent ſubſtances of a large maſs; but upon the alternate reflexion and tranſmiſſion of the different kinds of rays, peculiar to ſubſtances reduced to the form of thin plates, or conſiſting of ſeparate and very minute parts. But where the dimenſions of the coronas are pretty conſtant, as in the uſual and larger halo, which is about half the diameter of the rainbow, they may, perhaps, be explained on the general principles of refraction only.

Deſcartes obſerves, that the halo never appears when it rains: from which he concludes that this phenomenon is occaſioned by the refraction of light in the round particles of ice, which are then floating in the atmoſphere; and though theſe particles are flat when they fall to the ground, he thought they muſt be protuberant in the middle, before their deſcent; and according to this protuberancy he imagined that the diameter of the halo would vary.—In treating of meteors, Gaſſendi ſuppoſed that a halo is the ſame thing with the rainbow, the rays of light being in both caſes twice refracted and once reflected within each drop of rain or vapour, and that all the difference there is between them ariſes from their different ſituation with reſpect to the obſerver. For, whereas, when the ſun is behind the ſpectator, and conſequently the rainbow before him, his eye is in the centre of the circle; when he views the halo, with his face towards the ſun, his eye is in the circumference of the circle; ſo that according to the known principles of geometry, the angle under which the object appears in this caſe, muſt be juſt half of what it is in the other. Though this writer ſays a great deal upon the ſubject, and endeavours to give reaſons why the colours of the halo are in a different order to thoſe of the rainbow, he does not deſcribe the progreſs of the rays of light from the ſun to the eye of the ſpectator when a halo is formed by them, and he gives no figures to explain his ideas.

Dechales, alſo, endeavours to ſhow that the generation of the halo is ſimilar to that of the rainbow. If, ſays he, a ſphere of glaſs or cryſtal, AB, (nº 1.) full of water, be placed in the beams of the ſun ſhining from C, there will not only be two circles of coloured light on the ſide next the ſun, and which conſtitute the two rainbows; but there will alſo be another on the part oppoſite to the ſun, the rays belonging to which meeting at E, afterwards diverge, and form the coloured circle G, as will be viſible, if the light that is tranſmitted through the globe be received on a piece of white paper. The colours alſo will appear to an eye placed in any part of the ſurface of the cone FEG. Meaſuring the angle FEH, he found it to be 23 degrees. They were only the extreme rays of this cone that were coloured like thoſe of the rainbow.

Plate CL.

This experiment he thought ſufficiently illuſtrated the generation of the halo; ſo that whenever the texture of the clouds is ſuch, as not entirely to intercept the rays of the ſun or moon, and yet have ſome degree of denſity, there will always be an halo round them, the colours of the rainbow appearing in thoſe drops which are 23 degrees diſtant from the ſun or moon. If the ſun be at A, and the ſpectator in B, the halo will be the circle DFE, DBE being 46 degrees, or twice 23.

The reaſon why the colours of the halo are more dilute than thoſe of the rainbow, he ſays, is owing principally to their being formed not in large drops of rain, but in very ſmall vapour; for if the drops of water were large, the cloud would be ſo thick, that the rays of the ſun could not be regularly tranſmitted through them; and, on the other hand, he had obſerved, that when the rainbow is formed by very thin vapours, the colours hardly appear. As for thoſe circles of colours which are ſometimes ſeen round candles, it was his opinion that they are owing to nothing but moiſture on the eye of the obſerver; for that he could never produce this appearance by means of vapour only, if he wiped his eyes carefully; and he had obſerved that ſuch circles are viſible to ſome perſons and not to others, and to the ſame perſons at one time and not another.

---

* Edin. Eſſays, Vol. i. p. 198.

The moſt conſiderable of all the theories reſpecting halos, and that which has met with moſt favourable and the longeſt reception, is that of Mr Huygens. Sir Iſaac Newton mentions it with reſpect, and Dr Smith, in his Complete Syſtem of Optics, does not ſo much as hint at any other. The occaſion of M. Huygens publiſhing his thoughts on this ſubject, was the appearance of a halo at Paris, on the 12th of May 1667, of which he gave an account in a paper read at the Royal Academy in that city, which was afterwards tranſlated, and publiſhed in the Engliſh Philoſophical Tranſactions, and which may be ſeen in Lowthorp's Abridgement, Vol. II. p. 189. But this article contains nothing more than the heads of a diſcourſe, which he afterwards compoſed, but never quite finiſhed, on this ſubject; and which has been tranſlated, with ſome additions, by Dr Smith, from whom the following account is chiefly extracted.

Our philoſopher had been firſt engaged to think particularly upon this ſubject, by the appearance of five ſuns at Warſaw, in 1658; preſently after which, he ſays, he hit upon the true cauſe of halos, and not long after of that of mock ſuns alſo.

To prepare the way for the following obſervations, it muſt be remarked, that if we can conceive any kind of bodies in the atmoſphere, which, according to the known laws of optics, will, either by means of reflection or refraction, produce the appearance in queſtion, when nothing elſe can be found that will do it, we muſt acquieſce in the hypotheſis, and ſuppoſe ſuch bodies to exiſt, even though we cannot give a ſatisfactory account of their generation. Now, two ſuch bodies are aſſumed by Mr Huygens; one of them a round ball, opaque in the centre, but covered with a tranſparent ſhell; and the other is a cylinder, of a ſimilar compoſition. By the help of the former he endeavours to account for halos, and by the latter for thoſe appearances which are called mock ſuns. Thoſe bodies which Mr Huygens requires, in order to explain theſe phenomena, are not, however, a mere aſſumption; for ſome ſuch, though of a larger ſize than his purpoſe requires, have been actually found, conſiſting of ſnow within and ice without. They are particularly mentioned by Deſcartes.

The balls with the opaque kernel, which he ſuppoſed to have been the cauſe of them, he imagines not to exceed the ſize of a turnip-ſeed; but, in order to illuſtrate this hypotheſis, he gives a figure of one, of a larger ſize, in ABCDEF, (n° 3.) repreſenting the kernel of ſnow in the middle of it. If the rays of light, coming from GH, fall upon the ſide AD, it is manifeſt they will be ſo refracted at A and D, as to bend inwards; and many of them will ſtrike upon the kernel EF. Others, however, as GA and HD, will only touch the ſides of the kernel; and being again refracted at B and C, will emerge in the lines BK, CK, croſſing each other in the point K, whoſe neareſt diſtance from the globule is ſomewhat leſs than its apparent diameter. If, therefore, BK and CK be produced towards M and L, (n° 4.) it is evident that no light can reach the eye placed within the angle LKM, but may fall upon it when placed out of that angle, or rather the cone repreſented by it.

For the ſame reaſon, every other of theſe globules will have a ſhadow behind it, in which the light of the ſun will not be perceived. If the eye be at N, and that be conceived to be the vertex of a cone, the ſides of which NR, NQ, are parallel to the ſides of the former cone KL, KM, it is evident that none of the globules within the cone QNR can ſend any rays of the ſun to the eye at N. But any other globule out of this cone, as X, may ſend thoſe rays, which are more refracted than XZ, to the eye; ſo that this will appear enlightened, while thoſe within the cone will appear obſcure. It is evident from this, that a certain area, or ſpace, quite round the ſun, muſt appear dark; and that the ſpace next to this area will appear luminous, and more ſo in thoſe parts that are neareſt to the obſcure area; becauſe, he ſays, it may eaſily be demonſtrated, that thoſe globules which are neareſt to the cone QNR exhibit the largeſt image of the ſun. It is plain, alſo, that a corona ought to be produced in the ſame manner whatever be the ſun's altitude, becauſe of the ſpherical figure of the globules

To verify this hypotheſis, our philoſopher adviſes us to expoſe to the ſun a thin glaſs bubble, filled with water, and, having ſome opaque ſubſtance in the centre of it; and he ſays we ſhall find, that we ſhall not be able to ſee the ſun through it, unleſs at a certain diſtance from a place oppoſite to the centre of it; but as ſoon as we do perceive the light; the image of the ſun will immediately appear the brighteſt, and coloured red, for the ſame reaſon as in the rainbow.

Theſe coronas, he ſays, often appear about the moon; but the colours are ſo weak as to appear only white. Such white coronas he had alſo ſeen about the ſun, when the ſpace within them appeared ſcarce darker than that without. This he ſuppoſes to happen where there are but few of thoſe globules in the atmoſphere; for the more plentiful they are, the more lively the colours of the halo appear; at the ſame time alſo the area within the corona will be the darker. The apparent diameter of the corona, which is generally about 45 degrees, depends upon the ſize of the dark kernel; for the larger it is with reſpect to the whole globule, the larger will be the dark cone behind it.

The globules that form theſe halos, Mr Huygens ſuppoſes to have conſiſted of ſoft ſnow, and to have been rounded by continual agitation in the air, and thawed on their outſides by the heat of the ſun.

To make the diameter of the halo 45 degrees, he demonſtrates that the ſemidiameter of the globule muſt be to the ſemidiameter of the kernel of ſnow very nearly as 1000 to 480; and that to make a corona of 100 degrees, it muſt be as 1000 to 680.

Mr Weidler, in his Commentary on parhelia, publiſhed at Wirtemburgh in 1733, obſerves that it is very improbable that ſuch globules as Mr Huygens's hypotheſis requires, with nuclei of ſuch preciſe proportion, ſhould exiſt; and if there were ſuch bodies, he thinks they would be too ſmall to produce the effects aſcribed to them. Beſides, he obſerves that appearances exactly ſimilar to halos are not uncommon, where fluid vapours alone are concerned; as when a candle is placed behind the ſteam of boiling water in froſty weather, or in the midſt of the vapour iſſuing copiouſly from a bath, or behind a receiver when the air is ſo much rarefied as to be incapable of ſupporting the water it contains. The rays of the ſun twice reflected and twice refracted within ſmall drops of water are ſufficient, he ſays, without any opaque kernel, to produce all the appearances of the halos that have the red light towards the ſun, as may be proved by experiment. That the diameter of the halos is generally half of that of the rainbow, he accounts for as Gaſſendi did before him.

M. Marriotte accounts for the formation of the ſmall coronas by the tranſmiſſion of light through aqueous vapours, where it ſuffers two refractions, without any intermediate reflection. He ſhows that light which comes to the eye, after being refracted in this manner, will be chiefly that which falls upon the drop nearly perpendicular; becauſe more rays fall upon any given quantity of ſurface in that ſituation, fewer of them are reflected with ſmall degrees of obliquity, and they are not ſo much ſcattered after refraction. The red will always be uttermoſt in theſe coronas, as conſiſting of rays which ſuffer the leaſt refraction. And whereas he had ſeen, when the clouds were driven briſkly by the wind, halos round the moon, varying frequently in their diameter, being ſometimes of two, ſometimes of three, and ſometimes of four degrees; ſometimes alſo being coloured, ſometimes only white, and ſometimes diſappearing entirely; he concluded that all theſe variations aroſe from the different thickneſs of the clouds, through which ſometimes more and ſometimes leſs light was tranſmitted. He ſuppoſed, alſo, that the light which formed them might ſometimes be reflected, and at other times refracted. As to thoſe coronas which conſiſt of two orders of colours, he imagined that they were produced by ſmall pieces of ſnow, which when they begin to diſſolve, form figures which are a little convex towards their extremities. Sometimes, alſo, the ſnow will be melted in different ſhapes; and in this caſe, the colours of ſeveral halos will be intermixed and confuſed; and ſuch, he ſays, he had ſometimes obſerved round the ſun.

M. Marriotte then proceeds to explain the larger coronas, namely thoſe that are about 45 degrees in diameter, and for this purpoſe he has recourſe to equiangular priſms of ice, in a certain poſition with reſpect to the ſun; and he takes pains to trace the progreſs of the rays of light for this purpoſe: but this hypotheſis is very improbable. In ſome caſes he thought that theſe large coronas were cauſed by hail-ſtones, of a pyramidal figure; becauſe after two or three of them had been ſeen about the ſun, there fell the ſame day ſeveral ſuch pyramidal hail-ſtones. M. Mariotte explains parhelia by the help of the ſame ſuppoſitions. See PARHELIA.

Sir Iſaac Newton does not appear to have given any particular attention to the ſubject of halos, but he has hinted at his ſentiments concerning them occaſionally; by which we perceive that he conſidered the larger and leſs variable appearances of this kind as produced according to the common laws of refraction, but that the leſs and more variable appearances depend upon the ſame cauſe with the colours of thin plates.

He concludes his explication of the rainbow with the following obſervation on halos and parhelias. "The light which comes through drops of rain by two refractions, without any reflection, ought to appear the ſtrongeſt at the diſtance of about 26 degrees from the ſun, and to decay gradually both ways as the diſtance from him increaſes. And the ſame is to be underſtood of light tranſmitted through ſpherical hail-ſtones: and if the hail be a little flatted, as it often is, the tranſmitted light may be ſo ſtrong, at a little leſs diſtance than that of 26 degrees, as to form a halo about the ſun or moon; which halo, as often as the hail-ſtones are duly figured, may be coloured, and then it muſt be red within by the leaſt refrangible rays, and blue without by the moſt refrangible ones; eſpecially if the hail-ſtones have opaque globules of ſnow in their centres to intercept the light within the halo, as Mr Huygens has obſerved, and make the inſide of it more diſtinctly defined than it would otherwiſe be. For ſuch hail-ſtones, though ſpherical, by terminating the light by the ſnow, may make a halo red within, and colourleſs without, and darker within the red than without, as halos uſe to be. For of thoſe rays which paſs cloſe by the ſnow, the red-making ones will be the leaſt refracted, and ſo come to the eye in the ſtraighteſt lines."

Some farther thoughts of Sir Iſaac Newton's on the ſubject of halos we find ſubjoined to the account of his experiments on the colours of thick plates of glaſs, which he conceived to be ſimilar to thoſe which are exhibited by thin ones. "As light reflected by a lens quick-ſilvered on the back ſide makes the rings of the colours above deſcribed, ſo (he ſays) it ought to make the like ring in paſſing through a drop of water. At the firſt reflexion of the rays within the drop, ſome colours ought to be tranſmitted, as in the caſe of a lens, and others to be reflected back to the eye. For inſtance, if the diameter of a ſmall drop or globule of water be about the 500dth part of an inch, ſo that a red-making ray, in paſſing through the middle of this globule, has 250 fits of eaſy tranſmiſſion within the globule, and all the red-making rays which are at a certain diſtance from this middle ray round about it have 249 fits within the globule, and all the like rays at a certain farther diſtance round about it have 248 fits, and all thoſe at a certain farther diſtance 247 fits, and ſo on, theſe concentric circles of rays, after their tranſmiſſion, falling on a white paper, will make concentric rings of red upon the paper: ſuppoſing the light which paſſes through one ſingle globule ſtrong enough to be ſenſible, and in like manner the rays of other colours will make rings of other colours. Suppoſe now that in a fair day the ſun ſhould ſhine through a thin cloud of ſuch globules of water or hail, and that the globules are all of the ſame ſize, the ſun ſeen through this cloud ought to appear ſurrounded with the like concentric rings of colours, and the diameter of the firſt ring of red ſhould be $7\frac{1}{4}$ degrees, that of the ſecond $10\frac{1}{4}$, that of the third 12° 33′, and according as the globules of water are bigger or leſs, the ring ſhould be leſs or bigger."

This curious theory our author informs us was confirmed by an obſervation which he made in 1692. He ſaw by reflexion, in a veſſel of ſtagnating water, three halos, crowns, or rings of colours about the ſun, like three little rainbows concentric to his body. The colours of the firſt, or innermoſt crown, were blue next the ſun, red without, and white in the middle, between the blue and red. Thoſe of the ſecond crown were purple and blue within, and pale red without, and green in the middle. And thoſe of the third were pale blue within, and pale red without. Theſe crowns incloſed one another immediately, ſo that their colours proceeded in this continual order from the ſun outward; blue, white, red; purple, blue, green, pale yellow, and red; pale blue, pale red. The diameter of the ſecond crown, meaſured from the middle of the yellow and red on one ſide of the ſun, to the middle of the ſame colour on the other ſide, was 9⅓ degrees or thereabouts. The diameters of the firſt and third he had not time to meaſure; but that of the firſt ſeemed to be about five or ſix degrees, and that of the third about twelve. The like crowns appear ſometimes about the moon: for in the beginning of the year 1664, on February 19th at night, he ſaw two ſuch crowns about her. The diameter of the firſt, or innermoſt, was about three degrees, and that of the ſecond about five degrees and a half. Next about the moon was a circle of white; and next about that the inner crown, which was of a bluiſh green within, next the white, and of a yellow and red without; and next about theſe colours were blue and green on the inſide of the outer crown, and red on the outſide of it.

At the ſame time there appeared a halo at the diſtance of about 22° 35′ from the centre of the moon. It was elliptical; and its long diameter was perpendicular to the horizon, verging below fartheſt from the moon. He was told that the moon has ſometimes three or more concentric crowns of colours encompaſſing one another next about her body. The more equal the globules of water or ice are to one another, the more crowns of colours will appear, and the colours will be the more lively. The halo, at the diſtance of 22½ degrees from the moon, is of another ſort. By its being oval, and more remote from the moon below than above, he concludes that it was made by refraction in ſome kind of hail or ſnow floating in the air in an horizontal poſture, the refracting angle being about 50 or 60 degrees. Dr Smith, however, makes it ſufficiently evident, that the reaſon why this halo appeared oval, and more remote from the moon towards the horizon, is a deception of ſight, and the ſame with that which makes the moon appear larger in the horizon.

Dr Kotelnihow, having, like Dr Halley, made very accurate obſervations to determine the number of poſſible rainbows, conſiders the coloured halo which appears about a candle as the ſame thing with one of theſe bows which is formed near the body of the ſun, but which is not viſible on account of his exceſſive ſplendor.

Laſtly, M. Muſchenbroeck concludes his account of coronas with obſerving, that ſome denſity of vapour, or ſome thickneſs of the plates of ice, divides the light in its tranſmiſſion through the ſmall globules of water, or their interſtices, into its ſeparate colours: but what that denſity was, or what was the ſize of the particles which compoſed the vapour, he could not pretend to determine.

Corona, among botaniſts, the names given by ſome to the circumference or margin of a radiated compound flower. It correſponds to the radius of Linnæus; and is exemplified in the flat, tongue-ſhaped petals which occupy the margin of the daiſy or ſunflower.

Corona Auſtralis, or *Meridionalis*, Southern Crown, a conſtellation of the ſouthern hemiſphere, whoſe ſtars in Ptolemy's catalogue are 13, in the Britiſh catalogue 12.

Corona Borealis, the Northern Crown, or Garland, in aſtronomy, a conſtellation of the northern hemiſphere, whoſe ſtars in Ptolemy's catalogue are eight, in Tycho's as many, and in Mr Flamſtead's 21.

Corona Imperialis, in conchyology, a name given by ſome authors to a kind of voluta, differing from the other ſhells of that family, by having its head ornamented with a number of points, forming a ſort of crown. See Voluta.

CORONAL, in anatomy, the firſt ſuture of the ſkull. See Anatomy, n° 13.

CORONALE os, the ſame with the os frontis. See Anatomy, n° 12.

CORONARY vessels, in anatomy, certain veſſels which furniſh the ſubſtance of the heart with blood.

Coronary Arteries, are two arteries ſpringing out of the aorta, before it leaves the pericardium. See Anatomy, n° 122, and 123.

Coronary Vein, a vein diffuſed over the exterior ſurface of the heart. See Anatomy, n° 122.

Stomachic Coronary, a vein inſerted into the trunk of the ſplenic vein, which, by uniting with the meſenteric, forms the vena porta. See Anatomy, n° 123

CORONARIÆ, in botany, the 10th order of plants in Linnæus's Fragments of a natural method. Under this name, inſtead of the more obvious one *libaceæ*, Linnæus collects a great number of genera, moſt of which furniſh very beautiful garden-flowers, *viz*. albuca, cyanella, fritillaria, helonias, hyacinthus, hypoxis, lilium, melanthium, ornithogalum, ſcilla, tulipa, agave, aletris, aloe, anthericum, aſphodelus, bromelia, burmannia, hemerocallis, polianthes, tillandſia, veratrum, yucca.

CORONATION, the ceremony of inveſting with a crown, particularly applied to the crowning of kings, upon their ſucceeding to the ſovereignty. See King.

CORONÆ (anc. geog.), a town of Bœotia, near mount Helicon, and the lake Copais, ſituated on an eminence; famous for the defeat of the Athenians and Bœotians by Ageſilaus.—Another Coronæ of Theſſaly, having Narthacium to the eaſt, and Lamia near the Sperchius, to the north, (Ptolemy).

CORONE (anc. geog.), a town of Meſſenia, ſituated on the ſea giving name to the Sinus Coronæus, (Pliny), now *Golfo di Coron*. Pauſanias takes it to be the *Aepea* of Homer; but Strabo *Thuria*, and Pliny *Pedaſus*, now *Coron*, in the territory of Belvidere, in the Morea. E. Long. 22. Lat. 36. 30.

CORONELLI (Vincent), a famous geographer, born at Venice. His ſkill in the mathematics having brought him to the knowledge of the count d'Eſtrees, his eminence employed him in making globes for Louis XIV. With this view Coronelli ſpent ſome time at Paris; and left a great number of globes there, which are eſteemed. In 1685, he was made coſmographer to the republic of Venice: and four years after, public profeſſor of geography. He founded an academy of coſmography at Venice; and died in that city in 1718. He publiſhed above 400 geographical charts, an abridgement of coſmography, ſeveral books on geography, and other works.

CORONER (*coronator*), an ancient officer in England, ſo called becauſe he hath principally to do with pleas of the crown, or ſuch wherein the king is more immediately concerned. And in this light, the lord chief juſtice of the king's bench is the principal coroner in the kingdom; and may, if he pleaſes, exerciſe the juriſdiction of a coroner in any part of the realm. But there are alſo particular coroners for every county of England; uſually four, but ſometimes ſix, and ſometimes fewer. This officer is of equal authority with the ſheriff; and was ordained, together with him, to keep the peace when the earls gave up the wardſhip of the county.

He is choſen by all the freeholders of the county court; and by the ſtatute of Weſtminſter 1. it was enacted, that none but lawful and diſcreet knights ſhould be choſen: but it ſeems now ſufficient if a man have lands enough to be made a knight, whether he be really knighted or not: for the coroner ought to have an eſtate ſufficient to maintain the dignity of his office, and anſwer any fines that may be made upon him for his miſbehaviour; and, if he hath not enough to anſwer, his fine ſhall be levied on the county, as a puniſhment for electing an inſufficient officer. Now, indeed, through the culpable neglect of gentlemen of property, this office has been ſuffered to fall into diſrepute, and get into low and indigent hands; ſo that although formerly no coroners would be paid for ſerving their country, and they were by the aforeſaid ſtatute of Weſtminſter 1. expreſsly forbidden to take a reward under pain of great forfeiture to the king; yet for many years paſt they have only deſired to be choſen for the ſake of their perquiſites; being allowed fees for their attendance by ſtatute 3 Hen. VII. c. 1. which Sir Edward Coke complains of heavily, though ſince his time thoſe fees have been much enlarged.

The coroner is choſen for life; but may be removed, either by being made ſheriff or choſen verderor, which are offices incompatible with the other; and by the ſtatute 25 Geo. II. c. 29. extortion, neglect, or miſbehaviour, are alſo made cauſes of removal.

The office and power of a coroner are alſo, like thoſe of the ſheriff, either judicial or miniſterial; but principally judicial. This is in great meaſure aſcertained by ſtatute 4 Edw. I. *De officio coronatoris*; and conſiſts, firſt, in inquiring, when any perſon is ſlain, or dies ſuddenly, or in priſon, concerning the manner of his death. And this muſt be *ſuper viſum corporis*; for if the body is not found, the coroner cannot ſit. He muſt alſo ſit at the very place where the death happened. And his inquiry is made by a jury from four, five or ſix of the neighbouring towns, over whom he is to preſide. If any be found guilty by this inqueſt of murder, he is to commit to priſon for farther trial, and is alſo to enquire concerning their lands, goods, and chattels, which are forfeited thereby; but whether it be murder or not, he muſt inquire whether any deodand has accrued to the king, or the lord of the franchiſe, by this death; and muſt certify the whole of this inquiſition to the court of king's-bench, or the next aſſizes. Another branch of his office is to inquire concerning ſhipwrecks; and certify whether wreck or not, and who is in poſſeſſion of the goods. Concerning treaſure-trove, he is alſo to inquire concerning the finders, and where it is, and whether any one be ſuſpected of having found and concealed a treaſure; "and that may well be perceived (ſaith the old ſtatute of Edw. I.), where one liveth riotouſly, haunting taverns, and hath done ſo of long time;" whereupon he might be attached and held to bail upon this ſuſpicion only.

The miniſterial office of the coroner is only as the ſheriff's ſubſtitute. For when juſt exception can be taken to the ſheriff, for ſuſpicion of partiality (as that he is intereſted in the ſuit, or of kindred to either plaintiff or defendant), the proceſs muſt then be awarded to the coroner, inſtead of the ſheriff, for execution of the king's writs.

CORONET. See CROWN.

CORONET, or cornet, of a horſe, the loweſt part of the paſtern, which runs round the coffin, and is diſtinguiſhed by the hair joining and covering the upper part of the hoof.

CORONILLA, *jointed podded* COLUTEA: A genus of the decandria order, belonging to the diadelphia claſs of plants; and in the natural method ranking under the 32d order, *Papilionaceæ*. The calyx is bilabiated, with two ſegments above coalited; the vexillum ſcarce any longer than the alæ; the legumen much contracted between the ſeeds. To this genus Linnæus alſo joins the emerus, or ſcorpion ſena; though Mr Miller makes it a diſtinct ſpecies. There are 11 ſpecies, all of them plants of conſiderable beauty, with very bright yellow flowers. All of them, however, are rather too tender for this climate, except the emerus. This ſpecies riſes with a ſhrubby ſtem, branching numerouſly ſix or eight feet high, cloſely garniſhed with winged leaves of three pair of lobes, terminated by an odd one; and, at the ſides of the branches, numerous long flower-ſtalks, each ſupporting two or three large yellow flowers of the papilionaceous kind, ſucceeded by longiſh pods; it is eaſily propagated by ſeeds, and likewiſe by layers or cuttings. The leaves of this plant are eſteemed laxative, and uſed as a ſubſtitute for common ſena in ſome parts of Europe. A dye is procured by fermentation from the leaves, like that of indigo.

CORONOID, and CONDYLOID, proceſſes. See ANATOMY, n° 26.

CORPORA CAVERNOSA, in anatomy, two ſpongious bodies, called alſo *corpora nervoſa* and *corpus ſpongioſum*. See ANATOMY, p. 738, col. 2.

CORPORA Pyramidalia, are two protuberances of the under part of the *cerebellum*, about an inch long; ſo called from their reſemblance to a pyramid. See ANATOMY, n° 134.

CORPORA Striata. See ANATONY, p. 758, col. 1.

CORPORAL, an inferior officer under a ſergeant, in a company of foot, who has charge over one of the diviſions, places and relieves centinels, and keeps good order in the corps de garde: he alſo receives the word from the inferior rounds, which paſſes by his corps de garde. This officer carries a fuſee, and is commonly an old ſoldier: there are generally three corporals in each company.

Corporal *of a Ship of War*, an officer under the maſter at arms, employed to teach the officers the exerciſe of ſmall arms, or of muſketry; to attend at the gang-way, on entering ports, and obſerve that no ſpirituous liquors are brought into the ſhip, unleſs by exepreſs leave from the officers. He is alſo to extinguiſh the fire and candles at eight o'clock in winter and nine in ſummer, when the evening gun is fired; and to walk frequently down in the lower decks in his watch, to ſee that there are no lights but ſuch as are under the charge of proper centinels.

Corporal *(Corporale)*, is alſo an ancient church-term, ſignifying the ſacred linen ſpread under the chalice in the euchariſt and maſs, to recieve the fragments of the bread, if any chance to fall. Some ſay, it was pope Euſebius who firſt enjoined the uſe of the corporal; others aſcribe it to St Silveſter. It was the cuſtom to carry corporals, with ſome ſolemnity, to fires, and to heave them againſt the flames, in order to extinguiſh them. Philip de Comines ſays, the pope made Louis XI. a preſent of the corporale, whereon my lord St Peter ſung maſs.

CORPORATION, a body politic or incorporate, ſo called, becauſe the perſons or members are joined into one body, and are qualified to take, grant, &c.

Of corporations there is a great variety ſubſiſting, for the advancement of religion, of learning, and of commerce; in order to preſerve entire and for ever thoſe rights and immunities, which, if they were granted only to thoſe individuals of which the body corporate is compoſed, would upon their death be utterly loſt and extinct. To ſhow the advantages of theſe incorporations, let us conſider the caſe of a college in either of the univerſities, founded *ad ſtudendum et orandum*, for the encouragement and ſupport of religion and learning. If this was a mere voluntary aſſembly, the individuals which compoſe it might indeed read, pray, ſtudy, and perform ſcholaſtic exerciſes together, ſo long as they could agree to do ſo: but they could neither frame, nor receive, any laws or rules of their conduct; none at leaſt which would have any binding force, for want of a coercive power to create a ſufficient obligation. Neither could they be capable of retaining any privileges or immunities: for, if ſuch privileges be attacked, which of all this unconnected aſſembly has the right or ability to defend them? And, when they are diſperſed by death or otherwiſe, how ſhall they transfer theſe advantages to another ſet of ſtudents, equally unconnected as themſelves? So alſo, with regard to holding eſtates or other property, if land be granted for the purpoſes of religion or learning to 20 individuals not incorporated, there is no legal way of continuing the property to any other perſons for the ſame purpoſes, but by endleſs conveyances from one to the other, as often as the hands are changed. But when they are conſolidated and united into a corporation, they and their ſucceſſors are then conſidered as one perſon in law: as one perſon, they have one will, which is collected from the ſenſe of the majority of the individuals: this one will may eſtabliſh rules and orders for the regulation of the whole, which are a ſort of municipal laws of this little republic; or rules and ſtatutes may be preſcribed to it at its creation, which are then in the place of natural laws: the privileges and immunities, the eſtates and poſſeſſions, of the corporation, when once veſted in them, will be for ever veſted, without any new conveyance to new ſucceſſions; for all the individual members that have exiſted from the foundation to the preſent time, or that ſhall ever hereafter exiſt, are but one perſon in law, a perſon that never dies: in like manner as the river Thames is ſtill the ſame river, though the parts which compoſe it are changing every inſtant.

Blackſt. Comment.

The honour of originally inventing theſe political conſtitutions entirely belongs to the Romans. They were introduced, as Plutarch ſays, by Numa; who finding, upon his acceſſion, the city torn to pieces by the two rival factions of Sabines and Romans, thought it a prudent and politic meaſure to ſubdivide theſe two into many ſmaller ones, by inſtituting ſeparate ſocieties of every manual trade and profeſſion. They were afterwards much conſidered by the civil law, in which they were called *univerſitates*, as forming one whole out of many individuals; or *collegia*, from being gathered together: they were adopted alſo by the canon law, for the maintenance of eccleſiaſtical diſcipline; and from them the ſpiritual corporations are derived. But our laws have conſiderably refined and improved upon the invention, according to the uſual genius of the Engliſh nation: particularly with regard to ſole corporations, conſiſting of one perſon only, of which the Roman lawyers had no notion; their maxim being that "tres faciunt collegium:" though they held, that if a corporation, originally conſiſting of three perſons, be reduced to one, "ſi univerſitas ad unum redit," it may ſtill ſubſiſt as a corporation, "et ſtet nomen univerſitatis."

As to the ſeveral ſorts of corporations, the firſt diviſion of them is into *aggregate* and *ſole*. Corporations aggregate conſiſt of many perſons united together into one ſociety, and are kept up by a perpetual ſucceſſion of members, ſo as to continue for ever: of which kind are the mayor and commonalty of a city, the head and fellows of a college, the dean and chapter of a cathedral church. Corporations ſole conſiſt of one perſon only and his ſucceſſors, in ſome particular ſtation, who are incorporated by law, in order to give them ſome legal capacities and advantages, particularly that of perpetuity, which in their natural perſons they could not have had. In this ſenſe the king is a ſole corporation: ſo is a biſhop: ſo are ſome deans and prebendaries, diſtinct from their ſeveral chapters: and ſo is every parſon and vicar. And the neceſſity, or at leaſt, uſe of this inſtitution will be very apparent, if we conſider the caſe of a parſon of a church. At the original endowment of pariſh-churches, the freehold of the church, the church-yard, the parſonage-houſe, the glebe, and the tithes of the pariſh, were veſted in the then parſon by the bounty of the donor, as a temporal recompence to him for his ſpiritual care of the inhabitants, and with intent that the ſame emoluments ſhould ever afterwards continue as a recompence for the ſame care. But how was this to be effected? The freehold was veſted in the parſon; and, if we ſuppoſe it veſted in his natural capacity, on his death it might deſcend to his heir, and would be liable to his debts and incumbrances:

brances: or at beſt the heir might be compellable, at ſome trouble and expence, to convey theſe rights to the ſucceeding incumbent. The law therefore has wiſely ordained, that the parſon, *quatenus* parſon, ſhall never die, any more than the king; by making him and his ſucceſſors a corporation. By which means all the original rights of the parſonage are preſerved entire to the ſucceſſor: for the preſent incumbent, and his predeceſſor who lived ſeven centuries ago, are in law one and the ſame perſon; and what was given to the one was given to the other alſo.

Another diviſion of corporations, either ſole or aggregate, is into *eccleſiaſtical* and *lay*. Eccleſiaſtical corporations are where the members that compoſe it are entirely ſpiritual perſons; ſuch as biſhops; certain deans and prebendaries; all archdeacons, parſons, and vicars; which are ſole corporations: deans and chapters at preſent, and formerly prior and convent, abbot and monks, and the like, bodies aggregate. Theſe are erected for the furtherance of religion, and perpetuating the rights of the church.—Lay corporations are of two ſorts, *civil* and *eleemoſynary*. The civil are ſuch as are erected for a variety of temporal purpoſes. The king, for inſtance, is made a corporation to prevent in general the poſſibility of an *interregnum* or vacancy of the throne, and to preſerve the poſſeſſions of the crown entire; for, immediately upon the demiſe of one king, his ſucceſſor is in full poſſeſſion of the regal rights and dignity. Other lay corporations are erected for the good government of a town or particular diſtrict, as a mayor and commonalty, bailiff and burgeſſes, or the like: ſome for the advancement and regulation of manufactures and commerce; as the trading companies of London and other towns: and ſome for the better carrying on of divers ſpecial purpoſes; as church-wardens, for conſervation of the goods of the pariſh; the college of phyſicians and company of ſurgeons in London, for the improvement of the medical ſcience; the royal ſociety for the advancement of natural knowledge; and the ſociety of antiquarians for promoting the ſtudy of antiquities. The eleemoſynary ſort are ſuch as are conſtituted for the perpetual diſtribution of the free alms, or bounty, of the founder of them to ſuch perſons as he has directed. Of this kind are all hoſpitals for the maintenance of the poor, ſick, and impotent; and all colleges, both *in* univerſities and *out* of them: which colleges are founded for two purpoſes: 1. For the promotion of piety and learning by proper regulations and ordinances. 2. For imparting aſſiſtance to the members of thoſe bodies, in order to enable them to proſecute their devotion and ſtudies with greater eaſe and aſſiduity. And all theſe eleemoſynary corporations are, ſtrictly ſpeaking, lay, and not eccleſiaſtical, even though compoſed of eccleſiaſtical perſons, and although they in ſome things partake of the nature, privileges, and reſtrictions of eccleſiaſtical bodies.

Having thus marſhalled the ſeveral ſpecies of corporations, let us next proceed to conſider, 1. How corporations in general may be created. 2. What are their powers, capacities, and incapacities. And, 3. How they may be diſſolved.

I. Corporations, by the civil law, ſeem to have been created by the mere act and voluntary aſſociation of members; provided ſuch convention was not contrary to law, for then it was *illicitum collegium*. It does not appear that the prince's conſent was neceſſary to be actually given to the foundation of them; but merely that the original founders of theſe voluntary and friendly ſocieties (for they were little more than ſuch) ſhould not eſtabliſh any meetings in oppoſition to the laws of the ſtate.

But in England the king's conſent is abſolutely neceſſary to the erection of any corporation, either impliedly or expreſsly given. The king's implied conſent is to be found in corporations which exiſt by force of the common law, to which former kings are ſuppoſed to have given their concurrence; common law being nothing elſe but cuſtom, ariſing from the univerſal agreement of the whole community. Of this ſort are the king himſelf, all biſhops, parſons, vicars, church-wardens, and ſome others; who by common law have ever been held (as far as our books can ſhow us) to have been corporations, *virtute officii*: and this incorporation is ſo inſeparably annexed to their offices, that we cannot frame a complete legal idea of any of theſe perſons, but we muſt alſo have an idea of a corporation, capable to tranſmit his rights to his ſucceſſors, at the ſame time. Another method of implication, whereby the king's conſent is preſumed, is as to all corporations by preſcription, ſuch as the city of London and many others, which have exiſted as corporations, time whereof the memory of man runneth out to the contrary; and therefore are looked upon in law to be well created. For though the members thereof can ſhow no legal charter of incorporation, yet in caſes of ſuch high antiquity the law preſumes there once was one; and that by the variety of accidents, which a length of time may produce, the charter is loſt or deſtroyed. The methods by which the kings conſent is expreſsly given, are either by act of parliament or charter. By act of parliament, of which the royal aſſent is a neceſſary ingredient, corporations may undoubtedly be created: but it is obſervable, that moſt of thoſe ſtatutes, which are uſually cited as having created corporations, do either confirm ſuch as have been before created by the king; as in the caſe of the college of phyſicians, erected by charter 10 Hen. VIII. which charter was afterwards confirmed in parliament; or, they permit the king to erect a corporation *in futuro* with ſuch and ſuch powers; as is the caſe of the bank of England, and the ſociety of the Britiſh fiſhery. So that the immediate creative act is uſually performed by the king alone, in virtue of his royal prerogative.

All the other methods therefore whereby corporations, exiſt, by common law, by preſcription and by act of parliament, are for the moſt part reducible to this of the king's letters patent, or charter of incorporation. The king's creation may be performed by the words *creamus, erigimus, fundamus, incorporamus*, or the like. Nay it is held, that if the king grants to a ſet of men to have *gildam mercatoriam*, "a mercantile meeting or aſſembly," this is alone ſufficient to incorporate and eſtabliſh them for ever.

The king (it is ſaid) may grant to a ſubject the power of erecting corporations, though the contrary was formerly held: that is, he may permit the ſubject

Corporation.

Blackſt. Comment.

ject to name the perſons and powers of the corporation at his pleaſure, but it is really the king that erects, and the ſubject is but the inſtrument; for though none but the king can make a corporation, yet *qui facit per alium, facit per ſe.* In this manner the chancellor of the univerſity of Oxford has power by charter to erect corporations; and has actually often exerted it in the erection of ſeveral matriculated companies, now ſubſiſting, of tradeſmen ſubſervient to the ſtudents.

When a corporation is erected, a name muſt be given to it; and by that name alone it muſt ſue and be ſued, and do all legal acts.

II. After a corporation is ſo formed and named, it acquires many powers and rights, which we are next to conſider. Some of theſe are neceſſarily and inſeparably incident to every corporation; which incidents, as ſoon as a corporation is duly erected, are tacitly annexed of courſe. As, 1. To have perpetual ſucceſſion. This is the very end of its incorporation: for there cannot be a ſucceſſion for ever without an incorporation; and therefore all aggregate corporations have a power neceſſarily implied of electing members in the room of ſuch as go off. 2. To ſue or be ſued, implead or be impleaded, grant or receive, by its corporate name, and do all other acts as natural perſons may. 3. To purchaſe lands, and hold them, for the benefit of themſelves and their ſucceſſors: which two are conſequential to the former. 4. To have a common ſeal. For a corporation, being an inviſible body, cannot manifeſt its intentions by any perſonal act or oral diſcourſe: it otherwiſe acts and ſpeaks only by its common ſeal. For though the particular members may expreſs their private conſents to any act, by words, or ſigning their names, yet this does not bind the corporation; it is the fixing of the ſeal, and that only, which unites the ſeveral aſſents of the individuals who compoſe the community, and makes one joint aſſent of the whole. 5. To make by-laws or private ſtatutes for the better government of the corporation; which are binding upon themſelves, unleſs contrary to the laws of the land, and then they are void. But no trading company is with us allowed to make by-laws which may affect the king's prerogative or the common profit of the people, under penalty of L. 40, unleſs they be approved by the chancellor, treaſurer, and chief juſtices, or the judges of aſſize in their circuits: and even though they be ſo approved, ſtill, if contrary to law, they are void. Theſe five powers are inſeparably incident to every corporation, at leaſt to every corporation aggregate: for two of them, though they may be practiſed, yet are very unneceſſary to a corporation ſole; viz. to have a corporate ſeal to teſtify his ſole aſſent, and to make ſtatutes for the regulation of his own conduct.

Corporations have a capacity to purchaſe lands for themſelves and ſucceſſors; but they are excepted out of the ſtatute of wills; ſo that no deviſe of lands to a corporation by will is good; except for charitable uſes, by ſtatute 43 Eliz. c. 4. which exception is again greatly narrowed by the ſtatute 9 Geo. II. c. 36. And alſo, by a great variety of ſtatutes, their privilege even of purchaſing from any living granter is much abridged; ſo that now a corporation, either eccleſiaſtical or lay, muſt have a licence from the king to purchaſe, before they can exert that capacity which is veſted in them by the common law: nor is even this in all caſes ſufficient. Theſe ſtatutes are generally called the ſtatutes of *mortmain.* See Mortmain.

Corporation.

Blackſt. Comment.

The general duties of all bodies politic, conſidered in their corporate capacity, may, like thoſe of natural perſons, be reduced to this ſingle one; that of acting up to the end or deſign, whatever it be, for which they were created by their founder.

III. How corporations may be diſſolved. Any particular member may be disfranchiſed, or loſe his place in the corporation, by acting contrary to the laws of the ſociety, or the laws of the land: or he may reſign it by his own voluntary act. But the body politic may alſo itſelf be diſſolved in ſeveral ways; which diſſolution is the civil death of the corporation: and in this caſe their lands and tenements ſhall revert to the perſon, or his heirs, who granted them to the corporation: for the law doth annex a condition to every ſuch grant, that if the corporation be diſſolved, the granter ſhall have the lands again, becauſe the cauſe of the grant faileth. The grant is indeed only during the life of the corporation; which may endure for ever; but when that life is determined by the diſſolution of the body politic, the granter takes it back by reverſion, as in the caſe of every other grant for life. The debts of a corporation, either to or from it, are totally extinguiſhed by its diſſolution; ſo that the members thereof cannot recover, or be charged with them, in their natural capacities: agreeable to that maxim of the civil law, *Si quid univerſitati debetur, ſingulis non debetur; nec, quod debet univerſitas, ſinguli debent.*

A corporation may be diſſolved, 1. By act of parliament, which is boundleſs in its operations. 2. By the natural death of all its members, in caſes of an aggregate corporation. 3. By ſurrender of its franchiſes into the hands of the king, which is a kind of ſuicide. 4. By forfeiture of its charter, through negligence or abuſe of its franchiſes; in which caſe the law judges that the body politic has broken the condition upon which it was incorporated, and thereupon the incorporation is void. And the regular courſe is to bring an information in nature of a writ of *quo warranto,* to inquire by what warrant the members now exerciſe their corporate power, having forfeited it by ſuch and ſuch proceedings. The exertion of this act of law, for the purpoſes of the ſtate, in the reigns of king Charles and king James II. particularly by ſeizing the charter of the city of London, gave great and juſt offence; though perhaps, in ſtrictneſs of law, the proceedings in moſt of them were ſufficiently regular: but the judgment againſt that of London was reverſed by act of parliament after the revolution; and by the ſame ſtatute it is enacted, that the franchiſes of the city of London ſhall never more be forfeited for any cauſe whatſoever. And becauſe by the common law corporations were diſſolved, in caſe the mayor or head officer was not duly elected on the day appointed in the charter or eſtabliſhed by preſcription, it is now provided, that for the future no corporation ſhall be diſſolved upon that account; and ample directions are given for appointing a new officer, in caſe there be no election, or a void one, made upon the charter or preſcriptive day.

Corporation Act, is that which prevents any perſon from being legally elected into any office relating to the government of any city or corporation, unleſs within a twelvemonth before he has received the ſacrament of the Lord's ſupper, according to the rites of the church of England; and which enjoins him to take the oaths of allegiance and ſupremacy when he takes the oath of office; otherwiſe his election is void.

CORPOREAL, thoſe qualities which denominate a body. See Incorporeal.

CORPOREITY, the quality of that which is corporeal, or his body; or that which conſtitutes or denominates it ſuch.--The corporeity of God was the capital error of the Anthropomorphites. Some authors reproach Tertullian with admitting a corporeity in the Deity: but it is manifeſt, by *body* he means no more than *ſubſtance*.—The Mahometans reproach the Samaritans at this day, with a belief of the corporeity of God. Many of the ancients believed the corporeity of angels.

CORPSE, a dead body.

If any one, in taking up a dead body, ſteals the ſhrowd, or other apparel, it will be felony. Stealing only the corpſe itſelf is not felony; but it is puniſhable as a miſdemeanor by indictment at common law.

CORPS, in architecture, is a term borrowed from the French, ſignifying any part that projects or advances beyond the naked of a wall; and which ſerves as a ground for ſome decoration or the like.

Corps de Bataille, is the main body of an army drawn up for battle.

Corps de Garde, a poſt in an army, ſometimes under covert, ſometimes in the open air, to receive a body of ſoldiery, who are relieved from time to time, and are to watch in their turns, for the ſecurity of a quarter, a camp, ſtation, &c.—The word is alſo uſed for the men who watch therein. It is uſual to have, beſide the great, a little corps de garde, at a good diſtance before the lines; to be the more readily advertiſed of the approach of the enemy.

CORPULENCY, the ſtate of a perſon too much loaded with fleſh or fat.

Corpulency is the occaſion of various diſeaſes, and particularly the apoplexy. It was held infamous among the ancient Lacedæmonians.

Sennertus mentions a man that weighed 600 pounds, and a maid 36 years of age who weighed 450. Bright of Malden, who died at the age of 29 years in 1750, weightd 616 pounds. Chiapin Vitelli, Marquis of Cerona, a noted Spaniſh general in his time, from an exceſſive corpulency, is ſaid to have reduced himſelf, by drinking of vinegar, to ſuch a degree of leanneſs, that he could fold his ſkin ſeveral times round him.

Caſtile ſoap, in the form of a bolus, an electuary, pills, or diſſolved in a gill or more ſoft water, from one to four drachms, taken at bed-time, is ſtrongly recommended with a view of reducing corpulency, in a diſcourſe on its nature, cauſes, and cure, by Malcolm Flemyng, M. D. Lond. 1760. See Medicine-*Index*.

CORPUS, in anatomy, is applied to ſeveral parts of the animal ſtructure: as *corpus colloſum, corpus cavernoſum*, &c. See Anatomy, p. 739, and p. 740.

Corpus is alſo uſed in matters of learning, for ſeveral works of the ſame nature collected and bound together. Gratian made a collection of the canons of the church, called *corpus canonum*. The *corpus* of the civil law is compoſed of the digeſt, code, and inſtitutes. We have alſo a *corpus* of the Greek poets; and another of the Latin poets.

Corpus Chriſti, a feſtival of the church of England, kept on the next Thurſday after Trinity-ſunday, inſtituted in honour of the euchariſt; to which alſo one of the colleges in Oxford is dedicated.

CORPUSCLE, in Phyſics, a minute particle, or phyſical atom, being ſuch as a natural body is made up of. By this word is not meant the elementary particles, nor the hypoſtatical principles of chemiſts; but ſuch particles, whether of a ſimple or compound nature, whoſe parts will not be diſſolved nor diſſipated by ordinary degrees of heat.

CORPUSCULAR philosophy, that way of philoſophiſing which endeavours to explain things, and to account for the phenomena of nature, by the motion, figure, reſt, poſition, &c. of the corpuſcles, or the minute particles of matter.

Mr Boyle ſums up the chief principles of the corpuſcular hypotheſis, which now flouriſhes under the mechanical philoſophy in theſe particulars:

1. They ſuppoſe that there is but one catholic or univerſal matter, which is an extended, impenetrable, and diviſible ſubſtance, common to all bodies, and capable of all forms. 2. That this matter, in order to form the vaſt variety of natural bodies, muſt have motion in ſome or all its aſſignable parts; and that this motion was given to matter by God the Creator of all things, and has all manner of directions and tendencies. 3. Matter muſt alſo be actually divided into parts, and each of theſe primitive particles, fragments, or atoms of matter, muſt have its proper magnitude or ſize, as alſo its peculiar figure or ſhape. 4. They ſuppoſe alſo, that theſe differently ſized and ſhaped particles may have as different orders and poſitions, whereof great variety may ariſe in the compoſition of bodies.

CORRADINI de Sezza (Peter Marcellinus), a learned civilian and cardinal, born at Sezza, in 1658, acquired the eſteem and confidence of Clement XI. and died at Rome in 1743. He was the author of a learned and curious work entitled "Verus Latium profanum & ſacrum," 2 vols folio; and a hiſtory of Sezza, in 4to.

CORRADO (Sebaſtian), an Italian grammarian of the 16th century, taught the Greek and Latin tongues at Reggio, where he formed an academy of polite literature; and at length removed to Bologna, in order to be profeſſor of thoſe languages. He wrote ſeveral works, the moſt eſteemed of which are, "Queſtura in qua Ciceronis Vita refertur," an excellent performance; and, "de Linguâ Latinâ." He died in 1556.

CORRECTION, in printing, the act of retrenching the faults in a work; or the reading which the corrector gives the firſt proofs, to point out and amend the faults, to be rectified by the compoſitor.

The corrections are placed on the margin of each page, right againſt the line where the faults are found. There are different characters uſed to expreſs different corrections, as D or ♂, *dele*, for any thing to be effaced or left out. When any thing is to be inſerted, Corrector ‖ Corroſives.

the place is marked in the line with a caret ‸, and the inſertion added in the margin. When a word, ſyllable, &c. is to be altered, it is eraſed out of the proof, and that to be put in its room written in the margin; always obſerving, if there be ſeveral miſtakes in the ſame line, that the corrections in the margin be ſeparated by little bars, or ſtrokes, | . If a ſpace be omitted, its place is marked with a caret, and the margin with ※. If a ſpace be wrong placed, as in the middle of a word, the two parts are connected with a cu rve, and the ſame character put in the margin. If a letter be inverted, it is expreſſed on the margin with ɔ. If any thing be tranſpoſed, it is marked thus: *The ſhorteſt* |*are the*| *follies* | *beſt*; for *the ſhorteſt follies are the beſt*; and in the margin is added *tr.* in a circle. If Roman characters are to be changed for Italic, or *vice verſa*, a line is drawn under them thus, and *Roman* or *Italic* added in the margin; if to capitals, a double line. If a word or ſentence is entirely omitted, the place is marked with a caret, and in the margin is inſerted the word *out*. If the letters of a word ſtand too far aſunder, a line is drawn under them, and in the margin is put a crooked line or hook, thus ‿.

CORRECTOR, in general, denotes ſomething that mends the faults or bad qualities of others.

Corrector of the Staple in Britain, a clerk belonging to the ſtaple, whoſe buſineſs is to write down and record the bargains that merchants make there.

Corrector, in medicine or pharmacy, an ingredient in a compoſition, which guards againſt or abates the force of another.

CORREGIDOR, the name of an officer of juſtice in Spain, and countries ſubject to the Spaniſh government. He is the chief judge of a town or province.

CORREGGIO. See Allegri.

CORRELATIVE, ſomething oppoſed to another in a certain relation. Thus, father and ſon are correlatives. Light and darkneſs, motion and reſt, are correlative and oppoſite terms.

CORRIGIOLA, in botany: A genus of the trigynia order, belonging to the pentandria claſs of plants; and in the natural method ranking under the 54th order, *Miſcellaneæ*. The calyx is pentaphyllous; the petals five; and one three-cornered ſeed.

CORROBORANTS, or Corroborative *Medicines*. See Strengtheners.

CORROSION, in a general ſenſe, the action of gnawing away, by degrees, the continuity of the parts of bodies.

Corrosion, in chemiſtry, an action of bodies, by means of proper menſtruums, that produces new combinations, and a change of their form, without converting them to fluidity.

CORROSIVE sublimate mercury. See Chemistry-*Index*.

CORRUGATOR muscle. See Anatomy, *Table of the Muſcles*.

CORROSIVES, in ſurgery, are medicines which corrode whatever part of the body they are applied to: ſuch are burnt alum, white precipitate of mercury, white vitriol, red precipitate of mercury, butter of antimony, lapis infernalis, &c.

Corrupticolæ, Corruption.

CORRUPTICOLÆ, a ſect who roſe out of the Monophyſites in Egypt about the year 519, under their chief Severus, the pretended patriarch of Alexandria.

Their diſtinguiſhing doctrine, whence they derived their name, was, that the body of Jeſus Chriſt was *corruptible*; that the fathers had owned it; and that to deny it was to deny the truth of our Saviour's paſſion.

On the other hand, Julian of Halicarnaſſus, another Eutychian, a refugee, as well as Severus, in Alexandria, maintained that the body of Jeſus Chriſt had been always incorruptible; that to ſay it was corruptible, was to make a diſtinction between Jeſus Chriſt and the Word, and by conſequence to make two natures in Jeſus Chriſt.

The people of Alexandria were divided between the two opinions; and the partiſans of Severus were called *corrupticolæ*, q. d. worſhippers of ſomething *corruptible*: ſometimes they were denominated *corruptibles*; and the adherents of Julian *incorruptibiles* or *phantaſiaſtæ*. The clergy and ſecular powers favoured the firſt; the monks and the people the latter.

CORRUPTION, the deſtruction, extinction, or at leaſt ceſſation for a time, of the proper mode of exiſtence of any natural body. See Putrefaction.

Corruption of Blood, in law, one of the conſequences of an attainder; and is both upwards and downwards; ſo that an attainted perſon can neither inherit lands or other hereditaments from his anceſtors, nor retain thoſe he is already in poſſeſſion of, nor tranſmit them by deſcent to any heir; but the ſame ſhall eſcheat to the lord of the fee, ſubject to the king's ſuperior right of forfeiture; and the perſon attainted ſhall alſo obſtruct all deſcents to his poſterity, wherever they are obliged to derive a title through him to a remoter anceſtor. See Attainder.

Blackſt. Comment.

This is one of thoſe notions which our laws have adopted from the feodal conſtitutions, at the time of the Norman conqueſt; as appears from its being unknown in thoſe tenures which are indiſputably Saxon, or Gavel kind: wherein, though by treaſon, according to the ancient Saxon laws, the land is forfeited to the king, yet no corruption of blood, no impediment of deſcents, enſues; and on judgment of mere felony, no eſcheat accrues to the lord. But, by the law of England, derived as above, a man's blood is ſo univerſally corrupted by attainder, that his ſons can neither inherit to him nor to any other anceſtor, at leaſt on the part of their attainted father.

This corruption of blood cannot be abſolutely removed but by authority of parliament. The king may excuſe the public puniſhment of an offender; but cannot aboliſh the private right which has accrued, or may accrue, to individuals as a conſequence of the criminal's attainder. He may remit a forfeiture in which the intereſt of the crown is alone concerned: but he cannot wipe away the corruption of blood; for therein a third perſon hath an intereſt, the lord who claims by eſcheat. If therefore a man hath a ſon, and is attainted, and afterwards pardoned by the king; this ſon can never inherit to his father, or father's anceſtors; becauſe his paternal blood, being once thoroughly corrupted by his father's attainder, muſt continue ſo: but if the ſon had been born after the pardon, he might inherit; becauſe, by the pardon, the father is made a new man, and may convey new inheritable blood to his after-born children.

This corruption of blood, thus ariſing from feudal principles, but perhaps extended farther than even theſe principles will warrant, has been long looked upon as a peculiar hardſhip: becauſe the oppreſſive parts of the feudal tenures being now in general aboliſhed, it ſeems unreaſonable to reſerve one of their moſt inequitable conſequences; namely, that the children ſhould not only be reduced to preſent poverty (which, however ſevere, is ſufficiently juſtified upon reaſons of public policy), but alſo be laid under future difficulties of inheritance, on account of the guilt of their anceſtors. And therefore in moſt (if not all) of the new felonies treated by Parliament ſince the reign of Henry VIII. it is declared that they ſhall not extend to any corruption of blood: and by the ſtatute 7 Anne c. 21. (the operation of which is poſtponed by the ſtatute 17 Geo. II. c. 39.) it is enacted, that, after the death of the late pretender and his ſons, no attainder for treaſon ſhall extend to the diſinheriting any heir, nor the prejudice of any perſon, other than the offender himſelf: which proviſions have indeed carried the remedy farther than was required by the hardſhip above complained of; which is only the future obſtruction of deſcents, where the pedigree happens to be deduced through the blood of an attainted anceſtor.

CORSAIR, a pirate or perſon who ſcours the ſeas, eſpecially the Mediterranean, with a veſſel armed for war, without commiſſion from any prince or power, to plunder merchant-veſſels. The word comes from the Italian *corſare*, of *corſo*, or *à curſibus*, by reaſon of their courſes, or excurſions—The name is commonly given to the piratical cruiſers of Barbary, who had their riſe about the beginning of the 16th century.

A *corſair* is diſtinguiſhed from a *privateer* in this, that the latter does it under a commiſſion, and only attacks the veſſels of thoſe at war with the ſtate whence his commiſſion is derived. The puniſhment of a corſair is to be hanged, without remiſſion; whereas privateers are to be treated as priſoners of war. All corſair veſſels are good prizes.

CORSELET, a little cuiraſs; or, according to others, an armour or coat made to cover the whole body, anciently worn by the pike-men, uſually placed in the front and flanks of the battle, for the better reſiſting the enemy's aſſaults, and guarding the ſoldiers placed behind them.

CORSICA, (anc. geog.) an iſland ſituated in that part of the Mediterranean anciently called the *Sea of Liguria*, in length from north to ſouth 150 miles, and where broadeſt 50, (Pliny). The ancient inhabitants were the Phocenſes, (Herodotus); from which they removed to Maſſilia. To them ſucceeded the Ligurians and Hiſpani, as appears from the ſimilitude of rites and cuſtoms: afterwards two Roman colonies, one by Marius, the other by Sylla. To the ſouth it is ſeparated from Sardinia by a narrow ſtrait called Ταφρος, or *Foſſa*, (Pliny); ſixty ſtadia or about ſeven miles in breadth, (Strabo). It was famous for its barren rocks, its woods, and its honey; which laſt was reckoned noxious, from the great plenty of yew-trees, according to Diodorus Siculus and Virgil. *Corſi* was the name of the people, (Livy); *Cyrnaeus*, the epithet, (Virgil).—The iſland ſtill retains its ancient name *Corſica*; ſituated between 8 and 10 degrees of eaſt longitude, and between 41 and 43 degrees of north latitude. It was formerly ſubject to Genoa; though the natives for many years diſputed their right. The iſland is now in the hands of the French; and have lately, in conſequence of the revolution in France, been admitted to a participation of all the rights and privileges of free citizens.

CORSNED, or MORSEL of EXECRATION, a ſpecies of trial or purgation* anciently in uſe in Britain, and which probably aroſe from an abuſe of revelation in the dark ages of ſuperſtition. It conſiſted of a piece of cheeſe or bread, about an ounce in weight, which was conſecrated with a form of exorciſm; deſiring of the Almighty that it might cauſe convulſions and paleneſs, and find no paſſage if the man was really guilty; but might turn to health and nouriſhment if he was innocent; as the water of jealouſy among the Jews was, by God's eſpecial appointment, to cauſe the belly to ſwell, and the thigh to rot, if the woman was guilty of adultery. This corſned was then given to the ſuſpected perſon, who at the ſame time alſo received the holy ſacrament: if indeed the corſned was not, as ſome have ſuſpected, the ſacramental bread itſelf; till the ſubſequent invention of tranſubſtantiation preſerved it from profane uſes with a more profound reſpect than formerly. Our hiſtorians aſſure us, that Godwin, Earl of Kent, in the reign of King Edward the Confeſſor, abjuring the death of the king's brother, at laſt appealed to his corſned, "per *buccellam deglutiendam abjuravit*," which ſtuck in his throat and killed him. This cuſtom has been long ſince gradually aboliſhed, though the remembrance of it ſtill ſubſiſts in certain phraſes of abjuration retained among the common people; as, "I will take the ſacrament upon it; May this morſel be my laſt;" and the like.

CORT (Cornelius), a celebrated engraver, was born at Hoorn in Holland in 1536. After having learned the firſt principles of drawing and engraving, he went to Italy to complete his ſtudies, and viſited all the places famous for the works of the great maſters. At Venice he was courteouſly received by Titian; and engraved ſeveral plates from the pictures of that admirable painter. He at laſt ſettled at Rome, where he died 1578, aged 42. According to Baſan, he was "the beſt engraver with the burin or graver only that Holland ever produced. We find in his prints," adds he, "correctneſs of drawing, and an exquiſite taſte." He praiſes alſo the taſte and lightneſs of touch with which he engraved landſcapes, and that without the aſſiſtance of the point. It is no ſmall honour to this artiſt, that Agoſtino Carracci was his ſcholar, and imitated his ſtyle of engraving rather than that of any other maſter. His engravings are very numerous (151 according to Abbé Marolles), and by no means uncommon.

CORTES *of* SPAIN, a term purely Spaniſh, ſignifying the *courts*, i. e. the ſtates, or aſſembly of the ſtates, at Madrid.

CORTES, or CORTEZ, (Ferdinand), a Spaniſh general, famous for the conqueſt of Mexico, and other victories over the natives of South America; but infamous for the cruelties he committed upon the vanquiſhed, without regard to rank, age, or ſex. It probably was on this account he was but coolly received on his return to Europe by his royal maſter Charles le Quint: it is even aſſerted that the emperor aſked him who he was? to which Cortez replied; "I am the man who have given you more provinces than your anceſtors have left you towns." Died in 1554, aged 63. See MEXICO.

* See *Trial*.

CORTEX, in botany; the rind or coarſe outer bark of plants. The organization of the outer and inner barks, which differ principally in the fineneſs of their texture, is particularly explained under the article PLANTS.

Wounds of the bark, and its ſeparations from the wood, whether naturally or artificially made, are eaſily cured, and made to unite again by proper care. If ſections be made in the rinds of the aſh and ſycamore of a ſquare figure, three ſides cut, and the fourth uncut, and the whole be afterwards bound round with a pack-thread, it will all unite again, only leaving a ſcar in each of the three ſides where it was cut. If ſeveral parts of the bark of either of theſe trees be cut off, and entirely ſeparated from the tree; ſome ſhallower, leaving a part of the bark on, and others deeper, to the wood itſelf; theſe pieces being again put into their places, and bound on with pack-thread, will not indeed unite, but a freſh bark will grow in their places, and thruſt them away: but if they be firſt carefully laid on in the exact direction in which they originally grew, and then the whole part beyond the wound on every ſide covered with a large plaſter of diachylon, or the like, and this bound over with pack-thread to keep all firmly in their places, the pieces of bark, whether cut off ſhallower or deep down to the very wood of the tree, will firmly unite themſelves to the places where they originally grew. This cure will be performed in about three weeks: but the outer rind of the ſeparated pieces will not be plump, but ſomewhat ſhrivelled; the edges alſo will recede ſomewhat from their original place; ſo that there remains a ſort of ſcar all round. Theſe experiments are beſt made in the ſpring ſeaſon; for in the autumn and winter, the ſap ariſing but weakly, the parts that ſhould unite wither before that is brought about. The ſucceſs of theſe experiments has made ſome think that the whole branch of a tree ſeparated and bound on again might unite with the reſt. But the experiments that have been made in the moſt favourable manner for ſuch a trial have all proved vain, the branch cut off withering always in a few days, however well united and carefully kept on.

CORTEX *Peruvianus*. See CINCHONA.

CORTEX *Winteranus*. See WINTERA.

CORTONA (Pietro da). See BERRETINI.

CORTONA, a very ancient town of Italy, mentioned by many of the Roman hiſtorians. It was originally called *Corton*, and lay to the northward of the lake Thraſymenus. It ſtill retains the name of Cortona. E. Long. 13. 0. N. Lat. 43. 15.

CORTONESE (Pietro Palo). See GOBBO.

CORTUSA, BEAR'S-EAR SANICLE: A genus of the monogynia order, belonging to the pentandria claſs of plants, and in the natural method ranking under the 21ſt order, *Preciæ*. The corolla is wheel-ſhaped, with its throat like an elevated ring; the capſule unilocular, oval, and quinquevalved at the top. There are two ſpecies, both of them very low, flowery, herbaceous perennials, crowned by umbels of monopetalous, wheel-ſhaped flowers, of a fine red colour. They are natives of montainous rocky parts abroad, ſo muſt have a dry lean ſoil; or they may be kept in pots of dry ſandy earth placed in the ſhade, and in ſummer muſt be duly watered; and their propagation here is by ſlipping the roots in October.

CORRUNNA, or GROYNE, a port-town of Gallicia in Spain, ſituated on a fine bay of the Atlantic ocean, about 32 miles north of Compoſtella: W. Long. 9. 0. and N. Lat. 43. 0.

CORUS, OMER, HOMER, or CHOMER, in the Jewiſh antiquities, a meaſure containing 10 baths or 75 gallons and 5 pints, as a meaſure of things liquid, and 32 pecks and 1 pint, as a meaſure for things dry. The *corus* or *omer* was moſt commonly a meaſure for things dry; and the greateſt that was uſed among the Jews. It contained, according to the rabbins 10 ephahs or 30 ſata or ſeahs. *Corus* is the moſt uſual term in the hiſtorical writers, and *omer* or *chomer* among the prophets.

CORUS is alſo uſed in ſome of the old writers for eight buſhels or a quarter; *decem* coros *tritici, ſive decem quarteria*.

CORUSCATION, a glittering or gleam of light iſſuing from any thing. It is chiefly uſed for a flaſh of lightning darting from the clouds in time of thunder.

There is a method of producing artificial coruſcations or ſparkling fiery meteors, which will be viſible not only in the dark but at noon-day, and that from two liquors actually cold. The method is this. Fifteen grains of ſolid phoſphorus are to be melted in about a drachm of water; when this is cold, pour upon it about two ounces of oil of vitriol; let theſe be ſhaken together, and they will at firſt heat, and afterwards they will throw up fiery balls in great number, which will adhere like ſo many ſtars to the ſides of the glaſs, and continue burning a conſiderable time; after this, if a ſmall quantity of oil of turpentine is poured in without ſhaking the vial, the mixture will of itſelf take fire, and burn very furiouſly. The veſſel ſhould be large and open at the top.

Artificial coruſcations may alſo be produced by means of oil of vitriol and iron, in the following manner. Take a glaſs body capable of holding three quarts; put into this three ounces of oil of vitriol and twelve ounces of water; then warming the mixture a little, throw in, at ſeveral times, two ounces, or more, of clean iron filings: upon this an ebullition and white vapours will ariſe: then preſent a lighted candle to the mouth of the veſſel, and the vapour will take fire, and afford a bright fulmination or flaſh like lightning. Applying the candle in this manner ſeveral times, the effect will always be the ſame; and ſometimes the fire will fill the whole body of the glaſs, and even circulate to the bottom of the liquor; at others, it will only reach a little way down its neck. The great caution to be uſed in making this experiment is the making the vapour of a proper heat: for if too cold, few vapours will ariſe; and if made too hot, they will ariſe too faſt, and will only take fire in the neck of the glaſs, without any remarkable corruſcation.

CORVORANT, formerly written CORMORANT. See PELICANUS.

CORVUS, the RAVEN or CROW kind, in ornithology; a genus of birds of the order of picæ, the diſtinguiſhing characteriſtics of which are theſe: The beak is convex and cultrated; the noſtrils are covered with briſtly feathers; the tongue is forked and cartilaginous; and the feet are of the walking kind. The ſpecies are 19. The moſt remarkable are:

1. The corax, or raven of Engliſh authors, weighs three pounds, and is about two feet two inches in length; the colour is black, finely gloſſed with a rich blue; the belly excepted, which is of a duſky colour. They are very docile, birds, and may be trained up to fowling like hawks; to fetch and carry like ſpaniels; they may be taught to ſpeak like parrots; and, what is moſt extraordinary of all, they may be taught to imitate the human voice in ſinging. They have a great propenſity to pilfer, often hiding things of value to the great loſs of the owner, without uſe to themſelves. They frequent the neighbourhood of great towns, where they are uſeful in devouring the carcaſes and filth which would otherwiſe prove a nuiſance. They, however, alſo deſtroy many living animals; ſuch as rabbits, young ducks, and chickens, and not unfrequently lambs which have been dropped in a weak ſtate. In clear weather they fly in pairs to a great height, making a deep loud noiſe, different from the common croaking. Their ſcent is remarkably good; and they are very long lived. The quills of ravens ſell for 12 s. *per* hundred, being of great uſe in tuning the lower notes of an harpſichord when the wires are ſet at a conſiderable diſtance from the ſticks.—The raven makes its neſt early in the ſpring, laying 5 or 6 eggs, of a pale bluiſh-green colour ſpotted with brown. With us it builds in trees; but in Greenland and Iceland makes its neſt in the holes of rocks, compoſing it of roots and twigs, together with the bones they have picked, and lining it with hair, moſs, &c. The fleſh of theſe birds, rank and unſavoury as we may well ſuppoſe it, is eaten in Greenland by many of the natives, who alſo uſe the ſkins as a warm under-covering.

2. The corone, or carrion-crow, in the form of its body agrees with the raven; alſo in its food, which is carrion and other filth. It will alſo eat grain and inſects; and like the raven will pick out the eyes: for which reaſon it was formerly diſtinguiſhed from the rook, which feeds entirely on grain and inſects, by the name of the *gor* or *gor-crow*. Virgil ſays that its croaking foreboded rain:

> Tum *cornix* plena pluviam vocat improba voce.

It was alſo thought a bird of bad omen, eſpecially if it happened to be ſeen on the left hand:

> Sæpe ſiniſtra cava prædixit ab ilice *cornix*.

England breeds more of this kind of birds than any other country in Europe. In the 24th of Henry VIII. they were grown ſo numerous, and thought to be ſo prejudicial to the farmer, that they were conſidered as an evil worthy of parliamentary redreſs; an act was paſſed for their deſtruction, in which rooks and choughs were included. Every hamlet was to provide crow-nets for ten years; and all the inhabitants were obliged at certain times to aſſemble during that ſpace to conſult of the proper means for extirpating them. But though the crow abounds thus in Britain, it is ſo rare in Sweden, that Linnæus ſpeaks of it only as a bird that he once knew killed there. It lays the ſame number of eggs as the raven, and of the ſame colour: immediately after deſerting their young they go in pairs. Both theſe birds are often found white or pied; an accident that befals black birds more frequently than any others. Mr Pennant ſays, he has obſerved one entirely of a pale brown colour, not only in its plumage, but even in its bill and feet. The crow weighs about 20 ounces. Its length is 18 inches; its breadth two feet two inches.

Concerning theſe birds, we have the following curious anecdote in Mr Edward's natural hiſtory*. "The reverend Mr Robinſon rector of Ouſby in Weſtmoreland and Cumberland, ſays, 'that birds are natural planters of all ſorts of wood and trees. They diſſeminate the kernels upon the earth, which like nurſeries brings them forth till they grow up to their natural ſtrength and perfection.' He ſays, 'About 25 years ago, coming from Roſecaſtle early in the morning, I obſerved a great number of crows very buſy at their work upon a declining ground of a moſſy ſurface: I went out of my way on purpoſe to view their labour, and I found they were planting a grove of oaks. The manner of their planting was thus: they firſt made little holes in the earth with their bills, going about and about till the hole was deep enough; and then they dropped in the acorn, and covered it with earth and moſs. The ſeaſon was at the latter end of autumn when all ſeeds are full ripe.' Mr Robinſon ſeems to think that Providence had given the crows this inſtinct ſolely for the propagation of trees; but I imagine it was given them principally for their own preſervation, by hiding proviſion in time of plenty, in order to ſupply them in a time of ſcarcity: for it is obſerved in tame pies and daws kept about houſes, that they will hide their meat when they have plenty of it, and fetch it from their hiding-places when they want. So that ſuch an inſtinct in theſe birds may anſwer a double purpoſe; both their own ſupport in times of need, and the propagation of the trees they plant: for wherever they hide a great number of nuts or grain in the earth, we cannot ſuppoſe they find them all again; but that as many will remain in the plot of ground they make uſe of, as can well grow by one another."

3. The frugilegus, or rook, is the corvus of Virgil; no other ſpecies of this kind being gregarious.

> *E paſtu decedens agmine magno*
> *Corvorum increpuit denſis exercitus alis.*

A very natural deſcription of the evening return of theſe birds to their neſts.

The rook differs not greatly in its form from the carrion crow: the moſt remarkable difference is in the noſtrils and root of the bill; which parts in the crow are well clothed with feathers, but in the rook are bare, or covered only with ſome briſtly hairs. This ariſes from its thruſting the bill into the earth continually, after the various worms and erucæ of inſects, on which it feeds; for it does not live on carrion, like

---

* Vol. V. Pref. xxv.

the laſt ſpecies and ravens. Beſides inſects, it alſo feeds on all ſorts of grain, to ſome inconvenience perhaps to the huſbandman, but no doubt doubly repaid by the good done him in extirpating the maggot of the chaferbeetle, which in ſome ſeaſons deſtroys whole crops of corn by feeding on the roots. The rook is a gregarious bird, ſometimes being ſeen in immenſe flocks, ſo as to almoſt darken the air. Theſe flights they regularly perform morning and evening, except in breeding-time, when the daily attendance of both male and female is required for the uſe of incubation, or feeding the young; for it is obſerved that they do both by turns. As theſe birds are apt to form themſelves into ſocieties, ſuch places as they frequent during the breeding-time are called *rookeries*; and they generally chooſe a large clump of the talleſt trees for this purpoſe; but make ſo great a litter, and ſuch a perpetual chatter, that nothing but habit and a length of time can reconcile one to the noiſe. The eggs are like thoſe of crows, but leſs, and the ſpots larger. They begin to build in March, and after the breeding-ſeaſon forſake their neſt trees, going to rooſt elſe where, but have been obſerved to return to them in Auguſt: in October they repair their neſts. In Britain they remain the whole year; yet we are told that both in France and Sileſia they are birds of paſſage. Whether they migrate or not in Sweden, we are not told; but Linnæus talks of their building there. The young birds are accounted good eating, eſpecially if ſkinned and put in a pie.

4. The cornix, or royſton crow, petty much reſembles the rook, feeding on inſects, and flying together in great flocks. In England it is a bird of paſſage, viſiting that kingdom in the beginning of winter, and leaving it with the woodcocks. In the maritime parts they feed on crabs and ſhell-fiſh. They are very common in Scotland: in many parts of the Highlands, and in all the Hebrides, Orknies, and Shetland, it is the only ſpecies of genuine crow; the carrion and rook being unknown there. It breeds and continues in thoſe parts the whole year round. In the Highlands, they breed indifferently in all kinds of trees: lay ſix eggs: have a ſhriller note than the common crows; are much more miſchievous; pick out the eyes of lambs, and even of horſes when engaged in bogs. They are, therefore, in many places proſcribed, and rewards given for killing them. For want of other food theſe birds will eat cran-berries or other mountain berries.

Plate CXLIX.

5. The dauricus, or white-breaſted crow is in length about 12 inches; the bill is black; the head and throat are black, gloſſed with blue; the neck and breaſt white; the reſt of the body, wings, and tail, blue black; the legs of a lead-colour; the claws black. The ſpecimen figured by Buffon came from Senegal; but it is by no means confined to that quarter. Pallas deſcribes the ſame ſpecies, which he ſays come early in the ſpring in great flights from China, and the ſouthern Monguls country, into the parts about the lake Baikal, but moſt frequent about the towns and villages on the river Lena, in which part the jackdaws and Royſton crows are very ſeldom ſeen. It is ſaid they are likewiſe found in vaſt numbers in the Iſland of Johann, where they live chiefly on inſects and fruits, and make their neſts in trees.

6. The monedula, or jack-daw, weighs nine ounces; the length thirteen inches, the breadth twenty-eight. The head is large in proportion to its body; which, Mr Willoughby ſays, argues him to be ingenious and crafty. The irides are white: the breaſt and belly are of a duſky hue inclining to aſh-colour: the reſt of the plumage is black, ſlightly gloſſed with blue: the claws are very ſtrong and hooked. It is a docile and loquacious bird. Jack-daws breed in ſteeples, old caſtles, and in high rocks, laying five or ſix eggs. Sometimes they have been known to breed in hollow-trees near a rookery, and join thoſe birds in their foraging parties. In ſome parts of Hampſhire, they make their neſts in rabbit holes; they alſo build in the interſtices between the upright and tranſum ſtones of Stonehenge; a proof of the prodigious height of that ſtupendous antiquity, for their neſts are placed beyond the reach of the ſhepherd boys, who are always idling about this ſpot. They are gregarious birds; and feed on inſects, grain, and ſeeds.—Theſe birds are frequently brought up tame: they have a practice of hiding that part of their food which they cannot eat; and often, alongſt with it, they ſecret ſmall valuables, thereby ſometimes occaſioning injurious ſuſpicions of theft in ſervants or others not guilty.

7. The glandarius, or jay, is one of the moſt beautiful of Britiſh birds. The weight is between ſix and ſeven ounces: the length 13 inches. The forehead is white ſtreaked with black; the head is covered with very long feathers, which it can erect at pleaſure into the form of a creſt: the whole neck, back, breaſt, and belly, are of a faint purple daſhed with grey; the covert-feathers of the wings are of the ſame colour. The firſt quill-feather is black; the exterior webs of the nine next are aſh-coloured; the interior webs duſky; the ſix next are black, but the lower ſides of their exterior webs are white tinged with blue; the two next wholly black; the laſt of a fine bay colour tipt with black. The leſſer coverts are of a light bay: the greater covert-feathers moſt beautifully barred with a lively blue, black, and white: the reſt are black: the rump is white. The tail conſiſts of twelve black feathers. The feet are of a pale brown; the claws large and hooked.—Jays build chiefly in woods, making their neſt of ſticks, fibres of roots, and tender twigs; and lay five or ſix eggs, of the ſize of a pigeon's, cinerous olive, marked with pale brown. The young keep with the old ones till the next pairing time in ſpring; when they chooſe each his mate to produce their future progeny. In general they feed on acorns, nuts, ſeeds, and fruits of all kinds; but will ſometimes deſtroy young chickens and eggs, and will alſo take away birds that have been caught in a trap or entangled with birdlime. They are often kept in cages, and will talk pretty well; but then loſe all their beauty ſo conſpicuous in the wild ſtate.

8. The caryocatactes, or nut-cracker, is ſomewhat leſs than the jack-daw: the bill is ſtrong, ſtraight, and black: the colour of the whole head and neck, breaſt and body, of a ruſty brown: the crown of the head and rump are plain; the other parts marked with triangular white ſpots: the wings are black; the coverts ſpotted in the ſame manner as the body: the tail is rounded at the end, black tipt with white: the vent-

feathers are white; the legs duſky. We find theſe birds ſcattered in many parts of Europe, but no where ſo plenty as in Germany; they are found alſo in Sweden and Denmark, where they frequent the mountainous parts. Sometimes they come in vaſt flocks into France, eſpecially Burgundy. They viſit England very ſeldom; are alſo found in North America, but not near the ſea-coaſts. One has been brought from Kamtſchatka by the late voyagers.—In manners this bird is ſaid to reſemble the jay, laying up a ſtore of acorns and nuts. In ſome parts it keeps chiefly in the pine foreſts, on the kernels of which it then feeds; but is ſaid frequently to pierce the trees like the woodpecker, for which the bill ſeems not unapt. It makes its neſts in holes of trees. Klein mentions two varieties, one ſmaller than the other; the largeſt, he ſays, breaks the nuts to pieces, and the other pierces them. Both feed at times on wild berries and inſects.

9. The pica, or magpie, is in length above 18 inches, and weighs 8 or 9 ounces. The bill is black: the irides are hazel; the ſcapulars, and all the under parts from the breaſt, are white; the reſt of the plumage, wings, and tail, black, gloſſed with green, purple, and blue, in different lights: the eleven firſt quills are white in the middle on the inner web, leſſening by degrees as they advance inwards: the tail is very cuneiform, the two middle feathers being near 11 inches in length, and the utmoſt only 5 inches and a half: the legs are black. We can form no judgement of the beauties of this bird, from thoſe dirty mutilated ſpecimens which we ſee expoſed daily in a wicker cage at every ſtall. It is only in a ſtate of nature that they can be found; and whoever views them in this ſtate, will do ſo with aſtoniſhment: for though the colours, at a diſtant view, ſeem to be mere black and white, yet the ſplendor that meets in every new ſituation the eye of the beholder, will oblige him to own that there is not a more beautiful bird in Britain. In theſe parts it is every where common. Mr Latham has been able to trace this bird no farther ſouth than Italy on the European continent; and to the north, Sweden, and Denmark. Forſter met with it at Madeira; and it is alſo ſeen in America, but not common, and is a bird of paſſage in thoſe parts. At Hudſon's Bay it is called by the Indians *Oue-ta-kee-aſke*, which ſignifies *Heart-Bird*; but for what reaſon does not appear. In manners it approaches to the crow, feeding almoſt on every thing in turn, both animal and vegetable; and like that will kill young ducks and chickens, and ſuck the eggs. It builds its neſt with art, making a thorny cover at top, leaving a hole on the ſide for admittance: lays ſix or ſeven pale greeniſh eggs, thickly ſpotted with black. It is a crafty bird in every ſtate, and if brought up young, becomes exceedingly familiar, and will talk a great many ſentences as well as imitate every noiſe within hearing, like a parrot, but not near ſo plain.

10. The graculus, or red-legged crow, is but thinly ſcattered over the northern world: no mention is made of it by any of the Fauniſts; nor do we find it in other parts of Europe except Britain and the Alps. It is produced in the iſland of Canadia in Aſia; and it viſits Egypt towards the end of the inundations of the Nile. Except in Egypt, it affects mountainous and rocky places; builds its neſt in high cliffs or ruined towers; and lays four or five eggs, white ſpotted with a dirty yellow. It feeds on inſects, and alſo on new-ſown corn. They commonly fly high, make a ſhriller noiſe than the jack-daw, and may be taught to ſpeak. It is a very tender bird, and unable to bear very ſevere weather; is of an elegant, ſlender-make; active, reſtleſs, and thieving; much taken with glitter, and ſo meddling as not to be truſted where things of conſequence lie. It is very apt to catch up bits of lighted ſticks; ſo that there are inſtances of houſes being ſet on fire by its means; on which account Cambden calls it *incendiaria avis*. It is found in Cornwall, Flintſhire, Caernarvonſhire, and Angleſea, in the rocky cliffs along the ſhores. It is alſo found in Scotland as far as Strathnavern, and in ſome of the Hebrides. Its colour is wholly black, beautifully gloſſed over with blue and purple: the legs and bill are of a bright orange colour inclining to red: the tongue is almoſt as long as the bill, and a little cloven: the claws are large, hooked, and black.

11. The criſtatus, or blue jay, is much ſmaller than the common jay. The bill is black and above an inch long: the head is creſted and blue: a ſtreak of the ſides of the head and throat are of a bluiſh white, and there is a ſpot of the ſame over the eye: hind part of the neck and back is blue; the wings and tail are the ſame; all the feathers of the laſt, except the two middle ones, tipped with white; the feathers of both it and the wings elegantly barred with black, and the greater coverts and ſecond quills tipped with white: the breaſt is of a bloſſom colour; the belly and under tail-coverts white: the legs are duſky brown: the tail is nearly as long as the reſt of the bird. The colours of the female are leſs bright than thoſe of the male—This ſpecies is ſaid to be peculiar to North America, but not ſeen farther north than the town of Albany. It builds in ſwaps, and has a ſoft delicate note. Its food is hazel-nuts, cheſnuts, and ſuch like, which it breaks by placing between the feet, and pecking with the bill till the ſhell gives way. It is alſo very fond of maize; and being a gregarious bird, often unites into flocks of 20,000 at leaſt, which alighting on a field of 10 or 12 acres ſoon lay waſte the whole: hence it is reckoned the moſt deſtructive bird in this country. They will often take up with ſnails and vermin thro' neceſſity, but not while any thing they like better is to be got at. They are not accounted good to eat.

12. The canadenſis is in length 9 inches, and weighs two ounces. The bill is blackiſh, and not quite an inch long: the irides are black: the forehead and throat are of a dirty yellowiſh white; the hind-head and ſides of blackiſh brown: the upper parts of the body are brown; beneath pale aſh, paleſt on the breaſt: the quills and tail are brown, tipped with white: tail is a little wedged: the legs and claws are blackiſh. Theſe birds inhabit Canada; and are frequent near Hudſon's Bay, where they are called *Whiſkijohn* and *Whiſkijack*. They breed early in the ſpring; build in pine-trees; and have two, rarely three, young at a time. The eggs are blue. They are not gregarious. Their food is black moſs, worms, and fleſh. They are very bold pilfering birds, ſtealing from the traveller even ſalt meat, and devouring often the bait from the traps ſet for

for the martins, as ſoon as the perſons who ſet them turn their backs. They lay up ſtores for winter; at which time they are ſeldom ſeen unleſs near habitations. They do not bear confinement well. What natural note they have, we are not told; but they are ſaid to act the mocking bird, in imitating that of others.—There are near 30 other ſpecies.

Corvus *(Raven)*, in aſtronomy, a conſtellation of the ſouthern hemiſphere; whoſe ſtars in Ptolemy's Catalogue are 7; in Tycho's as many; in the Britannic Catalogue 9.

Corvus, in Roman antiquity, a military engine, or rather gallery, moveable at pleaſure by means of pullies; chiefly uſed in boarding the enemy's ſhips to cover the men. The conſtruction of the corvus was as follows: They erected on the prow of their veſſels a round piece of timber of about a foot and an half diameter, and about 12 feet long: on the top of which they had a block or pulley. Round this piece of timber they laid a ſtage or platform of boards, four feet broad, and about 18 feet long, which was well framed and faſtened with iron. The entrance was long-ways, and it moved about on the abovementioned upright piece of timber as on a ſpindle, and could be hoiſted up within ſix feet of the top: about this was a ſort of parapet knee-high, which was defended with upright bars of iron ſharpened at the end, and towards the top there was a ring, by the help of which and a pulley or tackle, they raiſed or lowered the engine at pleaſure. With this moveable gallery they boarded the enemy's veſſels (when they did not oppoſe ſide to ſide), ſometimes on their bow, and ſometimes on their ſtern, as occaſion beſt ſerved. When they had grappled the enemy with theſe iron ſpikes, if they happened to ſwing broadſide to broadſide, then they entered from all parts; but in caſe they attacked them on the bow, they entered two and two by the help of this machine, the foremoſt defending the foreparts, and thoſe that followed the flanks keeping the boſs of their bucklers level with the top of the parapet.

CORYATE (Thomas), a very extraordinary perſonage, who ſeems to have made himſelf famous by his whimſical extravagancies, was the ſon of a clergyman, and born at Oldcombe in Somerſetſhire in 1577. He acquired Greek and Latin at Oxford; and going to London, was received into the houſehold of Henry prince of Wales. If Coryate was not over witty himſelf, he got acquainted with the wits of that time, and ſerved to exerciſe their abilities, having more learning than judgment. He was a great peripatetic: for, in 1608, he took a long journey on foot; and after he returned, publiſhed his travels under the following ſtrange title, *Crudities haſtily gobbled up in five months Travels in France, Savoy, Italy, Rhetia, Helvetia, ſome parts of High Germany, and the Netherlands*, Lond. 1611, 4to. In 1612 he ſet out again with a reſolution to ſpend ten years in travelling: he went firſt to Conſtantinople; and after travelling over a great part of the Eaſt, died of a flux at Surat in the Eaſt Indies. Some of the accounts of his peregrination are to be found in Purchas's Pilgrimages.

CORYBANTES, in antiquity, prieſts of Cybele, who danced and capered to the ſound of flutes and drums. See Crotalum.

Catullus, in his poem called *Atys*, gives a beautiful deſcription of them, repreſenting them as madmen. Accordingly Maximus Tyrius ſays, that thoſe poſſeſſed with the ſpirit of Corybantes, as ſoon as they heard the ſound of a flute, were ſeized with an enthuſiaſm, and loſt the uſe of their reaſon. And hence the Greeks uſe the word κορυϐαντειν, *to corobantize*, to ſignify a perſon's being tranſported or poſſeſſed with a devil. See Enthusiasm.

Some ſay that the Corybantes were all eunuchs; and that it is on this account Catullus, in his Atys, always uſes feminine epithets and relatives in ſpeaking of them.

Diodorus Siculus remarks, that Corybas, ſon of Jaſon and Cybele, paſſing into Phrygia with his uncle Dardanus, there inſtituted the worſhip of the mother of the gods, and gave his own name to the prieſts. Strabo relates it as the opinion of ſome, that the Corybantes were children of Jupiter and Calliope, and the ſame with the *Cabiri*. Others ſay the word had its origin from this, that the Corybantes always walked dancing (if the expreſſion may be allowed) or toſſing the head, κορυπτοντες βαινουσιν.

CORYBANTICA, a feſtival held in Crete, in memory of the Corybantes, who educated Jupiter when he was concealed in that iſland from his father Saturn, who would have devoured him.

CORYCEUM, in antiquity, that part of the gymnaſium where people undreſſed. It was otherwiſe called *apodyterion*.

CORYCOMACHIA, among the ancients, was a ſort of exerciſe in which they puſhed forwards a ball, ſuſpended from the ceiling, and at its return either caught it with their hands, or ſuffered it to meet their body. Oribaſius informs us it was recommended for extenuating too groſs bodies.

CORYDALES, in botany, an order of plants in the *Fragmenta Methodi Naturalis* of Linnæus, containing the following genera, *viz.* epimedium, hypecoum, leontice, melianthus, pinguicula, and utricularia.

CORYDALIS, in botany. See Fumaria.

CORYLUS, the Hazle: A genus of the polyandria order, belonging to the monœcia claſs of plants; and in the natural method ranking under the 50th order, *Amentaceæ*. The male calyx is monophyllous, ſcale-like, trifid, and uniflorous; there is no corolla; the ſtamina eight in number: The female calyx diphyllous and lacerated; no corolla; two ſtyles; and an egg-ſhaped nut. Mr Miller reckons three ſpecies, though other botaniſts make only two. They are all of the large ſhrub kind, hardy and deciduous; and have ſeveral varieties valuable for their nuts, as alſo for their variety in large wilderneſſes and ſhrubbery works. They will proſper in almoſt any ſoil or ſituation, and turn out to good account when growing in coppices to cut as underwood, and as poles for various uſes, as hoops, ſpars, hurdles, handles to huſbandry implements, walking ſticks, fiſhing rods, &c. for which purpoſes they may be cut every 5th, 7th, or 8th year, according to the purpoſes for which they are deſigned. The beſt method of propagating them is by layers, though they may alſo be raiſed from the nuts.

The kernels of the fruit have a mild, farinaceous, oily taſte, agreeable to moſt palates. Squirrels and mice are fond of them, as well as ſome birds, ſuch as jays, nutcrackers, &c. A kind of chocolate has been prepared for them, and there are inſtances of their having been formed into bread. The oil expreſſed from them is little inferior to the oil of almonds; and is uſed by painters, and by chemiſts, for receiving and retaining odours. The charcoal made of the wood is uſed by painters in drawing. Some of the Highlanders, where ſuperſtition is not totally ſubſided, look upon the tree itſelf as unlucky; but are glad to get two of the nuts naturally conjoined, which is a good omen. Theſe they call *cno chomhlaich*, and carry them as an efficacious charm againſt witchcraft.

Evelyn tells us, that no plant is more proper for thickening of copſes than the hazle, for which he directs the following expeditious method. Take a pole of hazle (aſh or poplar may alſo be uſed), of 20 or 30 feet in length, the head a little lopped into the ground, giving it a chop near the ground to make it ſuccumb; this faſtened to the earth with a hook or two, and covered with ſome freſh mould at a competent depth, (as gardeners lay their carnations), will produce a great number of ſuckers, and thicken and furniſh a copſe ſpeedily.

CORYMBIFERÆ, in botany, the name of an order or diviſion of the compound flowers adopted by Linnæus after Ray and Vaillant, in the former editions of his Fragments of a Natural Method. This title in the later editions is changed for *Diſcoideæ*, another name borrowed from Ray's Method, but uſed in a ſomewhat different ſenſe.

CORYMBIUM, in antiquity, an ornament of hair worn by the women. Its form was that of a corymbus.

Corymbium, in botany: A genus of the monogamia order, belonging to the ſyngeneſia claſs of plants; and in the natural method ranking under the 49th order, *Compoſitæ*. The calyx is diphyllous, uniflorous, and priſmatical; the corolla monopetalous and regular; there is one woolly ſeed below each floret.

CORYMBUS, properly ſignifies a cluſter of ivy berries. Among botaniſts, it is a mode of flowering in which the leſſer or partial flower-ſtalks are produced along the common ſtalk on both ſides; and, though of unequal lengths, riſe to the ſame height, ſo as to form a flat and even ſurface at the top. See Botany, nº 273.

CORYNOCARPUS, in botany: A genus of the monogynia order, belonging to the pentandria claſs of plants. The calyx is a pentaphyllous perianthium; the corolla conſiſts of five roundiſh, erect, and hollow petals; the ſtamina five ſubulated filaments ariſing from the baſe of the petals; the antheræ are erect and oblong; the pericarpium a monoſpermous, turbinat-clavated nut.

CORYPHA, Mountain Palm, or *Umbrella Tree*, in botany: A genus of the order of *Palmæ*, belonging to the monœcia claſs of plants. The corolla is tripetalous; the ſtamina ſix, with one piſtil; the fruit a monoſpermous plum. There is only one ſpecies, the umbracula, a native of the Weſt Indies, where it is called *codda-pana*. It riſes to a conſiderable height, and produces at the top many large palmated, plaited leaves, the lobes of which are very long, and are placed regularly round the end of a long ſpiny footſtalk, in a manner repreſenting a large umbrella. The flowers are produced on a branched ſpadix, from a compound ſpatha or ſheath: they are hermaphrodite, and each conſiſts of one petal, divided into three oval parts, and contains ſix awl-ſhaped ſtamina, ſurrounding a ſhort ſlender ſtyle, crowned with a ſimple ſtigma. The germen is nearly round, and becomes a large globular fruit of one cell, including a large round ſtone. Theſe plums having a pleaſant flavour are held in eſteem by the Indians.

CORYPHÆNA, in ichthyology a genus belonging to the order of thoracici. The head is declined and truncated; the branchioſtege membrane has ſix rays; and the back-fin runs the whole length of the back. There are twelve ſpecies, moſt of them natives of foreign ſeas. The moſt remarkable are the blue and parrot fiſhes, deſcribed by Mr Cateſby.—The head of the firſt is of an odd ſtructure, reſembling that of the ſpermaceti whale: the mouth is ſmall, each mandible armed with a ſingle row of even teeth, ſo cloſely joined that they ſeem entire bones; the iris of the eye is red. On the back is a long pliant fin, ſomewhat indented on the edge; behind the gills are two fins, one under the abdomen and another behind the anus. The tail is forked; and the whole fiſh entirely blue. They are taken on the coaſts of the Bahama Iſlands, and in moſt of the ſeas between the tropics.—The parrot-fiſh hath a large mouth, paved as it were with blunt teeth, cloſely connected, after the manner of the lupus marinus. The body is covered with large green ſcales; the eyes are red and yellow; the upper part of the head brown, the lower part and the gills blue, bordered with a duſky red: a ſtreak of red extends from the throat behind the gills, at the upper end of which is a bright yellow ſpot. The fins are five in number, one extending almoſt the length of the back, of a bay or cinnamon colour; there are two behind the gills, blended with black, green and purpliſh colours, with the upper edge verged with blue; under the abdomen is another red fin verged with blue; under the anus extends another long narrow green fin, with a liſt of red through the middle of it: at the baſis of the tail on each ſide is a large yellow ſpot. The tail is large, forked, and green, with a curved red line running through the middle parallel to the curve, and ending in two points. The fiſh is more eſteemed for beauty than the delicacy of its taſte. They are taken on the coaſts of Hiſpaniola, Cuba, and the Bahama Iſlands.

CORYPHÆUS, in the ancient tragedy, was the chief or leader of the company that compoſed the chorus: (See Chorus).—The word is formed from the Greek κορυφη, "tip of the head." The coryphæus ſpoke for all the reſt, whenever the chorus took part in the action, in quality of a perſon of the drama, during the courſe of the acts. Hence coryphæus had paſſed into a general name for the chief or principal of any company, corporation, ſect, opinion, &c. Thus Euſtacius of Antioch is called the *coryphæus* of the council of Nice; and Cicero calls Zeno the *coryphæus* of the ſtoics.

CORYZA, in medicine, a catarrh of the noſe. See Medicine-*Index*.

CORZOLA, or Curscola, an iſland in the gulph of Venice, divided from Raguſa in Dalmatia by a narrow ſtrait. E. Long. 18. 0. N. Lat. 42. 35.

COS, or Coos, (anc. geog.), a noble iſland on the coaſt of Caria, in the Hither Aſia, fifteen miles to the weſt of Halicarnaſſus, a hundred in compaſs, called *Meropis*; and hence Thucydides joins both names together, *Cos Meropis*: it had a cognominal town *Cos*, but originally called *Aſtypalaea*, mentioned by Homer; with a port locked or walled round, (Scylax, Mela). The iſland was fruitful, and yielded a generous wine, (Strabo). It boaſted of Hippocrates and Apelles; each at the head of his ſeveral profeſſion. It was the country of Philetas, an excellent elegiac poet, who flouriſhed in the time of Philip and Alexander; the preceptor of Ptolemy Philadelphus: ſo thin and light that he was obliged to wear lead to prevent the being blown away by a puff of wind (Aelian, Athenæus): much commended by Propertius. The *veſtes Coae*, made of ſilk, were famous for their fineneſs and colour, (Horace, Propertius, Tibullus). In the ſuburbs of Cos ſtood the temple of Æſculapius, a noble ſtructure, and extremely rich.

COS, the WHETSTONE, in natural hiſtory, a genus of vitreſcent ſtones, conſiſting of fragments of an indeterminate figure, ſub-opaque, and granulated.

Of this genus there are ſeveral ſpecies, ſome conſiſting of rougher, and others of ſmoother, or even of altogether impalpable particles; and uſed not only for whet-ſtones, but alſo for mill-ſtones, and other the like purpoſes.

COS TURCICA, *Turky-ſtone*, a ſpecies of ſtones of the garnet kind, belonging to the ſiliceous claſs. It is of a dull white, and often of an unequal colour; ſome parts appearing more compact than others. Its ſpecific gravity is 2598: it ſtrikes fire with ſteel, and efferveſces with acids. Mr Kirwan found that 100 parts of it contain 25 of mild calcareous earth, and no iron. Cronſtedt is of opinion that there are probably two ſorts of ſtones known by this name, as that deſcribed by Wallerius neither gives fire with ſteel nor efferveſces with acids. It is uſed as a whet-ſtone; and thoſe of the fineſt grain are the beſt hones for the moſt delicate cutting tools, and even for razors, lancets, &c.

COSCINOMANCY, the art of divination, by means of a ſieve. The word comes from κοσκινον, *cibrum*, "a ſieve;" and μαντεια, *divination*. The ſieve being ſuſpended, after rehearſing a formula of words, it is taken between two fingers only; and the names of the parties ſuſpected repeated: he at whoſe name the ſieve turns, trembles, or ſhakes, is reputed guilty of the evil in queſtion.

This muſt be a very ancient practice: Theocritus, in his third Idyllion, mentions a woman very ſkilful in it. It was ſometimes alſo practiſed by ſuſpending the ſieve by a thread, or fixing it to the points of a pair of ſheers, giving it room to turn, and naming, as before, the parties ſuſpected; in which laſt manner *coſcinomancy* is ſtill practiſed in ſome parts of England. It appears from Theocritus, that it was not only uſed to find out perſons unknown, but alſo to diſcover the ſecrets of thoſe that were known.

CO-SECANT, in geometry, the ſecant of an arch which is the complement of another to 90°. See GEOMETRY.

COSENAGE, in law, a writ that lies where the treſail, that is, the tritavus, the father of the beſail, or great grandfather, being ſeized in fee at his death of certain lands or tenements, dies; a ſtranger enters, and abates; then ſhall his heir have this writ of coſenage; the form of which ſee in Fitzh. Nat. Br. fol. 221.

COSENING, in law, an offence whereby any thing is done deceitfully, in or out of contracts, which cannot be fitly termed by any eſpecial name. In the civil law it is called *ſtellionatus*. See STELLIONATE.

COSENZA, the capital of the Hither Calabria, in the kingdom of Naples. E. Long. 16. 35. N. Lat. 39. 15. It is an archbiſhop's ſee.

COSHERING, in the feudal cuſtoms, a kind of right of the lords to lie and feaſt themſelves and their followers at their tenants houſes. The word *coſhering* may perhaps be derived from the old Engliſh word *coſhe*, a cot or cottage.

CO-SINE, in trigonometry, the ſine of an arch which is the complement of another to 90°. See GEOMETRY.

COSMETIC, in phyſic, any medicine or preparation which renders the ſkin ſoft and white, or helps to beautify and improve the complexion; as lip-ſalves, cold creams, ceruſs, &c.

COSMICAL, a term in aſtronomy, expreſſing one of the poetical riſings of a ſtar: thus a ſtar is ſaid to riſe coſmically when it riſes with the ſun, or with that point of the ecliptic in which the ſun is at that time: and the coſmical ſetting is when a ſtar ſets in the weſt at the ſame time that the ſun riſes in the eaſt.

COSMOGONY, in phyſics, ſignifies the ſcience of the formation of the univerſe. It is formed of κοσμος, *the world*, and γεινομαι, *I am born*.

In our conjectures about the formation of the world there are two principles which we ought never to loſe ſight of. 1. That of *creation*; for certainly matter could not give itſelf exiſtence, it muſt have received it. 2. That of a *Supreme Intelligence* directing this creation, and the arrangement of the parts of matter, in conſequence of which this world was formed. See CREATION and EARTH.

COSMOGRAPHY, the deſcription of the world; or the art which teaches the conſtruction, figure, diſpoſition, and relation of all the parts of the world, with the manner of repreſenting them on a plane. The word comes from κοσμος, *world*, and γραφω, *I deſcribe*.

Coſmography conſiſts chiefly of two parts. *Aſtronomy*, which ſhows the ſtructure of the heavens, and the diſpoſition of the ſtars; and *Geography*, which ſhows thoſe of the earth.

COSMOLABE (from κοσμος, *world*, and λαμϐανω, *I take*), an ancient mathematical inſtrument, ſerving to meaſure diſtances, both in the heavens and on earth. The *coſmolabe* is in great meaſure the ſame with the aſtrolabe. It is alſo called *pentacoſm*, or the *univerſal inſtrument*, by L. Morgard, in a treatiſe written expreſsly upon it, printed in 1612.

COSMOLOGY (from κοσμος, *world*, and λογος, *diſcourſe*), the ſcience of the world in general. This Wolfius calls *general*, or *tranſcendental coſmology*, and has written a treatiſe on the ſubject, wherein he endeavours to explain how the world ariſes from ſimple ſubſtances; and treats of the general principles of the modifications of material things, of the elements of bodies, of the laws of motion, of the perfection of the world, and of the order and courſe of nature.

COSMOPOLITE, or COSMOPOLITAN, a term

ſometimes uſed to ſignify a perſon who has no fixed living or place of abode, or a man who is a ſtranger nowhere. The word comes from the Greek κοσμος, "world," and πολις, "city."—One of the ancient philoſophers being interrogated what countryman he was? anſwered, he was a *coſmopolite*, i. e. an inhabitant or citizen of the world.

COSSACKS, a name given to the people inhabiting the banks of the rivers Dnieper and Don, near the Black Sea and borders of Turkey. The word implies irregular troops of horſe. Theſe people are divided into European and Aſiatic Coſſacks. The firſt conſiſt of the Zaporog, who dwell below the cataract of the Dnieper, ſome on the ſide next to Ruſſia, and others on the oppoſite ſide of that river; the Lower and Upper Coſſacks; the Bielogorod Coſſacks; and a part of the Don Coſſacks. The Aſiatic Coſſacks are compoſed of the reſt of the Don Coſſacks, the Grebin Coſſacks, the Yaik Coſſacks, and the Weſtern Calmuks, who retiring from thoſe that inhabited the ſouth borders of Siberia under Yaiuki Can, ſettled upon the Wolga, and are dependent upon Ruſſia.

The Coſſacks were known by that name ever ſince the 948th year of Chriſt. They dwelt upon mount Caucaſus, in the place now called *Cabardy*; and were reduced to the Ruſſian dominion by prince Mſtiſlaw in the year 1021. Many Ruſſians, Poles, and others, who could not live at home, have, at different times, been admitted among the Coſſacks; but the latter, abſtracted from theſe fugitives, muſt have been an ancient and well governed nation.

Towards the beginning of the 16th century, the Zaporog Coſſacks fixed their habitations on the ſpacious plains that extend along the banks of the Dnieper. They had undergone conſiderable hardſhips from the incurſions of the Tartars, for which they afterwards found means to avenge themſelves in an ample manner. The Poles being ſenſible how ſerviceable the Coſſacks might be in defending them from the ravages of the Tartars, and even of the Ruſſians, propoſed to them terms of alliance. In 1562, they ſolemnly took them under their protection, and engaged to pay them an annual ſubſidy; in return for which, the Coſſacks were to keep on foot a ſufficient body of troops for the defence of the Poliſh dominions. With a view to bind them ſtill more ſtrongly by ties of intereſt, the Poles gave them the whole country between the rivers Dnieper and Neiſter, and the borders of Tartary. The Coſſacks applied themſelves with great induſtry to the cultivation of this fertile ſpot; ſo that in a ſhort time it was interſperſed with large towns and handſome villages. Beſides they continually haraſſed the Turks, and did them great damage by their incurſions; and in order to prevent the latter from purſuing them, or making repriſals, they poſſeſſed themſelves of ſeveral ſmall iſlands in the Dnieper, where they kept their magazines, &c. The hettman, or general of the Coſſacks, was not in the leaſt ſubordinate to the field-marſhal of Poland; but acted in concert with him as an ally, and not as a ſubject of that republic. But this alliance, though of ſuch manifeſt advantage to both parties, was not of long duration. The Poles, ſeeing the vaſt improvements made by the Coſſacks in the country they had given up to them, became envious of them, and actually made an attempt to bring them into ſubjection, as we have ſeen in the hiſtory of Poland. In 1648 the Coſſacks gained great advantages over them, and next year came to an accommodation, in which they not only preſerved their old immunities, but obtained additional privileges. The reſult of all was, that theſe Coſſacks remained under the protection of Ruſſia; and as their former country was entirely laid waſte in the late wars, they ſettled in the Ruſſian Ukraine, upon receiving formal aſſurances from the court of Ruſſia, that no alteration ſhould be made in their political conſtitution, and that no taxes whatever ſhould be laid upon them. The Coſſacks, on the other hand, were always to keep in readineſs a good body of troops for the ſervice of Ruſſia: but in the year 1708 Mazeppa, their hettman or chief, went over from the Ruſſians to the Swedes; upon which Peter I. reſolved to prevent ſuch revolts for the future. To this end, after the battle of Pultowa, he ſent a ſtrong detachment into the abovementioned little iſlands in the Dnieper, whether the Coſſacks had fled, with their wives and children, and all their effects; and ordered them all to be put to the ſword without diſtinction, and the plunder to be divided among his ſoldiers. He likewiſe ſent a great number of men into their country, and cauſed ſeveral thouſands of the Coſſacks to be carried to the coaſts of the Baltic, where they were put to all ſorts of hard labour; by which means he in a manner extirpated the whole nation.

What diſtinguiſhes the Zaporog Coſſacks from all other people is, that they never ſuffer any women in their ſettlements, as the Amazons are ſaid not to have ſuffered any men among them. The women of theſe Coſſacks live in other iſlands of the Dnieper. They never marry, nor have any family: all their male children are inrolled as ſoldiers, and the females are left with their mothers. The brother often has children by his ſiſter, and the father by his daughter. They know no laws but thoſe which cuſtom has introduced, founded on their natural wants; though they have among them ſome prieſts of the Greek perſuaſion. They ſerve in the armies as irregulars; and woe to thoſe who fall into their hands.

The country of theſe Coſſacks, who are an aſſemblage of ancient Roxelans, Sarmatians, and Tartars, is called the *Ocraine* or *Ukraine*. It lies upon the borders of Ruſſia and Poland, Little Tartary, and Turkey, and was anciently a part of Scythia. By virtue of the laſt treaty ſettled between Ruſſia and Poland, in 1693, the latter remains in poſſeſſion of all that part of the Ukraine which is ſituated on the weſt ſide of the Dnieper, and is now but poorly cultivated. That on the eaſt ſide, inhabited by the Coſſacks, is in a much better condition, and extends about two hundred and ſixty miles in length, and as many in breadth. It is one continued fertile plain, watered by a great number of fine rivers, diverſified with pleaſant woods, and yields ſuch plenty of all ſorts of grain, pulſe, tobacco, honey, and wax, as to ſupply a great part of the Ruſſian empire with thoſe commodities. Its paſtures are exceeding rich, and its cattle very large; but the inhabitants are greatly plagued by locuſts, which infeſt this fine country. The houſes in the Ukraine are, like thoſe of the Ruſſians, moſtly built with timber.

The Coſſacks are tall and well made, generally hawk-noſed, and of a good mien. They are hardly, vigorous, brave, and extremely jealous of what is moſt valuable in life, their liberty: fickle and wavering, but ſociable, cheerful, and ſprightly. They are a very powerful people, and their forces conſiſt wholly of cavalry. Their dialect is a compound of the Poliſh and Ruſſian language; but the latter is the moſt predominant. They were formerly Pagans or Mahometans; but upon their entering into the Poliſh ſervice, they were baptized Chriſtians of the Romiſh communion; and now that they belong to Ruſſia, they profeſs themſelves members of the Greek church.

Each of their towns, with the diſtrict belonging to it, is governed by an officer called *ottomann* or *attamann*.

The Don-Coſſacks, ſo called from their reſidence upon the banks of the river Don, greatly reſemble thoſe already deſcribed. In the year 1559, when the czar Iwan Baſilowitz was emperor of Ruſſia, they voluntarily put themſelves under his protection, and are at this time on a pretty equal footing with the other Ruſſian ſubjects. They have ſeveral towns and villages upon the banks of the Don; but are prevented from extending themſelves farther up the country, by the ſcarcity of freſh water and wood in many places. Their chief ſupport is grazing and agriculture, and occaſionally robbing and plundering, for which they want neither capacity nor inclination. Every town is governed by a magiſtrate called *tamann;* and the tamanns, with their towns, are under the juriſdiction of two ottomanns, who reſide at Tſherkaſky. The troops of theſe Coſſacks likewiſe conſiſt entirely of cavalry. In this country all the towns and villages are fortified and encompaſſed with paliſades, to defend them againſt the incurſions of the Calmucs and Kuban Tartars, with whom they are continually at war. The Coſſacks, in general, are of great ſervice to garriſon towns by way of defence, or to purſue an enemy; but are not ſo good at regular attacks.

The Sietſh Coſſacks, who are alſo called *Haidamacks*, have their particular hettman. They inhabit the Ruſſian, Poliſh, and Turkiſh dominions, along the banks of the Dnieper.

The Yaik Coſſacks dwell on the the ſouth ſide of the river Yaik; and upon the ſucceſs of the Ruſſian arms in the kingdom of Aſtracan, voluntarily ſubmitted to them. In ſtature they greatly reſemble the other Coſſacks; though by their booriſh manner of living, and intermarriages with the Tartars, they have not the ſhape and air peculiar to the reſt of their countrymen. Their natural diſpoſitions and cuſtoms are, however, nearly the ſame. Huſbandry, fiſhing, and feeding of cattle, are their principal employments; and, like the other tribes, they let ſlip no opportunity of making depredations on their neighbours. Their continual wars with the Kara-Kalpacs and the Kaſatſhaia-Horda oblige them to keep their towns and villages in a ſtate of defence. They are indeed ſubject to Ruſſian waiwodes, to whom they pay an annual tribute in corn, wax, honey, and cattle; but they have alſo their particular chiefs, who govern them according to their ancient cuſtoms. Though the generality of the Yaik Coſſacks profeſs the Greek religion, yet a great many relicts of Mahometaniſm and Paganiſm are ſtill found among them. Being naturally bold and hardy, they make excellent ſoldiers; and they are not ſo turbulent as the other Coſſacks. They live entirely at peace with the Calmuks and their other neighbours, and even maintain a commerical intercourſe with them.

COSE DE GENISTE, an order of knighthood inſtituted in 1234. by Louis IX. at his marriage with Margaret of Provence. The motto on the collar of this order was, *exaltat humilis*.

COSSET, among farmers, a colt, calf, or lamb, brought up by hand without the dam.

COSTA (Chriſtopher), a celebrated botaniſt of the 16th century, was born in Africa, of a Portugueſe father, and went into Aſia to perfect himſelf in the knowledge of ſimples, where he was taken priſoner, but found means to make his eſcape, and after ſeveral voyages, practiſed phyſic at Bourgos. He wrote, 1. A Treatiſe on Indian Drugs and Medicines. 2. His Voyages to the Indies. 3. A book in praiſe of Women; and other works.

COSTAL, an appellation given by anatomiſts to ſeveral parts belonging to the ſides: thus we meet with coſtal muſcles, vertebræ, &c.

COSTANZO (Angelo di), an Italian hiſtorian and poet, lord of Catalupo, was born in 1507, of a noble and ancient family of Naples, and died about 1591. He wrote, 1. A Hiſtory of Naples, from 1250 to 1489; the beſt edition of which is that of Aquila, in 1582, in folio, very ſcarce. 2. Italian Poems, which are eſteemed, and have had ſeveral editions.

COSTA-RICCA, a province of North America in New Spain and in the audience of Guatimala, bounded on the north-eaſt by the northern ocean, on the ſouth-weſt by the ſouth ſea, on the north-weſt by Nicaragua, and on the ſouth-eaſt by Veragua. The ſoil is not very fertile, though there is plenty of cattle. Carthage is the capital town.

COSTARD (George), a clergyman of the church of England, and author of ſeveral learned works was born about the year 1710. He was educated at Wadham College, Oxford; and took the degree of M. A. in 1733. The firſt eccleſiaſtical ſituation in which he was placed was that of curate of Iſlip in Oxfordſhire. In 1747 he publiſhed in 8vo, Some obſervations tending to illuſtrate the Book of Job. In 1750 he publiſhed Two Diſſertations: I. On the meaning of the Word *Keſitah*, mentioned in Job, chap. xlii. ver. 11. II. on the Signification of the Word *Hermes*. In 1752 he publiſhed, in 8vo, at Oxford, *Diſſertationes II. Critico-Sacræ, quarum prima explicatur, Ezek. xiii. 18. Altera vero, 2 Reg. x. 22.* In 1755 he wrote a letter to Dr Birch, which is preſerved in the Britiſh Muſeum, reſpecting the meaning of the phraſe *ſphæra barbarica*. Some time after this he undertook to publiſh a ſecond edition of Dr Hyde's *Hiſtoria Religionis veterum Perſarum, eorumque Magorum*; and which was accordingly printed, under his inſpection, and with his corrections, at the Clarendon Preſs at Oxford, in 4to, in 1760. Mr Coſtard's extenſive learning having now recommended him to the notice of Lord Chancellor Northington, he obtained, by the favour of that nobleman, in June 1764, the vicarage of Twickenham in Middleſex; in which ſituation he continued till his death. In 1767 he publiſhed, in one volume quarto, The Hiſtory of Aſtronomy, with its application to Geography, Hiſtory, and chronology;

occaſionally exemplified by the Globes. This work was chiefly intended for the uſe of ſtudents, and contains a full and diſtinct view of the ſeveral improvements made in geography and aſtronomy. Mr Coſtard has ſhown, "by a gradual deduction, at what time, and by whom, the principal diſcoveries have been made in geography and aſtronomy; how each diſcovery has paved the way to what followed; and by what eaſy ſteps, through the revolution of ſo many ages, theſe very uſeful ſciences have advanced towards their preſent ſtate of perfection." In 1778 he publiſhed, in 8vo, A Letter to Nathaniel Braſſey Halhead, Eſq; containing ſome Remarks on his Preface to the Code of Gentoo Laws. This appears to have been the laſt of his publications. It contains ſome criticiſms which were intended to invalidate the opinion which Mr Halhead had conceived concerning the great antiquity of the Gentoo laws; and ſome arguments againſt a notion which had been adopted by ſeveral writers, drawn from the obſervation of natural phenomena, that the world is far more ancient than it is repreſented to be by the Hebrew chronology. Mr Coſtard died on the 10th of January 1782. He was a man of uncommon learning, and eminently ſkilled in Grecian and oriental literature. His private character was amiable, and he was much reſpected in the neighbourhood in which he lived for his humanity and benevolence.—Beſides the works already mentioned, he wrote ſome others; and was alſo the author of learned papers, inſerted in the Philoſophical Tranſactions, on aſtronomical and chronological ſubjects.

COSTIVENESS, a preternatural detention of the feces, with an unuſual dryneſs and hardneſs thereof, and thence a ſuppreſſion of their evacuation. See (the *Index* ſubjoined to) MEDICINE.

COSTMARY, the Engliſh name of a ſpecies of tanſy. See TANACETUM.

COSTS, in law, imply the expences of a ſuit recovered by the plaintiff, together with damages. Coſts were not allowed by the common law, the amercement of the vanquiſhed party being his only puniſhment; but they are given by ſtatute*. Coſts are allowed in chancery for failing to make anſwer to a bill exhibited, or making an inſufficient anſwer: and if a firſt anſwer be certified by a maſter to be inſufficient, the defendant is to pay 40s.; 3l. for a ſecond inſufficient anſwer; 4l. for a third, &c. But if the anſwer be reported good, the plaintiff ſhall pay the defendant 40s. coſts.

COSTUME, a rule or precept in painting, by which the artiſt is enjoined to make every perſon and thing ſuſtain its proper character, and not only obſerve the ſtory, but the circumſtances, the ſcene of action, the country or place, and take care that the habits, arms, manners, proportions, and the like, exactly correſpond.

COSTUS, in botany: A genus of the monogynia order, belonging to the monandria claſs of plants; and in the natural method ranking under the eighth order *Scitamineæ*. The corolla is interior, inflated, and ringent, with the under lip trifid. There is but one ſpecies, *viz.* the arabicus, a native of the Indies. The root was formerly in ſome eſteem as an attenuant, and ſerviceable in venereal complaints; but it is now rarely preſcribed or met with in the ſhops.

COTA (Rodriguez), a Spaniſh poet in the 16th century, was the author of the *Tragi-comedia de Caliſto y Melibea*, which has been tranſlated into Latin by Gaſpar Barthius, and into French by James de Lavardin. The Spaniards ſet a great value on this performance.

CO-TANGENT, the tangent of an arch which is the complement of another to 90°. See GEOMETRY.

COTBUS, a town of Germany in Lower Luſace. It is a ſtrong important place, and has been ſubject to the king of Pruſſia ever ſince the year 1645. It is ſeated on the river Spree, 60 miles ſouth-by-eaſt of Berlin, and 55 ſouth-eaſt of Wirtemberg. Here are a great number of French Proteſtants, who have introduced manufactures; and this place is noted for excellent beer, pitch, and the cultivation of flax. E. Long. 15. 29. N. Lat. 51. 40.

COTE, a term uſed in courſing, to expreſs the advantage one greyhound has over another when he runs by the ſide of it, and putting before it, gives the hare a turn. See COURSING.

Cote-Gare, a kind of refuſe wool, ſo clung or clotted together that it cannot be pulled aſunder. By 13 Rich. II. ſtat. 1. c. 9. it is provided, that neither denizen or foreigner make any other refuſe of wools but cote-gare and villein. So the printed ſtatute has it; but in the parliament-roll of that year it is *cod-land* and *villein*. *Cot*, or *cote*, ſignifies as much as cottage in many places, and was ſo uſed by the Saxons according to Verſtegan.

COTELERIUS (John Baptiſt), fellow of the Sorbonne, and king's Greek profeſſor, was born at Niſmes in Languedoc in 1627. He made a collection of the fathers who lived in the apoſtolic age, which he publiſhed at Paris in two volumes folio in 1672; all reviewed and corrected from ſeveral MSS. with a Latin tranſlation and notes. He alſo publiſhed *Monumenta Eccleſiæ Græcæ*, in 3 vols; being a collection of Greek tracts out of the king's and M. Colbert's libraries, and which had never been publiſhed before: to theſe he added a Latin tranſlation and notes. He intended a farther proſecution of this work; but his intenſe ſtudies broke his conſtitution, and deprived him of life in 1686. Beſides his great ſkill in languages and eccleſiaſtical antiquities, Cotelerius was remarkable for his probity and candour.

COTERELLUS. *Cotarius*, and *coterellus*, according to Spelman and Du Freſne, are ſervile tenants; but in Doomſday and other ancient MSS. there appears a diſtinction, as well in their tenure and quality as in their name: for the cotarius hath a free ſoccage tenure, and paid a ſtated firm or rent in proviſions or money, with ſome occaſional cuſtomary ſervices; whereas the coterellus ſeems to have held in mere villenage, and his perſon, iſſue, and goods, were diſpoſable at the pleaſure of the lord.

COTERIE, a term adopted from the French trading aſſociations or partnerſhips, where each perſon advances his quota of ſtock and receives his proportion of gain; and which retains its original meaning when applied to little aſſemblies or companies aſſociated for mirth and good humour, where each one furniſhes his quota of pleaſantry. Here they coin new words not underſtood elſewhere, but which it becomes faſhionable for others to uſe; and they are thought ridiculous who

---

* Blackſt. Comment. iii. 399, 400.

are ignorant of them. It has been uſed of late to ſignify a club of ladies.

COTES (Roger), an excellent mathematician of the 18th century. He early diſcovered an inclination to the mathematics; and at 17 years of age was admitted a penſioner of Trinity College, Cambridge. In 1706 he was appointed profeſſor of aſtronomy in the profeſſorſhip founded by Dr Plume archdeacon of Rocheſter, being choſen the firſt in that chair for his great merit and learning. In the year 1713, at the requeſt of Dr Richard Bentley, he publiſhed at Cambridge, in 4to, a ſecond edition of Sir Iſaac Newton's *Principia*, with all the improvements which the author had annexed thereto; to which he perfixed an excellent Preface. He prepared ſeveral uſeful books for the public; and wrote A Deſcription of the great Meteor which appeared on the 6th of March 1716, publiſhed in the Philoſophical Tranſactions. He lived but a little while to carry on the diſcourſes for which he was eminently qualified; dying in the prime of his age in 1716, to the great regret of all the lovers of the ſciences.

COTESWOLD, ſeveral ſheep-cotes, and ſheep feeding on hills. It comes from the Saxon *cote*, i. e. *caſa*, "a cottage," and *wold*, "a place where there is no wood."

COTHURNUS, Buskin, a very high ſhoe or patten raiſed on ſoals of cork, worn by the ancient actors in tragedy to make them appear taller and more like the heroes they repreſented; moſt of whom were ſuppoſed to be giants. It covered the greateſt part of the leg, and was tied beneath the knee. Æſchylus is ſaid to have invented the cothurnus. See Buskin.

COTICE, or Cotise', in heraldry, is the fourth part of the bend; which with us is ſeldom or ever borne but in couples, with a bend between them: whence probably the name; from the French *cote*, "ſide;" they being borne, as it were, a-ſide of the bend.—A bend thus bordered is ſaid to be *cotiſed, cotice*. He bears ſable on a bend cotiſed argent three cinquefoils.

COTILLON, the name of a well-known briſk dance, in which eight perſons are employed. The term is French, and ſignifies an under-petticoat.

COTRONE, a town in the Hither Calabria, ſtanding on the ſite of the ancient Croton, though not occupying the ſame extent of Ground: (See Croton). It is fortified with ſingle walls, and a caſtle erected by Charles V. Its private buildings are poor and ſordid, the ſtreets diſmal and narrow. Cheeſe and corn are the principal commodities. For the ſtowage of corn, there are ranges of granaries in the ſuburbs; and the annual export is about 200,000 tomoti. The cheeſe is tolerably good; but has a great deal of that hot acrid taſte ſo common to all cheeſe made with goats milk. The wine is not unpleaſant, and appears ſuſceptible of improvement by better management in the making and keeping.

COTT, a particular ſort of bed-frame, ſuſpended from the beams of a ſhip for the officers to ſleep in between the decks. This contrivance is much more convenient at ſea than either the hammocks or fixed cabins: being a large piece of canvas ſewed into the form of a cheſt, about ſix feet long, one foot deep, and from two to three feet wide. It is extended by a ſquare wooden frame with a canvas bottom, equal to its length and breadth, to retain it in an horizontal poſition.

COTTAGE, Cottagium, is properly a little houſe for habitation without lands belonging to it; ſtat. 4 Edw. I. But by a later ſtatute, 31 Eliz. c. 7. no man may build a cottage unleſs he lay four acres of land thereto; except it be in market-towns or cities, or within a mile of the ſea, or for the habitation of labourers in mines, ſailors, foreſters, ſhepherds, &c. and cottages erected by order of juſtices of peace for poor impotent people are excepted out of the ſtatute. The four acres of land to make it a cottage within the law are to be freehold, and land of inheritance; and four acres holden by copy, or for life or lives, or for any number of years, will not be ſufficient to make a lawful cottage.

COTTON, in commerce, a ſoft downy ſubſtance found on the goſſypium, or cotton-tree. See Gossypium.

Cotton is ſeparated from the ſeeds of the plant by a mill, and then ſpun and prepared for all ſorts of fine work, as ſtockings, waiſtcoats, quilts, tapeſtry, curtains, &c. With it they likewiſe make muſlin; and ſometimes is is mixed with wool, ſometimes with ſilk, and even with gold itſelf.

The fineſt ſort comes from Bengal and the coaſt of Coromandel,

Cotton makes a very conſiderable article in commerce, and is diſtinguiſhed into cotton-wool and cotton-thread. The firſt is brought moſtly from Cyprus, St John d'Arce, and Smyrna: the moſt eſteemed is white, long, and ſoft. Thoſe who buy it in bales ſhould ſee that it has not been wet, moiſture being very prejudicial to it.

Of cotton-thread, that of Damas, called *cotton d'ounce*, and that of Jeruſalem, called *bazas*, are the moſt eſteemed; as alſo that of the Weſt India iſlands. It is to be choſen white, fine, very dry, and evenly ſpun. The other cotton-threads are the half bazas, the rames, the beledin, and gondezel; the payas and montaſiri, the geneguins, the baquins, the joſſelaſſars, of which there are two ſorts. Thoſe of India, known by the name of Tutucorin, Java, Bengal, and Surat, are of four or five ſorts, diſtinguiſhed by the letters A, B, C, &c. They are ſold in bags, with a deduction of one pound and a half on each of thoſe of Tutucorin, which are the deareſt, and two pounds on each bag of the other ſorts. For thoſe of Fielebas, Smyrna, Aleppo, and Jeruſalem, the deduction at Amſterdam is eight in the hundred for the tare, and two in the hundred for weight, and on the value one *per cent.* for prompt payment.

Cotton of Siam, is a kind of ſilky cotton in the Antilles, ſo called becauſe the grain was brought from Siam. It is of an extraordinary fineneſs, even ſurpaſſing ſilk in ſoftneſs. They make hoſe of it there preferable to ſilk ones for their luſtre and beauty. They ſell from 10 to 12 and 15 crowns a pair, but there are very few made unleſs for curioſity.

The manner of packing Cotton as practiſed in the Antilles. The bags are made of coarſe cloth, of which they take three ells and a half each; the breadth is one ell three inches. When the bag has been well ſoaked in water, they hang it up, extending the mouth of it to croſs pieces of timber nailed to poſts fixed in the ground ſeven or eight feet high. He who packs it goes into the bag, which is ſix feet nine inches deep, or thereabouts, and preſſes down the cotton, which another hands him, with hands and feet: obſerving to tread it equally every where, and putting in but little at a time. The beſt time of packing is in rainy moiſt weather, provided the cotton be under cover. The bag ſhould contain from 300 to 320 pounds. The tare abated in the Antilles is three in the hundred. Cotton being a production applicable to a great variety of manufactures, it cannot be too much cultivated in our own plantations that will admit of it.

Cotton-Spinning, the art or proceſs of reducing cotton-wool into yarn or thread.

The moſt ſimple method for this purpoſe, and the only one in uſe for a long time in Britain, was by the hand upon the well-known domeſtic machine called a *one-thread-wheel*. But as the demand for cotton-goods began to increaſe, other inventions were thought of for expediting this part of the manufacture. About 50 years ago, one Paul and others of London contrived an engine for a more eaſy and expeditious method of ſpinning cotton, and for which they obtained a patent; but the undertaking did not prove ſucceſsful. Some years thereafter, various machines were conſtructed by different perſons for facilitating the ſpinning of cotton; but without producing any very material or laſting advantage. At length, about the year 1767, Mr James Hargrave, a weaver in the neighbourhood of Blackburn in Lancaſhire, conſtructed a machine by which a great number of threads (from 20 to 80) might be ſpun at once, and for which he obtained his Majeſty's letters-patent. This machine is called a *Jenny*, and is the beſt contrivance for ſpinning *woof* or *ſhute* that has hitherto appeared. It is now commonly conſtructed for 84 threads; and with it one perſon can ſpin 100 Engliſh hanks in the day, each hank containing 840 yards.

Carding of cotton, as a preparation for ſpinning, uſed formerly to be performed by the hand, with a ſingle pair of cards, upon the knee: but this being a tedious method, ill ſuited to the rapid operations of the new ſpinning machines, other methods were contrived for affording a quicker and more adequate ſupply. The firſt improvement for this purpoſe was likewiſe made by Mr Hargrave; and conſiſted in applying two or three cards to the ſame board, and fixing them to a ſtool or ſtock; whence they obtained the name of *ſtock-cards*. With theſe, one woman could perform two or three times as much work as ſhe could do before in the common way. A ſtill more expeditious method of carding, however, by what are commonly called *cylinder-cards*, was ſoon afterwards invented, and is that which is now moſt commonly practiſed: but as ſeveral perſons lay claim to this invention, it is not eaſy to determine to whom in particular the merit of it is due.

The next and moſt capital improvements which this branch of manufacture received were from Mr Arkwright, a native of Lancaſhire, now Sir Richard Arkwright of Cromford in Derbyſhire. He firſt brought forward his new method of ſpinning cotton in 1768, for which he obtained a patent in 1769; he afterwards, in 1775, obtained a patent for engines which he had conſtructed to prepare the materials for ſpinning: though one of theſe patents, being challenged at law, was ſet aſide ſome years before it expired.

The reſult of Mr Arkwright's different inventions and improvements is a combination of machinery, by which cotton is *carded*, *roved*, and *ſpun*, with the utmoſt exactneſs and equality; and ſuch a degree of perfection attained in ſpinning *warp*, as is not to be equalled in any other part of the world. To theſe improvements Britain is entirely indebted for the great extent of its cotton manufactures; large buildings having been erected for that branch both in England and Scotland, many of which contain ſeveral thouſands of ſpindles, each driven by one or more large water-wheels; and ſome of ſuch extent as to ſpin at the rate of one thouſand yards of twiſt or warp yarn in the minute.

Other machines have been invented at different times, and a variety of improvements made by different mechanics and manufacturers; one of which in particular we muſt not omit to mention. It is called a *Mule* being a kind of mixture of machinery between the *warp*-machine of Mr Arkwright and the *woof*-machine or hand-jenny of Mr Hargrave, and was alſo invented in Lancaſhire. This machine bids fair to be of a great uſe in ſpinning cotton yarn for muſlins to a degree of fineneſs never before known in Britain, being nearly equal in quality to thoſe uſually brought from India.

Cotton Mills, are large buildings with peculiar machinery for carding, roving, and ſpinning cotton: (ſee the preceding article.)—Theſe were entirely unknown in Britain before the different inventions and improvements of Meſſrs Arkwright and Hargrave; ſince which time great numbers have been erected in England, and ſeveral in Scotland.

The firſt erections of the kind were by Meſſrs Arkwright and Hargrave, both in the town of Nottingham, and both nearly at the ſame time. The Engines were then driven by horſes: but ſince that time they have been chiefly erected upon water-falls in different parts of the country; particularly the warp machines, which are better adapted for being driven by water than any other. The moſt extenſive of theſe is in the village and neighbourhood of Cromford in Derbyſhire, and under the immediate inſpection of Sir Richard Arkwright. The firſt that was erected in Scotland was for Mr Peter Brotherſton, under the inſpection and direction of Mr John Hackett from Nottingham; and is in the neighbourhood of Pennycuick near Edinburgh. Since which time ſeveral have been erected in the neighbourhood of Glaſgow, Paiſley, Lanark, Perth, &c.

General State of the Cotton Manufactory. The facilities which the manufacturers of Great Britain had ſuddenly acquired, and the immenſe capitals which they have ſo recently laid out in expenſive machinery and other heavy eſtabliſhments for carrying on the cotton trade, are unparalleled in the annals of the world. Above one hundred and forty cotton-mills are now built in Great Britain, of which nearly two-thirds have been erected within theſe ſeven years. Beſides theſe, there are above 20,500 hand-mills or jennies for ſpinning the ſhute for the twiſted yarn ſpun by the water-mills.

Above a million of money was, within this time, ſunk in mills, hand engines, and other machines, including the grounds and neceſſary buildings.

Expence of water-mills, -	L. 715,000	0	0
Ditto of hand-jennies, houſes, buildings, and auxiliary machinery, ſuppoſed at leaſt, -	285,000	0	0
Total, -	L. 1,000,000	0	0

A power had been alſo created of working nearly two millions of ſpindles; and men, women, and children were trained to this buſineſs, capable of carrying the cotton manufacture almoſt to any extent. In 1787, the power of ſpindles capable of being worked was eſtimated as follows:

In the water-mills, - - -	286,000
In the jennies, - - - -	1,665,100
Total ſpindles,	1,951,100

In the branches applicable to muſlin and callico, it was calculated that employment was given to 100,000 men and women, and at leaſt 60,000 children; many of the latter having been taken from different pariſhes and hoſpitals in Great Britain.

The quantity of the raw material of cotton wool conſumed in this manufacture, which did not amount to 6,000,000 lb. in 1781, and was only about 11,000,000 lb. ſix years ago, had amounted in the year 1787 to the enormous height of 22,000,000 lb. and upwards; and the aſtoniſhing rapidity of this increaſe is in ſome meaſure to be attributed to the extenſion of theſe branches to the goods of India, particularly the callicoes and muſlins.

Britiſh callicoes were firſt made in Lancaſhire about the year 1772, but the progreſs was ſlow till within theſe laſt 12 years. The quantity manufactured has ſince extended from about 50,000 to 1,000,000 of pieces made in the courſe of a ſingle year.

Britiſh muſlins were not ſucceſsfully introduced until the year 1781, and were carried to no great extent until 1785, after which period the progreſs during two years became rapid beyond all example. The acquiſition of cotton wool of a ſuperior quality from Demerara and the Brazils, and the improvements made in the ſpinning fine yarns upon the mule jennies, had given a ſpring to this branch of the cotton manufactory, which extended it beyond what it was poſſible to have conceived. Above half a million pieces of muſlin of different kinds, including ſhawls and handkerchiefs, were computed to be annually made in Great Britain; while the quantity not only increaſed daily with the new acceſſion of powers that were burſting forth upon the country, but the quality was exceedingly improved; and ſince a yearly ſupply of about 300 bales of Eaſt Indian cotton has been obtained by the way of Oſtend, yarns have been ſpun, and muſlins have been wove, equal to any from India. Nothing, therefore, but a fine raw material appeared wanting to enable the Britiſh manufacturer to carry this branch to the greateſt extent; and, of all others, it is that ſpecies of cotton goods which deſerves moſt to be encouraged, becauſe of the immenſe return it makes for labour more than any other branch of the cotton manufactory. Eaſt India cotton wool has been ſpun into one pound of yarn worth five guineas; and when wove into muſlin, and afterwards ornamented by children in the tambour, has extended to the value of L. 15; yielding a return of 5,900 *per cent.* on the raw material.

But the ſtate of the raw materials, and the progreſſive and aſtoniſhing increaſe of this manufacture, will be beſt explained by what follows:

	Cotton Wool uſed in the Mauufacture.	Suppoſed Value when. manufactured.
1781,	lb. 5,101,920	L. 2,000,000
1782,	11,206,810	3,900,000
1783,	9,546,179	3,200,000
1784,	11,280,238	3,950,000
1785,	17,992,888	6,000,000
1786,	19,151,867	6,500,000
1787,	22,600,000	7,500,000

Such was the progreſs of the Britiſh cotton manufactory till 1787; when, with eſtabliſhments and mechanical powers capable of bringing forward immenſe quantities of goods into the conſumption, this manufacture was checked by a great and ſudden reduction of the prices of Eaſt India goods of the ſame ſpecies, which were ſold above 20 *per cent.* on an average under the loweſt prices at which the Britiſh manufacturer can afford to ſell without loſs.

This conduct in the Eaſt India Company quickly operated to the great prejudice of the Britiſh manufactures; and there is no ſaying how far theſe might be reduced, ſhould that company be allowed to preſs goods upon the market at prices which have no relation to the original coſt, and under circumſtances where the juſt laws of competition cannot operate, and where every idea of protecting-duties is annihilated in the effect of the general ſyſtem.

It is believed, however, that the home-manufacture of this article, in all its different branches, has of late revived, and is likely to be carried on with greater advantage to the manufacturer than ever it was before.

Lavender COTTON. See SANTOLINA.

Philoſophic COTTON, a name given to the flowers of zinc, on account of their white colour and reſemblance to cotton.

Flax made to reſemble COTTON. See FLAX.

Silk COTTON. See BOMBAX.

COTTON-*Weed*. See GNAPHALIUM.

COTTON (Sir Robert), a moſt eminent Engliſh antiquarian, deſcended from an ancient family, was born in 1570. In his 18th year he began to collect ancient records, charters, and other MSS. Camden, Selden, and Speed, acknowledged their obligations to him in their reſpective works. He was highly diſtinguiſhed by queen Elizabeth, and by James I. who created him a baronet. He wrote many things himſelf; but our principal obligations to him are for his valuable library, conſiſting of curious manuſcripts, &c. which he was forty years in collecting. At his death in 1631, he left the property of it to his family, though deſigned for public uſe. A large acceſſion was made to this library by private benefactions before the death of the founder, and afterwards by the purchaſes of his heirs, and donations of others, who added to it a great number of books, chiefly relating to the hiſtory and antiquities of the Britiſh nation. An act of parliament was obtained, at the requeſt of Sir John Cotton, in 1700, for preſerving it after his deceaſe, under the above denomination, for public uſe. It is now fixed in the Britiſh Muſeum. For ſtatutes relating to it, ſee 12 and 13 W. III. c. 5. and 5 Anne, cap. 30.

Cotton (Charles), a burleſque poet, was deſcended of a good family, and lived in the reigns of Charles II. and James II. His moſt celebrated piece is *Scarronides*, or *Traveſtie* of the firſt and fourth books of the Æneid. But though, from the title, one would be apt to imagine it an imitation of Scarron's famous Traveſtie of the ſame author, yet, upon examination, it would be found greatly to excel not only that, but every other attempt of the ſame kind that hath been hitherto made in any language. He has alſo tranſlated ſeveral of Lucian's dialogues, in the ſame manner, under the title of *the Scoffer Scoff'd*;—and written another poem of a more ſerious kind, entitled *the Wonders of the Peak*. The exact period of either Mr Cotton's birth or his death, is no-where recorded; but it is probable the latter happened about the time of the revolution. Neither is it better known what his circumſtances were with reſpect to fortune; they appear, however, to have been eaſy, if one may judge from the turn of his writings, which is ſuch as ſeems ſcarcely poſſible for any one to indulge whoſe mind was not perfectly at eaſe. Yet there is one anecdote told of him, which ſeems to ſhow that his vein of humour could not reſtrain itſelf on any conſideration, viz. that in conſequence of a ſingle couplet in his *Virgil Traveſtie*, wherein he has made mention of a peculiar kind of ruff worn by a grandmother of his who lived in the Peak, he loſt an eſtate of L. 400 *per annum*; the old lady, whoſe humour and teſty diſpoſition he could by no means have been a ſtranger to, being never able to forgive the liberty he had taken with her; and having her fortune wholly at her diſpoſal, although ſhe had before made him her ſole heir, altered her will, and gave it away to an abſolute ſtranger.

COTTUS, or **Bull-head**, in ichthyology, a genus belonging to the order of thoracici. The head is broader than the body, and the gill membrane has ſix rays. There are ſix ſpecies; the moſt remarkable are,

1. The gobio, or river-bull head, is very common in all our clear brooks: it lies almoſt always at the bottom, either on the gravel or under a ſtone: it depoſits its ſpawn in a hole which it forms among the gravel, and quits it with great reluctance. It feeds on water inſects. This fiſh ſeldom exceeds the length of three inches and an half: the head is large, broad, flat, and thin at its circumference, being well adapted for inſinuating itſelf under ſtones: on the middle part of the covers of the gills is a ſmall crooked ſpine turning inwards. The eyes are very ſmall: the irides yellow: the body grows ſlender towards the tail, and is very ſmooth. The colour of this fiſh is as diſagreeable as its form, being duſky, mixed with a dirty yellow; the belly is whitiſh. The taſte, however, is excellent.

2. The cataphractus, armed bull-head, or *pogge*, is very common on moſt of the Britiſh coaſts. It ſeldom exceeds five inches and an half in length; and even ſeldom arrives at that ſize. The head is large, bony, and very rugged: the end of the noſe is armed with four ſhort upright ſpines: on the throat are a number of ſhort white beards: the body is octogoeal, and covered with a number of ſtrong bony cruſts, divided into ſeveral compartments, the ends of which project into a ſharp point, and form ſeveral echinated lines along the back and ſides from the head to the tail.

3. The ſcorpius, or father-laſher, is not uncommon on the rocky coaſts of Britain; it lurks under ſtones, and will take a bait. It ſeldom exceeds 8 or 9 inches in length. The head is large, and has a moſt formidable appearance, being armed with vaſt ſpines, which it can oppoſe to any enemy that attacks it, by ſwelling out its cheeks and gill-covers to a large ſize. The noſe and ſpace contiguous to the eyes are furniſhed with ſhort ſharp ſpines; the covers of the gills are terminated by exceeding long ones, which are both ſtrong and very ſharp pointed. The mouth is large; the jaws covered with very ſmall teeth; the roof of the mouth is furniſhed with a triangular ſpot of very minute teeth. This ſpecies is very frequent in the Newfoundland ſeas, where it is called *ſcolping*: it is alſo as common on the coaſt of Greenland, in deep water near the ſhore. It is a principal food of the natives, and the ſoup made of it is ſaid to be agreeable as well as wholeſome.

COTULA, **may-weed**: A genus of the polygamia ſuperflua order, belonging to the ſyngeneſia claſs of plants. The receptacle is almoſt naked; the pappus marginated; the florets of the diſc quadrifid; of the radius frequently none. There are ſix ſpecies, all of them herbaceous annuals, riſing ſix or eight inches high, and adorned with yellow flowers. There are none of them natives of Britain, and moſt of them require artificial heat.

Cotula, or *Cotyla* a liquid meaſure in uſe among the ancients.

Fannius ſays, the cotyla was the ſame thing with the hemina, which was half a ſextary.

> *At* cotylas, *quas ſi placeat, dixiſſe licebit*
> *Heminas recepit geminas extarias unus.*

Chorier obſerves, that the cotyla was uſed as a dry meaſure as well as a liquid one; from the authority of Thucydides, who in one place mentions two cotylæ of wine, and in another two cotylæ of bread.

COTURNIX, in ornithology. See Tetrao.

COTYLEDON, **navel-wort**; a genus of the pentagynia order, belonging to the decandria claſs of plants; and in the natural method ranking under the 13th order, *Succulentæ*. The calyx is quinquefid; the corolla monopetalous: there are five nectariferous ſcales at the baſe of the germen, and five capſules. There are eight ſpecies, moſt of them hardy ſucculent perennials; though ſome require to be kept in a ſtove, as being natives of warm climates. They riſe from half a foot to a yard and an half high, and are adorned with yellow flowers growing in umbels. They are eaſily propagated either by ſeed or cuttings of their branches.

COTYLEDONES, in anatomy, are certain glandular bodies, adhering to the chorion of ſome animals.

Cotyledones, in botany, the periſhable porous ſide-lobes of the ſeed, which involve, and for ſome time furniſh nouriſhment to the embryo plant. See Botany, p. 435.

COTYTTO, the goddeſs of all debauchery. Her feſtivals called *Cotyttia* were celebrated by the Athenians, Corinthians, Thracians, &c. during the night. Her prieſts were called *baptæ*, and nothing but debauchery

chery and wantonneſs prevailed at the celebration. A feſtival of the ſame name was obſerved in Sicily, where the votaries of the goddeſs carried about boughs hung with cakes and fruit, which it was lawful for any perſon to pluck off. It was a capital puniſhment to reveal whatever was ſeen or done at theſe ſacred feſtivals. It coſt Eupolis his life for an unſeaſonable reflection upon them. The goddeſs Cotytto is ſuppoſed to be the ſame as Proſerpine.

COUCH, in painting, denotes a lay, or impreſſion of colour, whether in oil or water, wherewith the painter covers his canvas, wall, wainſcot, or other matter to be painted.

The word is alſo uſed for a lay or impreſſion on any thing, to make it firm and conſiſtent, or to ſcreen it from the weather.

Paintings are covered with a couch of varniſh; a canvas to be painted muſt firſt have two couches of ſize, before the colours be laid; two or three couches of white lead are laid on wood, before the couch of gold be applied: the leather-gilders lay a couch of water and whites of eggs on the leather, before they apply the gold or ſilver leaf.

The gold wire-drawers alſo uſe the word *couch* for the gold or ſilver leaf wherewith they cover the maſs to be gilded or ſilvered, before they draw it through the iron that is to give it its proper thickneſs.

The gilders uſe couch for the quantity of gold or ſilver leaves applied on the metals in gilding or ſilvering. Each couch of gold is but one leaf, or two at moſt, and each of ſilver three to gild: if the gilding be hatched, there are required from eight to twelve couches; and only three or four if it be without hatching. To ſilver there are required from four to ten couches, according to the beauty of the work.

Couch-Graſs, in botany. See Triticum.

COUCHANT, in heraldry, is underſtood of a lion, or other beaſt, when lying down, but with his head raiſed; which diſtinguiſhes the poſture of couchant from dormant, wherein he is ſuppoſed quite ſtretched out and aſleep.

COUCHE, in heraldry, denotes any thing lying along: thus, chevron-couché, is a chevron lying ſideways, with the two ends on each ſide of the ſhield, which ſhould properly reſt on the baſe.

COUCHER, or Courcher, in Engliſh ſtatutes, is uſed for a factor, or one that continues in ſome place or country for traffic; as formerly in Gaſcoign, for the buying of wines. Anno 37. Edw. III. c. 16.

Coucher is alſo uſed for the general book in which any religious houſe or corporation regiſter their particular acts. Anno 3 and 4. Edw. VI. c. 10.

COUCHING *of a* Cataract, in ſurgery. See Surgery-*Index*.

COVE, a ſmall creek or bay, where boats and ſmall veſſels may ride at anchor, ſheltered from the wind and ſea.

COVENANT, in law, is the conſent and agreement of two or more perſons to do, or not to do, ſome act, or thing, contracted between them. Alſo it is the declaration the parties make, that they will ſtand to ſuch agreement, relating to lands or other things; and is created by deed in writing, ſealed and executed by the parties, otherwiſe it may be implied in the contract as incident thereto. And if the perſons do not perform their covenants, a writ or action of covenant is the remedy to recover damages for the breach of them.

Covenant, in eccleſiaſtical hiſtory, denotes a contract or convention agreed to by the Scotch in the year 1638, for maintaining their religion free from innovation. In 1581, the general aſſembly of Scotland drew up a confeſſion of faith, or national covenant, condemning epiſcopal government, under the name of *hierarchy*, which was ſigned by James I. and which he enjoined on all his ſubjects. It was again ſubſcribed in 1590 and 1596. The ſubſcription was renewed in 1638, and the ſubſcribers engaged by oath to maintain religion in the ſame ſtate as it was in 1580, and to reject all innovations introduced ſince that time. This oath annexed to the confeſſion of faith received the name of the *covenant;* as thoſe who ſubſcribed it were called *covenanters*.

Covenant, in theology, is much uſed in connection with other terms; as, 1 *The Covenant of Grace* is that which is made between God and thoſe who believe the goſpel, whereby they declare their ſubjection to him, and he declares his acceptance of them and favour to them. The goſpel is ſometimes denominated a *covenant of grace*, in oppoſition to the Moſaic law. 2. *Covenant of Redemption* denotes, a mutual ſtipulation, tacit or expreſs, between Chriſt and the Father, relating to the redemption of ſinners by him, previous to any act on Chriſt's part under the character of Mediator. 3. *Covenant of Works* ſignifies, in the language of ſome divines, any covenant whereby God requires perfect obedience from his creatures, in ſuch a manner as to make no expreſs proviſion for the pardon of offences to be committed againſt the precepts of it, on the repentance of ſuch ſuppoſed offenders, but pronounces a ſentence of death upon them; ſuch, they ſay, was the covenant made with Adam in a ſtate of innocence, and that made with Iſrael at Mount Sinai.

Solemn League and Covenant, was eſtabliſhed in the year 1643, and formed a bond of union between Scotland and England. It was ſworn and ſubſcribed by many in both nations; who hereby ſolemnly abjured popery and prelacy, and combined together for their mutual defence. It was approved by the parliament and aſſembly at Weſtminiſter, and ratified by the general aſſembly of Scotland in 1645. King Charles II. diſapproved of it when he ſurrendered himſelf to the Scots army in 1646: but in 1650 he declared his approbation both of this and the national covenant by a ſolemn oath; and in Auguſt of the ſame year, made a farther declaration at Dunfermline to the ſame purpoſe, which was alſo renewed on occaſion of his coronation at Scone in 1651. The covenant was ratified by parliament in this year, and the ſubſcription of it required by every member, without which the conſtitution of the parliament was declared null and void. It produced a ſeries of diſtractions in the ſubſequent hiſtory of that country, and was voted illegal by parliament, and proviſion made againſt it. Stat. 14. Car. II. c. 4.

Ark of the Covenant, in Jewiſh antiquity. See Ark.

COVENTRY, a town of Warwickſhire, in England, ſituated in W. Long. 1. 26. N. Lat. 52. 25. It is an ancient place, and is ſuppoſed to derive its name from a convent formerly ſituated here. Leofric, earl of Mercia, who rebuilt the religious houſe after it had been deſtroyed by the Danes, and was lord of the place about the year 1040, is ſaid, upon ſome provocation, to have loaded them with heavy taxes. Being importuned by his lady, Godiva, to remit them, he conſented, upon condition that ſhe ſhould ride naked through the town, which he little imagined ſhe would ever comply with. But he found himſelf miſtaken: for ſhe accepted the offer, and rode through the town with her long hair ſcattered all over her body; having firſt enjoined the citizens not to venture, on pain of death, to look out as ſhe paſſed. It is ſaid, however, that a certain taylor could not help peeping; and to this day there is an effigy of him at the window whence he looked. To commemorate this extraordinary tranſaction, and out of reſpect to the memory of their patroneſs, the citizens make a proceſſion every year, with the figure of a naked woman on horſeback. After Leofric's death, the earls of Cheſter became lords of the city, and granted it many privileges. At length it was annexed to the earldom of Cornwal; and growing conſiderable, had divers immunities and privileges conferred upon it by ſeveral kings; particularly that of a mayor and two bailiffs by Edward III.; and Henry VI. made it, in conjunction with ſome other towns and villages, a diſtinct county, independent of the county of Warwick. But afterwards Edward IV. for their diſloyalty, deprived them of their liberties, which were not reſtored till they had paid a fine of 500 merks. By a charter from James I. an alderman is allotted to each ward, with the powers of the juſtices of the peace within the city and its liberties. The walls were ordered to be demoliſhed at the reſtoration; and now nothing remains of them but the gates, which are very lofty. Coventry is noted for the two parliaments which were held in it; the one called the parliament of *Dunces*, and the other of *Devils*. The former was ſo called on account of the excluſion of the lawyers; and the attainders of the duke of York, the earls of Saliſbury, Warwick, and March, procured the other the epithet of *Devils*. The town-houſe of Coventry is much admired for its painted windows repreſenting ſeveral kings and others that have been benefactors to the city. The chief manufactures carried on here are temmies and ribbands.

Coventry ſends two members to parliament, and gives title of earl to an ancient family of the ſame name.—Coventry is a biſhop's ſee. The biſhopric is ſaid to have been founded by Oſwy king of Mercia, in the year 656 or 657; and although it hath a double name, yet, like Bath and Wells, it is a ſingle dioceſe. It was ſo extremely wealthy, that king Offa, by the favour of pope Adrian, conſtituted it an archiepiſcopal ſee; but this title was laid aſide on the death of that king. In 1075, Peter, the 34th biſhop, removed the ſee to Cheſter. In 1102, Robert de Limſey, his immediate ſucceſſor, removed it to Coventry; and Hugo Novant, the 41ſt biſhop, removed it back to Litchfield, but with great oppoſition from the monks of Coventry. The diſpute was finally ſettled in a manner nearly ſimilar to that which is mentioned between Bath and Wells. Here it was agreed that the biſhop ſhould be ſtyled from both places, and that Coventry ſhould have the precedence; that they ſhould chooſe the biſhop alternately; and that they ſhould both make one chapter to the biſhop, in which the prior of Coventry ſhould be the chief man. Matters continued thus till the Reformation, when the priory of Coventry being diſſolved by king Henry VIII. the ſtyle of the biſhop continued as before. But an act of parliament paſſed 33d of king Henry VIII. to make the dean and chapter of Litchfield one ſole chapter to the biſhop. This ſee hath given three ſaints to the church, and to the nation, one lord chancellor, three lord treaſurers, three preſidents of Wales, one chancellor to the univerſity of Cambridge, and one maſter of the Wardrobe. The old church built by king Oſwy being taken down by Roger de Clinton, the 37th biſhop, he built the beautiful fabric that now ſtands in 1148, and dedicated it to the Virgin Mary and St Chad. During the grand rebellion, the church ſuffered much; but, ſoon after the Reſtoration, it was repaired and beautified. This dioceſe contains the whole counties of Stafford and Derby (except two pariſhes of the former), the largeſt part of Warwickſhire, and near only one half of Shropſhire, in which are 555 pariſhes, of which 250 are impropriate. It hath four archdeaconries, viz. Stafford, Derby, Coventry, and Shrewſbury. It is valued in the king's books at L. 559 : 18 : $2\frac{3}{4}$, and is computed to be worth annually L. 2800. The clergy's tenth is L. 590 : 16 : $11\frac{1}{4}$. To this cathedral belong a biſhop, a dean, a precentor, a chancellor, a treaſurer, four archdeacons, twenty-ſeven prebendaries, five prieſt vicars, ſeven lay clerks, or ſinging men, eight choriſters, and other under officers and ſervants.

CO-VERSED SINE, in geometry, the remaining part of the diameter of a circle, after the verſed ſine is taken from it. See GEOMETRY.

COVERT, in law.—*Feme Covert* denotes a woman married, and ſo covered by, or under the protection of, her huſband.

Covert-way, or CORRIDOR, in fortification, a ſpace of ground, level with the field on the edge of the ditch, three or four fathoms broad, ranging quite round the half moons and other works towards the country. It has a parapet raiſed on a level, together with its banquets and glacis. See FORTIFICATION.

COVERTURE, in law, is applied to the ſtate and condition of a married women, who is under the power of her huſband, and therefore called *femme couvert*.

COUGH, in medicine. See (*Index* ſubjoined to) MEDICINE.

COUGH, in farriery. See FARRIERY, § vi.

COUGH, called the huſk, is a diſeaſe to which young bullocks are ſubject. In this diſorder the wind-pipe and its branches are loaded with ſmall taper worms. Farmers count the diſeaſe incurable; but fumigations with mercurials, as cinnabar, or with fœtids, as tobacco, might prove ſerviceable.

COUHAGE, or STINKING-BEANS; a kind of kidney-beans imported from the Eaſt Indies, where they are uſed as a cure for the dropſy. The down growing on the outſide of the pod is ſo pointed as, like a nettle, to ſting the fleſh, though not with ſo painful a ſenſation. This, by a corruption of the word, is called *cowitch*. The plant is a ſpecies of DOLICHOS.

COVIN, a deceitful compact or agreement between two or more to deceive or prejudice a third perſon;

As, if a tenant for life conſpire with another, that this other ſhall recover the land which the tenant holds, in prejudice of him in reverſion. Dr Skinner takes the word to be a corruption of the Latin *conventum*, and therefore writes it *coven*. See CONSPIRACY.

COVING, in building, is when houſes are built projecting over the ground plot, and the turned projecture arched with timber, lathed and plaſtered.

COVINUS, among the ancients, a kind of chariot, in which the Gauls and Britons uſed to fight in battles.

COUL, or COWL. See COWL.

COULTER, in huſbandry, and iron-inſtrument, fixed in the beam of a plough, and ſerving to cut the edge of each furrow. See AGRICULTURE.

COUNCIL, or COUNSEL, in a general ſenſe, an aſſembly of divers conſiderable perſons to concert meaſures relative to the ſtate.

In Britain, the law, in order to aſſiſt the king in the diſcharge of his duties, the maintenance of his dignity, and the exertion of his prerogative, hath aſſigned him a diverſity of councils to adviſe with.

1. The firſt of theſe is the high court of parliament. See PARLIAMENT.

2. The peers of the realm are by their birth hereditary counſellors of the crown; and may be called together by the king, to impart their advice in all matters of importance to the realm, either in time of parliament, or, which hath been their principal uſe, when there is no parliament in being. Accordingly, Bracton, ſpeaking of the nobility of his time, ſays, they might properly be called "conſules a conſulendo; reges enim tales ſibi aſſociant ad conſulendum." And in the law-books it is laid down, that the peers are created for two reaſons: 1. *Ad conſulendum*, 2. *Ad defendendum, regem:* for which reaſons the law gives them certain great and high privileges; ſuch as freedom from arreſts, &c. even when no parliament is ſitting; becauſe the law intends, that they are always aſſiſting the king with their counſel for the common-wealth, or keeping the realm in ſafety by their proweſs and valour.

Inſtances of conventions of the peers, to adviſe the king have been in former times very frequent; though now fallen into diſuſe, by reaſon of the more regular meetings of parliament. Sir Edward Coke gives us an extract of a record, 5 Henry IV. concerning an exchange of lands between the king and the earl of Northumberland, wherein the value of each was agreed to be ſettled by advice of parliament (if any ſhould be called before the feaſt of St Lucia), or otherwiſe by advice of the grand council of peers, which the king promiſes to aſſemble before the ſaid feaſt, in caſe no parliament ſhall be called. Many other inſtances of this kind of meeting are to be found under the ancient kings: though the formal method of convoking them had been ſo long left off, that when king Charles I. in 1640, iſſued out writs under the great ſeal, to call a council of all the peers of England, to meet and attend his majeſty at York, previous to the meeting of the long parliament, the earl of Clarendon mentions it as a new invention, not before heard of; that is, as he explains himſelf, ſo old, that it had not been practiſed in ſome hundreds of years. But though there had not for ſo long before been an inſtance, nor has there been any ſince, of aſſembling them in ſo ſolemn a manner, yet in caſes of emergency, princes have at ſeveral times thought proper to call for, and conſult as many of the nobility as could eaſily be brought together: as was particularly the caſe with king James II. after the landing of the prince of Orange; and with the prince of Orange himſelf, before he called the convention parliament which afterwards called him to the throne.

Blackſt. Comment.

Beſides this general meeting, it is uſually looked upon to be the right of each particular peer of the realm, to demand an audience of the king, and to lay before him with decency and reſpect ſuch matters as he ſhall judge of importance to the public weal. And therefore, in the reign of Edward II. it was made an article of impeachment in parliament againſt the two Hugh Spencers, father and ſon, for which they were baniſhed the kingdom, "that they by their evil covin would not ſuffer the great men of the realm, the king's good counſellors, to ſpeak with the king, or to come near him; but only in preſence and hearing of ſaid Hugh the father and Hugh the ſon, or one of them, and at their will, and according to ſuch things as pleaſed them."

3. A third council belonging to the king, are, according to Sir Edward Coke, his judges of the courts of law, for law-matters. And this appears frequently in the Engliſh ſtatutes, particularly 14 Edward III. c. 5. and in other books of law. So that when the king's council is mentioned generally, it muſt be defined, particularized, and underſtood, *ſecundum ſubjectam materiem;* "according to the ſubject matter:" and if the ſubject be of a legal nature, then by the king's council is underſtood his council for matters of law; namely, his judges: Therefore, when by ſtatute 16 Richard II. c. 5. it was made a high offence to import into England any papal bulls, or other proceſſes from Rome; and it was enacted, that the offenders ſhould be attached by their bodies, and brought before the king and his council to anſwer for ſuch offence; here, by the expreſſion of king's *council*, were underſtood the king's judges of his courts of juſtice, the ſubject-matter being legal: this being the general way of interpreting the word *council*.

4. But the principal council belonging to the king is his *privy council*, which is generally, by way of eminence, called *the Council*. For an account of its conſtitution and powers, ſee the article *PRIVY-COUNCIL*.

Aulic COUNCIL. See AULIC.

Common COUNCIL, in the city of London, is a court wherein are made all bye-laws which bind the citizens. It conſiſts, like the parliament, of two houſes; an upper compoſed of the lord mayor and aldermen; and a lower, of a number of common-council men, choſen by the ſeveral wards, as repreſentatives of the body of the citizens.

COUNCIL of War, an aſſembly of the principal officers of an army or fleet, occaſionally called by the general or admiral to concert meaſures for their conduct with regard to ſieges, retreats, engagements, &c.

COUNCIL, in church hiſtory, an aſſembly of prelates and doctors, met for the regulating matters relating to the doctrine or diſcipline of the church.

National COUNCIL, is an aſſembly of prelates of a nation under their primate or patriarch.

Oecumenical or *General* COUNCIL, is an aſſembly which repreſents the whole body of the univerſal church. The Romaniſts reckon eighteen of them; Bullinger, in his treatiſe de Conciliis, ſix; Dr Prideaux, ſeven; and biſhop Beveridge has increaſed the number to eight, which, he ſays, are all the general councils which have ever been held ſince the time of the firſt Chriſtian emperor. They are as follows: 1. The council of Nice, held in the reign of Conſtantine the Great, on account of the hereſy of Arius. 2. The council of Conſtantinople, called under the reign and by the command of Theodoſius the Great, for much the ſame end that the former council was ſummoned. 3. The council of Epheſus, convened by Theodoſius the younger at the ſuit of Neſtorius. 4. The council of Calcedon, held in the reign of Martianus, which approved of the Eutychian hereſy. 5. The ſecond council of Conſtantinople, aſſembled by the emperor Juſtinian, condemned the three chapters taken out of the book of Theodorus of Mopſueſtia, having firſt decided that it was lawful to anathematize the dead. Some authors tell us, that they likewiſe condemned the ſeveral errors of Origen about the Trinity, the plurality of worlds, and pre-exiſtence of ſouls. 6. The third council of Conſtantinople, held by the command of Conſtantius Pogonatus the emperor, in which they received the definitions of the five firſt general councils, and particularly that againſt Origen and Theodorus of Mopſueſtia. 7. The ſecond Nicene council. 8. The fourth council of Conſtantinople, aſſembled when Louis II. was emperor of the Weſt. The regulations which they made are contained in twenty-ſeven canons, the heads of which are ſet down by M. du Pin, to whom the reader is referred.

COUNSEL, in a general ſenſe, ſignifies advice or inſtruction how to behave in any difficult matter.

Counsel, or *Advocates*, in Engliſh courts of law, are of two ſpecies or degrees; BARRISTERS and SERJEANTS. See theſe articles; alſo ADVOCATE.

From both theſe degrees ſome are uſually ſelected to be his majeſty's counſel, learned in the law; the two principal of whom are called his *attorney-general*, and *ſolicitor-general*. The firſt king's counſel, under the degree of ſerjeant, was Sir Frances Bacon, who was made ſo *honoris cauſa*, without either patent or fee: ſo that the firſt of the modern order (who are now the ſworn ſervants of the crown, with a ſtanding ſalary) ſeems to have been Sir Francis North, afterwards lord keeper of the Great Seal to King Charles II. Theſe king's counſel anſwer, in ſome degree, to the advocates of the revenue, *advocati fiſci*, among the Romans. For they muſt not be employed in any cauſe againſt the crown without ſpecial licenſe; in which reſtriction they agree with the advocates of the fiſc: but, in the imperial law, the prohibition was carried ſtill farther, and perhaps was more for the dignity of the ſovereign; for, excepting ſome peculiar cauſes, the fiſcal advocates were not permitted to be at all concerned in private ſuits between ſubject and ſubject. A cuſtom has of late years prevailed of granting letters patent of precedence to ſuch barriſters as the crown thinks proper to honour with that mark of diſtinction: whereby they are intitled to ſuch rank and preaudience as are aſſigned in their reſpective patents; ſometimes next after the king's attorney-general, but uſually next after his majeſty's counſel next being. Theſe, as well as the queen's attorney and ſolicitor-general, rank promiſcuouſly with the king's counſel; and, together with them, ſit within the bar of their reſpective courts: but receive no ſalaries, and are not ſworn; and therefore are at liberty to be retained in cauſes againſt the crown. And all other ſerjeants and barriſters indiſcriminately, (except in the court of common-pleas, where only ſerjeants are admitted), may take upon them the protection and defence of any ſuitors, whether plaintiff or defendent; who are therefore called their *clients*; like the dependents on the ancient Roman orators. Theſe indeed practiſed *gratis*, for honour merely, or at moſt for the ſake of gaining influence: and ſo likewiſe it is eſtabliſhed with us, that a counſel can maintain no action for his fees; which are given, not as *locatio vel conductio*, but as *quiddam honorarium*; not as a ſalary or hire, but as a mere gratuity, which a counſellor cannot demand without doing wrong to his reputation; as is alſo laid down with regard to advocates in the civil law, whoſe *honorarium* was directed, by a decree of the ſenate, not to exceed in any caſe 10,000 ſeſterces, or about L. 80 of Engliſh money. And in order to encourage due freedom of ſpeech in the lawful defence of their clients, and at the ſame time to check the unſeemly licentiouſneſs of proſtitute and illiberal men (a few of whom may ſometimes inſinuate themſelves even into the moſt honourable profeſſions), it hath been holden that a counſel is not anſwerable for any matter by him ſpoken, relative to the cauſe in hand, and ſuggeſted in the client's inſtructions; altho' it ſhould reflect upon the reputation of another, and even prove abſolutely groundleſs; but if he mentions an untruth of his own invention, or even upon inſtructions, if it be impertinent to the cauſe in hand, he is then liable to an action from the party injured. And counſel guilty of deceit and colluſion are puniſhable by the ſtatute Weſtm. 1. 3 Edw. I. c. 28. with impriſonment for a year and a day, and perpetual ſilence in the courts: a puniſhment ſtill ſometimes inflicted for groſs miſdemeanours in practice.

Blackſt. Comment.

COUNSELLOR, in general, a perſon who adviſes another: thus we ſay, a counſellor at law, a privy counſellor, &c.

Counsellor at Law, a perſon retained by a client to plead his cauſe in a public court of judicature. See ADVOCATE, BARRISTER, COUNSEL, and SERJEANT.

Privy-Counsellor. See *Privy-Council*.

COUNT, (COMES), a nobleman who poſſeſſes a domain erected into a county. See VISCOUNT.

Engliſh and Scottiſh counts we diſtinguiſh by the title of *earls*; foreign ones ſtill retain their proper name. The dignity of a count is a medium between that of a duke and a barron—According to the modern uſe, moſt plenipotentiaries and ambaſſadors aſſume the title of counts, though they have no county; as the count d'Avaux, &c.

Anciently, all generals, counſellors, judges, and ſecretaries of cities under Charlemagne, were called *counts*; the diſtinguiſhing character of a duke and count being this, that the latter had but one town under him but the former ſeveral.

A count has a right to bear on his arms a coronet, adorned with three precious ſtones, and ſurmounted with three large pearls, whereof thoſe in the middle and extremities of the coronet advance above the reſt.

Counts were originally lords of the court, or of the emperor's retinue, and had their name *comites*, *á comitando*, or *á commeando:* hence thoſe who were always in the palace, or at the emperor's ſide, were called *counts palatine*, or *comites á latere*. See **Palatine**.

In the times of the commonwealth, *comites* among the Romans was a general name for all thoſe who accompanied the proconſuls and proprætors into the provinces, there to ſerve the commonwealth; as the tribunes, præfects, ſcribes, &c.

Under the emperors, *comites* were the officers of the palace. The origin of what we now call *counts* ſeems owing to Auguſtus, who took ſeveral ſenators to be his *comites*, as Dion obſerves, *i. e.* to accompany him in his voyages and travels, and to aſſiſt him in the hearing of cauſes; which were thus judged with the ſame authority as in full ſenate. Gallienus ſeems to have aboliſhed this council, by forbidding the ſenators being found in the armies: and none of his ſucceſſors re-eſtabliſhed it.

Theſe counſellors of the emperor were really counts, *comites*, *i. e.* companions of the prince; and they ſometimes took the title thereof, but always with the addition of the emperor's name whom they accompanied; ſo that it was rather a mark of their office than a title of dignity.—Conſtantine was the firſt who converted it into a dignity; and under him it was that the name was firſt given abſolutely. The name once eſtabliſhed, was in a little time indifferently conferred, not only on thoſe who followed the court, and accompanied the emperor, but alſo on moſt kinds of officers; a long liſt whereof is given us by Du Cange.

Euſebius tells us that Conſtantine divided the counts into three claſſes; the firſt bore the title of *illuſtres;* the ſecond that of *clariſſimi*, and afterwards *ſpectabiles;* the third were called *perfectiſſimi*. Of the two firſt claſſes was the ſenate compoſed; thoſe of the third had no place in the ſenate, but enjoyed ſeveral other of the privileges of ſenators.

There were counts who ſerved on land, others at ſea; ſome in a civil, ſome in a religious, and ſome in a legal capacity: as *comes ærarii*, *comes ſacrarum largitionum*, *comes ſacri conſiſtorii*, *comes curiæ*, *comes capellæ*, *comes archiatrorum*, *comes commerciorum*, *comes veſtiarius*, *comes horreorum*, *comes opſoniorum* or *annonæ*, *comes domeſticorum*, *comes equorum*, *regiorum* or *comes ſtabuli*, *comes domorum*, *comes excubitorum*, *comes notariorum*, *comes legum* or *profeſſor in jure*, *comes limitum* or *marcarum*, *comes portus Romæ*, *comes patrimonii*, &c.

The Francs, Germans, &c. paſſing into Gaul and Germany, did not aboliſh the form of the Roman government; and as the governors of cities and provinces were called *counts*, *comites*, and *dukes*, *duces*, they continued to be called ſo. They commanded in time of war; and in time of peace they adminiſtered juſtice. Thus, in the time of Charlemagne, counts were the ordinary judges and governors of the cities.

Theſe counts of cities were beneath the dukes and counts who preſided over provinces; the firſt being conſtituted in the particular cities under the Juriſdiction of the latter. The counts of provinces were in nothing inferior to dukes, who themſelves were only governors of provinces. Under the laſt of the ſecond race of French kings they got their dignity rendered hereditary, and even uſurped the ſovereignty when Hugh Capet came to the crown: his authority was not ſufficient to oppoſe their encroachments: and hence it is they date the privilege of wearing coronets in their arms; they aſſumed it then, as enjoying the rights of ſovereigns in their particular diſtricts or counties. But, by degrees, moſt of the counties became re-united to the crown.

The quality of count is now become very different from what it was anciently; being now no more than a title, which a king grants upon erecting a territory into a county, with a reſerve of juriſdiction and ſovereignty to himſelf. At firſt there was no clauſe in the patent of erection, intimating the reverſion of the county to the crown in default of heirs male; but Charles IX. to prevent their being too numerous, ordained that duchies and counties, in default of heirs male, ſhould return to the crown.

The point of precedence between counts and marquiſes has been formerly much controverted: the reaſon was, that there are counts who are peers of France, but no marquiſes: but the point is now given up, and marquiſes take place; though anciently, when counts were governors of provinces, they were on a level even with dukes.

William the Conqueror, as is obſerved by Camden, gave the dignity of counts in fee to his nobles; annexing it to this or that county or province, and allotting for their maintenance a certain proportion of money, ariſing from the prince's profits in the pleadings and forfeitures of the provinces. To this purpoſe he quotes an ancient record, thus: Hen. II. *Rex Angliæ his verbis comitem creavit; ſciatis nos feciſſe Hugonem Bigot comitem de Norſ. &c. de tertio denarii de Norwich & Norfolk, ſicut aliquis comes Angliæ, &c.*

The Germans call a count, *graaf*, or *graff;* which, according to a modern critic, properly ſignifies *judge;* and is derived from *gravio* or *graffio*, of γραφω, *I write*. They have ſeveral kinds of theſe counts or graffs; as landgraves, marchgraves, burg-graves, and palſgraves, or counts palatine. Theſe laſt are of two kinds; the former are of the number of princes, and have the inveſtiture of a palatinate; the others have only the title of *count palatine* without the inveſtiture of any palatinate. Some aſſert, that by publicly profeſſing the imperial laws for twenty years, the perſon acquires the dignity of a count palatine; and there are inſtances of profeſſors in law who have aſſumed the title accordingly: but there are others who queſtion this right.

Count, in law, denotes the original declaration in a real action; as the declaration is in a perſonal one: the libellus of the civilians anſwers to both.—Yet, count and declaration are ſometimes confounded, and uſed for each other; as, count in debt, count in appeal, &c.

Count-Wheel, in the ſtriking part of a clock, a wheel which moves round once in 12 or 24 hours. It is ſometimes called the *locking-wheel*. See *Clock-Making*.

COUNTER, a term which enters into the compoſition of diverſe words of our language, and generally implies oppoſition; but when applied to deeds, means an exact copy kept of the contrary party, and ſometimes ſigned by both parties.

Counter-Changed, in heraldry, the intermixture, or oppoſition of any metal with a colour.

Counter-Flory, in heraldry, is ſaid of a treſſure whoſe flower-de-luce are oppoſite to others. See HERALDRY.

Counter-Drawing, in painting, is the copying a deſign, or painting, by means of a fine linen-cloth, an oiled paper, or other tranſparent matter, where the ſtrokes appearing through are followed with a pencil, with or without colour. Sometimes it is done on glaſs, and with frames or nets divided into ſquares with ſilk or with thread, and alſo by means of inſtruments invented for the purpoſe, as the parallelogram.

Counter-Ermine, in heraldry, is the contrary of ermine, being a black field with white ſpots.

COUNTERFEITS, in law, are perſons that obtain any money or goods by counterfeit letters or falſe tokens, who being convicted before juſtices of aſſize or of the peace, &c. are to ſuffer ſuch puniſhment as ſhall be thought fit to be inflicted under death, as impriſonments, pillory, &c.

COUNTER-FOIL, or COUNTER-STOCK, in the exchequer, that part of an ally which is kept by an officer of the court.

Counter-Guard, in fortification, is a work raiſed before the point of a baſtion, conſiſting of two long faces parallel to the faces of the baſtion, making a ſaliant angle: they are ſometimes of other ſhapes, or otherwiſe ſituated.

Counter-Light, or *Counter-jour*, a light oppoſite to any thing, which makes it appear to diſadvantage. A ſingle counter-light is ſufficient to take away all the beauty of a fine painting.

Counter-March, in military affairs, a change of the face or wings of a battalion, by which means thoſe that were in the front come to be in the rear. It alſo ſignifies returning, or marching back again.

Counter-Mine, in war, a well and gallery drove and ſunk till it meet the enemy's mine to prevent its effect.

Counter-Paled, in heraldry, is when the eſcutcheon is divided into twelve pales parted perfeſſe, the two colours being counter-changed; ſo that the upper are of one colour and the lower of another.

Counter-Part, in muſic, denotes one part to be applied to another. Thus the baſs is ſaid to be a counter-part to the treble.

Counter-Paſſant, in heraldry, is when two lions are in a coat of arms, and the one ſeems to go quite the contrary way from the other.

Counter-Point, in muſic: a term derived from the Latin prepoſition *contra* and the verb *pungere*; becauſe the muſical characters by which the notes in each part are ſignified are placed in ſuch a manner each with reſpect to each as to ſhow how the parts anſwer one another. See COMPOSITION.

Counter-Pointed (Contre-pointé), in heraldry, is when two chevrons in one eſcutcheon meet in the points, the one riſing as uſual from the baſe, and the other inverted falling from the chief; ſo that they are counter to one another in the points. They may alſo be counter-pointed when they are founded upon the ſides of the ſhield, and the points meet that way, called *counter-pointed* in *feſſe*.

COUNTERPOISE, in the manege, is the liberty of the action and ſeat of a horſe-man; ſo that in all the motions made by the horſe, he does not incline his body more to one ſide than to the other, but continues in the middle of the ſaddle, being equally on his ſtirrups, in order to give the horſe the proper and ſeaſonable aids.

COUNTER-POTENT *(Contre potencé)*, in heraldry, is reckoned a fur as well as vair and ermine; but compoſed of ſuch pieces as repreſent the tops of crutches, called in French *potences*, and in old Engliſh *potents*.

Counter-Proof, in rolling-preſs printing, a print taken off from another freſh printed; which by being paſſed through the preſs, gives the figure of the former, but inverted. To counter-prove, is alſo to paſs a deſign in black lead, or red chalk, through the preſs, after having moiſtened with a ſponge both that and the paper on which the counter-proof is to be taken.

Counter-Quartered (contre-ecartelé), in heraldry, denotes the eſcutcheon, after being quartered, to have each quarter again divided into two.

Counter-Saliant, is when two beaſts are borne in a coat leaping from each other directly the contrary way.

Counter-Scarp, in fortification, is properly the exterior talus or ſlop of the ditch; but it is often taken for the covered-way and the glacis. In this ſenſe we ſay, the enemy have lodged themſelves on the counterſcarp. Angle of the counter-ſcarp, is that made by two ſides of the counter-ſcarp meeting before the middle of the curtain.

Counter-Signing, the ſigning the writing of a ſuperior in quality of ſecretary. Thus charters are ſigned by the king, and counter-ſigned by a ſecretary of ſtate, or lord chancellor.

Counter-Time, in the manege, is the defence or reſiſtance of a horſe that interrupts his cadence, and the meaſure of his manege, occaſioned either by a bad horſeman or by the malice of the horſe.

COUNTER, is alſo the name of a counting-board in a ſhop, and of a piece of metal with a ſtamp on it, uſed in playing at cards.

Counter of a Horſe, that part of a horſe's forehand which lies between the ſhoulders and under the neck.

Counter in a Ship, are two. 1. The hollow arching from the gallery to the lower part of the ſtraight piece of the ſtern is called the *upper-counter*. 2. The lower counter is between the tranſom and the lower part of the gallery.

COUNTER, is alſo the name of two priſons in the city of London, viz. the Poultry and Woodſtreet.

COUNTORS, CONTOURS, or COUNTERS, has been uſed for ſerjeants at law, retained to defend a cauſe, or to ſpeak for their client in any court of law. It is of thoſe Chancer ſpeaks;

> ——A ſheriff had he been, and a contour,
> Was no where ſuch a worthy vavaſour.

They were anciently called *ſerjeant contours*.

COUNTRIES, among the miners, a term or appellation they give to their works under ground.

COUNTRY, among geographers, is uſed indifferently to denote either a kingdom, province, or leſſer diſtrict. But its moſt frequent uſe is in contradiſtinction to town.

Country-Dance is of Engliſh origin, though now tranſplanted into almoſt all the countries and courts of

Europe. There is no eſtabliſhed rule for the compoſition of tunes to this dance, becauſe there is in muſic no kind of time whatever which may not be meaſured by the motions common in dancing; and there are few ſong tunes of any note within the laſt century, that have not been applied to country-dances.

COUNTY, in geography, originally ſignified the territory of a count or earl, but now it is uſed in the ſame ſenſe with ſhire; the one word coming from the French, the other from the Saxon.—In this view, a county is a circuit or portion of the realm: into fifty-two of which, the whole of England and Wales, is divided for its better government and the more eaſy adminiſtration of juſtice.

For the execution of the laws in the ſeveral counties, excepting Cumberland, Weſtmoreland, and Durham, every Michaelmas term officers are appointed, under the denomination of *ſheriffs*. Other officers of the ſeveral counties, are, a lord lieutenant, who has the command of the militia of the county; cuſtodes rotulorum, juſtices of peace, bailiffs, high-conſtable, and coroner.

Of the fifty-two counties, there are three of ſpecial note, which are therefore termed *counties palatine*, as Lancaſter, Cheſter, and Durham. See Palatine.

County-Corporate, is a title given to ſeveral cities, or ancient boroughs on which Engliſh monarchs have thought fit to beſtow extraordinary privileges; annexing to them a particular territory, land, or juriſdiction; and making them counties of themſelves, to be governed by their own ſheriffs and magiſtrates.

County-Court, in Engliſh law, a court incident to the juriſdiction of the ſheriff. It is not a court of record, but may hold pleas of debt or damages under the value of 40s. Over ſome of which cauſes theſe inferior courts have, by the expreſs words of the ſtatute of Glouceſter, a juriſdiction totally excluſive of the king's ſuperior courts. For in order to be intitled to ſue an action of treſpaſs for goods before the king's juſticiars, the plaintiff is directed to make affidavit that the cauſe of action does really and *bone fide* amount to 40s. which affidavit is now unaccountably diſuſed, except in the court of exchequer. The ſtatute alſo 43 Eliz. c. 6. which gives the judges in many perſonal actions, where the jury aſſeſs leſs damages than 40s. a power to certify the ſame and abridge the plaintiff of his full coſts, was alſo meant to prevent vexation by litigious plaintiffs; who, for purpoſes of mere oppreſſion, might be inclinable to inſtitute ſuch ſuits in the ſuperior courts for injuries of a trifling value. The county-court may alſo hold plea of many real actions, and of all perſonal actions to any amount, by virtue of a ſpecial writ called *juſticies*; which is a writ empowering the ſheriff for the ſake of diſpatch to do the ſame juſtice in his county-court, as might otherwiſe be had at Weſtminſter. The freeholders of the county are the real judges in this court, and the ſheriff is the miniſterial officer. The great conflux of freeholders, which are ſuppoſed always to attend at the county-court (which Spelman calls *forum plebeiæ juſtitiæ et theatrum comitivæ poteſtatis*), is the reaſon why all acts of parliament at the end of every ſeſſion were wont to be there publiſhed by the ſheriff; why all outlawries of abſconding offenders are there proclaimed; and why all popular elections which the freeholders are to make, as formerly of ſheriffs and conſervators of the peace, and ſtill of coroners, verderors, and knights of the ſhire, muſt ever be made *in pleno comitatu*, or in full county-court. By the ſtatute 2 Edw. VI. c. 25. no county-court ſhall be adjourned longer than for one month, conſiſting of 28 days. And this was alſo the ancient uſage, as appears from the laws of king Edward the elder: *prepoſitus* (that is, the ſheriff) *ad quartam circiter ſeptimanam frequentem populi concionem celebrato; cuique jus dicito; liteſque ſingulas dirimito.* In thoſe times the county-court was a court of great dignity and ſplendour, the biſhop and the ealdorman (or earl), with the principal men of the ſhire, ſitting therein to adminiſter juſtice both in lay and eccleſiaſtical cauſes. But its dignity was much impaired, when the biſhop was prohibited, and the earl neglected to attend it. And, in modern times, as proceedings are removeable from hence into the king's ſuperior courts, by writ of *pone* or *recordare*, in the ſame manner as from hundred-courts and courts-baron; and as the ſame writ of falſe judgment may be had, in nature of a writ of error, this has occaſioned the ſame diſuſe of bringing actions therein.

COUPAR, the name of a town in Scotland, capital of the county of Fife, ſituated about 10 miles weſt of St Andrew's: W. Long. 2. 40. N. Lat. 56. 20.—*Coupar* is alſo the name of a village in the ſhire of Angus, inhabited chiefly by weavers in the linen trade.

COUPED, in heraldry, is uſed to expreſs the head, or any limb, of an animal, cut off from the trunk, ſmooth; diſtinguiſhing it from that which is called *eraſſed*, that is, forcibly torn off, and therefore is ragged and uneven.

Couped, is alſo uſed to ſignify ſuch croſſes, bars, bends, chevrons, &c. as do not touch the ſides of the eſcutcheon, but are, as it were, cut off from them.

COUPEE, a motion in dancing, wherein one leg is a little bent, and ſuſpended from the ground; and with the other a motion is made forwards.

The word in the original French ſignifies a *cut*.

COUPLE-CLOSS, in heraldry, the fourth part of a chevron, never borne but in pairs, except there be a chevron between them, ſaith Guillim, though Bloom gives an inſtance to the contrary.

COUPLET, a diviſion of a hymn, ode, ſong, &c. wherein an equal number, or equal meaſure, of verſes, is found in each part; which diviſions, in odes, are called *ſtrophes*.—Couplet, by an abuſe of the word, is frequently made to ſignify a couple of verſes.

COURAGE, in ethics, is that quality of the mind, derived either from conſtitution or principle, or both, that enables men to encounter difficulties and dangers. See Fortitude.

COURANT, a French term ſynonymous with *current*, and properly ſignifies running. See Current.

Courant, is alſo a term in muſic and dancing; being uſed to expreſs both the tune or air and the dance. With regard to the firſt, *courant*, or *currant*, is a piece of muſic in triple time: the air of the courant is ordinarily noted in triples of minims; the parts to be repeated twice. It begins and ends when he who beats the meaſure falls his hand; in contradiſtinction from the ſaraband, which ordinarily ends when the hand is raiſed. With regard to dancing, the courant was long the moſt common of all the dances practiſed in England: it conſiſts, eſſentially, of a time, a ſtep, a balance, and a coupee; though it alſo admits of other motions. Formerly they leaped their ſteps; in which point, the courant differed from the low dance and pavades. There are ſimple courants and figured courants, all danced by two perſons.

COURAP, the modern name for a diſtemper very common in Java and other parts of the Eaſt-Indies. It is a ſort of herpes or itch on the arm-pits, groins, breaſt, and face: the itching is almoſt perpetual; and the ſcratching is followed by great pain and a diſcharge of matter, which makes the linen ſtick ſo to the ſkin as not eaſily to be ſeparated without tearing off the cruſt. *Courap* is a general name for any ſort of itch; but this diſtemper is thus called by way of eminence. It is ſo contagious that few eſcape it. For the cure, gentle and repeated purging is uſed, and externally the ſublimate in a ſmall quantity is a good topic.

COURAYER (PETER FRANCIS), a Roman Catholic clergyman, diſtinguiſhed by great moderation, charity, and temper, concerning religious affairs, as well as by learning, was born at Vernon in Normandy, 1681. While canon regular and librarian of the abbey of St Genevieve at Paris, he applied to archbiſhop Wake for the reſolution of ſome doubts, concerning the epiſcopal ſucceſſion in England, and the validity of their ordinations: he was encouraged to this by the friendly correſpondence which had paſſed between the archbiſhop and M. du Pin of the Sorbonne. The archbiſhop ſent him exact copies of the proper records; and on theſe he built his "Defence of Engliſh Ordinations," which was publiſhed in Holland, 1727. This expoſing him to a proſecution in his own country, he took refuge in England; where he was well received, and preſented the ſame year by the univerſity of Oxford with a doctor's degree. As it is ſomewhat uncommon for a Roman Catholic clergyman to be admitted to degrees in divinity by Proteſtant univerſities, the curious may be gratified with a ſight of the diploma, and the doctor's letter of thanks, in "The preſent State of the Republic of Letters, for June 1728. In 1736, he tranſlated into French, and publiſhed, "Father Paul's Hiſtory of the Council of Trent," in 2 vols. folio, and dedicated it to queen Caroline; who augmented to 200 l. a penſion of 100 l. a-year, which he had obtained before from the court. The learned Jer. Markland, in a letter to his friend Bowyer, September 1746, ſays, "Mr Clarke has given me F. Courayer's tranſlation of the Hiſtory of the Council of Trent; with whoſe preface I am ſo greatly pleaſed, that if he be no more a Papiſt in other tenets than he is in thoſe he mentions (which are many, and of the moſt diſtinguiſhed claſs), I dare ſay there are very few conſiderate Proteſtants who are not as good Catholics as he is." His works are many, and all in French: he tranſlated Sleidan's "Hiſtory of the Reformation." He died in 1776, after two days illneſs, at the age of 95; and was buried in the cloiſter of Weſtminſter-abbey. In his will, dated Feb. 3d 1774, he declares, that he "dies a member of the Catholic church, but without approving of many of the opinions and ſuperſtitions which have been introduced into the Romiſh church, and taught in their ſchools and ſeminaries; and which they have inſiſted on as articles of faith, though to him they appear to be not only not founded in truth, but alſo to be highly improbable." And his practice was conformable to this declaration; for at London he conſtantly went to maſs, and at Ealing in the country, whither he often retired, as conſtantly attended the ſervice of the pariſh church; declaring at all times, that he "had great ſatisfaction in the prayers of the church of England."

COURBARIL. See HYMENEA.

COURIER, or CURRIER, (from the French *courir*, "to run,") a meſſenger ſent poſt, or expreſs, to carry diſpatches.

Antiquity, too, had its couriers. We meet with two kinds: 1. Thoſe who ran on foot, called by the Greeks *hemerodromi*, q. d. "couriers of a day." Pliny, Corn. Nepos, and Cæſar, mention ſome of theſe who would run 20, 30, 36, and in the circus even 40 leagues per day. 2. Riding couriers (*curſores equitantes*), who changed horſes, as the modern couriers do.

Xenophon attributes the firſt couriers to Cyrus. Herodotus ſays, they were very ordinary among the Perſians, and that there was nothing in the world more ſwift than theſe kind of meſſengers. "That prince (ſays Xenophon) examined how far a horſe would go in a day; and built ſtables, at ſuch diſtances from each other, where he lodged horſes, and perſons to take care of them, and at each place kept a perſon always ready to take the packet, mount a freſh horſe, and forward it to the next ſtage: and thus quite through his empire."

But it does not appear that either the Greeks or Romans had any regular fixed couriers till the time of Auguſtus: under that prince they travelled in cars; though it appears from Socrates they afterwards went on horſeback. Under the weſtern empire, they were called *viatores*; and under that of Conſtantinople, *curſores*; whence the modern name. See POST.

COURLAND, a duchy ſituated between E. Long. 21. 26. and between N. Lat. 56. 30. and 57. 30. It is bounded by the river Dwina, which divides it from Livonia, on the north; by Lithuania, on the eaſt; by Samogitia, on the ſouth; and by the Baltic ſea on the weſt; being 130 miles long and 30 broad. This duchy was formerly independent, and elected their own duke; but is now ſubject to Ruſſia.

COURSE (*route*), in navigation, the angle contained between the neareſt meridian and that point of the compaſs upon which a ſhip ſails in any particular direction.

COURSE, in architecture, denotes a continued range of ſtones, level, or of the ſame height, throughout the whole length of the building; and not interrupted by any aperture. It forms a parapet to the intermediate ſpace between the body of the building and the wings.

COURSE of Plinths, is the continuity of a plinth of ſtone or plaſter in the face of a building; to mark the ſeparation of the ſtories.

COURSE is alſo uſed for the time ordinarily ſpent in learning the principles of a ſcience, or the uſual points and queſtions therein. Thus, a ſtudent is ſaid to have finiſhed his courſe in the humanity, in philoſophy, &c.

Course is alſo uſed for the elements of an art exhibited and explained, either in writing or by actual experiment. Hence our courſes of philoſophy, anatomy, chemiſtry, mathematics, &c. probably ſo called as going throughout or running the whole length or courſe of the art, &c.

COURSES, a name by which the principal ſails of a ſhip are diſtinguiſhed, viz. the main-ſail, the fore-ſail, and the mizen: the mizen-ſtay-ſail and fore-ſail are alſo ſometimes comprehended in this denomination; as are the main-ſtay-ſails of all brigs and ſchooners. See Sail.

COURSING, among ſportſmen. There are three ſeveral ſorts of courſes with gre-hounds: 1. At the hare; 2. At the fox; and, 3. At the deer.

For the *deer,* there are two ſorts of courſes; the one in the paddock, the other either in the foreſt or the purlieu. For the paddock courſe, there muſt be the gre-hound and the terrier, and the mongrel gre-hound, whoſe buſineſs it is to drive away the deer before the gre-hounds are ſlipped; a brace or a leaſh are the uſual number ſlipped at a time, ſeldom at the utmoſt more than two brace. In courſing the deer in the foreſt or purlieu, there are two ways in uſe: the one is courſing from wood to wood; and the other, upon the lawns cloſe by the keeper's lodge. In the courſing from wood to wood, the way is to throw in ſome young hounds into the wood to bring out the deer, and if any deer come out that is not weighty, or a deer or antler which is buck, ſore, or ſorrel, then you are not to ſlip your gre-hounds, which are held at the end of the wood, where the keepers, who can gueſs very well on theſe occaſions, expect that the deer will come out. If a proper deer come out, and it is ſuſpected that the brace or leaſh of gre-hounds ſlipped after him will not be able to kill him, it is proper to way-lay him with a couple of freſh gre-hounds.

The courſing upon the lawn is the moſt agreeable of all other ways. When the keeper has notice of this, he will lodge a deer for the courſe; and then, by coming under the wind, the gre-hound may be brought near enough to be ſlipped for a fair courſe.

The beſt method of courſing the *hare,* is to go out and find a hare ſitting; which is eaſily done in the ſummer, by walking acroſs the lands, either ſtubble, fallow, or corn grounds, and caſting the eye up and down; for in ſummer they frequent thoſe places for fear of the ticks, which are common in the woods at that ſeaſon; and in autumn the rains falling from the trees offend them. The reſt of the year there is more trouble required; as the buſhes and thickets muſt be beat to rouſe them, and oftentimes they will lie ſo cloſe, that they will not ſtir till the pole almoſt touches them: the ſportſmen are always pleaſed with this, as it promiſes a good courſe. If a hare lies near any cloſe or covert, and with her head that way, it is always to be expected that ſhe will take to that immediately on being put up; all the company are therefore to ride up and put themſelves between her and the covert before ſhe is put up, that ſhe may take the other way, and run upon open ground. When a hare is put up, it is always proper to give her ground, or *law,* as it is called; that is, to let her run 12 ſcore yards, or thereabouts, before the gre-hounds are ſlipped at her; otherwiſe ſhe is killed too ſoon, the greater part of the ſport is thrown away, and the pleaſure of obſerving the ſeveral turnings and windings that the creature will make to get away is all loſt. A good ſportſman had rather ſee a hare ſave herſelf after a fair courſe, than ſee her murdered by the gre-hounds as ſoon as ſhe is up.

In courſing the *fox,* no other art is required, than ſtanding cloſe, and in a clear wind, on the outſide of ſome grove where it is expected he will come out; and when he is come out, he muſt have head enough allowed him, otherwiſe he will return back to the covert. The ſloweſt gre-hound will be able to overtake him, after all the odds of diſtance neceſſary; and the only danger is the ſpoiling the dog by the fox, which too frequently happens. For this reaſon, no gre-hound of any value ſhould be run at this courſe; but the ſtrong, hard, bitter dogs, that will ſeize any thing.

The laws of courſing eſtabliſhed by the duke of Norfolk, and other ſportſmen of the kingdom of England, are theſe:

1. He that is choſen fewterer or letter-looſe of the dogs, ſhall receive the gre-hounds matched to run together into his leaſh as ſoon as he comes into the field; he is to march next to the hare-finder, or him who is to ſtart the hare, until he come to the form; and no horſeman or footman is to go before or ſideways, but all ſtraight behind, for the ſpace of about 40 yards. 2. A Hare ought never to be courſed with more than a brace of gre-hounds. 3. The hare-finder is to give the hare three ſohoes before he puts her up from her form or ſet, to the end that the dogs may be prepared and attend her ſtarting. 4. If there be not a particular danger of loſing the hare, ſhe ſhould have about twelve ſcore yards law. 5. The dog that gives the firſt turn, if after that there be neither cote, ſlip, nor wrench, wins the wager. 6. A go-by, or bearing the hare, is accounted equivalent to two turns. 7. If neither dog turns the hare, he that leads to the laſt covert wins. 8. If any dog turns the hare, ſerves himſelf, and turns her again, it is as much as a cote, and a cote is eſteemed as much as two turns. 9. If all the courſe be equal, he that bears the hare ſhall win; and if he be not borne, the courſe ſhall then be judged *dead.* 10. If a dog take a fall in his courſe, and yet perform his part, he may challenge the advantage of a turn more than he gave. 11. If a dog turn the hare, ſerve himſelf, and give divers cotes, and yet in the end ſhall ſtand ſtill in the field, the other dog, if he turns home to the covert, although he gives no other, ſhall be adjudged to win the wager. 12. If by misfortune a dog be rid over in the courſe, that courſe ſhall be adjudged void, and he that did the miſchief is to make reparation to the owner. 13. If a dog gives the firſt and laſt turn, and there be no other advantage betwixt them, he that gives the odd turn wins. 14. A cote is when a gre-hound goes end ways by the ſide of his fellow, and gives the hare a turn. 15. A cote ſerves for two turns, and two trippings or jerkings for a cote; and if the hare turns not quite about, ſhe only *wrencheth,* in the ſportman's phraſe. 16. If there be no cotes given by either of the gre-hounds, but one ſerves the other at turning, then he that gives the moſt turns wins the wager. 17.

Sometimes a hare does not turn, but wrenches; for ſhe does not turn except ſhe turns as it were round. In theſe caſes, two wrenches ſtand for one turn. 18. He that comes in firſt at the death of the hare takes her up, and ſaves her from breaking; he cheriſhes the dogs, and cleanſes their mouths from the wool; he is adjuged to have the hare for his pains. 19. Finally, thoſe who are judges of the leaſh, muſt give their judgment before they depart out of the field, or elſe it is not to ſtand as valid.

COURT, an appendage to a houſe or habitation; conſiſting of a piece of ground incloſed with walls, but open upwards.

COURT is alſo uſed for the palace or place where a king or ſovereign prince reſides.

Blackſt. Comment.

COURT, in a law ſenſe is defined to be a place wherein juſtice is judicially admininſtered. And as, by our excellent conſtitution, the ſole executive power of the laws is inveſted in the perſon of the king, it will follow that all courts of juſtice, which are the medium by which he adminiſters the laws, are derived from the power of the crown. For whether created by act of parliament or letters patent, or ſubſiſting by preſcription (the only methods by which any court of judicature can exiſt), the king's conſent in the two former is expreſsly, and in the latter impliedly, given. In all theſe courts, the king is ſuppoſed in contemplation of law to be always preſent; but as that is in fact impoſſible, he is there repreſented by his judges, whoſe power is only an emanation of the royal prerogative.

For the more ſpeedy, univerſal, and impartial adminiſtration of juſtice between ſubject and ſubject, the law hath appointed a prodigious variety of courts, ſome with a more limited, others with a more extenſive juriſdiction: ſome conſtituted to inquire only, others to hear and determine: ſome to determine in the firſt inſtance, others upon appeal and by way of review. See LAW, nº xcviii. xcxix. c. cxli. clvi. clvii. clviii. and the reſpective articles in the order of the alphabet. One diſtinction may be here mentioned, that runs throughout them all; viz, that ſome of them are courts *of record*, others *not of record*. A court of record is that where the acts and judicial proceedings are enrolled in parchment for a perpetual memorial and teſtimony: which rolls are called the *records of the courts*, and are of ſuch high and ſupereminent authority, that their truth is not to be called in queſtion. For it is a ſettled rule and maxim, that nothing ſhall be averred againſt a record, nor ſhall any plea, or even proof, be admitted to the contrary. And if the exiſtence of a record be denied, it ſhall be tried by nothing but itſelf; that is, upon bare inſpection whether there be any ſuch record or no; elſe there would be no end of diſputes. But if there appear any miſtake of the clerk in making up ſuch record, the court will direct him to amend it. All courts of record are the king's courts, in right of his crown and royal dignity, and therefore no other court hath authority to fine or impriſon; ſo that the very erection of a new juriſdiction with power of fine or impriſonment, makes it inſtantly a court of record.—A court not of record is the court of a private man; whom the law will not intruſt with any diſcretionary power over the fortune or liberty of his fellow-ſubjects. Such are the courts baron incident to every manor, and other inferior juriſdictions: where the proceedings are not enrolled or recorded; but as well their exiſtence as the truth of the matters therein contained ſhall, if diſputed, be tried and determined by a jury. Theſe courts can hold no plea of matters cognizable by the common law, unleſs under the value of 40s.; nor of any forcible injury whatſoever, nor having any proceſs to arreſt the perſon of the defendant.

In every court there muſt be at leaſt three conſtituent parts, the *actor*, *reus*, and *judex*: the *actor*, or plaintiff, who complains of an injury done; the *reus*, or defendant, who is called upon to make ſatisfaction for it; and the *judex*, or judicial power, which is to examine the truth of the fact, to determine the law ariſing upon that fact, and, if any injury appears to have been done, to aſcertain and by its officers to apply the remedy. It is alſo uſual in the ſuperior courts to have attorneys, and advocates or counſel, as aſſiſtants. See ATTORNEY and COUNSEL.

COURT-Baron, in Engliſh law, a court incident to every manor in the kingdom, to be holden by the ſteward within the ſaid manor. This court-baron is of two natures; the one is a cuſtomary-court appertaining entirely to the copyholders, in which their eſtates are transferred by ſurrender and admittance, and other matters tranſacted relative to their tenures only. The other is a court of common law, and it is the court of the *barons*, by which name the freeholders were ſometimes anciently called: for that it is held before the freeholders who owe ſuit and ſervice to the manor, the ſteward being rather the regiſtrar than the judge. Theſe courts, though in their nature diſtinct, are equally confounded together. The court we are now conſidering, viz. the freeholder's court, was compoſed of the lord's tenants, who were the *pares* of each other, and were bound by their feodal tenure to aſſiſt their lord in the diſpenſation of domeſtic juſtice. This was formerly held every three weeks; and its moſt important buſineſs is to determine, by writ of right, all controverſies relating to the right of lands within the manor. It may alſo hold plea of any perſonal actions, of a debt, treſpaſs on the caſe, or the like, where the debt or damages do not amount to 40s. Which is the ſame ſum, or three marks, that bounded the juriſdiction of the ancient Gothic courts in their loweſt inſtance, or *fierding courts*, ſo called becauſe four were inſtituted within every ſuperior diſtrict or hundred. But the proceedings on a writ of right may be removed into the county-court by a precept from the ſheriff called a *tolt*, *quia tollit atque eximit cauſam e curia baronum*. And the proceedings in all other actions may be removed into the ſuperior courts by the king's writs of *pone*, or *accedas ad curiam*, according to the nature of the ſuit. After judgment given, a writ alſo of *falſe judgment* lies to the courts at Weſtminſter to rehear and review the cauſe, and not a writ of *error*; for this is not a court of record: and therefore, in ſome of theſe writs of removal, the firſt direction given is to cauſe the plaint to be recorded, *recordari facias loquelam*.

COURT-Martial, a court appointed for the puniſhing offences in officers, ſoldiers, and ſailors, the powers of which are regulated by the mutiny-bill.

For other courts, ſee ADMIRALTY, ARCHES, BENCH, COUNTY, COMMON-*Pleas*, CHANCERY, ECCLESIASTICAL, DUCHY, FACULTY, REQUESTS, HUSTINGS, CHIVALRY, FOREST, STANNARY, STAR-*Chamber*, PREROGATIVE, UNIVERSITY, LEGATE, LEET, MAYOR, PIEPOUDRE, &c.

COURTESY, or CURTESY, *of England*; a certain tenure whereby a man marrying an heireſs ſeized of lands of fee ſimple, or fee-tail general, or ſeized as heir of the tail ſpecial, and getteth a child by her that cometh alive into the world, though both it and his wife die forthwith; yet, if ſhe were in poſſeſſion, he ſhall keep the land during his life, and is called *tenant per legem Angliæ*, "or tenant by the courteſy of England;" becauſe this privilege is not allowed in any country except Scotland, where it is called *curialitas Scotiæ*.

COURTESAN, a woman who proſtitutes herſelf for hire, eſpecially to people of ſuperior rank. Lais, the famous Theban courteſan, ſtands on record for requiring no leſs than 10,000 crowns for a ſingle night. Of all places in the world, Venice is that where courteſans abound the moſt. It is now 300 years ſince the ſenate, which had expelled them, was obliged to recal them; in order to provide for the ſecurity of women of honour, and to keep the nobles employed leſt they ſhould turn their heads to make innovations in the ſtate.

COURTRAY, a town of the Auſtrian Netherlands, ſituated on the river Lys, about 23 miles ſouth-weſt of Ghent, and 14 eaſt of Ypres. E. Long. 3. 10. N. Lat. 50. 48.

COUSIN, a term of relation between the children of brothers and ſiſters, who in the firſt generation are called *couſin-germans*, in the ſecond generation *ſecond-couſins, &c.* If ſprung from the relations of the father's ſide, they are denominated *paternal* couſins; if on the mother's, *maternal*.

The word is ordinarily derived from *conſanguineus*; though Menage brings it from *congenius*, or *congeneus*, q. d. *ex eodem genere*.

In the primitive times, it was allowed couſin-germans to marry, to prevent their making alliances in heathen families: but Theodoſius the Great prohibited it, under pain of death; on pretence that they were, in ſome ſort, brothers and ſiſters with regard to each other.

COUSIN (John), a celebrated French painter, who excelled in painting on glaſs. His picture of the Laſt Judgment, in the veſtry of the Minims of the Wood of Vincennes, is much admired. He was alſo a good ſculptor. He wrote ſeveral works on geometry and perſpective; and died after the year 1689.

COUSU, in heraldry, ſignifies a piece of another colour or metal placed in the ordinary, as if it were ſewed on, as the word imports. This is generally of colour upon colour, or metal upon metal, contrary to the general rule of heraldry.

COUTANCES, a port town of Normandy, and capital of Coutantin, in W. Long. 1. 32. Lat. 49. 10. This town, anciently called *Conſtantia* or *Coſedia*, is pleaſantly ſituated among meadows and rivulets about ſix miles diſtant from the ſea. By the remains of a Roman aqueduct, and other ancient ruins, it appears to be a place of great antiquity. It is the ſee of a biſhop ſuffragan of Rome; and has a manificent cathedral, eſteemed one of the fineſt pieces of Gothic architecture in Europe. The trade of this town is very inconſiderable, and the fortifications are quite demoliſhed. They have ſeveral religious houſes, and two parochial churches.

COUTHUTLAUGH, from the Saxon *couth*, "knowing," and *utlaugh*, "outlaw;" he that wittingly receives a man outlawed, and cheriſhes or conceals him: for which offence he was in ancient times ſubject to the ſame puniſhment with the outlaw himſelf.

COVERT, in heraldry, denotes ſomething like a piece of hanging, or a pavilion falling over the top of a chief or other ordinary, ſo as not to hide, but only to be a covering to it.

COW, in zoology. See BOS.

Cow-Burner. See BUPRESTIS.

Sea-Cow, in zoology. See TRICHECUS.

Cow-Itch, or *Couhage*, in botany. See COUHAGE, and DOLICHOS.

Cow's-Lip, in botany. See PRIMULA.

COWARD, in heraldry, a term given to a lion borne in an eſcutcheon with his tail doubled, or turned in between his legs.

COWEL (Dr John), a learned and eminent civilian, born about the year 1554. In 1607 he compiled a *Law Dictionary*, which gave great offence to Sir Edward Coke and the common lawyers: ſo that they firſt accuſed him to James I. as aſſerting that the king's prerogative was in ſome caſes limited; and when they failed in that attempt, they complained of him to the houſe of commons, as a betrayer of the rights of the people, by aſſerting that the king was not bound by the laws; for which he was committed to cuſtody and his book publicly burnt. He alſo publiſhed *Inſtitutiones Juris Anglicani*, in the manner of Juſtinian's Inſtitutes; and died of the operation for the ſtone, in 1611.

COWES, a town and harbour on the north-eaſt coaſt of the Iſle of Wight, in Hampſhire. It has no market, but is the beſt place for trade in the whole iſland; but as it lies low, the air is accounted unhealthy. It is eight miles ſouth-eaſt of Portſmouth. W. Long. 1. 25. N. Lat. 50. 45.

COWL, or COUL, a ſort of monkiſh habit worn by the Bernardines and Benedictines. The word is formed from *cucullus*, by confounding the two firſt ſyllables into one, as being the ſame twice repeated.—There are two kinds of cowls: the one white, very large, worn in ceremony, and when they aſſiſt at the office; the other black, worn on ordinary occaſions in the ſtreets, &c.

F. Mabillon maintains the coul to be the ſame thing in its origin with the ſcapular. The author of the apology of the Emperor Henry IV. diſtinguiſhes the forms of couls: the one a gown reaching to the feet, having ſleeves, and a capuchin, uſed in ceremonies; the other a kind of hood to work in, called alſo a *ſcapular*, becauſe it only covers the head and ſhoulders.

COWLEY (Abraham), an eminent poet, was born at London 1618. His father who was a grocer, dying before he was born, his mother procured him to be admitted a king's ſcholar at Weſtminſter. His firſt inclination to poetry aroſe on his lighting on Spencer's Fairy Queen, when he was but juſt able to read: and this inclination ſo far improved in him, that at 13 he began to write ſeveral poems; a collection of which was publiſhed in 1613, when he was but 15. He has been repreſented as poſſeſſed of ſo bad a memory that his teachers could never bring him to retain the ordinary rules of grammar. But the fact was, as Dr Johnſon notices, not that he could not learn or retain the rules; but that being able to perform his exerciſes without them, he ſpared himſelf the labour. In 1636 he was elected a ſcholar of Trinity College, Cambridge, and removed to that univerſity. Here he went through all his exerciſes with a remarkable degree of reputation: and at the ſame time muſt have purſued his poetical turn with great eagerneſs, as it appears that the greateſt part of his poems were written before he left that univerſity. He had taken his degree of Maſter of Arts before 1643, when, in conſequence of the turbulence of the times, he, among others, was ejected from the college: whereupon, retiring to Oxford, he entered himſelf of St John's college: and that very year, under the denomination of a *ſcholar of Oxford*, publiſhed a ſatire called the Puritan and the Papiſt. It is apparent, however, that he did not remain very long at Oxford: for his zeal to the royal cauſe engaging him in the ſervice of the king, who was very ſenſible of his abilities, and by whom he was frequently employed, he attended his majeſty in many of his journeys and expeditions, and gained not only that prince's eſteem, but that of many other great perſonages, and in particular of Lord Falkland, one of the principal ſecretaries of ſtate.

During the heat of the civil war, he was ſettled in the Earl of St Alban's family; and when the queen-mother was obliged to retire into France, he accompanied her thither, laboured ſtrenuouſly in the affairs of the royal family, undertook ſeveral very dangerous journeys on their account, and was the principal inſtrument in maintaining an epiſtolary correſpondence between the king and queen, whoſe letters he cyphered and decyphered with his own hand. His poems intitled The Miſtreſs, were publiſhed at London in 1647: and his comedy called The Guardian, afterwards altered and publiſhed under the title of Cutter of Coleman-ſtreet, in 1650. In 1656 it was thought proper by thoſe on whom Mr Cowley depended that he ſhould come over into England, and, under pretence of privacy and retirement, ſhould give notice of the poſture of affairs in that nation. Upon his return he publiſhed a new edition of his poems, conſiſting of four parts; viz. I. Miſcellanies. II. The Miſtreſs, or Several Copies of Love-Verſes. III. Pindarique Odes, written in imitation of the Style and manner of Pindar. IV. Davideis, a ſacred Poem of the troubles of David, in four books.

Soon after his arrival, however, he was ſeized, in the ſearch after another gentleman of conſiderable note in the king's party; but although it was through miſtake that he was taken, yet when the republicans found all their attempts of every kind to bring him over to their party proved ineffectual, he was committed to a ſevere confinement, and it was even with conſiderable difficulty that he obtained his liberty; when venturing back to France, he remained there, in his former ſituation, till near the time of the king's return. During his ſtay in England he wrote his Two Books of Plants, publiſhed firſt in 1662; to which he afterwards added four books more; and all ſix, together with his other Latin poems, were printed at London in 1678. It appears by Mr Wood's *Faſti Oxonienſes*, that our poet was created doctor of phyſic at Oxford, December 2. 1657.

Soon after the reſtoration he became poſſeſſed of a very competent eſtate, through the favour of his principal friends the duke of Buckingham and the earl of St Alban's; and being now upwards of 40 years of age, he took up a reſolution to paſs the remainder of a life which had been a ſcene of tempeſt and tumult, in that ſituation which had ever been the object of his wiſhes, a ſtudious retirement. His eagerneſs to get out of the buſtle of a court and city made him leſs careful than he might have been in the choice of a healthful habitation in the country; by which means he found his ſolitude from the very beginning ſuit leſs with the conſtitution of his body than with his mind. His firſt rural reſidence was at Barn Elms, a place which, lying low, and being near a large river, was ſubject to a variety of breezes from land and water, and liable in the winter-time to great inconvenience from the dampneſs of the ſoil. The conſequence of this Mr Cowley too ſoon experienced, by being ſeized with a dangerous and lingering fever. On his recovery from this he removed to Chertſey, a ſituation not much more healthy, where he had not been long before he was ſeized with another conſuming diſeaſe. Having languiſhed under this for ſome months, he at length got the better of it, and ſeemed pretty well recovered from the bad ſymptoms; when one day in the heat of ſummer 1667, ſtaying too long in the fields to give ſome directions to his labourers, he caught a moſt violent cold, which was attended with a defluction and ſtoppage in his breaſt; and for want of timely care, by treating it as a common cold, and refuſing advice till it was paſt remedy, he departed this life on the 28th of July in that year, being the 49th of his age; and, on the 3d of Auguſt following, he was interred in Weſtminſter-abbey, near the aſhes of Chaucer and his beloved Spencer. He was a man of a very amiable character, as well as an admirable genius. King Chales II. on the news of his death, declared "that Mr Cowley had not left a better man behind him in England." A monument was erected to his memory by George Villiers duke of Buckingham in 1675.

Beſides the works already mentioned, Mr Cowley wrote, among other things, A propoſition for the Advancement of Experimental Philoſophy; A Diſcourſe by way of Viſion concerning the Government of Oliver Cromwell; and Several Diſcourſes by way of Eſſays in proſe and verſe. Mr Cowley had deſigned alſo a Diſcourſe concerning Style, and a Review of the Principles of the Primitive Chriſtian Church, but was prevented by death. A ſpurious piece, intitled The Iron Age, was publiſhed under Mr Cowley's name during his abſence; and, in Mr Dryden's Miſcellany Poems, we find A Poem on the Civil War, ſaid to be written by our author, but not extant in any edition of his works. An edition of his works was publiſhed by Dr Spratt, afterwards biſhop of Rocheſter, who alſo prefixed to it an account of the author's thor's life. The reverend editor mentions, as very excellent of their kind, Mr Cowley's Letters to his Friends; none of which, however, were publiſhed.

The moral character of Mr Cowley appears, from every account of it, to have been very excellent. "He is preſented by Dr Spratt (ſays Dr Johnſon) as the moſt amiable of mankind: and this poſthumous praiſe may be ſafely credited, as it has never been contradicted by envy or by faction.

As a poet, his merits have been variouſly eſtimated, Lord Clarendon has ſaid he made a flight above all men; Addiſon, in his account of the Engliſh poets, that he improved upon the Theban bard; the duke of Buckingham upon his tomb-ſtone, that he was the Engliſh Pindar, the Horace, the Virgil, the delight, the glory of his times. And with reſpect to the harſhneſs of his number, the eloquent ſpratt tells us, that if his verſes in ſome places ſeem not as ſoft and flowing as one would have them, it was his choice and not his fault.

"Such (ſays Mr Knox) is the applauſe laviſhed on a writer who is now ſeldom read. That he could ever be eſteemed as a Pindaric poet, is a curious literary phenomenon. He totally miſtook his own genius when he thought of imitating Pindar. He totally miſtook the genius of Pindar, when he thought his own incoherent ſentiments and numbers bore the leaſt reſemblance to the wild yet regular ſublimity of the Theban. He neglected even thoſe forms, the ſtrophe, antiſtrophe, and epode, which even imitative dullneſs can copy. Sublime imagery, vehement pathos, poetic fire, which conſtitute the eſſence of the Pindaric ode are incompatible with witty conceits, accurate antitheſes, and vulgar expreſſion. All theſe imply the coolneſs of deliberate compoſition, or the meanneſs of a little mind; both of them moſt repugnant to the truly Pindaric, in which all is rapturous and noble. Wit of any kind would be improperly diſplayed in ſuch compoſition; but to increaſe the abſurdity, the wit of Cowley is often falſe. That he had a taſte for Latin poetry, and wrote in it with elegance, the well known epitaph on himſelf, upon his retirement, and an admirable imitation of Horace, are full proofs. But ſurely his rhetorical biographer makes uſe of the figure hyperbole, when he affirms that Cowley has excelled the Romans themſelves. He was inferior to many a writer of leſs fame in the *Muſæ Anglicanæ*. But ſtill he had great merit; and I muſt confeſs I have read his Latin verſes with more pleaſure than any of his Engliſh can afford." *Eſſays*, vol. ii. p. 363—365.

To Cowley's compoſitions in proſe Mr Knox hath paid a very honourable teſtimony. He ſays, that in this department he is an elegant, a pleaſing, a judicious writer; and that it is to be much lamented that he did not devote a greater part of his time to a kind of writing which appeared natural to him, and in which he excelled.

Dr Joſeph Warton obſerves, that it is no caricature of Cowley to repreſent him as being poſſeſſed of a ſtrained affectation of ſtriving to be witty upon all occaſions. "It is painful (adds this excellent critic) to cenſure a writer of ſo amiable a mind, ſuch integrity of manners, and ſuch a ſweetneſs of temper. His fancy was brilliant, ſtrong, and ſprightly; but his taſte falſe and unclaſſical, even though he had much learning."

Dr Beattie has characteriſed Cowley in the following terms. "I know not whether any nation ever produced a more ſingular genius than Cowley. He abounds in tender thoughts, beautiful lines, and emphatical expreſſions. His wit is inexhauſtible, and his learning extenſive; but his taſte is generally barbarous, and ſeems to have been formed upon ſuch models as Donne, Martial, and the worſt parts of Ovid: nor is it poſſible to read his longer poems with pleaſure, while we retain any reliſh for the ſimplicity of ancient compoſition. If this author's ideas had been fewer, his conceits would have been leſs frequent; ſo that in one reſpect learning may be ſaid to have hurt his genius. Yet it does not appear that Greek and Latin did him any harm; for his imitations of Anacreon are almoſt the only parts of him that are now remembered or read. His Davideis, and his tranſlations of Pindar, are deſtitute of harmony, ſimplicity, and every other claſſical grace."

But the works of this celebrated poet have been no where ſo amply criticiſed as in his Life by Dr Johnſon. After a particular examination of the different pieces, the Doctor, in taking a general review of Cowley's poetry, obſerves, That "he wrote with abundant fertility, but negligent or unſkilful ſelection; with much thought, but with little imagery; that he is never pathetic, and rarely ſublime, but always either ingenious or learned, either acute or profound." Of his proſe he ſpeaks with great approbation. "No author (ſays he) ever kept his verſe and his proſe at a greater diſtance from each other. His thoughts are natural, and his ſtyle has a ſmooth and placid equability, which has never yet obtained its due commendation. Nothing is far-ſought or hard-laboured; but all is eaſy without feebleneſs, and familiar without groſſneſs." Upon the whole, he concludes as follows: "It may be affirmed, without any encomiaſtic fervour, that he brought to his poetic labours a mind replete with learning, and that his paſſages are embelliſhed with all the ornaments which books could ſupply; that he was the firſt who imparted to Engliſh numbers the enthuſiaſm of the greater ode and the gaiety of the leſs; that he was qualified for ſprightly ſallies and for lofty flights; that he was among thoſe who freed tranſlation from ſervility, and, inſtead of following his author at a diſtance, walked by his ſide; and that if he left verſification yet improvable, he left likewiſe from time to time ſuch ſpecimens of excellence as enabled ſucceeding poets to improve it."

So many of Cowley's productions being now eſteemed ſcarcely worthy of a peruſal, while others of them are diſtinguiſhed by their beauty, Dr Hurd (the preſent biſhop of Worceſter) thought proper to make a ſelection of them, which he publiſhed in 1772, under the title of Select Works of Mr Abraham Cowley, in two volumes; with a Preface and Notes by the Editor.

COX (Richard), a learned prelate, and principal pillar of the Reformation, was born at Whaddon in Buckinghamſhire, of low parentage, in the year 1499. From Eaton ſchool he obtained a ſcholarſhip in King's-college in Cambridge, of which he became a fellow in

1519: he was thence invited to Oxford by Cardinal Wolſey, and was there made one of the junior canons of Cardinal College. In 1525 he was incorporated bachelor; and the following year took the degree of maſter of arts in the ſame univerſity. In this ſituation he became remarkable for his learning and poetical abilities; but his attachment to the opinions of Luther rendered him hateful to his ſuperiors, who ſtripped him of his preferment, and threw him into priſon on a ſuſpicion of hereſy. Being, however, ſoon releaſed, he was choſen maſter of Eaton ſchool, which flouriſhed remarkably under his care. In 1537 he commenced doctor of divinity at Cambridge; in 1540 was made archdeacon of Ely; and the following year prebendary of that cathedral, on its being new founded by king Henry VIII. In 1546 he was made dean of Chriſt-church, Oxford. By the recommendation of Archbiſhop Cranmer and biſhop Goodrich, to the latter of whom he had been chaplain, he not only obtained the above preferments, but was choſen preceptor to Prince Edward; on whoſe acceſſion to the throne he became a favourite at court, was ſworn of the privy council, and made king's almoner. In 1547 he was elected chancellor of Oxford; in 1548 canon of Windſor; and the next year dean of Weſtminſter. About this time he was appointed one of the commiſſioners to viſit the univerſity of Oxford; in which office his zeal for reformation was ſo exceſſive, that he deſtroyed a number of curious and valuable books, for no better reaſon than becauſe they were written by Roman Catholics. On the acceſſion of Queen Mary he was ſtripped of all his preferments and committed to the Marſhalſea. He was, however, ſoon releaſed, and immediately left the kingdom. Having reſided ſome time at Straſburgh with his intimate friend Peter Martyr, on the death of Queen Mary he returned to England, and, with other divines, was appointed to reviſe the liturgy. He often preached before the queen; and in 1559 was preferred to the ſee of Ely, which he continued to enjoy upwards of 21 years. He was, however, no favourite with the queen: the reaſon aſſigned for which was, his zealous oppoſition to her retaining the crucifix and wax-candles on the altar of the royal chapel; alſo his ſtrenuous defence of the marriage of the clergy, which her majeſty always diſapproved. He died on the 22d of July 1581, aged 81. He was a man of conſiderable learning, a zealous and rigid bulwark of the church of England, and an implacable enemy both to Papiſts and Puritans. In a letter to Archbiſhop Parker, he adviſes him to proceed vigorouſly in reclaiming or *puniſhing* the Puritans, and not to be diſcouraged at the frown of thoſe court-favourites who protected them; aſſuring him that he might expect the bleſſing of God on his *pious* labours to free the church from their dangerous attempts, and to eſtabliſh uniformity.—This zealous reformer we find had not totally loſt ſight of the popiſh text, *compel them to come in*: but a ſtronger proof of his implacability and ſelf-importance appears in his letter to the lord treaſurer Burleigh, in which he warmly expoſtulates with the council for interpoſing in behalf of the Puritans, or meddling in affairs of the church, admoniſhing them to keep their own ſphere. Such language from a biſhop would make a modern privy council ſtare. His works are, 1. Two Latin Orations on the Diſpute between Dr Treſham and Peter Martyr, Lond. 1549, 4to. 2. Liturgy of the Church of England: in compiling, and afterwards correcting which, he was principally concerned. 3. The Lord's Prayer in verſe, commonly printed at the end of David's Pſalms by Sternhold and Hopkins. 4. Tranſlation of the four Goſpels, the Acts of the Apoſtles, and the Epiſtle to the Romans, in the new tranſlation of the Bible in the reign of Queen Elizabeth. 5. Reſolutions of ſome queſtions concerning the Sacrament, in the Collections of records at the end of Burnet's Hiſtory of the Reformation. 6. Several Letters to the Queen and others, publiſhed in Strype's Annals of the Reformation. He is alſo ſaid to have been concerned in the declaration concerning the divine inſtitution of biſhops, and to have aſſiſted Lilye in his Grammar.

COXWOLD, a town in the North riding of Yorkſhire, 14 miles north of York. W. Long. 1. 10. N. Lat. 54. 16.

COYPEL (Anthony), an excellent French painter, born at Paris in 1661. Noel Coypel, his father being choſen by M. Colbert to be director of the academy at Rome, he took his ſon with him into Italy, where Anthony Coypel formed himſelf on the works of the greateſt maſters, and on his return to France was made firſt painter to the duke of Orleans. That prince employed him in painting the grand gallery of the royal palace, and allowed him a penſion. In 1714, he was director of the Academy of Painting and Sculpture. In 1715, he was made firſt painter to the French king, and was ennobled on account of his merit. He died in 1722. M. Coypel, his ſon alſo excelled in the ſame art.

COZENING; tricking, or defrauding. In law it denotes an offence where any thing is done deceitfully, whether belonging to contracts or not, which cannot be properly termed by any ſpecial name.

COZUMEL, an iſland near the weſtern coaſt of Jucatan, where Cortez landed and refreſhed his troops before entering upon the conqueſt of Mexico. W. Long. 89. 0. and N. Lat. 13. 0.

CRAB, in zoology. See CANCER.

CRAB's Claws, in the materia medica, are the tips of the claws of the common crab broken off at the verge of the back part, ſo much of the extremity of the claws only being allowed to be uſed in medicine as is tinged with this colour. The blackneſs, however, is only ſuperficial; they are of a greyiſh white within, and when levigated furniſh a tolerable white powder.

Crab's claws are of the number of the alkaline abſorbents, but they are ſuperior to the generality of them in ſome degree, as they are found on a chemical analyſis to contain a volatile urinous ſalt.

CRAB's Eyes, in pharmacy, are a ſtrong concretion in the head of the cray-fiſh. They are rounded on one ſide, and depreſſed and ſinuated on the other, conſiderably heavy, moderately hard, and without ſmell. We have them from Holland, Muſcovy, Poland, Denmark, Sweden, and many other places.

Crab's eyes are much uſed both in the ſhop-medicines and extemporaneous preſcriptions, being accounted not only abſorbent and drying, but alſo diſcuſſive and diuretic.

CRAB-Lice, a troubleſome kind of vermin, which ſtick ſo faſt with their claws to the ſkin as to render it difficult to diſlodge them. Being viewed with a glaſs they nearly reſemble the ſmall crab-fiſh; whence they obtained their popular name. They are alſo called *pluctulæ, morpiones, petolæ*, and *peſſolatæ*: they uſually infeſt the arm-pits and *pudenda*. They will be quickly deſtroyed, and drop off dead, upon the application of a rag wet with the milk of ſublimate. This ſort of vermin is reckoned to prognoſticate ſpeedy mortality to thoſe whom they abandon without being removed by medicine.

Crab, a ſort of wooden pillar, whoſe lower end, being let down through a ſhip's decks, reſts upon a ſocket like the capſtern; and having in its upper end three or four holes, at different heights, through the middle of it, one above another, into which long bars are thurſt, whoſe length is nearly equal to the breadth of the deck. It is employed to wind in the cable, or to purchaſe any other weighty matter which requires a great mechanical power. This differs from a capſtern, as not being furniſhed with a *drum-head*, and by having the bars to go entirely through it, reaching from one ſide of the deck to the other; whereas thoſe of the capſtern, which are ſuperior in number, reach only about eight inches or a foot into the drum-head, according to the ſize thereof. This machine is repreſented in Plate CXXVII. n° 4. See alſo Capstern.

Crab-Yaws, a name in Jamaica for a kind of ulcer on the ſoles of the feet, with hard callous lips, ſo hard that it is difficult to cut them. The *ungt. cærul. fort.* is their cure.

CRACATOA, the moſt ſoutherly of a cluſter of iſlands lying in the entrance of the ſtraits of Sunda in the Eaſt Indies. Its whole circumference does not exceed nine miles; and off its north-eaſtern extremity is a ſmall iſland forming a road, in which Captain Cook anchored when viſiting this iſland on his laſt voyage. On the ſouthern part of the ſmall iſland is a reef of rocks, within which is a tolerable ſhelter againſt all northerly winds, there being 27 fathoms water in the mid-channel, and 18 near the reef. Between the two iſlands there is a narrow paſſage for boats. The ſhore that conſtitutes the weſt ſide of the road runs in a north-weſterly direction, having a bank of coral running into the ſea for a little way, ſo that it is difficult for boats to land except at the time of high water; but the anchoring ground is very good and free from rocks. In the inland parts the ground is elevated, riſing on all ſides gradually from the ſea, and is entirely covered with wood, excepting a few ſpots which are cleared by the inhabitants for ſowing rice. The climate is reckoned very healthy in compariſon with the neighbouring countries, but is very thinly inhabited. There are abundance of turtle on the coral reefs, but other refreſhments are ſcarce, and ſold at an exorbitant price. Water is not plentiful: Captain Cook was obliged to ſupply himſelf from a ſmall ſpring oppoſite to the ſouthern extremity of the ſmall iſland abovementioned. To the ſouthward is a hot ſpring, whoſe waters are uſed as a bath by the inhabitants. The road where the Reſolution anchored lies in S. Lat. 8. 6. and by obſervation, in 105. 36. E. Long. by the time-keeper in 104. 48. The variation of the compaſs one degree W. On the full and change days it is high water at ſeven o'clock in the morning, and the tide riſes three feet two inches perpendicular.

CRACKOW, a city of Poland, ſituated in a palatinate of the ſame name, E. Long. 20. 16. N. Lat. 50. 8. It was formerly the capital of Poland, where the kings were elected and crowned, and was once almoſt the centre of the Poliſh dominions, but is now a frontier town; a proof how much the power of this republic has been contracted.

Crackow ſtands in an extenſive plain, watered by the Viſtula, which is broad but ſhallow: the city and its ſuburbs occupy a vaſt track of ground, but are ſo badly peopled, that they ſcarcely contain 16,000 inhabitants. The great ſquare in the middle of the town is very ſpacious, and has ſeveral well-built houſes, once richly furniſhed and well inhabited, but moſt of them now either untenanted or in a ſtate of melancholy decay. Many of the ſtreets are broad and handſome; but almoſt every building bears the moſt ſtriking marks of ruined grandeur; the churches alone ſeem to have preſerved their original ſplendor. The devaſtation of this unfortunate town was begun by the Swedes at the commencement of the preſent century, when it was beſieged and taken by Charles XII. but the miſchiefs it ſuffered from that ravager of the north were far leſs deſtructive than thoſe it experienced during the late dreadful commotions, when it underwent repeated ſieges, and was alternately in poſſeſſion of the Ruſſians and Confederates. The effects of cannon, grape, and muſket ſhot, are ſtill diſcernible on the walls and houſes. In a word, Crackow exhibits the remains of ancient magnificence, and looks like a great capital in ruins: from the number of fallen and falling houſes one would imagine it had lately been ſacked, and that the enemy had left it only yeſterday. The town is ſurrounded with high walls of brick, ſtrengthened by round and ſquare towers of whimſical ſhapes, in the ancient ſtyle of fortification: theſe walls were built by Venceſlaus king of Bohemia during the ſhort period in which he reigned over Poland.

The univerſity of Crackow was formerly, and not unjuſtly, called the mother of Poliſh literature, as it principally ſupplied the other ſeminaries with profeſſors and men of learning; but its luſtre has been greatly obſcured by the removal of the royal reſidence to Warſaw, and ſtill more by the late inteſtine convulſions. In this city the art of printing was firſt introduced into Poland by Haller; and one of the earlieſt books was the Conſtitutions and Statutes compiled by Caſimir the Great, and afterwards augmented by his ſucceſſors. The characters are Gothic, the ſame which were univerſally uſed at the invention of printing: the great initial letters are wanting, which ſhows that they were probably painted and afterwards worn away. The year in which this compilation was printed is not poſitively known; but its publication was certainly anterior to 1496, as it does not contain the ſtatutes paſſed by John Albert in that year. The moſt flouriſhing period of the univerſity was under Sigiſmond Auguſtus in the 16th century, when ſeveral of the German reformers fled from the perſecutions of the emperor Charles V. and found an aſylum in this city. They gave to the world ſeveral verſions of the ſacred writings, and other theological publications, which diffuſed the reformed religion over great part of Poland. The protection which Sigiſmond Auguſtus afforded to men of learning of all denominations, and the univerſal toleration which he extended to every ſect of Chriſtians, created a ſuſpicion that he was ſecretly inclined to the new church; and it was even reported that he intended to renounce the catholic faith, and publicly profeſs the reformed religion.

Towards the ſouthern part of the town, near the Viſtula, riſes a ſmall eminence or rock, upon the top of which is built the palace, ſurrounded with brick walls and old towers, which form a kind of citadel to the town. This palace owes its origin to Ladiſlaus Jaghellon; but little of the ancient ſtructure now appears, as the greateſt part was demoliſhed by Charles XII. in 1702, when he entered this town in triumph after the battle of Cliſſow. It has been ſince repaired: the remains of the old palace conſiſt of a few apartments, which are left in their ancient ſtate as they exiſted in the laſt century. This palace was formerly the reſidence of the kings of Poland, who, from the time of Ladiſlaus Loketec, have been crowned at Crackow. The Poliſh and German hiſtorians differ concerning the time when the title of king was firſt claimed by the ſovereigns of this country; but the moſt probable account is, according to Mr. Coxe, that in 1295 Premiſlaus aſſumed the regal title, and was inaugurated at Gneſna by the archbiſhop of that dioceſe. He was ſucceeded by Ladiſlaus Loketec, who offending the Poles by his capricious and tyrannical conduct, was depoſed before he was crowned; and Venceſlaus king of Bohemia, who had married Richſa daughter of Premiſlaus, being elected in his ſtead, was in 1300 conſecrated at Gneſna. Ladiſlaus, after flying from his country and undergoing a ſeries of calamitous adventures, was at length brought to a ſenſe of his miſconduct. Having regained the affection of his ſubjects, he was reſtored, in the lifetime of Venceſlaus, to part of his dominions; and he recovered them all upon the demiſe of that monarch in the year 1305: he governed, however, for ſome years without the title of king; but at length in 1320 was crowned at Crackow, to which place he transferred the ceremony of the coronation; and afterwards enacted, that for the future his ſucceſſors ſhould be inaugurated in the cathedral of this city.

Since that period all the ſovereigns have been conſecrated at Crackow, excepting the preſent king. Previous to his election a decree was iſſued by the diet of convocation, that the coronation ſhould be ſolemniſed for this turn at Warſaw, without prejudice in future to the antient right of Crackow; a proviſo calculated to ſatisfy the populace, but which will not probably prevent any future ſovereign from being crowned at Warſaw, now become the capital of Poland and the reſidence of its kings. The diadem and other regalia uſed at the coronation are ſtill kept in the palace of Crackow, under ſo many keys, and with ſuch care, that it was impoſſible to obtain a ſight of them.

Adjoining to the palace ſtands the cathedral, alſo within the walls of the citadel. Here all the ſovereigns, from the time of Ladiſlaus Loketec, have been interred, a few only excepted, viz. Louis and Ladiſlaus III. who were kings of Hungary as well as of Poland, and whoſe bodies were depoſited in Hungary; Alexander, who died and was buried at Vilna; Henry of Valois, interred in France; and the late monarch Auguſtus III. The ſepulchres of the kings of Poland are not diſtinguiſhed by any peculiar magnificence: their figures are carved in marble of no extraordinary workmanſhip, and ſome are without inſcriptions.

The biſhop of Crackow is the firſt in the kingdom, duke of Saveria, and very often a cardinal. His revenues are larger than thoſe of his metropolitan the archbiſhop of Gneſna, and are computed to amount to 40,000 dollars *per annum*.

CRADLE, a well known machine in which infants are rocked to ſleep.

It denotes alſo that part of the ſtock of a croſs-bow where the bullet is put.

Cradle, in ſurgery, a caſe in which a broken leg is laid after being ſet.

Cradle, in engraving, is the name of an inſtrument uſed in ſcraping mezzotintos and preparing the plate. It is formed of ſteel, reſembling a chiſſel with one ſloping ſide, upon which are cut hollow lines very near each other, and at equal diſtances. The acting part of this tool is made circular, and the corners are rounded. After being properly tempered, it muſt be ſharpened on the whetſtone. There are various ſizes of this inſtrument.

Cradle, among ſhipwrights, a frame placed under the bottom of a ſhip, in order to conduct her ſmoothly and ſteadily into the water when ſhe is going to be launched; at which time it ſupports her weight while ſhe ſlides down the deſcent or ſloping paſſage called *the ways*, which are for this purpoſe daubed with ſoap and tallow. See Plate CL.

CRAFT, a general name for all ſorts of veſſels employed to load or diſcharge merchant ſhips, or to carry alongſide or return the ſtores of men of war. Such are lighters, hoys, barges, prames, &c. See thoſe articles.

CRAKE, or Corn-crake. See Rallus.

CRAIL, or Careil, a parliament town of Scotland, ſituated on the ſea-coaſt of the county of Fife, about ſeven miles ſouth-eaſt of St Andrew's. W. Long. 2. 20. and N. Lat. 56. 17.

CRAMBE, Sea-cabbage, Sea-beach Kale, or Sea-colewort, in botany: A genus of the ſiliquoſa order, belonging to the tetradynamia claſs of plants; and in the natural method ranking under the 39th order, *Siliquoſæ*. The four longer filaments are forked at top, with an anthera only on one point of each; the fruit a dry, globoſe, and deciduous berry. There are three ſpecies, all of them herbaceous eſculents with perennial roots, producing annually large leaves reſembling thoſe of cabbage ſpreading on the ground, with ſtrong flower-ſtalks and yellowiſh flowers. Only one of the ſpecies is a native of Britain. It grows wild on the ſhores of many of the maritime counties of England, but is cultivated in many gardens as a choice eſculent; and the young robuſt ſhoots of its leaves and flower-ſtalks, as they iſſue forth from the earth after the manner of aſparagus ſhoots, are then in the greateſt perfection for uſe. At this period they appear white as if blanched, and when boiled eat exceeding ſweet and tender. Its principal ſeaſon for uſe is in April and May. This plant may alſo be employed in the pleaſure-ground as a flowering perennial, for the ſtalks divided into fine branchy heads of flowers. It is propagated by ſeeds ſown in any common light earth in autumn or ſpring, where the plants are to remain, which, when two years old, will produce ſhoots fit for uſe, will multiply exceedingly by the roots, and continue for many years.

CRAMERIA, in botany, a genus of the monogynia order, belonging to the tetrandria claſs of plants. There is no calyx; the corolla has four petals; the ſuperior nectary is trifid, the inferior biphyllous; the fruit is a dry, monoſpermous, and echinated berry.

CRAMOND, OVER and NETHER, two villages about four miles weſt of Edinburgh; of which only the laſt deſerves notice, as having been once a famous naval ſtation of the Romans. It is ſituated at the influx of the river Almon into the Forth. Three Roman roads meet at this place, which was called by them *Alaterva*, and whither they brought their grain for the ſupport of their troops. The village contains about 300 inhabitants. Here are the remains of a bath and ſudatory; and manyaltars, medals, &c. have been dug up.

CRAMP, a kind of numbneſs or convulſion, occaſioned by a thick viſcid vapour entering the membranes of the muſcles, which contracts or extends the neck, arms, legs, &c. with a voilent but tranſitory pain; being uſually driven off with friction alone. The word comes from the German *krampſe*, which ſignifies the ſame.

A glaſs of tar water, to be drank night and morning, has been recommended; and a rod of brimſtone, when held in the hand has given preſent relief.

CRAMP-Fiſh, or *Torpedo*. See RAJA.

CRAMP-Iron, or *Cramps*, a piece of iron bent at each end, which ſerves to faſten together pieces of wood, ſtones, or other things.

CRAMPONEE, in heraldry, an epithet given to a croſs which has at each end a cramp or ſquare piece coming from it; that from the arm in chief towards the ſiniſter angle, that from the arm on that ſide downwards, that from the arm in baſe towards the dexter ſide, and that from the dexter arm upwards.

CRANAGE, the liberty of uſing a crane at a wharf, and alſo the money paid for drawing up wares out of a ſhip, &c. with a crane.

CRANE, in ornithology. See ARDEA.

CRANE, in mechanics, a machine uſed in building for raiſing large ſtones and other weights. See MECHANICS.

CRANE's-Bill, in botany. See GERANIUM.

CRANE-Fly, in zoology, a ſpecies of TIPULA.

CRANGANOR, a Dutch factory on the Malabar coaſt in the Eaſt Indies, ſeated in E. Long. 75. 5. N. Lat. 10. 0. See COCHIN.

CRANIOLARIA, in botany: A genus of the angioſpermia order, belonging to the didynamia claſs of plants; and in the natural method ranking under the 40th order, *Perſonatæ*. The calyx of the flower is double, the under one tetraphyllous, the upper one a monophyllous ſpatha; the tube of the corolla very long; the capſule almoſt the ſame with that of the *martynia*; which ſee. There are two ſpecies, both natives of hot climates, and neither of them poſſeſſed of any remarkable property.

CRANIUM, in anatomy, an aſſemblage of ſeveral bones which cover and encloſe the brain and cerebellum, popularly called the *ſkull*. See ANATOMY, n° 11. The word comes from the Greek κρανιον, of κρανος, *galea*, "helmet;" becauſe it ſerves to defend the brain like a head-piece. Pezron, again, derives κρανιον from the Celtic *cren*, becauſe of its roundneſs.

CRANK, a contrivance in machines in manner of an elbow, only of a ſquare form, projecting out from an axis or ſpindle; and ſerving, by its rotation, to raiſe and fall the piſtons of engines for raiſing water or the like.

CRANK, in ſea-language. A ſhip is ſaid to be *crank-ſided*, when, for want of a ſufficient quantity of ballaſt or cargo, ſhe cannot bear her ſails, or can bear but ſmall ſail, for fear of overſetting.—She is ſaid to be *crank by the ground*, when her floor is ſo narrow that ſhe cannot be brought on ground without danger.

CRANK is alſo an iron brace which ſupports the lanthorns on the poop-quarters, &c.

CRANMER (Thomas), a celebrated archbiſhop, reformer, and martyr, was the ſon of Thomas Cranmer, Eſq; of Aſlacton in Nottinghamſhire, where our author was born in 1489. At the age of 14, he was admitted a ſtudent of Jeſus' College, Cambridge, of which he afterwards became fellow; but marrying the relation of an inn-keeper's wife, he loſt his fellowſhip and quitted the college. On the death of his wife he was re-admitted fellow of Jeſus' College. In 1523 he took the degree of doctor of divinity, and was made theological lecturer and examiner. The plague being at Cambridge, he retired to the houſe of a relation at Waltham Abbey, where, meeting with Fox the king's almoner, and Gardiner the ſecretary, he gave his opinion concerning King Henry's marriage with Catharine much to the ſatisfaction of his majeſty. This opinion was, that inſtead of diſputing about the validity of the King's marriage with Catharine, they ſhould reduce the matter to this ſimple queſtion, "Whether a man may marry his brother's wife or no?" When the King was told of it, he ſaid, "This fellow has got the right ſow by the ear." He then ſent for him to court, made him one of his chaplains, and ordered him to write a vindication of the divorce in agitation. This book having quieted the tender conſcience of the King, he was deſirous that all Europe ſhould be convinced of the illegality of his marriage with Queen Catharine; and for that purpoſe ſent Cranmer to France, Italy, and Germany, to diſpute the matter with the divines of thoſe countries. At Nuremberg Cranmer married a ſecond wife. Being returned to England, in March 1533 he was conſecrated archbiſhop of Canterbury; in May following he pronounced the ſentence of divorce between the King and Queen; and ſoon after married the amorous monarch to Ann Boleyn. Being now at the head of the church, he exerted himſelf in the buſineſs of the Reformation. The Bible was tranſlated into Engliſh, and monaſteries diſſolved principally by his means.

In 1536 the royal conſcience again required the aſſiſtance of our archbiſhop: in this year he divorced the King from Ann Boleyn. In 1537 he viſited his dioceſe, and endeavoured to aboliſh the ſuperſtitious obſervation of holidays. In 1539 he and ſome of the biſhops fell under the King's diſpleaſure, becauſe they could not be brought to give their conſent in parliament that the monaſteries ſhould be ſuppreſſed for the King's ſole uſe. He alſo ſtrenuouſly oppoſed the act for the ſix articles in the houſe of lords, ſpeaking three days againſt it; and upon the paſſing of that ſtatute ſent away his wife into Germany. In 1540 he was one of the commiſſioners for inſpecting into matters of religion, and explaining ſome of its chief doctrines. The reſult of their commiſſion was the book intitled A neceſſary Erudition of any Chriſtian Man. After Lord Cromwell's death (in whoſe behalf he had written to the King), he retired and lived in great privacy, meddling not at all with ſtate affairs. In 1541 he gave orders, purſuant to the King's directions, for taking away ſuperſtitious ſhrines; and, exchanging Biſhopſbourn for Bekeſbourn, united the latter to his dioceſe. In 1542 he procured the “Act for the advancement of true religion and the aboliſhment of the contrary,” which moderated the rigour of the ſix articles. But the year following, ſome enemies preferring accuſations againſt him, he had like to have been ruined, had not the King interpoſed in his behalf. His majeſty continued afterwards to protect him from his enemies; and at his death appointed him one of the executors of his will, and one of the regents of the kingdom. In 1546 he crowned young Edward, during whoſe ſhort reign he promoted the reformation to the utmoſt of his power; and was particularly inſtrumental in compoſing, correcting, and eſtabliſhing the liturgy by act of parliament. He had alſo a ſhare in compiling the thirty-nine articles of religion.

In 1553 he oppoſed the new ſettlement of the crown upon Lady Jane Gray, and would no way be concerned in that affair (though at laſt, through many importunities, he was prevailed upon to ſet his hand to it): neither would he join in any of Dudley's ambitious projects. Upon Queen Mary's acceſſion to the throne, he was committed to the Tower; partly for ſetting his hand to the inſtrument of Lady Jane's ſucceſſion, and partly for the public offer he had made a little before of juſtifying openly the religious proceedings of the late king. Some of his friends, foreſeeing the ſtorm that was likely to fall upon him, adviſed him to fly, but he abſolutely refuſed. In the enſuing parliament, on November the 3d, he was attainted, and at Guildhall found guilty of high treaſon; whereupon the fruits of his archbiſhopric were ſequeſtered. In April 1554, he and Ridley and Latimer were removed to Oxford, in order for a public diſputation with the Papiſts; which was accordingly held there towards the middle of the month, with great noiſe, triumph, and impudent confidence on the Papiſts ſide, and with as much gravity, learning, modeſty; and convincing ſufficiency on the ſide of the Proteſtant biſhops. The 20th of April, two days after the end of theſe diſputations, Cranmer and the two others were brought before the commiſſioners, and aſked, Whether they would ſubſcribe (to Popery)? which they unanimouſly refuſing, were condemned as heretics. From this ſentence the archbiſhop appealed to the juſt judgment of the Almighty; and wrote to the council, giving them an account of the diſputation, and deſiring the Queen's pardon for his treaſon, which it ſeems was not yet remitted. By the convocation which met this year, his Defence of the true and catholic Doctrine of the Sacrament of the Body and Blood of our Saviour Chriſt was ordered to be burnt. Some of his friends petitioned the Queen in his behalf; putting her in mind how he had once preſerved her in her father's time by his earneſt interceſſions with him for her, ſo that ſhe had reaſon to believe he loved her, and would ſpeak the truth to her more than all the reſt of the clergy. All endeavours in his behalf, however, were ineffectual; and the Archbiſhop being degraded and moſt ignominiouſly treated, was at laſt flattered and terrified into an inſincere recantation and renunciation of the Proteſtant faith. But this triumph was not ſufficient to gratify the pious vengeance of the Romiſh Mary. On the 24th of Feb. 1556, a writ was ſigned for the burning of Cranmer; and on the 24th March, which was the fatal day, he was brought to St Mary's church, Cambridge, and placed on a kind of ſtage over againſt the pulpit, where Dr Cole provoſt of Eton was appointed to preach a ſermon on the occaſion. While Cole was haranguing, the unfortunate Cranmer expreſſed great inward confuſion; often lifting up his hands and eyes to heaven, and frequently pouring out floods of tears. At the end of the ſermon, when Cole deſired him to make an open profeſſion of his faith, as he had promiſed him he would, he firſt prayed in the moſt fervent manner; then made an exhortation to the people preſent, not to ſet their minds upon the world, to obey the King and Queen, to love each other, and to be charitable. After this he made a confeſſion of his faith, beginning with the creed, and concluding with theſe words: “And I believe every word and ſentence taught by our Saviour Jeſus Chriſt, his apoſtles, and prophets, in the Old and New Teſtament.—And now (added he) I come to the great thing that ſo much troubleth my conſcience more than any thing I ever did or ſaid in my whole life; and that is the ſetting abroad a writing contrary to the truth, which I here now renounce as things written with my hand contrary to the truth which I thought in my heart; and written for fear of death, and to ſave my life if it might be: that is, all ſuch bills and papers which I have written or ſigned with my hand ſince my degradation, wherein I have written many things untrue. And foraſmuch as my hand offended, writing contrary to my heart, my hand ſhall firſt be puniſhed; for, may I come to the fire, it ſhall be firſt burned. As for the pope, I refuſe him, as Chriſt's enemy and antichriſt, with all his falſe doctrine. And as for the ſacrament, I believe as I have taught in my book againſt the Biſhop of Wincheſter.” Thunderſtruck as it were with this unexpected declaration, the enraged Popiſh crowd admoniſhed him not to diſſemble. “Ah! (replied he with tears), ſince I lived hitherto, I have been a hater of falſehood and a lover of ſimplicity, and never before this time have I diſſembled.” Whereupon they pulled him off the ſtage with the utmoſt fury, and hurried him to the place of his martyrdom over againſt Baliol College; where he put off his clothes in haſte, and ſtanding in his ſhirt, and without ſhoes, was faſtened with a chain to the ſtake. Some preſſing him to agree to his former recantation, he anſwered, ſhowing his hand, “This is the hand that wrote it, and therefore it ſhall firſt ſuffer puniſhment.” Fire being applied to him, he ſtretched out his right hand into the flame, and held it there unmoved (except that once with it he wiped his face) till it was conſumed; crying with a loud voice, “This hand hath offended;” and often repeating, “This unworthy right hand." At laſt, the fire getting up, he ſoon expired, never ſtirring or crying out all the while; only keeping his eyes fixed to heaven; and repeating more than once, "Lord Jeſus receive my ſpirit." Such was the end of the renowned Thomas Cranmer, in the 67th year of his age.

It was noticed above, that after the paſſing of the act for the ſix articles, Archbiſhop Cranmer ſent his wife into Germany. But ſhe afterwards returned again to England; and Mr, Strype informs us, that "in the time of King Edward, when the marriage of the clergy was allowed, he brought her forth, and lived openly with her." Mr. Gilpin ſays, "he left behind him a widow and children; but as he always kept his family in obſcurity for prudential reaſons, we know little about them. They had been kindly provided for by Henry VIII; who, without any ſolicitation from the Primate himſelf, gave him a conſiderable grant from the Abbey of Walbeck in Nottinghamſhire, which his family enjoyed after his deceaſe. King Edward made ſome addition to his private fortune; and his heirs were reſtored in blood by an act of parliament in the reign of Elizabeth."

Archbiſhop Cranmer wrote a great number of books: many of them he publiſhed himſelf; and many of them ſtill remain in MSS. *viz.* two folio volumes in the king's library, ſeveral letters in the Cotton collection, &c.

Mr. Gilpin remarks, That "the character of the Archbiſhop hath been equally the ſubject of exaggerated praiſe and of undeſerved cenſure. The moſt indefenſible parts of the Archbiſhop's character are the readineſs with which he ſometimes concurred in the unjuſtifiable proceedings of Henry VIII. and the inſtances wherein he ſhowed himſelf to be actuated by intolerant principles.

"He firſt recommended himſelf to Henry by the zeal which he diſplayed in promoting the king's divorce from queen Catharine. As to this, it may be allowed, that Dr. Cranmer might think the marriage wrong: but though it poſſibly might be a point of conſcience with the King, it could however be none with him; and there was manifeſtly a difference between adviſing not to do a thing, and adviſing to undo it when already done, at leaſt in a matter of ſo diſputable a nature. On the other hand, to repudiate a woman with whom the King had cohabited near 20 years as his wife, and to illegitimate a daughter, bred up in the higheſt expectations, and now marriageable, were acts of ſuch cruelty, that it ſeems to indicate a want of feeling to be in any degree acceſſary to them. To this may be added, that the notoriety of the King's paſſion for Ann Boleyn, which all men believed to be, if not the firſt mover, at leaſt the principal ſpring of his pretended ſcruples, threw a very indelicate imputation on all who had any concern in the affair. No ſerious churchman, one would imagine, could be fond of the idea of adminiſtering to the King's paſſions. It is with concern, therefore, that we ſee a man of Dr Cranmer's integrity and ſimplicity of manners acting ſo much out of character as to compound an affair of this kind, if not with his conſcience, at leaſt with all delicacy of ſentiment; and to parade through Europe, in the quality of an ambaſſador, defending every where the King's *pious intentions*. But the cauſe (continues Mr. Gilpin) animated him. With the illegality of the King's marriage, he endeavoured virtually to eſtabliſh the inſufficiency of the pope's diſpenſation; and the latter was an argument ſo near his heart, that it ſeems to have added merit to the former. We cannot indeed account for his embarking ſo zealouſly in this buſineſs without ſuppoſing his principal motive was to free his country from the tyranny of Rome, to which this ſtep very evidently led. So deſirable an end would in ſome degree, he might imagine, ſanctify the means.

Of two of the inſtances of perſecution in which Archbiſhop Cranmer was concerned, Mr Gilpin gives the following account. "Joan Bocker and George Paris were accuſed, though at different times; one for denying the humanity of Chriſt, the other for denying his divinity. They were both tried and condemned to the ſtake; and the Archbiſhop not only conſented to theſe acts of blood, but even perſuaded the averſion of the young King into compliance. "Your majeſty muſt diſtinguiſh (ſaid he, informing his royal pupil's conſcience) between common opinions and ſuch as are the eſſential articles of faith. Theſe latter we muſt on no account ſuffer to be oppoſed." Mr Gilpin juſtly obſerves, that "nothing even plauſible can be ſuggeſted in defence of the Archbiſhop on this occaſion, except only that the ſpirit of Popery was not yet wholly repreſſed." Theſe inſtances of injuſtice and barbarity were indeed totally indefenſible, and a great diſgrace to Cranmer and to all who were concerned in them. It does not appear that he endeavoured to promote the death of Lambert; but, as Mr Gilpin obſerves, it were to be wiſhed he had rid his hands of the diſputation likewiſe. The public diſputation, in which Cranmer bore ſome part, proved the means of bringing Lambert to the ſtake.

One of the moſt honourable tranſactions of Archbiſhop Cranmer's life, was the firm ſtand that he made againſt the act of the ſix articles. This act was ſo ſtrongly ſupported by the King, that even the Proteſtants in parliament made little oppoſition to it. But Cranmer oppoſed it with great zeal and ſteadineſs. "The good Archbiſhop (ſays Mr Gilpin) never appeared in a more truly chriſtian light than on this occaſion. In the midſt of ſo general a defection (for there were numbers in the houſe who had hitherto ſhown great forwardneſs in reformation) he alone made a ſtand. Three days he maintained his ground, and baffled the arguments of all oppoſers. But argument was not their weapon, and the Archbiſhop ſaw himſelf obliged to ſink under ſuperior power. Henry ordered him to leave the houſe. The Primate refuſed: 'It was God's buſineſs (he ſaid), and not man's.' And when he could do no more, he boldly entered his proteſt. Such an inſtance of fortitude is ſufficient to wipe off many of thoſe courtly ſtains which have faſtened on his memory."

His behaviour in the caſe of the Duke of Norfolk was alſo entitled to great commendation. "The laſt act of this reign (ſays Mr Gilpin) was an act of blood, and gave the Archbiſhop a noble opportunity of ſhowing how well he had learned that great Chriſtian leſſon of forgiving an enemy. Almoſt without the ſhadow of juſtice, Henry had given directions to have the Duke of Norfolk attainted by an act of parliament. The King's mandate ſtood in lieu of guilt, and the bill paſſed the houſe with great eaſe. No man, except the Biſhop of Wincheſter, had been ſo great an enemy to the Archbiſhop as the Duke of Norfolk. He had always thwarted the Primate's meaſures, and oftener than once had practiſed againſt his life. How many would have ſeen with ſecret pleaſure the workings of Providence againſt ſo rancorous an enemy; ſatisfied in having themſelves no hand in his unjuſt fate! But the Archbiſhop ſaw the affair in another light: He ſaw it with horror; and although the King had in a particular manner intereſted himſelf in this buſineſs, the Primate oppoſed the bill with all his might; and when his oppoſition was vain, he left the houſe with indignation, and retired to Croydon."

He was indeed remarkable for the placability of his temper, and for ſhowing kindneſs to thoſe by whom he had been greatly injured. Hence it is mentioned in Shakeſpeare's Henry VIII. as a common ſaying concerning him:

——" Do my Lord of Canterbury
But one ſhrewd turn, and he's your friend for ever."

Archbiſhop Cranmer was a great friend and patron of learned foreigners who had been perſecuted for their attachment to the principles of the Reformation. Mr Gilpin ſays, " the ſuffering profeſſors of Proteſtantiſm, who were ſcattered in great numbers about the various countries of Europe, were always ſure of an aſylum with him. His palace at Lambeth might be called a ſeminary of learned men; the greater part of whom perſecution had driven from home. Here, among other celebrated reformers, Martyr, Bucer, Aleſs, Phage, found ſanctuary. Martyr, Bucer, and Phage were liberally penſioned by the Archbiſhop till he could otherwiſe provide for them. It was his wiſh to fix them in the two univerſities, where he hoped their great knowledge and ſpirit of inquiry would forward his deſigns of reſtoring learning; and he at length obtained profeſſorſhips for them all. Bucer and Phage were ſettled at Cambridge; where they only ſhowed what might have been expected from them, both dying within a few months after their arrival. But at Oxford Martyr acted a very conſpicuous part, and contributed to introduce among the ſtudents there a very liberal mode of thinking.

Of the learning of Archbiſhop Cranmer, Mr Gilpin remarks, that " it was chiefly confined to his profeſſion." He had applied himſelf in Cambridge to the ſtudy of the Greek and Hebrew languages; which, though eſteemed at that time as the mark of hereſy, appeared to him the only ſources of attaining a critical knowledge of the Scriptures. He had ſo accurately ſtudied canon law, that he was eſteemed the beſt canoniſt in England; and his reading in theology was ſo extenſive, and his collections from the fathers ſo very voluminous, that there were few points in which he was not actually informed, and in which he could not give the opinions of the ſeveral ages of the church from the times of the Apoſtles. He was a ſenſible writer, rather nervous than elegant. His writings were entirely confined to the great controverſy which then ſubſiſted, and contain the whole ſum of the theological learning of thoſe times. His library was filled with a very noble collection of books, and was open to all men of letters.

Mr Gilpin, after remarking that Archbiſhop Cranmer preached often wherever he viſited, ſays, " In his ſermons to the people he was very plain and inſtructive; inſiſting chiefly on the eſſentials of Chriſtianity. The ſubjects of his ſermons, for the moſt part, were from whence ſalvation is to be fetched, and on whom the confidence of man ought to lean. They inſiſted much on the doctrines of faith and works; and taught what the fruits of faith were, and what place was to be given to works: they inſtructed men in the duties they owed their neighbour, and that every one was our neighbour to whom we might any way do good; they declared what men ought to think of themſelves after they had done all; and, laſtly, what promiſes Chriſt hath made, and who they are to whom he will make them good. Thus he brought in the true preaching of the Goſpel, altogether different from the ordinary way of preaching in thoſe days; which was to treat concerning ſaints, to tell legendary tales of them, and to report miracles wrought for the confirmation of tranſubſtantiation and other Popiſh corruptions. And ſuch a heat of conviction accompanied his ſermons, that the people departed from them with minds poſſeſſed of a great hatred of vice, and burning with a deſire of virtue."

He was a great economiſt of his time. Mr Gilpin ſays, " he roſe commonly at five o'clock, and continued in his ſtudy till nine. Theſe early hours, he would ſay, were the only hours he could call his own. After breakfaſt he generally ſpent the remainder of the morning either in public or private buſineſs. His chapel-hour was eleven, and his dinner-hour twelve. After dinner he ſpent an hour either in converſation with his friends, in playing at cheſs, or in, what he liked better, overlooking a cheſs-board. He then retired again to his ſtudy till his chapel-bell rang at five. After prayers, he generally walked till ſix, which was in thoſe times the hour of ſupper. His evening meal was ſparing. Often he ate nothing; and when that was the caſe, it was his uſual cuſtom, as he ſat down to table, to draw on a pair of gloves; which was as much as to ſay, that his hands had nothing to do. After ſupper, he ſpent an hour in walking and another in his ſtudy, retiring to his bedchamber about nine. This was his uſual mode of living when he was moſt vacant, but very often his afternoons as well as his mornings were engaged in buſineſs. He generally, however, contrived, if poſſible, even in the buſieſt day, to devote ſome proportion of his time to his books beſides the morning. And Mr Fox tells us, he always accuſtomed himſelf to read and write in a ſtanding poſture; eſteeming conſtant ſitting very pernicious to a ſtudious man."

Mr Gilpin alſo obſerves, " that he was a very amiable maſter in his family, and admirably preſerved the difficult medium between indulgence and reſtraint. He had, according to the cuſtom of the times, a very numerous retinue, among whom the moſt exact order was obſerved. Every week the ſteward of his houſehold held a kind of court in the great hall of his palace; in which all family affairs were ſettled, ſervants wages were paid, complaints were heard, and faults examined. Delinquents were publicly rebuked, and after the third admonition diſcharged. His hoſpitality and charities were great and noble; equal to his ſtation, greater often than his abilities. A plentiful table was among the virtues of thoſe days. His was always bountifully covered. In an upper room was ſpread his own, where he ſeldom wanted company of the firſt diſtinction. Here a great many learned foreigners were daily entertained, and partook of his bounty. In his great hall a long table was plentifully covered every day for gueſts and ſtrangers of a lower rank; at the upper end of which were three ſmaller tables, deſigned for his own officers and inferior gentlemen. Among the other inſtances of the Archbiſhop's charity, we have one recorded which was truly noble. After the deſtruction of monaſteries, and before hoſpitals were erected, the nation ſaw no ſpecies of greater miſery than that of wounded and diſbanded ſoldiers. For the uſe of ſuch miſerable objects as were landed on the ſouthern coaſts of the iſland, the Archbiſhop fitted up his manor-houſe of Beckeſburn in Kent. He formed it indeed into a complete hoſpital; appointing a phyſician, a ſurgeon, nurſes, and every thing proper, as well for food as phyſic. Nor did his charity ſtop here. Each man, on his recovery, was furniſhed with money to carry him home, in proportion to the diſtance of his abode."

To conclude with the character given by Mr Hume: "Archbiſhop Cranmer was undoubtedly a man of merit; poſſeſſed of learning and capacity; and adorned with candour, ſincerity, and beneficence, and all thoſe virtues which were fitted to render him uſeful and amiable in ſociety. His moral qualities procured him univerſal reſpect; and the courage of his martyrdom, though he fell ſhort of the rigid inflexibility obſerved in many, made him the hero of the Proteſtant party."

CRANNY, in glaſs-making, an iron inſtrument wherewith the necks of glaſſes are formed.

CRANTARA, among the antient Britons, was a ſort of military ſignal uſed for collecting the diſtant and ſcattered warriors to the ſtandard of their chief. A prince having immediate occaſion for the aſſiſtance of his followers to repel ſome ſudden invaſion or engage in ſome expedition, beſides ſtriking the ſhield and ſounding the horn to give warning to thoſe who were within hearing, he ſent the crantara, or a ſtick burnt at the end and dipped in the blood of a goat, by a ſwift meſſenger, to the neareſt hamlet, where he delivered it without ſaying one word but the name of the place of rendezvous. This crantara, which was well underſtood to denounce deſtruction by fire and ſword to all who did not obey this ſummons, was carried with great rapidity from village to village; and the prince in a little time found himſelf ſurrounded by all his warriors ready to obey his commands.

CRANTOR, a Greek philoſopher and poet, was born at Solos in Cilicia. He left his native country where he was admired; went to Athens, and there ſtudied with Polemon under Xenocrates. He was conſidered as one of the chief ſupporters of the Platonic ſect; and was the firſt who wrote commentaries upon Plato's works. He flouriſhed 270 years before Chriſt.

CRAPE, a light tranſparent ſtuff, in manner of gauze; made of raw ſilk gummed and twiſted on the mill; woven without croſſing, and much uſed in mourning.

Crapes are either craped, *i. e.* criſped, or ſmooth; the firſt double, expreſſing a cloſer mourning; the latter ſingle, uſed for that leſs deep. Note, White is reſerved for young people, or thoſe devoted to virginity. The ſilk deſtined for the firſt is more twiſted than that for the ſecond; it being the greater or leſs degree of twiſting, eſpecially of the wrap, which produces the criſping given when taken out of the loom, ſteeped in clear water, and rubbed with a piece of wax for the purpoſe.

Crapes are all dyed raw. The invention of this ſtuff came originally from Bologna: but the chief manufacture of it is ſaid to be at Lyons.

Hiſtory tells us, that St Bathilda, queen of France, made fine crape *(crepa)* of gold and ſilver, to lay over the body of St Eloy. The Bollandiſts own they cannot find what this *crepa* was. Binet ſays, it was a frame to cover the body of the ſaint: but others, with reaſon, take it to be a tranſparent ſtuff, through which the body might be ſeen; and that this was the *crepa* whence our word crape was formed.

CRAPULA, among phyſicians; a term for SURFEIT.

CRASHAW (Richard), who was in his lifetime honoured with the friendſhip of Cowley, and ſince his death by the praiſe of Mr Pope, who condeſcended both to read his poems and to borrow from them; was the ſon of William Craſhaw, an eminent divine, and educated at the Charter-houſe near London. He was then ſent to Pembroke hall in Cambridge, and was afterwards of Peter-houſe, where he was fellow; in both which colleges he was diſtinguiſhed for his Latin and Engliſh poetry. Afterwards he was ejected from his fellowſhip, together with many others, for denying the covenant in the time of the rebellion; and he changed his religion, being by catholic artifices perverted to the church of Rome; not *converted*, but rather, as Pope ſays, *outwitted*. He went to Paris, in hopes of recommending himſelf to ſome preferment there; but being a mere ſcholar, was incapable of executing the new plan he had formed. There he fell into great diſtreſs, which Cowley the poet hearing of in 1646, very kindly ſought him out, gave him all the aſſiſtance he could, and at laſt got him recommended to Henrietta Maria queen of England, then reſiding at Paris. Obtaining from her letters of recommendation, he travelled into Italy; and by virtue of thoſe letters became ſecretary to a cardinal at Rome, and at laſt one of the canons or chaplains of the rich church of our lady at Loretto, ſome miles diſtance from thence, where he died and was buried about 1650. Before he left England he wrote certain poems, entitled, *Steps to the Temple*; "becauſe (ſays Wood) he led his life in the temple of God, in St Mary's church near to his college. There, as we learn from the preface to theſe poems, he lodged under Tertullian's roof of angels. There he made his neſt more gladly than David's ſwallow near the houſe of God: where, like a primitive ſaint, he offered more prayers in the night than others uſually offer in the day. There he penned the ſaid poems called *Steps to the Temple for happy Souls to climb to Heaven by*. To the ſaid Steps are joined other poems called *The Delights of the Muſes*, wherein are ſeveral Latin poems; which, though of a mere human mixture, yet they are ſweet as they are innocent. He hath alſo written *Carmen Deo noſtro*, being hymns and other ſacred poems, addreſſed to the counteſs of Denbigh. He was excellent in five languages beſides his mother tongue, namely, Hebrew, Greek, Latin, Italian, and Spaniſh.

CRASIS (from *κραγνυμι*, *to mix*), the temper of the blood peculiar to every conſtitution.

Crasis, in grammar, is a figure whereby two different letters are either contracted into one long letter or a diphthong. Such, *e. g.* is οφις for οφιας; αληθη for αληθεα, &c. τυχȣς, for τυχεος, &c. where ι and α are contracted into ι; ε and α into η; ε and ο into ȣ.

CRASSAMENTUM, in phyſic, the thick red or fibrous part of the blood, otherwiſe called *cruor*, in contradiſtinction to the ſerum or aqueous part.

CRASSULA, lesser orphine, or live-ever: A genus of the pentagynia order, belonging to the pentandria claſs of plants; and in the natural method ranking under the 13th order, *Succulentæ*. The calyx is pentaphyllous; the petals five, with five nectariferous ſcales at the baſe of the germen, and five capſules. Their are 17 ſpecies, all of them natives of warm climates. Several of them are cultivated in this country, but require the aſſiſtance of artifical heat for their preſervation. They riſe from one foot to ſix or eight in height, and are ornamented with oblong, thick, ſucculent leaves, and funnel ſhaped pentapetalous flowers of a ſcarlet, white, or greeniſh colour. They are propagated by off-ſets or cuttings; and muſt be potted in light ſandy compoſt, retained in a ſunny part of the green-houſe all winter, and very ſparingly watered. In ſummer they may be placed in the full air in a ſheltered place, and in dry weather watered twice a-week.

CRASSUS (M. Licinius), a celebrated Roman, ſurnamed *Rich* on account of his opulence. At firſt he was very circumſcribed in his circumſtances, but by educating ſlaves and ſelling them at a high price he ſoon enriched himſelf. The cruelties of Cinna obliged him to leave Rome, and he retired to Spain, where he remained concealed for 8 months. After Cinna's death he paſſed into Africa, and thence to Italy, where he ſerved Sylla and ingratiated himſelf in his favour. When the Gladiators with Spartacus at their head had ſpread an univerſal alarm in Italy and defeated ſome of the Roman generals, Craſſus was ſent againſt them. A battle was fought, in which Craſſus ſlaughtered 12,000 of the ſlaves, and by this deciſive blow ſoon put an end to the war, and was honoured with an *ovatio* at his return. He was ſoon after made conſul with Pompey in the year of Rome 682, and in this high office he diſplayed his opulence by entertaining the populace at 10,000 tables. He was afterwards Cenſor, and formed the firſt triumvirate with Pompey and Cæſar. As his love of riches was more predominant than that of glory, Craſſus never imitated the ambitious conduct of his colleagues, but was ſatisfied with the province of Syria, which ſeemed to promiſe an inexhauſtible ſource of wealth. With hopes of enlarging his poſſeſſions he ſet off from Rome, though the omens proved unfavourable, and every thing ſeemed to threaten his ruin. He croſſed the Euphrates, and forgetful of the rich cities of Babylon and Seleucia, he haſtened to make himſelf maſter of Parthia. He was betrayed in his march by the delay of Artavaſdes, king of Armenia, and the perfidy of Ariamnes. He was met in a large plain by Surena the general of the forces of Orodes king of Parthia, and a battle was fought in which 20,000 Romans were killed and 10,000 taken priſoners. The darkneſs of the night favoured the eſcape of the reſt; and Craſſus, forced by the mutiny and turbulence of his ſoldiers, and the treachery of his guides, truſted himſelf to the general of the enemy on pretence of propoſing terms of accommodation, and he was killed. His head was cut off and ſent to Orodes, who poured melted gold down his throat, and inſulted his misfortunes. Though he has been called avaricious, yet he ſhowed himſelf always ready of lending money to his friends without intereſt. He was fond of philoſophy, and his knowledge of hiſtory was great and extenſive.

CRATÆGUS, wild-service tree, hawthorn, &c.: A genus of the digynia order, belonging to the icoſandria claſs of plants; and in the natural method ranking under the 36th order, *Pomaceæ*. The calyx is quinquefid; the petals five; the berry inferior, diſpermous. There are ten ſpecies, all of the tree and ſhrub kind, hardy and deciduous. Thoſe moſt valuable for economical and ornamental purpoſes in gardening are the following.

1. The oxycanthus, hawthorn, or white-thorn, grows naturally all over Europe. In the ſtate in which we are uſed to obſerve it, it is nothing better than a tall, uncouth, irregular ſhrub; but trained up as a ſtandard, it ſwells to a large timber ſize, with a tall ſtem and a full ſpreading head. The ſtandard hawthorn, whether we view its flowers in the ſpring, its foliage in the ſummer, or its fruit in the autumn and winter, is one of the moſt ornamental plants, ſtanding ſingly, that can be ſcattered over a park or lawn. Its uſes will be explained under the article Hedges.

In order to propagate a quantity of quick, one method is generally practiſed; namely, firſt burying the haws, and taking them up to ſow the October following; though, ſays Hanbury, there is another way more preferable; namely, to prepare the beds and ſow the haws ſoon after they are gathered. Whoever purſues the former method, having gathered what quantity of haws will anſwer his purpoſe, ſhould in ſome bye-corner of the kitchen-garden or nurſery dig an hole or pit capacious enough to receive them; ſome of the earth which came out of the hole, after the haws are put in it, ſhould be laid upon them; and being thus carefully covered down, they may remain there till October. Then, having ground well dug, and cleared of the roots of all troubleſome weeds, and the mould being fit for working, the beds ſhould be made for the haws. Four feet is a very good width for theſe beds, as they may be eaſily reached over to be weeded; and if the alleys between be each one foot and a half wide, they will be of a good ſize. The beds being marked out with a line, ſufficient mould muſt be raked out to cover the haws an inch and an half deep. This being done, and the bottom of the beds being made level and even, the haws ſhould be ſown, and afterwards gently tapped down with the back of the ſpade; and then the fine mould, which had been raked out of the beds, muſt be thrown over them, covering them an inch and an half deep. In the ſpring the plants will come up, and in the ſummer following ſhould be kept clear of weeds; though it does ſometimes happen, that few of them will appear till the ſecond ſpring after ſowing. Sometimes the young

Cratægus.

young plants are planted out from the ſeed-beds at one, two, or three years old; but the beſt plants are obtained by tranſplanting them into freſh mould the firſt or ſecond year, letting them remain in the nurſery two or three years longer. The practice of the London nurſerymen is this: The ſtrongeſt of the ſeed-bed plants having been drawn at two or three years old for ſale, they clear the beds entirely by drawing the remaining weak underling plants, and tranſplanting them into freſh beds in this manner, which they call *bedding them:* The ground having been trenched, and the tips of the plants, as well as the lower fibres of their roots having been taken off with a ſharp knife, they ſtrain a line along one ſide of the bed; and by chopping with a ſpade by the ſide of the line, leave a clift or drill of a depth proportioned to the length of the plants to be laid in; and drawing the looſe mould ſomewhat towards them, leave the ſide of the drill next to the line with a ſmooth poliſhed face. Againſt this face the plants are ſet up, leaning towards the line, about three inches aſunder, leaving their heads about an inch above the mould, and placing their roots at ſuch a depth as to bury their ſtems from two to three inches deeper than they ſtood in the ſeed-bed. The looſe mould being returned and preſſed gently to the roots with the foot, the line is removed, and another row planted in the ſame manner about a foot from the firſt.

The common hawthorn ſports in the following varieties; The large ſcarlet hawthorn; the yellow hawthorn; the white hawthorn; the maple-leaved hawthorn; the double-bloſſomed hawthorn: the Glaſtonbury thorn. The large ſcarlet hawthorn is no more than a beautiful variety of the common haw. It is exceedingly large, oblong, perfectly ſmooth, and of a bright ſcarlet; and from the additional ſplendor it acquires by the berries, it is propagated to cauſe variety in plantations for obſervation and pleaſure. Yellow haw is a moſt exquiſite plant. The buds at their firſt coming out in the ſpring are of a fine yellow, and the fruit is of the colour of gold. The tree is a great bearer, and retains its fruit all winter, cauſing a delightful effect in plantations of any kind. It is a native of Virginia, is greatly admired, and no collection of hardy trees ſhould be without it. White haw is but a paltry tree compared with the former. It hardly ever grows to the height of the common hawthorn, is an indifferent bearer, and the fruit is ſmall and a very bad white. Maple-leaved hawthorn will grow to be near twenty feet high, and has very few thorns. The leaves are larger than the common hawthorn, reſemble thoſe of the maple, and are of a whitiſh-green colour. The flowers are produced in large bunches in June, and are ſucceeded by remarkable fruit, of a ſhining red, which looks beautiful in the winter. Double bloſſomed hawthorn produces a full flower, and is one of the ſweeteſt ornaments in the ſpring. Nature ſeems to have peculiarly deſigned this ſort for the pleaſure-garden; for though it be the common hawthorn only with the flowers doubled, yet it may be kept down to what ſize the owner pleaſes; ſo that it is not only ſuitable for wilderneſs-quarters, ſhrubberies, and the like, but is alſo uſeful for ſmall gardens, where a tree or two only are admitted. Theſe beautiful double flowers come out in large bunches in May, and the tree is ſo good a bearer that it will often appear covered with them. Their colour at their firſt appearance is a delicate white: They afterwards die to a faint red colour, and are freqnently ſucceeded by ſmall imperfect fruit. Glaſtonbury thorn differs in no reſpect from the common hawthorn, only that it ſometimes flowers in the winter. It is ſaid to have originally been the ſtaff of Joſeph of Arimathea, that noble counſellor who buried Chriſt. He, according to the tradition of the abbey of Glaſtonbury, attended by eleven companions, came over into Britain, and founded, in honour of the Bleſſed Virgin, the firſt Chriſtian church in that iſle. As a proof of his miſſion, he is ſaid to have ſtuck his ſtaff into the ground, which immediately ſhot forth and bloomed. This tree is ſaid to have bloſſomed on Chriſtmas-day ever ſince, and is univerſally diſtinguiſhed by the name of the *Glaſtonbury thorn.* Hanbury ſays, I have many plants that were originally propagated from this thorn: and they often flower in the winter, but there is no exact time of their flowering; for in fine ſeaſons they will ſometimes be in blow before Chriſtmas, ſometimes they afford their bloſſoms in February, and ſometimes it ſo happens that they will be out on Chriſtmas day.

Cratægus.

2. The azarolus, or azarole thorn, is a native of Italy and the ſouth of France. It will grow to be fifteen or ſixteen feet high. The leaves are large, nearly trifid, ſerrated and obtuſe. The flowers are large, come out in May, and in the different varieties are ſucceeded by fruit of different ſize, ſhape, and reliſh. The principal varieties of this ſpecies are: The azarole with ſtrong thorns; the azarole with no thorns; the jagged leaved azarole; the oriental medlar.

3. The aria theophracti, called the *white leaf-tree,* is a native of moſt of the cold countries of Europe. It will grow to be more than twenty feet high. This tree is engaging at all times of the year, and catches the attention even in the winter; for then we ſee it ſtand, though naked of leaves, with a fine ſtrait ſtem, with ſmooth branches, ſpotted with white, at the end of which are the buds, ſwelled for the next year's ſhoot, giving the tree a bold and fine appearance. In the ſpring the leaves come out of courſe, and look delightfully, having their upper ſurface green and the lower white. Their figure is oval; they are unequally ſerrated, about three inches long, and half as wide. Several ſtrong nerves run from the mid-rib to the border, and they are placed alternately on the branches which appear as if powdered with the fineſt meal. The flowers are produced at the end of the branches in May; they are white, grow in large bunches, having meally footſtalks; and are ſucceeded by red berries, which will be ripe in autumn.

5. The terminalis, wild ſervice, or maple leaved ſervice, is a large growing tree, native of England, Germany, Switzerland, and Burgundy. It will arrive to near fifty feet, and is worth propagating for the ſake of the timber, which is very white and hard. This tree grows naturally in ſeveral woods in England; and it is the fruit of this ſpecies that is tied in bunches and expoſed for ſale in the autumn: It is gathered in the woods, and by ſome perſons is much liked. The leaves in ſome degree reſemble thoſe of the maple tree in ſhape; their upper ſurface is a fine green, their un-

der hoary; and they grow alternately on the branches. The flowers come out in May, exhibiting themſelves in large cluſters at the ends of the branches: They are white, and are ſucceeded by the aforeſaid eatable fruit, which when ripe is of a brown colour, and about the ſize of a large haw.

5. The coccinea, or Virginian azarole, is a native of Virginia and Canada. It will grow to be near twenty feet high. The ſtem is robuſt, and covered with a light-coloured bark. The branches are produced without order, are of a dark brown colour, and poſſeſſed of a few ſharp thorns. The leaves are ſpear-ſhaped, oval, ſmooth, and ſerrated; of a thickiſh conſiſtence, and often remain on the tree the greateſt part of the winter. Each ſeparate flower is large; but as few of them grow together, the umbels they form are rather ſmall. They come out in May, and are ſucceeded by large dark-red-coloured fruit, which ripens late in the autumn. The varieties of this ſpecies are: The pear-leaved thorn; the plum-leaved thorn with very long ſtrong ſpines and large fruit; the plum-leaved thorn with ſhort ſpines and ſmall fruit.

6. The crus galli, or cockſpur thorn, is a native of Virginia and Canada, and grows to about twenty feet high. It riſes with an upright ſtem, irregularly ſending forth branches, which are ſmooth, and of a browniſh colour, ſpotted thinly with ſmall white ſpots. It is armed with thorns that reſemble the ſpurs of cocks, which gained it the appellation of cockſpur thorn. In winter the leaf-buds appear large, turgid, and have a bold and pleaſant look among others of different appearances. In ſummer this tree is very delightful. The leaves are oval, angular, ſerrated, ſmooth, and bend backwards. They are about four inches long, and three and a half broad; have five or ſix pair of ſtrong nerves running from the mid rib to the border; and die to a browniſh-red colour in the autumn. The flowers are produced in very large umbels, making a noble ſhow in May; and are ſucceeded by large fruit of a bright red colour, which have a good effect in the winter. The principal varieties of this ſpecies are: The cockſpur hawthorn with many thorns; the cockſpur hawthorn with no thorns; the cockſpur with eatable fruit. "The latter was ſent me (ſays Hanbury) from America with that name, and I have raiſed ſome trees of the ſeed; but they have not yet produced any fruit, ſo that I cannot pretend to ſay how far it may be deſirable; though I have been informed it is reliſhed in America by ſome of the inhabitants there."

7. The tomentoſa, gooſeberry-leaved Virginia hawthorn, grows to about ſeven or eight feet high. The branches are ſlender, and cloſely ſet with ſharp thorns. The leaves are cuneiform, oval, ſerrated, and hairy underneath. The flowers are ſmall, and of a white colour: They are produced from the ſides of the branches about the end of May; and are ſucceeded by yellow fruit, which ripens late in autumn. There is a variety of this called the *Carolina Hawthorn*, which has longer and whiter leaves, larger flowers and fruit, and no thorns.

8. The viridis, or green-leaved Virginia hawthorn, has the ſtem and branches altogether deſtitute of thorns. The leaves are lanceolate, oval, nearly trilobate, ſerrated, ſmooth, and green on both ſides. The flowers are white, moderately large, come out the end of May, and are ſucceeded by a roundiſh fruit, which will be ripe late in the autumn.

The reſpective ſpecies are all propagated by ſowing of the ſeeds; and the varieties are continued by budding them upon ſtocks of the white thorn. This latter method is generally practiſed for all the ſorts; though when good ſeeds can be procured, the largeſt and moſt beautiful plants are raiſed that way. 1. In order to raiſe them from ſeeds, let theſe be ſown ſoon after they are ripe, in beds of freſh, light, rich earth. Let alleys be left between the beds, for the conveniency of weeding, and let the ſeeds be covered over with fine mould about an inch deep. The ſummer following the beds muſt be kept clean of weeds, and probably ſome few plants will appear: But this is not common in any of the ſorts; for they generally lie till the ſecond ſpring after ſowing before they come up. At the time they make their appearance they muſt be watered if the weather proves dry; and this ſhould be occaſionally repeated all ſummer. They ſhould alſo be conſtantly kept clean from weeds; and in the autumn the ſtrongeſt may be drawn out, and ſet in the nurſery-ground, a foot aſunder, in rows that are two feet diſtant from each other; while the weakeſt may remain until another year. During the time they are in the nurſery, the ground between the rows ſhould be dug every winter, and the weeds conſtantly hoed down in the ſummer; and this is all the trouble they will require until they are planted out for good, which may be in two, three, or more years, at the pleaſure of the owner, or according to the purpoſes for which they are wanted. 2. Theſe trees are eaſily propagated by budding alſo; they will all readily take on one another; but the uſual ſtocks are thoſe of the common hawthorn. In order to have theſe the beſt for the purpoſe, the haws ſhould be got from the largeſt trees, ſuch as have the feweſt thorns and largeſt leaves. After they are come up, and have ſtood one year in the ſeed-bed, the ſtrongeſt ſhould be planted out in the nurſery, a foot aſunder and two feet diſtant in the rows; and the ſecond ſummer after many of them will be fit for working. The end of July is the beſt time for this buſineſs; and cloudy weather, night and morning, are always preferable to the heat of the day. Having worked all the different ſorts into theſe ſtocks, they may be let alone until the latter end of September, when the baſs matting ſhould be taken off. In the winter the ground between the rows ſhould be dug, and in the ſpring the ſtock ſhould be headed about half a foot above the bud. The young ſhoots the ſtocks will always attempt to put out, ſhould be as conſtantly rubbed off; for theſe would in proportion ſtarve the bud and ſtop its progreſs. With this care ſeveral of the ſorts have been known to ſhoot ſix feet by the autumn; and as they will be liable to be blown out of their ſockets by the high winds which often happen in the ſummer, they ſhould be ſlightly tied to the top of the ſtock that is left on for the purpoſe, and this will help to preſerve them.

CRATCHES, in the manege, a ſwelling on the paſtern, under the fetlock, and ſometimes under the hoof; for which reaſon it is diſtinguiſhed into the ſinew cratches, which affect the ſinew, and thoſe upon the cronet, called *quitter-bones*.

CRATER, Cup, in aſtronomy, a conſtellation of the ſouthern hemiſphere; whoſe ſtars, in Ptolemy's Catalogue, are ſeven; in Tycho's, eight; in Hevelius's, ten; in the Britannic Catalogue, thirty-one.

Crater is alſo uſed to ſignify the mouth or opening of a volcano or burning mountain, from whence the fire is diſcharged. See Volcano.

CRATES, of Thebes, a famous philoſopher, was the diſciple of Diogenes the Cynic. It is ſaid that he threw all his money into the ſea, that he might the more freely apply himſelf to the ſtudy of philoſophy. Others aſſert that he placed it in another perſon's hands, with orders to give it to his children if they ſhould happen to be fools: For (ſaid Crates), if they ſhould be philoſophers, they will have no need of it: in which caſe it was to be given to the people. He flouriſhed about 328 years before Chriſt.

He ought not to be confounded with Crates, a famous academic philoſopher, the diſciple and friend of Polemon. This laſt Crates had Arceſilaus and other celebrated philoſophers for his diſciples; and flouriſhed about 300 years before Chriſt.

CRATEVA, the garlic pear: A genus of the monogynia order, belonging to the dodecandria claſs of plants; and in the natural method ranking under the 25th order, *Putamineæ*. The corolla is tetrapetalous; the calyx quadrifid; the berry inferior diſpermous. There are two ſpecies, both of them natives of ſeveral parts of India. They are both of the tree kind; and are chiefly diſtinguiſhed by their fruit. The tapia, or garlic pear, has a ſmooth round fruit about the ſize of an orange, with a hard brown ſhell or cover, which incloſes a meally pulp, filled with kidney-ſhaped ſeeds. It hath a ſtrong ſmell of garlic, and communicates the ſame to ſuch animals as feed upon it. The tender buds from the young branches being bruiſed and applied to the naked ſkin, will bliſter as effectually as cantharides. It riſes to the height of about 30 feet. The other grows to the ſize of a very large tree, with trifoliate leaves, ſawed on the edges. The flowers have the ſmell of roſes, and are ſucceeded by an oblong fruit of the ſize of an apple, covered with a very hard bony ſhell, and containing a ſoft fleſhy pulp, having the taſte of quinces. From the flowers of this plant is obtained by diſtillation a water highly odoriferous and cordial. The pulpy part of the fruit is prepared into various kinds of marmalades, which are exceedingly agreeable to the taſte, and are much uſed by the grandees in thoſe countries where the trees are native: they are alſo reckoned ſerviceable in dyſenteries. Both ſpecies may be propagated in Britain by ſeeds. Theſe are to be ſown upon a hot-bed in the ſpring; and when the plants come up, they are to be treated in the manner directed for the Annona.

CRATINUS, an ancient comic poet, of whom we ſhould ſcarcely have known any thing, had not Quintilian, Horace, and Perſius, mentioned him, Eupolis, and Ariſtophanes, as the great maſters of what we call the ancient comedy. It is gathered that he died in the 87th Olympiad. Suidas tells us that he wrote 21 plays, and that he was ſplendid and bright in his characters.

CRATIPPUS, a celebrated peripatetic philoſopher, was a native of Mitylene, where he taught philoſophy; but at length went to Athens, where Brutus and the ſon of Cicero were his diſciples. Pompey went to ſee him after the battle of Pharſalia, and propoſed to him his difficulties in relation to the belief of a Providence; when Cratippus comforted him, and by forcible arguments anſwered his objections. He wrote ſome pieces about divination: and is ſuppoſed to be the ſame with him whom Tertullian, in his book *De Anima*, has ranked among the writers upon dreams.

CRATO, a ſmall town of Portugal, in the province of Alentejo, with a rich priory. It is the chief commandery which the knights of Malta have in Portugal. W. Long. 8. 12 N. Lat. 38. 50.

CRAVAN, a town of France, in Burgundy, remarkble for its good wine, and for a battle fought there between the Engliſh and French. It is ſeated near the confluence of the rivers Cure and Yonne. E. Long. 3. 30. N. Lat. 47. 42.

CRAVEN, or Cravent, a word of reproach, uſed in trials by battel. See Battel.

CRAX; in ornithology, the curaſſou, a genus of birds belonging to the order of gallinæ. The baſe of the beak of each mandible is covered with wax; and the feathers of the head are curled. There are five ſpecies, viz. 1. The alecator, or Indian hen of Sloane, is about the ſize of a ſmall turkey. It is black, with a white belly. A yellow wax covers about one half of each mandible; the tongue is entire; the temples are bare and black; the tail is roundiſh and conſiſts of 14 prime feathers; the legs are ſtrong, and of a duſky brown colour. They are frequent at Guiana; and are called *poweſe* by the natives from their cry, which is ſomewhat ſimilar; are pretty numerous in the woods, and make no ſmall part of the food of the planters, being ſupplied therewith by the Indian hunters; and their fleſh is reckoned delicate, much like that of a turkey. They are eaſily brought up tame, and are frequently found in the Dutch ſettlements of Berbice, Eſſequebo, and Demerary. They are called at Braſil by the name of *curaſſo*. It is found in the warm parts of America. 2. The rubra, or Peruvian hen, is red, with a bluiſh head: it is a native of Peru. Theſe birds are natives of Mexico and Peru. They feed on fruits, and perch at nights on trees: the fleſh is white; and eſteemed very good food. They are frequently kept tame in the menageries in England, and readily mix with other poultry, feeding on bread and grain; but that climate is not near warm enough for their nature, they not being able to bear the dampneſs of the graſs of the meadows, which renders them ſubject to have their toes rot off. They will often live in this ſtate ſome time; and in one inſtance which Mr Latham ſaw, the whole of one foot was gone, and but part of one toe left on the other, before the creature died. 3. The mitu, or Braſilian pheaſant is black, with a duſky belly, and red wax: it is a native of Guinea and Brazil. 4. The globicera, has a yellow protuberance between the noſtrils, and is of a bluiſh black colour: it is likewiſe a native of Brazil. 5. The pauxi, or Meixcan pheaſant of Briſſonius, is of a bluiſh colour, with blue wax, and the tip of the tail and belly white: it is a native of Mexico.

Plate CLI.

CRAY-fish, or Craw-*Fiſh*. See Cancer.

The fleſh of cray-fiſh is cooling, moiſtening, and adapted to nouriſh ſuch as labour under atrophies. There are various methods of preparing theſe animals; they may be either boiled or fried, and then taken out of their ſhells, and made up in a variety of diſhes: but no parts of them are eatable except their claws and tails. Preparations and broths of cray-fiſh are celebrated not only for a palatable aliment, but alſo for anſwering ſome medicinal intentions, as being of a moiſtening quality, and ſheathing up and correcting acrimony. The broth is prepared of four or five craw-fiſh, which having their heads cut off, and their inteſtines extracted, are to be bruiſed and boiled in the broth of fleſh or poultry, until they become ſufficiently red; after which the liquor is to be ſtrained off and ſeaſoned, as the caſe may require. This broth may be rendered ſtill more medicinal by the addition of herbs, ſnails, or other ſubſtances; according to the intention of the phyſician. Their fleſh is accounted beſt in the ſummer months.

The delicate flavour of theſe fiſh depends, in a great meaſure on their food. When they have well-taſted food, their fleſh preſerves the reliſh of it: but when they feed on other things, they are often rendered of no value, by the flavour communicated to their fleſh by them. There are great quantities of theſe fiſh in the river Obra, on the borders of Sileſia, but the people find them ſcarce eatable, becauſe of a bitter aromatic flavour, very diſagreeable in food. It has been ſince obſerved, that the *calamus aromaticus* grows in vaſt abundance on the banks of that river, and that theſe creatures feed very greedily upon its roots. Theſe have a very remarkable bitterneſs mixed with their aromatic flavour, while freſh, which goes off very much in the drying; and on comparing the taſte of theſe roots with that of the cray-fiſh, there remains no doubt of the one being owing to the other.

They abound in the river Don in Muſcovy, where they are laid in heaps to putrefy; after which the ſtones called *crab's eyes* are picked out. Theſe animals are very greedy of fleſh, and flock in great numbers about carcaſes thrown into the water where they are, and never leave it while any remains. They alſo feed on dead frogs when they come into their way. In Swiſſerland there are ſome cray-fiſh which are red while they are alive, and others bluiſh. Some kinds of them alſo will never become red, even by boiling, but continue blackiſh.

The cray-fiſh diſcharges itſelf of its ſtomach, and, as M. Geoffroy thinks, of its inteſtines too. Theſe, as they putrefy and diſſolve, ſerve for food to the animal; during the time of the reformation, the old ſtomach ſeems to be the firſt food the new one digeſts. It is only at this time that the ſtones are found called *crab's eyes*; they begin to be formed when the old ſtomach is deſtroyed, and are afterwards wrapped up in the new one, where they decreaſe by degrees till they entirely diſappear.

CRAYER (Caſper de), was born at Antwerp in 1585, and was a diſciple of Raphael Coxis, the ſon of that Coxis who had ſtudied under Raphael; but he ſoon ſhowed ſuch proofs of genius, and of an elevated capacity, that he far ſurpaſſed his maſter, and therefore quitted him. Afterwards he made judicious obſervations on the particular excellencies of the moſt renowned maſters to which he had any acceſs; and taking nature for his conſtant director and guide, he formed for himſelf a manner that was exceedingly pleaſing. The firſt work which eſtabliſhed him in the favour of the court at Bruſſels, was a portrait of Cardinal Ferdinand, brother to the King of Spain, which he painted at full length, and as large as life. In that picture he ſucceeded ſo happily, that it was ſent to Madrid, and received there with ſuch concurrent approbation of the king and the whole court, that it laid the foundation of the fame and fortune of Crayer. For the king, as an acknowledgment of the painter's merit, ſent him a gold chain with a medal; and added, as a farther inſtance of his favour, an appointment for a conſiderable penſion. But nothing places the talents of Crayer in a ſtronger light, than the teſtimony of ſo excellent an artiſt as Rubens. That great man went to Antwerp particularly to viſit Crayer, and to ſee his work; and after examining attentively a picture of his painting, in the refectory of the abbey of Affleghem, he publicly declared that no painter could ſurpaſs Crayer. Nor was this maſter leſs diſtinguiſhed by Vandyck, who always expreſſed a real eſteem and friendſhip for him, and painted his portrait. He had ſomewhat leſs fire in his compoſitions than Rubens, but his deſign is frequently more correct. His compoſition generally conſiſted of a ſmall number of figures; and with diſcreet judgment, he avoided the encumbering his deſign with ſuperfluous particulars, or loading his ſubject with any thing that ſeemed not to contribute to its elegance or probability. He grouped his figures with ſingular ſkill, and his expreſſions have all the truth of nature. There is a remarkable variety in his draperies, and an equal degree of ſimplicity in their folds; and as to his colouring, it is admirable. Of all his cotemporary painters, he was accounted to approach neareſt to Vandyck, not only in hiſtory but in portrait. He principally painted religious ſubjects, and was continually at work, and although he lived to a great age, yet his temperance and conſtant regularity preſerved to him the full uſe of all his faculties; and to the laſt month of his life his pencil retained the ſame force and freedom which it poſſeſſed in his moſt vigorous time. The ſubject of that picture which was ſo honoured by the approbation of Rubens is the Centurian alighting from his horſe to proſtrate himſelf at the feet of our Saviour. It is a capital deſign of Crayer; and although it conſiſts of a great number of figures, the harmony and union are well preſerved.

CRAYON, a general name for all coloured ſtones, earths, or other minerals and ſubſtances, uſed in deſigning or painting in paſtel; whether they have been beaten and reduced to a paſte, or are uſed in their primitive conſiſtence, after ſawing or cutting them into long narrow ſlips. In this laſt manner are red crayons made of blood-ſtone or red chalk; black ones, of charcoal and black lead. Crayons of all other colours are compoſitions of earths reduced to paſte.

Crayon Painting. Whether the painter works with oil-colours, water-colours, or crayons, the grand object of his purſuit is ſtill the ſame: a juſt imitation of nature. But each ſpecies has its peculiar rules and methods. Painting with crayons requires in many reſpects a treatment different from painting in oil-colours; becauſe all colours uſed dry are in their nature of a much warmer complexion than when wet with oils, &c. For this reaſon, in order to produce a rich picture, a much greater portion of what painters term *cooling teints* muſt be applied in crayon-painting than would be judicious to uſe in oils. Without any danger of a miſtake, it is to be ſuppoſed, the not be-

being acquainted with this obſervation is one great cauſe why ſo many oil-painters have no better ſucceſs when they attempt crayon-painting. On the contrary, crayon-painters being ſo much uſed to thoſe teints which are of a cold nature when uſed wet, are apt to introduce them too much when they paint with oils, which is ſeldom productive of a good effect.

We ſhall now endeavour to give the ſtudent ſome directions towards the attainment of excellence in this art.

Of the Application of the Crayons, with ſome previous Diſpoſitions. The ſtudent muſt provide himſelf with ſome ſtrong blue paper, the thicker the better, if the grain is not too coarſe or knotty, though it is almoſt impoſſible to get any entirely free from knots. The knots ſhould be levelled with a penknife or razor, otherwiſe they will be exceedingly troubleſome. After this is done, the paper muſt be paſted very ſmooth on a linen cloth, previouſly ſtrained on a deal frame, the ſize according to the artiſt's pleaſure: on this the picture is to be executed; but it is moſt eligible not to paſte the paper on till the whole ſubject is firſt dead-coloured. The method of doing this is very eaſy, by laying the paper with the dead-colour on its face, upon a ſmooth board or table, when, by means of a bruſh, the backſide of the paper muſt be covered with paſte; the frame, with the ſtrained cloth, muſt then be laid on the paſted ſide of the paper; after which turn the painted ſide uppermoſt, and lay a piece of clean paper upon it, to prevent ſmearing it: this being done, it may be ſtroaked gently over with the hand; by which means all the air between the cloth and the paper will be forced out.

When the paſte is perfectly dry, the ſtudent may proceed with the painting. The advantages ariſing from paſting the paper on the frame according to this method, after the picture is begun, are very great, as the crayons will adhere much better than any other way; which will enable the ſtudent to finiſh the picture with a firmer body of colour and greater luſtre.

When the painters want to make a very correct copy of a picture, they generally make uſe of tiffany or black gauze, ſtrained tight on a frame, which they lay flat on the ſubject to be imitated, and with a piece of ſketching chalk trace all the outlines on the tiffany. They then lay the canvas to be painted on flat upon the floor, placing the tiffany with the chalked lines upon it, and with an handkerchief bruſh the whole over: this preſents the exact outlines of the picture on the canvas. The crayon-painter may alſo make uſe of this method when the ſubject of his imitation is in oils; but in copying a crayon-picture, he muſt have recourſe to the following method, on account of the glaſs.

The picture being placed upon the eaſel, let the outlines be drawn on the glaſs with a ſmall camel's hair pencil dipped in lake, ground thin with oils, which muſt be done with great exactneſs. After this is accompliſhed, take a ſheet of paper of the ſame ſize and place it on the glaſs, ſtroking over all the lines with the hand, by which means the colour will adhere to the paper, which muſt be pierced with pin-holes pretty cloſe to each other. The paper intended to be uſed for the painting muſt next be laid upon a table, and the pierced paper placed upon it; then with ſome fine-pounded charcoal, tied up in a piece of lawn, rub over the pierced lines, which will give an exact outline; but great care muſt be taken not to bruſh this off till the whole is drawn over with ſketching chalk, which is a compoſition made of whiting and tobacco-pipe clay, rolled like the crayons, and pointed at each end.

When a ſtudent paints immediately from the life, it will be moſt prudent to make a correct drawing of the outlines on another paper, the ſize of the picture he is going to paint, which he may trace by the preceding method, becauſe erroneous ſtrokes of the ſketching chalk (which are not to be avoided without great expertneſs) will prevent the crayons from adhering to the paper, owing to a certain greaſy quality in the compoſition.

The ſtudent will find the ſitting poſture, with the box of crayons in his lap, the moſt convenient method for him to paint. The part of the picture he is immediately painting ſhould be rather below his face; for, if it is placed too high, the arm will be fatigued. Let the windows of the room where he paints be darkened, at leaſt to the height of ſix feet from the ground; and the ſubject to be painted ſhould be ſituated in ſuch a manner, that the light may fall with every advantage on the face, avoiding too much ſhadow, which ſeldom has a good effect in portrait-painting, eſpecially if the face he paints from has any degree of delicacy.

Before he begins to paint, let him be attentive to his ſubject, and appropriate the action or attitude proper to the age of the ſubject: if a child, let it be childiſh; if a young lady, expreſs more vivacity than in the majeſtic beauty of a midle-aged woman, who alſo ſhould not be expreſſed with the ſame gravity as a perſon far advanced in years. Let the embelliſhments of the picture, and introduction of birds, animals, &c. be regulated by the rules of propriety and conſiſtency.

The features of the face being correctly drawn with chalks, let the ſtudent take a crayon of pure carmine, and carefully draw the noſtril and edge of the noſe next the ſhadow; then, with the fainteſt carmine teint, lay in the higheſt light upon the noſe and forehead, which muſt be executed broad. He is then to proceed gradually with the ſecond teint, and the ſucceeding ones, till he arrives at the ſhadows, which muſt be covered brilliant, enriched with much lake, carmine, and deep green. This method will at firſt offenſively ſtrike the eye, from its crude appearance; but in the finiſhing, it will be a good foundation to produce a pleaſing effect, colours being much more eaſily ſullied when too bright, than when the firſt colouring is dull, to raiſe the picture into a brilliant ſtate. The ſeveral pearly teints diſcernible in fine complexions muſt be imitated with blue verditer and white, which anſwers to the ultramarine teints uſed in oils. But if the parts of the face where theſe teints appear are in ſhadow, the crayons compoſed of black and white muſt be ſubſtituted in their place.

Though all the face when firſt coloured ſhould be laid in as brilliant as poſſible, yet each part ſhould be kept in its proper tone; by which means the rotundity of the face will be preſerved.

Let the ſtudent be careful when he begins the eyes to draw them with a crayon inclined to the carmine teint, of whatever colour the iriſes are; he muſt lay them in brilliant, and at firſt not loaded with colour, but executed lightly: no notice is to be taken of the pupil yet. The ſtudent muſt let the light of the eye incline very much to the blue caſt, cautiouſly avoiding a ſtaring white appearance, (which, when once introduced, is ſeldom overcome), preſerving a broad ſhadow thrown on its upper part, by the eye-laſh. A black and heavy teint is alſo to be avoided in the eye-brows; it is therefore beſt to execute them like a broad glowing ſhadow at firſt, on which, in the finiſhing, the hairs of the brow are to be painted; by which method of proceeding, the former teints will ſhow themſelves through, and produce the moſt pleaſing effect.

The ſtudent ſhould begin the lips with pure carmine and lake, and in the ſhadow uſe ſome carmine and black; the ſtrong vermilion teints ſhould be laid on afterwards. He muſt beware of executing them with ſtiff, harſh lines, gently intermixing each with the neighbouring colours, making the ſhadow beneath broad, and enriched with brilliant crayons. He muſt form the corner of the mouth with carmine, brown ochre, and greens, variouſly intermixed. If the hair is dark, he ſhould preſerve much of the lake and deep carmine teints therein; this may eaſily be overpowered by the warmer hair teints, which, as obſerved in painting the eye-brows, will produce a richer effect when the picture is finiſhed; on the contrary, if this method is unknown or neglected, a poverty of colouring will be diſcernible.

After the ſtudent has covered over, or as artiſts term it, has dead-coloured the head, he is to ſweeten the whole together, by rubbing it over with his finger, beginning at the ſtrongeſt light upon the forehead, paſſing his finger very lightly, and uniting it with the next teint, which he muſt continue till the whole is ſweetened together, often wiping his finger on a towel to prevent the colours being ſullied. He muſt be cautious not to ſmooth or ſweeten his picture too often, becauſe it will give riſe to a thin and ſcanty effect, and have more the appearance of a drawing than a ſolid painting; as nothing but a body of rich colours can conſtitute a rich effect. To avoid this (as the ſtudent finds it neceſſary to ſweeten with the finger), he muſt commonly repleniſh the picture with more crayon.

When the head is brought to ſome degree of forwardneſs, let the back-ground be laid in, which muſt be treated in a different manner, covering it as thin as poſſible, and rubbing it into the paper with a leather ſtump. Near the face the paper ſhould be almoſt free from colour, for this will do great ſervice to the head, and by its thinneſs give both a ſoft and ſolid appearance. In the back ground alſo, no crayon that has whiting in its compoſition ſhould be uſed, but chiefly ſuch as are the moſt brilliant and the leaſt adulterated. The ground being painted thin next the hair, will give the ſtudent an opportunity of painting the edges of the hair over in a light and free manner when he gives the finiſhing touches.

The ſtudent having proceeded thus far, the face, hair, and back-ground being entirely covered, he muſt carefully view the whole at ſome diſtance, remarking in what reſpect it is out of keeping, that is, what parts are too light and what too dark, being particularly attentive to the white or chalky appearances, which muſt be ſubdued with lake and carmine. The above method being properly put into execution, will produce the appearance of a painting, principally compoſed of three colours, viz. carmine, black, and white, which is the beſt preparation a painter can make for the producing a fine crayon picture.

The next ſtep is, to complete the back-ground and the hair, as the duſt, in painting theſe, will fall on the face, and would much injure it if that was completed firſt. From thence proceed to the forehead, finiſhing downward till the whole picture is completed.

In painting over the forehead the laſt time, begin the higheſt light with the moſt faint vermilion teint, in the ſame place where the faint carmine was firſt laid, keeping it broad in the ſame manner. In the next ſhade ſucceeding the lighteſt, the ſtudent muſt work in ſome light blue teints, compoſed of verditer and white, intermixing with them ſome of the deeper vermilion teints, ſweetening them together with great caution, inſenſibly melting them into one another, increaſing the proportion of each colour as his judgment ſhall direct. Some brilliant yellows may be uſed, but ſparingly; and towards the roots of the hair, ſtrong verditer teints, intermixed with greens, will be of ſingular ſervice. Cooling crayons, compoſed of black and white, ſhould ſucceed theſe and melt into the hair. Beneath the eyes, the ſweet pearly teints are to be preſerved, compoſed of verditer and white, and under the noſe, and on the temples, the ſame may be uſed; beneath the lips, teints of this kind alſo are proper, mixing them with the light greens and ſome vermilion.

In finiſhing the cheeks, let the pure lake clear them from any duſt contracted fom the other crayons; then with the lake may be intermixed the bright vermilion; and laſt of all (if the ſubject ſhould require it), a few touches of the orange-coloured crayon, but with extreme caution; after, ſweeten that part with the finger as little as poſſible, for fear of producing a heavy diſagreeable effect on the cheeks: as the beauty of a crayon-picture conſiſts in one colour ſhowing itſelf through, or rather between, another: this the ſtudent cannot too often remark, it being the only method of imitating beautiful complexions.

The eye is the moſt difficult feature to execute in crayons, as every part muſt be expreſſed with the utmoſt nicety, to appear finiſhed; at the ſame time that the painter muſt preſerve its breadth and ſolidity while he is particularizing the parts. To accompliſh this, it will be a good general rule for the ſtudent to uſe his crayon in ſweetening as much, and his finger as little, as poſſible. When he wants a point to touch a ſmall part with, he may break off a little of his crayon againſt the box, which will produce a corner fit to work with in the minuteſt parts. If the eye-laſhes are dark, he muſt uſe ſome of the carmine and brown ochre, and the crayon of carmine and black; and with theſe he may alſo touch the iris of the eye (if brown or hazel), making a broad ſhadow, cauſed by the eye-laſh. Red teints of vermilion, carmine, and lake, will execute the corners of the eye properly; but if the eye-lids are too red, they will have a diſagreeable ſore appearance. The pupil of the eye muſt be made of pure lamp-black: between this and the lower part of the iris, the light will catch very ſtrong, but it muſt not be made too ſudden, but be gently diffuſed round the pupil till it is loſt in ſhade. When the eye-balls are ſufficiently prepared, the ſhining ſpeck muſt be made with a pure white crayon, which ſhould be firſt broken to a point, and then laid on firm; but as it is poſſible they may be defective in neatneſs, they ſhould be corrected with a pin, taking off the redundant parts, by which means they may be formed as neat as can be required.

The difficulty, with reſpect to the noſe, is to preſerve the lines properly determined, and at the ſame time ſo artfully blended into the cheek, as to expreſs its projection, and yet no real line to be perceptible upon a cloſe examination; in ſome circumſtances it ſhould be quite blended with the cheek, which appears behind it, and determined entirely with a ſlight touch of red chalk. The ſhadow cauſed by the noſe is generally the darkeſt in the whole face, partaking of no reflection from its ſurrounding parts. Carmine and brown ochre, carmine and black, and ſuch brilliant crayons, will compoſe it beſt.

The ſtudent having before prepared the lips with the ſtrongeſt lake and carmine, &c. muſt with theſe colours make them completely correct; and when finiſhing, introduce the ſtrong vermilions, but with great caution, as they are extremely predominant. This, if properly touched, will give the lips an appearance equal, if not ſuperior, to thoſe executed in oils, notwithſtanding the ſeeming ſuperiority the latter has, by means of glazing (A), of which the former is entirely deſtitute.

When the ſtudent paints the neck, he ſhould avoid expreſſing the muſcles too ſtrong in the ſtem, nor ſhould the bones appear too evident on the cheſt, as both have an unpleaſing effect, denoting a violent agitation of the body; a circumſtance ſeldom neceſſary to expreſs in portrait-painting. The moſt neceſſary part to be expreſſed, and which ſhould ever be obſerved, (even in the moſt delicate ſubjects), is a ſtrong marking juſt above the place where the collar bones unite; and if the head is much thrown over the ſhoulders, ſome notice ſhould be taken of the large muſcle that riſes from behind the ear, and is inſerted into the pit between the collar bones. All inferior muſcles ſhould be, in general, quite avoided. The ſtudent will find this caution neceſſary, as moſt ſubjects, eſpecially thin perſons, have the muſcles of the neck much more evident than would be judicious to imitate. As few necks are too long, it may be neceſſary to give ſome addition to the ſtem, a fault on the other ſide being quite unpardonable, nothing being more ungraceful than a ſhort neck. In colouring the neck, let the ſtudent preſerve the ſtem of a pearly hue, and the light not ſo ſtrong as on the cheſt. If any part of the breaſt appears, its tranſparency muſt alſo be expreſſed by pearly teints; but the upper part of the cheſt ſhould be coloured with beautiful vermilions delicately blended with the other.

Of the Drapery. Dark blue, purple, black, pink, and all kinds of red draperies alſo, ſhould be firſt tinged with carmine, which will render the colours much more brilliant than any other method; over this ſhould be laid on the paper the middle teint (a medium between the light and dark teints, of which the drapery is to be painted), except the dark maſſes of ſhadow, which ſhould be laid on at firſt as deep as poſſible; theſe, ſweetened with the finger, being deſtitute of the ſmaller folds, will exhibit a maſterly breadth, which the leſſer folds, when added, ought by no means to deſtroy. With the light and dark teints, the ſmaller parts are next to be made with freedom, executing as much with the crayon, and as little with the finger as poſſible; in each fold touching the laſt ſtroke with the crayon, which ſtroke the finger muſt never touch. In the caſe of reflections, the ſimple touch of the crayon will be too harſh, therefore fingering will be neceſſary afterwards, as reflected lights are always more gentle than thoſe which are direct. With reſpect to reflections in general, they muſt always partake of the ſame colour as the object reflecting, but in the caſe of ſingle figures, it may be uſeful to make ſome particular obſervations.

In a blue drapery, let the reflections be of a greeniſh caſt; in green draperies, make them of a yellow teint; in yellow, of an orange; in orange, reflect a reddiſh caſt; in all reds, ſomething of their own nature, but inclined to the yellow: black ſhould have a reddiſh reflection; the reflection of a reddiſh teint will alſo preſent purples to the beſt advantage.

Of whatever colour the drapery is, the reflection on the face muſt partake thereof, otherwiſe the picture, like paintings on glaſs, will have but a gaudy effect.

Linen, lace, fur, &c. ſhould be touched ſpiritedly with the crayon, fingering very little, except the latter; and the laſt touches, even of this, like all other parts, ſhould be executed by the crayon, without ſweetening with the finger.

The methods above recommended have been practiſed by the moſt celebrated crayon-painters, whoſe works have been held in public eſtimation; but the knowledge of, and ability to execute, each ſeparate part with brilliancy and truth, will be found very inſufficient to conſtitute a complete painter, without his judgment enables him to unite them with each other, by correctneſs of drawing, propriety of light and ſhadow, and harmony of colouring. In order to accompliſh this, the ſtudent ſhould carefully avoid finiſhing one part in particular, till he has properly conſidered the connection it is to have with the reſt. The neglect of this is the principal reaſon why the performances of indifferent painters are ſo deſtitute of what is termed breadth, ſo conſpicuouſly beautiful in the works of great maſters. It muſt be granted that this obſervation relates more particularly to large compoſitions, where a diverſity of figures requires ſuch a judicious diſpoſition, that each may aſſiſt in the combination of a kind of univerſal harmony; yet, even in portrait-painting, the ſtudent ſhould be particularly attentive to obſerve this idea of breadth, if he is deſirous of acquiring that importance and dignity which conſtitutes excellence in painting.

Of the Materials. The perfection of the crayons conſiſts,

(A) The method with which painters in oils expreſs tranſparency in the lips is, by painting them firſt with light vermilion teints, and, when dry, touching them over with pure lake.

ſiſts, in a great meaſure, in their ſoftneſs; for it is impoſſible to execute a brilliant picture with them if they are otherwiſe; on which account great care ſhould be obſerved in the preparing them, to prevent their being hard. In all compoſitions, flake-white and white-lead ſhould be wholly rejected, becauſe the ſlighteſt touch with either of theſe will unavoidably turn black.

The uſual objection to crayon-paintings is, that they are ſubject to change; but whenever this happens, it is entirely owing to an injudicious uſe of the abovementioned whites, which will ſtand only in oils. To obviate the bad effects ariſing from the uſe of ſuch crayons, let the ſtudent make uſe of common whiting prepared in the following manner.

Take a large veſſel of water, put the whiting into it, and mix them well together; let this ſtand about half a minute, then pour off the top into another veſſel, and throw the gritty ſediment away; let what is prepared reſt about a minute, and then pour it off as before, which will purify the whiting and render it free from all dirt and grittineſs. When this is done, let the whiting ſettle, and then pour the water from it; after which, lay it on the chalk to dry, and keep it for uſe, either for white crayons, or the purpoſe of preparing teints with other colours, for with this all other teints may be ſafely prepared. If the ſtudent chooſes to make crayons of the whiting immediately after it is waſhed, it is not neceſſary to dry it on the chalk, for it may be mixed inſtantly with any other colour, which will ſave conſiderable trouble. All colours of a heavy or gritty nature, eſpecially blue verditer, muſt be purified by waſhing after this method.

The ſtudent muſt be provided with a large, flexible pallet-knife, a large ſtone and muller to levigate the colours, two or three large pieces of chalk to abſorb the moiſture from the colours after they are levigated, a piece of flat glaſs to prevent the moiſture from being abſorbed too much, till the colours are rolled into form, and veſſels for water, ſpirits, *&c.* as neceſſity and convenience ſhall direct.

I. Reds. It is rather difficult to procure either good carmine or good lake. Good carmine is inclined to the vermilion teint, and good lake to the carmine teint. The carmine crayons are prepared in the following manner.

1. Carmine. As their texture is inclinable to hardneſs, inſtead of grinding and rolling them, take a ſufficient quantity of carmine, lay it upon the grinding-ſtone, mix it with a levigating knife with ſpirits of wine till it becomes ſmooth and even. The chalk-ſtone being ready, lay the colour upon it to abſorb the ſpirit; but be careful that it is laid on in a proper ſhape for painting. If it is levigated too thin, the crayons will be too flat; and if too thick, it will occaſion a waſte of colour, by their adhering to the pallet-knife; but practice will render the proper degree of conſiſtency familiar. The ſimple colour being prepared, the next ſtep is to compoſe the different teints by a mixture with whiting; the proportion to be obſerved conſiſting of 20 gradations to one, which may be clearly underſtood by the following directions. Take ſome of the ſimple colour, and levigate it with ſpirits of wine, adding about one part of waſhed whiting to three parts of carmine, of which, when properly incorporated, make two parcels. The next gradation ſhould be compoſed of equal quantities of carmine and whiting, of which four crayons may be made. The third compoſition ſhould have one fourth carmine and three fourths whiting; of this make ſix crayons, which will be a good proportion with the reſt. The laſt teint ſhould be made of whiting, very faintly tinged with carmine, of which make about eight crayons, which will complete the abovementioned proportion. As theſe compound teints are levigated, they are to be laid immediately upon the chalk, that the moiſture may be abſorbed to the proper degree of dryneſs for forming into crayons, which may be known by its loſing the greater part of its adheſive quality when taken into the hand: if the conſiſtency is found to be right, it may be then laid upon the glaſs, which having no pores will prevent the moiſture from becoming too dry before it is convenient to form it into crayons, otherwiſe the crayons would be full of cracks and very brittle, which will be a great inconvenience when they are uſed in painting.

2. Lake. This is a colour very apt to be hard; to prevent which the ſtudent muſt obſerve the following particulars. Take about half the quantity of lake intended for the crayons and grind it very fine with ſpirits of wine; let it dry, and then pulverize it, which is eaſily done if the lake is good; then take the other half, and grind it with ſpirits, after which mix it with the pulverized lake, and lay it out directly in crayons on the chalk. This colour will not bear rolling. The ſimple colour being thus prepared, proceed with the compound crayons as directed before, and in the ſame degrees of gradation as the carmine teints.

3. Vermilion. The beſt is inclined to the carmine teint. Nothing is required to prepare this colour more than to mix it on the ſtone with ſoft water or ſpirits, after which it may be rolled into crayons. The different teints are produced by a mixture of the ſimple colour with whiting, according to the proportions already given.

II. Blues. 1. Pruſſian blue is a colour very apt to bind, and is rendered ſoft with more difficulty than carmine and lake. The ſame method of preparation is to be followed with this as directed with reſpect to lake, only it is neceſſary to grind a larger quantity of the pure colour, as it is chiefly uſed for painting draperies. The different teints may be made according to neceſſity, or the fancy of the painter. 2. Blue-verditer is a colour naturally gritty, and therefore it is neceſſary to waſh it well. Its particles are ſo coarſe as to require ſome binding matter to unite them, otherwiſe the crayons will never adhere together. To accompliſh this, take a quantity ſufficient to form two or three crayons, to which add a piece of ſlacked plaſter of Paris about the ſize of a pea; mix theſe well together, and form the crayons upon the chalk. This blue is extremely brilliant, and will be of great uſe in heightening draperies, *&c.* The teints muſt be formed with whiting as directed in the former inſtances, and are highly ſerviceable for painting fleſh, to produce thoſe pearly teints ſo beautiful in crayon-pictures. It is not neceſſary to mix the compounds with ſpirits, as clear water will be ſufficient.

III. Greens. Brilliant-greens are produced with great difficulty. In Switzerland, they have a method of making them far ſuperior to ours. We uſually take yellow ochre, and after grinding it with ſpirits, mix it with the powder of Pruſſian blue, then temper it with a knife, and lay the crayons on the chalk, without rolling them. Inſtead of this, ſome uſe king's yellow mixed with Pruſſian blue, and others brown ochre and Pruſſian blue. The crayons made of the two laſt may be rolled. Various teints may be produced by theſe colours, according to fancy or neceſſity; ſome to partake more of the blue, and others of the yellow.

IV. Yellows. 1. King's-yellow is the moſt uſeful and the moſt brilliant, levigated with ſpirits of wine, and compoſe the different teints as before directed. Yellow ochre and Naples yellow ground with ſpirits will make uſeful crayons. 2. Orange is produced with king's-yellow and vermilion ground together with ſpirits, and the teints formed as in other caſes, but no great quantity of them is required.

V. Browns. 1. Cullen's-earth is a fine dark brown. After ſix or eight of the ſimple crayons are prepared, ſeveral rich compound teints may be produced from it, by a mixture with carmine, in various degrees. Black, carmine, and this colour, mixed together, make uſeful teints for painting hair; ſeveral gradations may be produced from each of theſe by a mixture with whiting. Roman or brown ochre is an excellent colour, either ſimple or compounded with carmine. Whiting tinged in ſeveral degrees with either of theſe, will prove very ſerviceable in painting. 2. Umber may be treated in juſt the ſame manner, only it is neceſſary to levigate it with ſpirit of wine.

VI. Purples. Pruſſian blue ground with ſpirits and mixed with pulverized lake, will produce a good purple. Carmine thus mixed with Pruſſian blue, will produce a purple ſomething different from the former. Various teints may be made from either of theſe compounds by a mixture with whiting.

VII. Black. 1. Lamp-black is the only black that can be uſed with ſafety, as all others are ſubject to mildew: but as good lamp-black is very ſcarce the ſtudent will, perhaps, find it moſt expedient to make it himſelf; the proceſs of which is as follows: Provide a tin cone, fix it over a lamp at ſuch a height that the flame may juſt reach the cone for the ſoot to gather within it. When a ſufficient quantity is collected, take it out, and burn all the greaſe from it in a crucible. It muſt then be ground with ſpirits, and laid on the chalk to abſorb the moiſture. Various grey teints may be formed from this by a mixture with whiting, as mentioned in former inſtances.—2. Vermilion mixed with carmine: this is a compoſition of great uſe, and teints made from this with whiting will be found to be very ſerviceable. 3. Carmine and black is another good compound, of which five or ſix gradations ſhould be made, ſome partaking more of the black, and others having the carmine moſt predominant, beſides ſeveral teints by a mixture with whiting. 4. Vermilion and black is alſo a very uſeful compound, from which ſeveral different teints ſhould be made. 5. Pruſſian blue and black is another goood compound, and will be found of ſingular ſervice in painting draperies.

It is impoſſible to lay down rules for the forming every teint neceſſary in compoſing a ſet of crayons, there being many accidental compoſitions, entirely dependent on fancy and opinion. The ſtudent ſhould make it a rule to ſave the leavings of his colours: for of theſe he may form various teints, which will occaſionally be uſeful.

Of rolling the crayons, and diſpoſing them for painting. The different compoſitions of colours muſt be cut into a proper magnitude, after they are prepared, in order to be rolled into paſtils, for the convenience of uſing them. Each crayon ſhould be formed in the left hand with the ball of the right, firſt formed cylindrically, and then tapered at each end. If the compoſition is too dry, dip the finger in water; if too wet, the compoſition muſt be laid upon the chalk again to abſorb more of the moiſture. The crayons ſhould be rolled as quick as poſſible; and when finiſhed, muſt be laid upon the chalk again, to abſorb all remaining moiſture. After the gradation of teints from one colour are formed, the ſtone ſhould be well ſcraped and cleanſed with water before it is uſed for another colour.

When the ſet of crayons is completed according to the rules preſcribed, they ſhould be arranged in claſſes for the convenience of painting with them. Some thin drawers, divided into a number of partitions, is the moſt convenient method of diſpoſing them properly. The crayons ſhould be depoſited according to the ſeveral gradations of light. The bottom of the partitions muſt be covered with bran, as a bed for the colours; becauſe it not only preſerves them clean, but prevents their breaking.

The box made uſe of when the ſtudent paints, ſhould be about a foot ſquare, with nine partitions. In the upper corner, on the left hand (ſuppoſing the box to be in the lap when he paints), let him place the black and grey crayons, thoſe being the moſt ſeldom uſed; in the ſecond partition, the blues; in the third, the greens and browns; in the firſt partition on the left hand of the ſecond row, the carmines, lakes, vermilions, and all deep reds; the yellows and orange in the middle, and the pearly teints next; and as theſe laſt are of a very delicate nature, they muſt be kept very clean, that the gradations of colour may be eaſily diſtinguiſhed: in the loweſt row, let the firſt partition contain a piece of fine lining rag to wipe the crayons with while they are uſing; the ſecond, all the pure lake and vermilion teints; and the other partition may contain thoſe teints which, from their complex nature, cannot be claſſed with any of the former.

CRAZE-MILL, or *Crazing-Mill*, a mill in all reſpects like a griſt-mill to grind corn, and is ſo called by the tin-miners, who uſe it to grind their tin, which is yet too great, after trambling.

CREAM, a general name applicable to all ſubſtances that ſeparate from a liquor, and are collected upon its ſurface: but is more particularly applied to the following.

Cream of Lime, is that part of the lime which had been diſſolved in the water in its cauſtic ſtate, but having again attracted ſome fixed air from the atmoſphere, becomes incapable of ſolution, and therefore ſeparates from the water in the mild ſtate of chalk or limeſtone.

Cream of Milk, generally called ſimple *cream*, is the moſt oily part of the milk; which being naturally only mixed, and not diſſolved in the reſt, ſoon ſeparates from them, as being ſpecifically lighter: after which it collects on the ſurface; from which it is generally ſkimmed, to complete the diſengagement of the oily from the caſeous and ſerous parts that is to make butter*. Cream of milk is not only an agreeable aliment when recent, but is alſo uſeful in medicine as a lenient, when applied to tetters and eryſipelas attended with pain and proceeding from an acrid humour.

* See Butter, Milk, and Cheeſe.

Cream of Tartar. See Chemistry, n° 886.

CREAT, in the manege, an uſher to a riding maſter; or a gentleman bred in the academy, with intent to make himſelf capable of teaching the art of riding the great horſe.

CREATION, in its primary import, ſeems to ſigniſy the bringing into being ſomething which did not before exiſt. The term is therefore moſt generally applied to the original production of the materials whereof the viſible world is compoſed. It is alſo, however, uſed in a ſecondary or ſubordinate ſenſe, to denote thoſe ſubſequent operations of the Deity upon the matter ſo produced, by which the whole ſyſtem of nature and all the primitive genera of things received their form, qualities, and laws.

There is no ſubject concerning which there have been more diſputes than this of creation. It is certain that none of the ancient philoſophers had the ſmalleſt idea of its being poſſible to produce a ſubſtance out of nothing, or that even the power of the Deity himſelf could work without any materials to work upon. Hence ſome of them, among whom was Ariſtotle, aſſerted that the world was eternal both as to its matter and form. Others, though they believed that the gods had given the world its form, yet imagined the materials whereof it is compoſed to have been eternal. Indeed the opinions of the ancients, who had not had the benefit of revelation, were on this head ſo confuſed and contradictory, that nothing of any conſequence can be deduced from them. The freethinkers of our own and of former ages have denied the poſſibility of creation, as being a contradiction to reaſon; and of conſequence have taken the opportunity from thence to diſcredit revelation. On the other hand, many defenders of the ſacred writings have aſſerted, that creation out of nothing, ſo far from being a contradiction to reaſon, is not only probable, but demonſtrably certain. Nay, ſome have gone ſo far as to ſay, that from the very inſpection of the viſible ſyſtem of nature, we are able to infer that it was once in a ſtate of non-exiſtence. It would be impoſſible for us, however, to enter into the multiplicity of arguments uſed on both ſides; nor can we pretend to ſettle it, as the ſubject is confeſſedly above human comprehenſion.

1
What works of creation God is known to have performed.

As to the works of creation which the Deity is known to us to have performed; all other beings, beſide himſelf, are his creatures. Men and other animals that inhabit the earth and the ſeas, all the immenſe varieties of herbs and plants of which the vegetable kingdom conſiſts; the globe of the earth, and the expanſe of the ocean; theſe we know to have been produced by his power. Beſides the terreſtrial world which we inhabit, we ſee many other material bodies diſpoſed around it in the wide extent of ſpace. The moon, which is in a particular manner connected with our earth, and even dependent upon it; the ſun, and the other planets with their ſatellites, which, like the earth, circulate round the ſun, and appear to derive from him light and heat; thoſe bodies which we call fixed ſtars, and conſider as illuminating and cheriſhing with heat each its peculiar ſyſtem of planets; and the comets which at certain periods ſurpriſe us with their appearance, and the nature of whoſe connection with the general ſyſtem of nature, or with any particular ſyſtem of planets, we cannot pretend to have fully diſcovered;—theſe are ſo many more of the Deity's works, from the contemplation of which we cannot but conceive the moſt awful ideas of his creative power.

Matter, however, whatever the varieties of form under which it is made to appear, the relative diſpoſition of its parts, or the motions communicated to it, is but an inferior part of the works of creation. We believe ourſelves to be animated with a much higher principle than brute matter; in viewing the manners and economy of the lower animals, we can ſcarce avoid acknowledging even them to conſiſt of ſomething more than various modifications of matter and motion: The other planetary bodies which ſeem to be in circumſtances nearly analogous to thoſe of our earth, are ſurely, as well as it, deſtined for the habitations of rational, intelligent beings. The exiſtence of intelligences of an higher order than man, though infinitely below the Deity, appears extremely probable:—Of theſe ſpiritual beings called Angels we have expreſs intimation in ſcripture; (ſee the article Angels.) Such are our notions concerning the exiſtence of beings eſſentially diſtinct from matter, and in their nature far ſuperior to it: theſe, too, muſt be the creatures of the Deity, and of his works of creation the nobleſt part. But the limits of creation we muſt not pretend to define. How far the regions of ſpace extend, or how they are filled, we know not. How the planetary worlds, the ſun and the fixed ſtars, are occupied, we do not pretend to have aſcertained. We are even ignorant how wide a diverſity of forms, what an infinity of living animated beings may inhabit our own globe. So confined is our knowledge of creation; yet ſo grand, ſo awful, that part which our narrow underſtandings can comprehend!

2
The periods of time at which God executed his works of creation.

Concerning the periods of time at which the Deity executed his ſeveral works of creation, it cannot be pretended that mankind have had opportunities of receiving very particular information. From viewing the phenomena of nature, and conſidering the general laws by which they are regulated, we cannot draw any concluſive or even plauſible inference with reſpect to the preciſe period at which the univerſe muſt have begun to exiſt. We know not, nor can we hope to aſcertain, whether the different ſyſtems of planets circulating round our ſun and the other fixed ſtars, were all created at one period, or each at a different period. We cannot even determine, from any thing that appears on the face of nature, whether our earth was not created at a later period than any of her fellow planets which revolve round the ſame ſun. Aſtronomers are, from time to time, making new diſcoveries in the heavens; and it is impoſſible to ſay whether ſome of theſe ſucceſſive diſcoveries may not be owing to ſucceſſive creations.

Philoſophers have, indeed, formed ſome curious conjectures concerning the antiquity of the earth, from the appearances of its ſurface, and from the nature and diſpoſition of its interior ſtrata. The beds of lava in the neighbourhood of volcanoes have afforded ground for ſome calculations, which, though they do not fix the period of the earth's origin, are yet thought to prove that period to have been much more remote than the earlieſt age of ſacred or profane hiſtory. * In the neighbourhood of mount Ætna, or on the ſides of that extenſive mountain, there are beds of lava covered over with a conſiderable thickneſs of earth: and at leaſt another, again, which though known from ancient monuments and hiſtorical records to have iſſued from the volcano at leaſt 2000 years ago, is ſtill almoſt entirely deſtitute of ſoil and vegetation: in one place a pit has been cut through ſeven different ſtrata of lava; and theſe have been found ſeparated from each other by almoſt as many thick beds of rich earth. Now, from the fact, that a ſtratum of lava 2000 years old is yet ſcantily covered with earth, it has been inferred by the ingenious canon Recupero, who has laboured 30 years on the natural hiſtory of mount Ætna, that the loweſt of theſe ſtrata which have been found divided by ſo many beds of earth, muſt have been emitted from the volcanic crater at leaſt 14000 years ago; and conſequently that the age of the earth, whatever it may exceed this term of years, cannot poſſibly be leſs. Other facts of a ſimilar nature likewiſe concur to juſtify this conjecture.

But all theſe facts are as nothing in compariſon with the long ſeries which would be requiſite to eſtabliſh ſuch a conjecture as an incontrovertible truth. And, beſides, any evidence which they can be ſuppoſed to afford, may be very eaſily explained away. The bed of lava which in the courſe of 2000 years has ſcarce acquired a covering of earth, is confeſſed to ſtand in a ſituation in which it is expoſed to the ſpray of the ſea, and to all the violence of winds and rains. In ſuch a ſituation, it cannot be thought that a thick bed of earth could, in any length of time, be formed on it: we might as well expect depth of ſoil and vigorous vegetation on the craggy cliffs of hills. In crevices here and there over it in which the earth has been retained, there is a depth of ſoil which ſupports large trees. This fact, therefore, admits of no ſuch inference as that which Recupero has pretended to deduce from it. The local circumſtances, again, of the ſeven ſtrata that have been pierced through, are very different. They are ſituated at Jaci Reale, in a ſituation where ſhowers of aſhes from the volcano muſt frequently fall; and where whatever falls muſt be naturally retained and accumulated:—ſo that ſeven beds of earth might be formed on theſe ſeven ſtrata of lava much ſooner than one thin layer could be formed on the ſtratum abovementioned. In other places, ſome of which are within the influence of the ſame awful volcano, and ſome adjacent to that of Veſuvius, ſoil is known to have accumulated on lava with the help of ſhowers of aſhes from the volcanoes, with ſufficient rapidity to juſtify this ſuppoſition concerning the coverings of the ſtrata at Jaci Reale. From the obſervation of theſe phenomena of volcanoes, therefore, no facts have been gained that can help us to determine with any certainty the earth's age. And ſo wide is the variety of circumſtances to be here taken into account, that it cannot be hoped that this *deſideratum* will be ever ſupplied from this quarter. See further the article EARTH: nº 177 and 178.

But by examining the compoſition and arrangement of the interior ſtrata of the globe, and by viewing the general appearance of its ſurface, the ingenuity of philoſophers has, with better hopes, ſought to gueſs at the length of time during which it muſt have exiſted. Obſerving the exuviæ of ſea and land animals depoſited at profound depths under ground, and accompanied with vegetable bodies in a good ſtate of preſervation, as well as with oleaginous and bituminous ſubſtances which have in all probability been formed from vegetable bodies; and remarking at the ſame time with what confuſion the other materials, compoſing the cruſt of this terreſtrial ball, are, in various inſtances, not arranged, but caſt together; they have concluded that the earth muſt have exiſted for many an age before the earlieſt events recorded in ſacred or profane hiſtory, and muſt have undergone many a revolution, before it ſettled in its preſent ſtate. Such at leaſt are the ideas which Buffon and M. de Luc, and alſo Dr Hutton ‡, ſeem deſirous to impreſs us with concerning its changes and antiquity.—It will be only doing juſtice to theſe philoſophers to acknowledge, that they have collected, with amazing induſtry, almoſt every fact in the natural hiſtory of the earth that can ſerve to give plauſibility to their conjectures. But ſtill their facts, beſides the inconſiſtency of many of them, are by far too ſcanty to warrant the concluſions which they have pretended to deduce from them. See the article EARTH

3
Accounts of the antiquity of the earth from profane hiſtory.

The voice of profane hiſtory is far from being deciſive concerning the age of the world; nor is it to be expected that it ſhould. When the earth firſt aroſe into exiſtence, we can be at no loſs to conceive that mankind were not ſpectators of the event: and we may naturally imagine that the firſt human beings who occupied it, would be too much buſied in furniſhing themſelves with the immediate neceſſaries and the conveniences of life, to think of curious reſearches into *its* origin, or even their own. Profane hiſtory is not, however, without accounts of the age of the earth and the origin of human ſociety; but thoſe accounts are various and contradictory.—Plato in his dialogue intitled *Critias*, mentions his celebrated Atalantis to have been buried in the ocean about 9000 years before the age in which he wrote. He aſſerts it to have been well known to the Egyptian prieſts and to the cotemporary inhabitants of Attica. The learned world, indeed, generally agree in regarding his accounts of that iſland as a fiction, which the author himſelf did not deſign to be underſtood in any other light: ſome, however, are more credulous, and others go ſo far as acknowledge doubts: and, if the exiſtence of ſuch an iſland, at a period ſo diſtant, be admitted as a fact worthy of any credit, the age of the world may be reckoned as at leaſt conſiderably more than 12,000 years. The pretenſions of the Chineſe repreſent the world as ſome hundreds of thouſands of years older: and we are alſo told * that the aſtronomical records of the ancient Chaldæans carried back the origin of ſociety to a very remote period; no leſs than 473,000 years. The Egyptian prieſts reckoned between Menes and Sethon 341 generations †. But theſe accounts are ſo diſcordant, and ſo ſlenderly ſupported by evidence, that we cannot heſitate to reject them all as falſe; the fables of hiſtorians ſcarce merit ſo much attention as the hypotheſes of philoſophers.

4
The era of the creation as ſtated in profane hiſtory.

When from profane we turn to ſacred hiſtory, we may reaſonably expect more accurate and more credible information concerning the antiquity of the globe. As the authenticity of the Holy Scriptures is ſo incontrovertibly eſtabliſhed, wherever they afford evidence concerning any fact, that evidence muſt be regarded as deciſive. A fact ſo important as the preſent may be thought highly worthy of a place in them. Unfortunately, however, even the ſacred writings do not fix the area of the creation with ſufficient accuracy; they leave us, in ſome meaſure, at a loſs whether to extend what they ſay concerning that era to the whole contents of created ſpace, or to confine it to our earth and its inhabitants: different copies give different dates; and even in the ſame copy, different parts relating the ſame events, either diſagree or do not ſpeak deciſively with regard to the length of the time in which they paſſed.—In the beginning of the ſixth chapter of the firſt book of Kings, the time which elapſed between the departure of the children of Iſrael from Egypt, and the period at which Solomon laid the foundation of his temple, is ſaid to have been 480 years: And in the book of Judges again, the age of all the patriarchs amounts to 592 years. † The Hebrew copy of the bible, which we Chriſtians for good reaſons conſider as the moſt authentic, dates the creation of the word 3944 years before the Chriſtian era. The Samaritan bible, again, fixes the era of the creation 4305 years before the birth of Chriſt. And the Greek tranſlation, known by the name of the *Septuagint* verſion of the bible, gives 5270 as the number of the years which intervened between thoſe two periods. As many other different calculations of the years contained in the ſame intermediate ſpace of time, might be formed upon other dates in the ſacred volume, differing in the different copies. By comparing the various dates in the ſacred writings, examining how theſe have come to diſagree and to be diverſified in different copies, endeavouring to reconcile the moſt authentic profane with ſacred chronology, and eking out deficiency of dates and evidence with conjecture; ſome ingenious men have formed ſchemes of chronology, plauſible indeed, but not ſupported by ſufficient authorities, which they would gladly perſuade us to receive in preference to any of thoſe abovementioned. Uſher makes out from the Hebrew bible 4004 years, as the term between the creation and the birth of Chriſt; Joſephus, according to Dr Wills and Mr Whiſton, makes it 4658 years; and M. Pezron, with the help of the Septuagint, extends it to 5872 years. Uſher's ſyſtem is the moſt generally received.

† *Univerſal Hiſt.* vol. i. *Preface.*

But though theſe different ſyſtems of chronology are ſo inconſiſtent and ſo ſlenderly ſupported, yet the differences among them are ſo inconſiderable in compariſon with thoſe which ariſe before us when we contemplate the chronology of the Chineſe, the Chaldeans, and the Egyptians, and they agree ſo well with the general information of authentic hiſtory and with the appearances of nature and of ſociety, that they may be conſidered as nearly fixing the true period of the creation of the earth.

5
No information on this head to be obtained from any other ſource but ſacred hiſtory.

Profane hiſtory cannot be expected to contain an account of the firſt events which paſſed after the creation of the ſubſtances of which the univerſe conſiſts. The conjectures of ancient philoſophers on this ſubject cannot merit attention; for vague tradition, and the appearances of nature, the only data on which they could proceed in forming their conjectures, could admit of no fair inductions concerning thoſe events; and beſides, inſtead of liſtening to tradition, or examining the appearances of nature, they generally conſulted imagination, and imagination alone, on ſuch occaſions. Here, therefore, we have nothing to hope but from the ſacred writings. From them we may expect hiſtorical information, not to be obtained from any other ſource. What they communicate is communicated on divine authority; and it is only on ſuch authority we can receive any accounts concerning the creation.

6
Hints concerning the creation in the book of Job.

A few hints in the book of Job, afford the earlieſt information to be found in the ſcriptures concerning the creation of the world. "Where waſt thou when I laid the foundations of the earth, when the morning ſtars ſang together, and all the ſons of God ſhouted for joy *?" "Behold, he put no truſt in his ſervants, and his angels he charged with folly †." "And unto man, (or to Adam), he ſaid, Behold, the fear of the Lord is wiſdom, and to depart from evil is underſtanding ‡." Theſe paſſages rather hint at than relate facts. But it has been inferred from them, that there were ſtars in the firmament, and angels in heaven, before the formation of our globe; that angels as well as man have fallen; and that other injunctions, beſides that of abſtaining from the forbidden fruit, were laid on Adam when he was firſt placed in Paradiſe ||. If the interpretation be admitted as juſt, the firſt of theſe facts may be conſidered as forming, as it were, a point with which our knowledge of the works of the Deity commences: the period of time at which the ſecond event took place is not ſpecified; and the precept to Adam muſt no doubt have be been uttered after he was formed and inſpired with intelligence. Yet with regard to the firſt of the above quotations from the book of Job, the only one that is of importance to us at preſent it muſt be acknowledged, that it has been differently underſtood. The morning ſtars might ſing together, and the ſons of God ſhout for joy, on account both of their own creation and of the creation of the earth at one time; and yet Job, having been himſelf made a conſcious being at a much later period, not be able to tell where he was at that era of exulting gratitude and congratulation.

7
Moſaic account of the creation.

Moſes relates that * "in the beginning God created the heavens and the earth. And the earth (continues he) was without form and void; and darkneſs was upon the face of the deep: and the ſpirit of God moved upon the face of the waters. And God ſaid, Let there be light, and there was light. And God ſaw the light, that it was good: and God divided the light from the darkneſs. And God called the light day, and the darkneſs he called night: and the evening and the morning were the firſt day." During five ſucceeding days the work of creation was carried on. On

* Gen. i. 1.

the ſecond day, a firmament was made to ſeparate the waters, and that firmament called *heaven:* on the third day, the waters were collected into ſeas, and the land from which the waters retired cauſed to produce graſs and trees and other plants: on the fourth day, lights were made to appear in the firmament: to enlighten the earth, to divide the day from the night, and to diſtinguiſh time into ſeaſons and years: on the fifth day, the ſeas were peopled with whales and other fiſhes, and the air with fowls: on the ſixth day, the earth was furniſhed with reptiles and quadrupeds of all kinds; and on the ſame day, the firſt human pair, the progenitors of all the human race, were created in God's own image.

8
Difficulties occurring in the above account.

Some difficulties occur in comparing this account of the creation with the laws which appear at preſent to regulate the ſyſtem of nature. We find it hard to conceive how the earth, while yet a ſtranger to the influence of the ſun, could experience the viciſſitude of day and night; and are aſtoniſhed at the rapidity with which trees and herbage firſt overſpread its ſurface. The condition of matter when the earth was without form and void, and the operation of the ſpirit of God on the face of the waters, are equally myſterious.

9
Attempts to ſolve thoſe difficulties. Dr Burnet's theory.

Some ingenious men have eagerly laboured to remove theſe difficulties. Among theſe is Dr Burnet, whoſe theory of the earth has now been long conſidered as fanciful and ill-founded. He ſuppoſes all the celeſtial bodies, even the ſun and all the other planets of the ſolar ſyſtem, to have exiſted long before the earth. The chaos on which the ſpirit of God moved, conſiſted, according to him, of the firſt principles from which all terreſtrial bodies have been formed. When thoſe laws by which the material world is regulated firſt began to operate on the maſs, he ſuppoſes that its groſſer and heavier parts would ſink towards the centre, and there form a ſolid ball. Around this ſolid ball two ſpecies of particles would ſtill float together in confuſion. Of theſe he thinks one, being more volatile, would by degrees make its eſcape from the other, would leave it ſtill recumbent on the ſolid centre, and ſpread around it in an atmoſphere. The middle ſtratum he compoſes of aqueous and oleaginous fluids; and he makes no doubt, that after the air had made its eſcape, the levity of the oleaginous fluids would enable them to riſe above the aqueous, and diſpoſe themſelves next the ſurface of the liquid maſs. On them he ſuppoſes the impure atmoſphere to have then depoſited a quantity of terrene particles, ſufficient to form, by intermixture with the oils, a thick cruſt of rich earth for the production of plants and herbage, and to afford an habitation to animals. This delicate ſhell he was careful not to furrow with ſeas or load with mountains; either of theſe would have reduced all to confuſion. Such is *his* earth; and after moulding it with ſo much ingenuity, and into ſo happy a form, he contents himſelf, without venturing to uſe the ſame freedoms with the remaining part of Moſes's account of the creation.

10
Objections to Dr Burnet's theory.

But Moſes affords nothing that can be with any propriety uſed in the foundation of ſuch a theory: he tells not whether the chaos conſiſted of thoſe terrene, and aqueous, and oleaginous, and aërial particles which Dr Burnet finds in it; he confines not the ſeas within a cruſt of earth; nor does he inform us that the ſcenery of nature was not diverſified by hills and vales. Beſides, the author of this theory has, without any evidence, ſuppoſed matter to have been originally under the influence of laws very different from thoſe by which it is at preſent regulated. Oil, indeed, while fluid, floats above water: but in a concrete ſtate, it ſinks in water like other ſolid bodies. If reduced into that ſtate by combination with terrene matters, ſufficient to render the mixture proper for the nouriſhment and production of vegetables; its ſpecific gravity will be ſtill greater, and it will conſequently ſink ſo much the ſooner. How a concrete ſubſtance, conſiſting of earth and oil, could float on water, appears an inexplicable enigma. But we need not here take farther pains in combating and triumphing over this theory, which has long ſince fallen and ſunk to its grave.

11
Mr Whiſton's theory.

Mr Whiſton treats both the ſcriptures and the laws of nature with greater reverence. Yet he certainly involves himſelf in no trifling difficulties in attempting to ſolve thoſe which Moſes preſents. He ſuppoſes the ſun, moon, and ſtars to be all more ancient than the earth. The chaos from which the earth was formed, he repreſents as having been originally the atmoſphere of a comet. The ſix days of the creation he would perſuade us to believe equal to ſix of our years: for he is of opinion, that the earth did not revolve daily round its axis, but only annually round its orbit, till after the fall of man.

On the firſt day or year, therefore, the more ponderous parts of the chaos were according to this theory conglomerated into an orb of earth, the chinks and interſtices over that orb filled up with water, and the exterior part or atmoſphere rarefied, ſo as to admit ſome faint glimmering of the rays of the ſun.

On the ſecond day, the atmoſphere was diffuſed to its due extent around the earth, and reduced to a degree of rarity and purity which rendered it ſtill more ſuitable for the tranſmiſſion of light; the earth was ſtill more conſolidated; and the waters being almoſt entirely excluded from the interſtices which they before occupied, were partly ſpread over the ſurface of the earth, and partly raiſed in vapour into the atmoſphere or firmament.

On the third day, the earth's ſurface became ſo irregular, in one place riſing into hills, in another ſinking into vales, as to cauſe the waters, which were before equally diffuſed, to collect into ſeas and lakes, leaving large tracts of ground unoccupied. And no ſooner was a part of the earth's ſurface left bare by the waters, than the general influence of the ſun produced on it a rich covering of herbage, and all the different ſpecies of vegetables.

On the fourth day, the earth was rendered ſubject to the regular influence of the ſun, moon, and ſtars.

On the fifth day or year, things were ſo far advanced, that fiſhes and fowls were now produced from the waters.

On the ſixth day was the earth furniſhed with animals; and the lord of all the other animals, man, was now created.

12
Objections to Mr Whiſton's theory.

Such is Mr Whiſton's account of the phenomena of the Moſaic creation. But he likewiſe aſſumes much more than can be reaſonably granted. The atmoſphere of a comet could not well be the primitive chaos; it is not an obſcure, but a pellucid fluid; and its exterior ſtrata, if of the ſame nature with the matter of our earth, muſt be ſcorified by its near approaches to the ſun. Had the earth not begun to move round its axis till after the work of creation was completed, the immoderate degrees of heat and cold which its different parts would have alternately felt, would in all probability have proved fatal to both plants and animals. Even the moſt artful interpretation of Moſes's words cannot repreſent him as meaning to inform us that the ſun and moon were created at different periods. But philoſophy will ſcarce permit us to imagine that the moon was formed before the earth. And therefore we cannot upon good grounds agree with Mr Whiſton, that the creation of the earth was later than that of the other bodies of the ſolar ſyſtem.

13 M. de Luc's theory and objections.

Among others who have endeavoured to explain the original formation of the earth, and the changes which it has undergone, is M. de Luc. This coſmologiſt, like Mr Whiſton, thinks that the days of the creation were much longer periods of time than our preſent days. He ſeems to think that the earth had exiſted long before the Moſaic creation; but began at that era to experience new changes, and to be regulated by new laws; that all the different events deſcribed by Moſes in his hiſtory of the creation, actually took place in the order in which he relates them; but that Moſes's days are indefinite ſpaces of time, which muſt have been very long, but of which we cannot hope to aſcertain the preciſe length. Theſe are ingenious conjectures; but they do not appear neceſſary, nor are they juſtified by facts. For a fuller and more cloſe inveſtigation of this part of the ſubject, we muſt refer to the article Earth: and ſhall now cloſe the preſent article with a ſhort explanation of what appears to us the moſt natural way of underſtanding Moſes's account of the creation.

It has been conjectured*, with great probability, that the creation of which Moſes is the hiſtorian, was neither confined to the earth alone, nor extended to the whole univerſe. The relation which all the planets of the ſolar ſyſtem bear to the ſame illuminating body countenances the conjecture, that they, together with the luminary by which they are enlightened, were all created at one period: but it would perhaps be to conceive too meanly of the benevolence, wiſdom, and active power of the Deity to ſuppoſe that before that period theſe had never been exerted in any work of creation. Yet even here we have not demonſtrative evidence.

On the ſuppoſition that the whole ſolar ſyſtem was created at once, which has at leaſt the merit of doing no violence to the narrative of Moſes, the creation of the ſun and the other planets may be underſtood to have been carried on at the ſame time with the creation of the earth. In that caſe, even in the courſe of the firſt day, though not longer than our preſent days, thoſe bodies might be reduced to ſuch order, and their relative motions ſo far eſtabliſhed, as to begin the diſtinction between light and darkneſs, day and night.

On the ſecond day, we may naturally underſtand from Moſes's narrative, that the atmoſphere was purified, and the ſpecific gravities of aqueous vapour and atmoſpheric air ſo adjuſted, as to render the latter capable of ſupporting the former.

On the third day the waters were firſt collected into lakes and ſeas: but in what manner, we cannot well determine. Some call in the operation of earthquakes; others tell us, that when the earth was firſt formed, the exterior ſtrata were, at different parts over its ſurface, of different ſpecific gravities; and that the more ponderous parts now ſunk nearer the common centre, while the lighter parts ſtill remaining equally remote from it as before, formed iſlands, continents, hills, and mountains. But theſe are mere fancies; and we have not facts to offer in their ſtead. On the latter part of this day vegetables were cauſed to ſpring up over the earth. Their growth muſt have been much more rapid than we ever behold it now: but by what particular act of ſupernatural power that might be effected, we ſhould in vain inquire.

On the fourth day the ſun, moon, and ſtars, were made to appear. But according to the conjecture which we have mentioned as plauſible, though without aſcribing to it the evidence of certain truth, thoſe heavenly bodies are to be conſidered as having been created before this day. But they might now begin to exert their full influence on the earth in the ſame manner as they have ſince continued to do.

The creation of the inanimate world was now finiſhed, and the earth prepared for the reception of animals. On the fifth day, therefore, were the living inhabitants of the air and the waters created.

On the ſixth day the inferior animals inhabiting the earth were firſt created; and after that, the whole work was crowned by the creation of a male and female of the human ſpecies. To the account of the creation of the animals, nothing certain can be added in explanation of Moſes's narrative. No more but one pair of the human ſpecies were at firſt created: the ſame oeconomy might poſſibly be obſerved in the creation of the inferior animals.

CREBILLON (Proſper Joliot de), a French writer of tragedy, and uſually ranked after Corneille and Racine, was born at Dijon in 1674. He was originally deſtined to the profeſſion of the law, and placed at Paris with that view; but the impetuoſity of his paſſions rendering him unfit for buſineſs, he was urged by ſome friends, who diſcerned very well his natural turn, to attempt dramatic compoſitions. He complied, but not till after many refuſals; and gave at length a tragedy, which met with great ſucceſs. He then marched on in the career he had begun, but was checked by a fit of love for an apothecary's daughter; which fit of love ended in marriage. His father, doubly enraged at his ſon for thus ſurrendering himſelf to the two demons of love and poetry, diſinherited him; but falling ſick ſome years after, in 1707, he re-eſtabliſhed him in all his rights, and died. Crebillon was, however, little better for his acquiſitions, the greateſt part being probably waſted before they came; and thus, though high in fame and at the prime of life, he ſtill continued poor. He loſt his wife in 1711, and fortune long frowned upon him, till at laſt he obtained a place in the French academy, and the employment of cenſor of the police. He was afterwards in good circumſtances, and happy to the end of his life, which was a very long one; for he did not die till 1762, aged 88. He was much regretted and lamented, as old as he was; being a very worthy man, and poſſeſſed of many and great virtues. He was of a temperament extremely robuſt, without which he could not have held out ſo long; for he eat prodigiouſly, and continued to the laſt ſo to do. He ſlept little, and lay as hard as if upon the floor; not from any pious principle of mortifying, but becauſe he liked it. He was always ſurrounded with about 30 dogs and cats; and uſed to ſmoak a good deal of tobacco, to keep his room ſweet againſt their exhalations. Whenever he was ill, he uſed to manage himſelf according to his own fancy and feelings; for he always made a jeſt of phyſic and phyſicians. He was a dealer in *bons mots*. Being aſked one day in full company, which of his works he thought the beſt? "I don't know (ſays he) which is my beſt production; but this (pointing to his ſon) is certainly my worſt."

---

* Univ. Hiſt. vol. i. p. 25.

CRECY, Crescy, or Cressy. See Cressy.

CREDENTIALS, letters of recommendation and power, eſpecially ſuch as are given to ambaſſadors or public miniſters, by the prince or ſtate that ſends them to foreign courts.

CREDIBILITY, a ſpecies of evidence, leſs indeed than abſolute certainty or demonſtration, but greater than mere poſſibility: it is nearly allied to probability, and ſeems to be a mean between poſſibility and demonſtration.

CREDIT, in commerce, a mutual truſt or loan of merchandize or money, on the reputation of the probity and ſolvability of a dealer.

Credit is either public or private. Every trader ought to have ſome eſtate, ſtock, or portion of his own, ſufficient to carry on the traffic he is engaged in: they ſhould alſo keep their dealings within the extent of their capital, ſo that no diſappointment in their returns may incapacitate them from ſupporting their credit. Yet traders of worth and judgment may ſometimes lie under the neceſſity of borrowing money for carrying on their buſineſs to the beſt advantage; but then the borrower ought to be ſo juſt to his own reputation and to his creditors, as to be well aſſured that he has ſufficient effects within his power to pay off his obligations in due time. But if a trader ſhould borrow money to the extent of his credit, and launch out into trade ſo as to employ it with the ſame freedom as if it was his own proper ſtock, ſuch a way of management is very precarious, and may be attended with dangerous conſequences. Merchants ought never to purchaſe their goods for exportation upon long credit, with intent to diſcharge the debt by the return of the ſame goods; for this has an injurious influence on trade ſeveral ways: and if any merchant has occaſion to make uſe of his credit, it ſhould always be for the borrowing of money, but never for the buying of goods; nor is the large credit given to wholeſale traders a prudential or juſtifiable practice in trade.

The public credit of a nation is ſaid to run high when the commodities of that nation find a ready vent, are ſold at a good price, and when dealers may be ſafely truſted with them: alſo when lands and houſes find ready purchaſers; when money is to be borrowed at a low intereſt: when people think it ſafe and advantageous to venture large ſtocks in trade; and when notes, mortgages, &c. will paſs for money.

Letters of Credit, are thoſe given to perſons in whom a merchant, &c. can truſt, to take money of his correſpondent abroad, in caſe he happens to need it.

Credit is alſo uſed for the currency which papers or bills have in the public or among dealers. In this ſenſe credit is ſaid to riſe, when, in negociating the ſhares of the company, they are received and ſold at prices above *par*, or the ſtandard of their firſt creation. Diſcredit is oppoſed to credit, and is uſed where money, bills, &c. fall below *par*.

Credit was alſo anciently a right which lords had over their vaſſals; conſiſting in this, that during a certain time they might oblige them to lend them money. In this ſenſe, the Duke of Britanny had credit during fifteen days on his own ſubjects, and thoſe of the biſhop of Nantes; and the biſhop had the ſame credit or right among his ſubjects and thoſe of that prince.

CREDITON, a market-town in Devonſhire, conſiderable for a good woollen manufactory: it is ſituated about 9 miles north-weſt of Exeter, in W. Long. 3. 50. and N. Lat. 50. 50.

CREDITOR, a perſon to whom any ſum of money is due, either by obligation, promiſe, or otherwiſe. See Debt.

CREDULITY denotes a weakneſs of mind, by reaſon of which a perſon yields his aſſent to propoſitions or facts, before he has conſidered their evidence.

CREECH (Thomas), eminent for his tranſlations of ancient authors both in proſe and verſe, was ſon of Thomas Creech, and born near Sherborne in Dorſetſhire in 1659. He was educated in grammar learning under Mr Curganven of Sherborne, to whom he afterwards dedicated a tranſlation of one of Theocritus's Idylliums; and entered a commoner of Wadham college in Oxford in 1675. Wood tells us that his father was a gentleman; but Giles Jacob ſays, in his Lives and characters of Engliſh Poets, that his parents circumſtances not being ſufficient to afford him a liberal education, his diſpoſition and capacity for learning raiſed him up a patron in Colonel Strangeways, whoſe generoſity ſupplied that defect. Be that as it will, Creech diſtinguiſhed himſelf much, and was accounted a good philoſopher and poet, and a diligent ſtudent. June 13. 1683. he took the degree of maſter of arts, and not long after was elected probationer fellow of All-ſouls college; to which, Jacob obſerves, the great reputation acquired by his tranſlation of Lucretius recommended him. Wood tells us, that upon this occaſion he gave ſingular proofs of his claſſical learning and philoſophy before his examiners. He alſo took the degree of B. D. on the 18th of March 1696. He now began to be well known by the works he publiſhed; but Father Niceron obſerves, that they were of no great advantage to his fortune, ſince his circumſtances were always indifferent. In 1699, having taken holy orders, he was preſented by his college to the living of Welwyn in Hertfordſhire; but this he had not long enjoyed before he put an end to his own life. The motives of this fatal cataſtrophe have been variouſly repreſented. The author of the *Nouvelles de la Republique des Lettres* informs us, that in the year 1700 Mr Creech fell in love with a woman who treated him with great neglect, though ſhe was complaiſant enough to ſeveral others. This affront he could not bear, and reſolved not to ſurvive it. Whereupon he ſhut himſelf up in his ſtudy, where he hanged himſelf about the end of June 1700, and was found in that circumſtance three days after. The Poetical Regiſter ſays nothing of the particular manner of his death, but only that he unfortunately made away with himſelf in the year 1701; and aſcribes this fatal cataſtrophe of Mr Creech's life to the moroſeneſs of his temper, which made him leſs eſteemed than his great merit deſerved, and engaged him in frequent animoſities and diſputes upon that account. But from an original letter of Arthur Charlett, preſerved in the Bodleian library, it has lately been diſcovered, that this unhappy event was owing to a very different cauſe. There was a fellow collegian of whom Creech frequently borrowed money; but repeating his applications too often, he met one day with ſuch a cold reception, that he retired in a fit of gloomy diſguſt, and in three days was found hanging in his ſtudy. Creech's principal performances are, 1. A Tranſlation of Lucretius. 2. A Tranſlation of Horace; in which, however, he has omitted ſome few odes. 3. The Idylliums of Theocritus, with Rapin's Diſcourſe of Paſtorals. 4. A tranſlation of Manilius's Aſtronomicon. Beſides tranſlations of ſeveral parts of Virgil, Ovid, and Plutarch; printed in different collections.

CREED, a brief ſummary of the articles of a Chriſtian's belief.

The moſt ancient form of creeds is that which goes under the name of the apoſtolic creed: beſides this, there are ſeveral other ancient forms and ſcattered remains of creeds to be met with in the primitive records of the church. The firſt is the form of apoſtolical doctrine, collected by Origen; the ſecond is a fragment of a creed preſerved by Tertullian; the third remains of a creed is in the works of Cyprian; the fourth, a creed compoſed by Gregory Thaumaturgus, for the uſe of his own church; the fifth, the creed of Lucian the martyr; the ſixth, the creed of the apoſtolical conſtitutions. Beſides theſe ſcattered remains of the ancient creeds, there are extant ſome perfect forms, as thoſe of Jeruſalem, Ceſarea, Antioch, &c.

The moſt univerſal creeds are, the APOSTOLICAL, the ATHANASIAN, and the NICENE creeds. See theſe articles.

Theſe three creeds are uſed in the public offices of the church of England; and ſubſcription to them is required of the clergy, and of diſſenting teachers properly qualified by the toleration act, as the eighth article declares that they may be proved by the ſureſt teſtimonies of ſcripture.

CREEK, a part of a haven, where any thing is landed from the ſea. So many landing-places as there are in a harbour or port, ſo many creeks there are. It is alſo ſaid to be a ſhore or bank whereon the water beats, running in a ſmall channel from any part of the ſea; from the Latin *crepido*. This word is uſed in the ſtat. 4 Hen. IV. c. 20. and 5 Eliz. c. 5.

CREENGLES. See CRINGLE.

CREEPER, in ornithology. See CERTHIA.

CREEPER, in naval affairs, an inſtrument of iron reſembling a grappling, having a *ſhank*, and four hooks or claws. It is uſed to throw into the bottom of any river or harbour, with a rope faſtened to it, to hook and draw up any thing from the bottom which may have been loſt. See Plate CL.

CRELLIUS (John), a famous Socinian, born in 1590, in a village near Noremberg. In 1612 he went into Poland, where the Unitarians had a ſchool, in which he became profeſſor of divinity, and miniſter at Crackow, where he died in 1632, aged 42. He was the author, 1. Of a famous Treatiſe againſt the Myſtery of the Trinity; 2. Commentaries on a part of the New Teſtament; and other works. All of them are ſcarce.

CREMA, a city and biſhop's ſee of Italy, capital of a diſtrict of the Milaneſe, called from it *Cremaſco*: it ſtands almoſt in the middle between Milan and Mantua, in E. Long. 10. 15. and N. Lat. 45. 20.

CREMASTER, in anatomy, the name of a muſcle of the teſticle, of which there is one on each ſide. See ANATOMY, *Table of the Muſcles*.

CREMATION is ſometimes uſed for burning, particularly when applied to the ancient cuſtom of burning the dead. This cuſtom is well known to have prevailed among moſt eaſtern nations, and continued with their deſcendants after they had peopled the different parts of Europe. Hence we find it prevailing in Greece, Italy, Gaul, Britain, Germany, Sweden, Norway, and Denmark, till Chriſtianity aboliſhed it.

CREMONA (anc. geog.), a Roman colony, with municipal rights, ſettled beyond the Po, below the confluence of the Addua, on the report of Hannibal's march into Italy (Polybius): a town at this day ſtill maintaining its name and flouriſhing ſtate. It was an opulent and mercantile city; but ſuffered greatly in the civil wars of Auguſtus (Virgil). In the war with Vitellius, it was deſtroyed by the partizans of Veſpaſian; but was ſoon after rebuilt by the munificence of the citizens and exhortations of Veſpaſian, (Tacitus). Now capital of the Cremoneſe, in the duchy of Milan. E. Long. 10. 30. Lat. 45.

CRENATED, in botany. See BOTANY-*Index*.

CRENELLE, or IMBATTLED, in heraldry, is uſed when any honourable ordinary is drawn, like the battlements on a wall to defend men from the enemies ſhot. This attribute belongs to the arms of ſuch as have defended caſtles for their prince or country, or of ſuch as are ſkilled in architecture.

CRENOPHYLAX, in antiquity, a magiſtrate of Athens, who had the inſpection of fountains.

CREODIBA, in the cuſtoms of the middle age, a robbery and murder committed in a wood, where the body of the perſon killed was burnt in order to prevent any diſcovery of the crime. The word, ſays Wendelinus, is compounded of *cruy* and *diven*, that is, "wood-robbers."

CREOLES, a name given to the families deſcended from the Spaniards who firſt ſettled at Mexico in America. Theſe are much more numerous than the Spaniards properly ſo called, and the Mulattoes, which two other ſpecies of inhabitants they diſtinguiſh; and are excluded from all conſiderable employments.

CREON, king of Corinth, was ſon of Syſiphus. He promiſed his daughter Glauce to Jaſon, who had repudiated Medea. To revenge the ſucceſs of her rival, Medea ſent her for a preſent a gown covered with poiſon. Glauce put it on, and was ſeized with ſudden pains.

Her body took fire, and ſhe expired in the greateſt torments. The houſe alſo was conſumed by the fire, and Creon and his family ſhared Glauce's fate.

Creon, ſon of Menœtius, was father of Jocaſta, the wife and mother of Oedipus. At the death of Laius, who had married Jocaſta, Creon aſcended the vacant throne of Thebes. As the ravages of the Sphynx were intolerable, Creon offered his crown and daughter in marriage to him who could explain the enigmas which the monſter propoſed. Oedipus was happy in his explanations, and he aſcended the throne of Thebes and married Jocaſta without knowing that ſhe was his mother, and by her he had two ſons, Polynices and Eteocles. Theſe two ſons mutually agreed after their father's death to reign in the kingdom each a year alternately. Eteocles firſt aſcended the throne by right of ſeniority; but when he was once in power he refuſed to reſign at the appointed time, and his brother led againſt him an army of Argives to ſupport his right. The war was decided by a ſingle combat between the two brothers They both killed one another, and Creon aſcended the throne till Leodamus the ſon of Eteocles ſhould be of a ſufficient age to aſſume the reins of government. In his regal capacity he commanded that the Argives, and more particularly Polynices, who was the cauſe of all the bloodſhed, ſhould remain unburied. If this was in any manner diſobeyed, the offenders were to be buried alive. Antigone the ſiſter of Polynices tranſgreſſed, and was accordingly puniſhed. Hæmon the ſon of Creon, who was paſſionately fond of Antigone, killed himſelf on her grave, when his father refuſed to grant her pardon. Creon was afterwards killed by Theſeus, who had made war with him becauſe he refuſed burial to the Argives.

CREPANCE, in the manege, a chop or cratch in a horſe's leg, given by the ſpunges of the ſhoes of one of the hinder feet croſſing and ſtriking againſt the other hinder foot. This cratch degenerates into an ulcer.

CREPIDÆ, among the Romans, a kind of ſlippers or ſhoes, which were always worn with the *pallium*, as the *calcei* were with the *toga*.

CREPIS, hawk-weed: A genus of the polygamia ſuperflua order, belonging to the ſyngeneſia claſs of plants; and in the natural method ranking under the 49th order, *Compoſitæ*. The receptacle is naked; the calyx calyculated with deciduous ſcales; the pappus feathery and ſtalked. There are 14 ſpecies, moſt of them herbaceous annuals, riſing to the height of a foot or a foot and an half; and having their branches terminated by ligulated compound red and yellow flowers. Theſe are very large, and conſiſt of many flat florets ſpread over one another imbricatim, and when fully blown appear as if radiated. They are very conſpicuous and beautiful: and appear in June, July, and Auguſt. They are ſucceeded by plenty of ſeed, which, if permitted to ſcatter on the ground, will produce a number of young plants without further trouble.

CREPITATION, that noiſe which ſome ſalts make over the fire in calcination, called alſo *detonation*.

Crepitation is alſo uſed in ſurgery, for the noiſe made by the ends or pieces of bones, when the ſurgeon moves a limb to aſſure himſelf by his ear of the exiſtence of a fracture.

CREPUNDIA, in antiquity, a term uſed to expreſs ſuch things as were expoſed along with children, as rings, jewels, &c. ſerving as tokens whereby they afterwards might be known.

CREPUSCULUM, in aſtronomy, twilight; the time from the firſt dawn or appearance of the morning to the riſing of the ſun; and again, between the ſetting of the ſun and the laſt remains of day.

Papias derives the word from *creperus*; which, he ſays, anciently ſignified *uncertain*, *doubtful*, q. d. *a dubious light*. The crepuſculum is uſually computed to begin and end when the ſun is about 18 degrees below the horizon; for then the ſtars of the ſixth magnitude diſappear in the morning, and appear in the evening. It is of longer duration in the ſolſtices than in the equinoxes, and longer in an oblique than in a right ſphere.

The crepuſcula are occaſioned by the ſun's rays refracted in our atmoſphere, and reflected from the particles thereof to the eye. See Twilight.

CRESCENT, the new moon, which, as it begins to recede from the ſun, ſhows a little rim of light, terminating in points or horns, which are ſtill increaſing till it become full and round in the oppoſition. The word is formed from *creſco*, "I grow."

The term is alſo uſed for the ſame figure of the moon in its wane or decreaſe, but improperly; becauſe the points or horns are then turned towards the weſt, whereas they look to the eaſt in the juſt creſcent.

Crescent, in heraldry, is a bearing in form of a half moon. The Ottomans bear ſinople, a creſcent montant, argent.

The creſcent is frequently uſed as a difference in coat-armour, to diſtinguiſh it for that of a ſecond brother or junior family.

The figure of the creſcent is the Turkiſh ſymbol; or rather is that of the city Byzantium, which bore this device from all antiquity; as appears from medals ſtruck in honour of Auguſtus, Trajan, &c.

The creſcent is ſometimes montant, i. e. its points look towards the top of the chief, which is its moſt ordinary repreſentation; whence ſome contend, that the creſcent, abſolutely ſo called, implies that ſituation; though other authors blazon it montant, when the horns are towards the dexter-ſide of the eſcutcheon, in which poſition others call it *incroiſſant*.

Creſcents are ſaid to be *adoſſed*, when their backs or thickeſt parts are turned towards each other; their points looking to the ſides of the ſhield. *Creſcent inverted*, is that whoſe points look towards the bottom: *turned creſcents*, are placed like thoſe adoſſed; the difference is, that all their points look to the dexter-ſide of the ſhield: *conturned creſcents*, on the contrary, look to the ſiniſter ſide: *affronted* or *appointed creſcents*, are contrary to the adoſſed, the points looking towards each other.

Crescent is alſo the name of a military order, inſtituted by Renatus of Anjou, King of Sicily, &c. in 1448; ſo called from the badge or ſymbol thereof, a creſcent of gold enamelled. What gave occaſion to this eſtabliſhment was, that Renatus took for his device a creſcent, with the word *loz*, "praiſe," which, in the ſtyle of rebus, makes *loz in creſcent*, q. d. *by advancing in virtue, one merits praiſe.*

CRESCENTIA, the CALABASH-TREE: A genus of the angioſpermia order, belonging to the didynamia claſs of plants; and in the natural method ranking under the 25th order, *Putamineæ*. The calyx is bipartite and equal; the corolla gibbous; the berry pedicellated or ſtalked, unilocular, and polyſpermous; the ſeeds bilocular. There are two ſpecies.

1. The cujete, with oblong narrow leaves and a large oval fruit, is a native of Jamaica and the Leeward Iſlands. It hath a thick trunk covered with a whitiſh bark, which riſes from 20 to 30 feet high, and at the top divides into many branches, forming a large and regular head, garniſhed with leaves, which come out irregularly, ſometimes ſingle; at other times many ariſe out of the ſame knot: the flowers are produced from the ſides of the large branches, and ſometimes from the trunk, ſtanding upon long footſtalks. They have but one petal, which is irregular; and they are of a greeniſh yellow colour, ſtriped and ſpotted with brown. Theſe are ſucceeded by very large fruit, generally ſpherical, ſometimes oval; and at other times they have a contracted neck like a bottle; and are ſo large, that when the pulp and ſeeds are cleaned out, the ſhells will contain three pints or two quarts of liquid. The fruit is covered externally with a thin ſkin of a greeniſh-yellow colour when ripe. When this is peeled off, there appears a hard ligneous ſhell, incloſing a pale yellowiſh ſoft pulp of a tart unſavoury flavour, ſurrounding a great number of flat heart-ſhaped ſeeds. 2. The latifolia, or broad-leaved calabaſh, ſeldom riſes more than 15 or 20 feet high, with an upright trunk, covered with a white ſmooth bark, ſending out many lateral branches at the top, garniſhed with leaves three inches in length, and one and a quarter broad, ranged alternately. The flowers come out as in the former ſpecies; but are ſmaller, and of a deeper yellow colour. The fruit of this ſort is ſometimes round, ſometimes oval, but of very unequal ſizes. Both theſe ſpecies are eaſily propagated by ſeeds; but the plants are too tender to live in Britain, unleſs they are conſtantly kept in a ſtove.

The ſhells of calabaſhes are made uſe of for various purpoſes. At Barbadoes, beſides drinking-cups and punch-bowls, there are made of them ſpoons, diſhes, and other utenſils for the ſlaves. Some of theſe ſhells are ſo large, as to be capable of holding 15 pints of water. The pulp is ſeldom eaten, except by cattle in the time of drought. The wood, which is hard and ſmooth, is made into ſtools, chairs, and other furniture.

CRESCIMBENI (John Maria), an Italian, was born at Macerata in Ancona, 1663. His talents for poetry and eloquence developed themſelves early. His verſes at firſt had too much pomp and point; but reſiding in Rome, and reading the beſt Italian poets, brought him back to nature. He not only reformed himſelf, but undertook to reform bad taſte in general. From this motive he projected the eſtabliſhment of a new academy, under the name of *Arcadia*; the members of which at firſt did not exceed 14, but afterwards increaſed much. They called themſelves the ſhepherds of Arcadia, and each took the name of ſome ſhepherd and ſome place in that ancient kingdom. The founder of this ſociety was appointed the director of it in 1690, and held this honourable poſt 38 years; namely, to the year of his death, which happened in 1728. Among a great number of works, in verſe and proſe, the principal is, An Hiſtory of the Italian Poetry, very much eſteemed, and reprinted, 1731, at Venice, in ſix volumes 4to. This hiſtory is accompanied with a commentary, containing anecdotes of Italian poets. He publiſhed alſo an Hiſtory of the Academy of Arcadia, together with the Lives of the moſt illuſtrious Arcadians: and many other works.

CRESCY, or CRESSY. See CRESSY.

CRESS, WATER-CRESS, or CRESSES, in botany. See SISYMBRIUM.

Indian CRESS. See TROPÆOLUM.

CRESSY, a port town of Picardy in France, about 44 miles ſouth of Calais, and 27 north-weſt of Abbeville, remarkable on account of the victory obtained there over the French by Edward III. of England, in the year 1346. E. Long. 2. 0. N. Lat. 50 20.

Edward having encountered and overcome many difficulties in his expedition, was at laſt ſo cloſely followed and haraſſed by the French army, commanded by the King of France in perſon, that he determined to make a ſtand at this place, and to give his purſuers a check. For this purpoſe he choſe his ground with great judgment, on the gentle declivity of a hill, with a thick wood in his rear. He ordered deep entrenchments to be made on each flank, and waited with firmneſs the approach of his enemies. The King of France, dreading nothing ſo much as the eſcape of the Engliſh, began the march of his great army from Abbeville early in the morning, Auguſt 26. and continued it ſeveral hours with great eagerneſs, till he received intelligence that the Engliſh had halted at Creſſy, and were prepared to give him battle. He was adviſed at the ſame time not to engage that day, when his troops were much fatigued with their march, and in great diſorder; and he was diſpoſed to have taken this advice. But the diſcipline of theſe times was ſo imperfect, that the orders given for halting were not obeyed; and one corps of this mighty hoſt impelling another, they continued advancing till they came into the preſence of their enemies in much confuſion.

Henry's Hiſtory, Vol. IV. p. 178.

Edward had employed the forenoon of this important day in drawing up his army in the moſt excellent order, in three lines. The firſt line, which conſiſted of 800 men at arms, 4000 Engliſh archers, and 600 Welſh foot, was commanded by his young, amiable, and heroic ſon, the Prince of Wales, aſſiſted by the Earls of Warwick and Oxford, and ſeveral other noblemen. The ſecond line, compoſed of 800 men at arms, 4000 halbardiers, and 2400 archers, was led by the Earls of Arundel and Northampton; the laſt line, or body of reſerve, in which were 700 men at arms, 5300 billmen, and 6000 archers, was ranged along the ſummit of the hill, and conducted by the King in perſon, attended by the Lords Moubray, Mortimer, and others. When the army was completely formed, Edward rode along the lines, and by his words and looks inſpired his troops with the moſt ardent courage and ſtrongeſt hopes of victory. He then commanded the cavalry to diſmount, and the whole army to ſit down upon the graſs, in their ranks, and refreſh themſelves with meat, drink, and reſt. As ſoon as the French army came in view, they ſprung from the ground, full of ſtrength and ſpirit, and ſtood ready to receive them.

The King of France, aſſiſted by the Kings of Bohemia and Majorca, the Dukes of Lorraine and Savoy, and ſeveral other ſovereign princes, with the flower of the French nobility, laboured to reſtore ſome degree of order to his prodigious army, and drew it up alſo in three lines, but very indiſtinctly formed. The firſt line was commanded in chief by the King of Bohemia; the ſecond by the Earl of Alençon, the King of France's brother; and the third by Philip in perſon; and each of theſe lines contained a greater number of troops than the whole Engliſh army.

The battle of Creſſy was begun about three o'clock in the afternoon, Auguſt 26. by a great body of Genoeſe croſs-bowmen, in the French ſervice, who let fly their quarrels at too great a diſtance to do any execution, and were preſently routed by a ſhower of arrows from the Engliſh archers. The Earl of Alençon, after trampling to death many of the flying Genoeſe, advanced to the charge, and made a furious attack on that corps commanded by the Prince of Wales. The Earls of Arundel and Northampton advanced with the ſecond line to ſuſtain the Prince, and Alençon was ſupported by as many troops as could crowd to his aſſiſtance. Here the battle raged for ſome time with uncommon fury; and the Earl of Warwick, anxious for the fate of the day and the ſafety of the Prince, ſent a meſſenger to the King, intreating him to advance with the third line. Edward, who had taken his ſtand on a wind-mill on the top of the hill, from whence he had a full view of both armies, aſked the meſſenger, if his ſon was unhorſed, or wounded, or killed? and being anſwered, that the Prince was unhurt, and performed prodigies of valour, "Go then," ſaid he, "and tell my ſon and his brave companions, that I will not deprive them of any part of the glory of their victory." This flattering meſſage being made known, inſpired the Prince and his troops with redoubled ardour; and the king of Bohemia, the Earl of Alençon, and many other great men, being ſlain, the whole firſt and ſecond lines of the French army were put to flight. Philip, undiſmayed at the ſlaughter of his troops, and the fall of ſo many princes, advanced to the charge with the line under his immediate command. But this body ſoon ſhared the ſame fate with the other two; and Philip, after having been unhorſed, and wounded in the neck and thigh, was carried off the field by John de Hainault, and fled with no more than five knights and about 60 ſoldiers in his company, of all his mighty army, which at the beginning of the battle conſiſted of more than 120,000 men. Such was the famous victory of Creſſy, the greateſt ever gained by any King of England. After the battle, the King flew into the arms of the Prince of Wales, and graſping him to his boſom, cried in an eſtacy of joy, "My dear ſon, you have this day ſhowed yourſelf worthy of the knighthood which you lately received, and of the crown for which you have ſo bravely fought; perſevere in your honourable courſe." The Prince, as modeſt as he was brave, ſunk down on his knees, his face covered with bluſhes, and begged his father's bleſſing. Edward continued with his army at Creſſy three days, employed in numbering and burying the dead. The French had left on this bloody ſcene the King of Bohemia, 11 other princes, 80 bannerets, 1200 knights, 1500 gentlemen, 4000 men of arms, and 30,000 other ſoldiers.

CREST, in armoury, denotes the uppermoſt part of an armoury; or that part riſing over the caſk or helmet.—Next to the mantle, ſays Guillim, the creſt or cognizance claims the higheſt place, being ſeated on the moſt eminent part of the helmet; yet ſo as to admit an interpoſition of ſome eſcrol, wreath, chapeau, crown, &c.

The ancient warriors wore creſts to ſtrike terror in their enemies, as the ſight of the ſpoils of animals they had killed; or to give them the more formidable mien, by making them appear taller, &c.

In the ancient tournaments, the cavaliers had plumes of feathers, eſpecially thoſe of oſtriches and herons, for their creſts; theſe tufts they called *plumarts;* and were placed in tubes, on the tops of high caps or bonnets. Some had their creſts of leather; others of parchment, paſteboard, &c. painted or varniſhed, to keep out the weather; others of ſteel, wood, &c. on which were ſometimes repreſented a member or ordinary of the coat; as, an eagle, fleur-de-lys, &c. but never any of thoſe called *honourable ordinaries*, as pale, feſſe, &c. The creſts were changeable at pleaſure; being reputed no other than as an arbitrary device or ornament.

Herodotus attributes the riſe of creſts to the Carians, who firſt bore feathers on their caſks, and painted figures on their bucklers; whence the Perſians called them *cocks*.

The creſt is eſteemed a greater mark of nobility than the armoury, as being borne at tournaments; to which none were admitted till they had given proof of their nobility. Sometimes it ſerves to diſtinguiſh the ſeveral branches of a family. It has alſo ſerved, on occaſion, as the diſtinguiſhing badge of factions. Sometimes the creſt is taken from the device; but more uſually it is formed of ſome piece of the arms: thus, the emperor's creſt is an eagle; that of Caſtile, a caſtle, &c. Families that exchange arms, as the houſes of Brunſwick and Cologne have done, do not change their creſts; the firſt ſtill retain the horſe, and the latter the mermaid.

CREST, in heraldry, the figure placed above the helmet in an atchievement. See HERALDRY.

CREST-fallen, a fault of an horſe, when the upper part of his neck, called the *creſt*, hangs to one ſide: this they cure by placing it upright, clipping away the ſpare ſkin, and applying plaſters to keep it in a proper poſition.

CRETA, or CHALK, in natural hiſtory. See CHALK

CRETE, one of the largeſt iſlands in the Mediterranean, lying between 22 and 27 degrees of eaſt longitude, and between 35 and 36 degrees of north latitude. According to Strabo, this iſland is 287 miles in length; and according to Pliny, 270; and according to Scylax, 312. As to its breadth, it is not, as Pliny obſerves, above 55 miles where wideſt; whence it was ſtyled, as Stephanus obſerves, the *Long Iſland.* It has the Archipelago to the north, the African ſea to the ſouth, the Carpathian ſea to the eaſt, and the Ionian to the weſt. Anciently it was known by the names of *Aeria, Chthonia, Idæa, Curete, Macaris,* &c. but its moſt common name was that of *Crete.*

The Cretan mythologiſts, quoted by Diodorus Siculus, relate that the firſt inhabitants of the Iſland were the Dactyli, Idæi, who dwelt around mount Ida;

they were regarded as magicians, becauſe they poſſeſſed a variety of knowledge, and were particularly ſkilled in religious myſteries. Orpheus, who diſtinguiſhed himſelf ſo highly in poetry and muſic, was their diſciple. They diſcovered the uſe of fire, iron, and braſs, and invented the art of working theſe metals in Berecynthius, a mountain near Aptera. Thoſe invaluable diſcoveries procured them divine honours. One of them, named Hercules, rendered himſelf famous by his courage and great exploits. He inſtituted the Olympic games: though poſterity, by a miſtake ariſing from his bearing the ſame name, have aſcribed that inſtitution to the ſon of Alcmena; who, indeed, trode in the ſteps of his predeceſſor, and raiſed himſelf alſo to immortality.

The Dactyli Idæi were the anceſtors of the Curetes. Theſe laſt, at firſt inhabited the foreſts and caves of the mountains. Afterwards they entered into domeſtic life, and contributed, by their inſtitutions, to the civilization of mankind. They taught men to collect flocks of ſheep, to tame the ferocity of wild animals for domeſtic purpoſes, and to invite bees into hives, that they might rifle them of the fruit of their labours. They firſt prompted men to the chaſe, and taught the uſe of the bow. They were the inventors of ſwords and of military dances. The noiſe which they made, by dancing in armour, hindered Saturn from hearing the cries of Jupiter, whoſe education Rhea had entruſted to them. With the aſſiſtance of the nymphs, they brought up that god in a cave in mount Ida, feeding him with the milk of the goat Amalthea, and with honey.

To this period mythology aſſigns the origin of the Titans; their abode near Gnoſſus, where ſtood the palace of Rhea; their travels over the whole earth; their war againſt Ammon, and his defence by Bacchus; the nuptials of Jupiter and Juno, celebrated nigh the river Therenus in Crete; the gods, goddeſſes, and heroes who deſcended from them.

The moſt illuſtrious of thoſe heroes were Minos and Rhadamanthus. They are ſaid to have been the ſons of Jupiter and Europa, who was conveyed into the iſland on a bull. Minos becoming king, built ſeveral cities; the moſt conſiderable of which are—Gnoſſus, on that ſide of the iſland which faces Aſia, Phœſtus on the ſouthern ſhore, and Cydon on the weſtern, facing Peloponneſus. He gave to his ſubjects a code of admirable laws, which he pretended to have received from his father Jupiter in the grotto of mount Ida.

Rhadamanthus diſtinguiſhed himſelf by the impartiality of his judgments, and by the inflexible ſeverity with which he inflicted puniſhment on the impious and wicked. His empire extended over the chief iſles of the Archipelago, and the inhabitants of the adjacent coaſts of Aſia ſubmitted to him on account of his high reputation for probity and juſtice. Mythologiſts have conſtituted him judge in the regions below, to determine the future ſtate of the righteous and the wicked. They have conferred on him the ſame honours which were beſtowed on Minos, the juſteſt of kings.

Thus far have been followed the Cretan traditions as they are related by Diodorus; but hiſtorians differ about the truth of them. There are a variety of opinions concerning the firſt inhabitants of Crete. Strabo, who has diſcuſſed them with great erudition, ſays, after ſeveral pages on the ſubject, "I am not fond of fables; yet I have detailed theſe at ſome length, becauſe they are connected with theology. Every diſcourſe concerning the gods ſhould examine the religious opinions of antiquity, and diſtinguiſh them from fable. The ancients were pleaſed to conceal their knowledge of nature under a veil. It is now impoſſible to unfold the meaning of their enigmas. But by expoſing to light the numerous allegories which they have left us, and by examining attentively their mutual relations and differences, genius may perhaps be able to unfold the truths which are couched under them."

But leaving mythology for the more certain records and monuments of hiſtory, we find that Crete received its name from Crés, the firſt of its monarchs. He was author of ſeveral uſeful inventions, which contributed to the happineſs of his ſubjects. Prompted by gratitude, they endeavoured to perpetuate the memory of his favours, and to immortalize his name, by naming the iſland after him.

In order to diſtinguiſh the true Cretans from ſtrangers, they were named *Eteocretes*. A number of colonies, from different parts of Greece, ſettled in the iſland. The agreeableneſs of the climate, and the fertility of the ſoil, invited them to fix their habitation there. The Lacedæmonians, Argives, and Athenians, were the principal people who ſent colonies into Crete. This is what makes Homer ſay, "Crete is an extenſive iſland in the midſt of the ſtormy main. The ſoil is rich and fertile. It contains an immenſe number of inhabitants. It is adorned with an hundred cities. Its inhabitants ſpeak in various languages. We find there Achæans, valiant Eteocretes, Cydonians, Dorians, and godlike Pelaſgians." The Eteocretes inhabited the ſouthern divſion of the iſland; they built there the city of Prœſus, and erected a temple to Dictæan Jove.

Crés was not the only monarch who reigned in the iſland of Crete. He had a ſeries of ſucceſſors. But hiſtory affords little information concerning them: only the names of a few of them are preſerved, and a ſmall number of events which happened under the reign of ſome others,—but blended and disfigured with an intermixture of fable. Among thoſe monarchs we find two Jupiters, and two of the name of Minos. However, moſt writers confound them, and aſcribe to one thoſe tranſactions and exploits which ſhould be ſhared between the two.

This remark chiefly regards Minos, who was eſteemed the wiſeſt legiſlator of antiquity. The office aſſigned him in the regions below, is a clear and certain proof of his having gained an exalted reputation by his juſtice. Greece, ſays Plato, has with great propriety adopted the laws of Crete; for they are founded on the ſolid baſis of reaſon and equity, and have a natural tendency to render the people, who live in ſubjection to them, opulent and happy. One of thoſe laws forbade "the Cretans ever to carry their feſtivity ſo far as to intoxicate themſelves with wine." The following was very ſuitable to repreſs the preſumptuous ardour of youth, "Let young people not canvaſs the laws with an indiſcreet curioſity; let them not examine whether the lawgiver has done right or wrong in promulgating them; but let them join unanimouſly in declaring them good, ſince they proceed from the gods. If any of the old men perceive ſomething in them meriting amendment, let him mention it to the magiſtrate, or diſcuſs it with his equals, but never in the preſence of the young people." That excellent code was engraven on tables of braſs; and Talos, chief miniſter to Minos, viſited all the towns and cities in the iſland, three times a-year, to obſerve in what manner the laws were executed and obeyed. The king of Crete, well knowing that the marvellous is neceſſary to command the belief and enforce the obedience of the people, pretended that he had received thoſe laws from his father Jupiter, in the grotto of mount Ida. In the ſame manner, Lycurgus, before promulgating his laws, repaired to Delphos, and gave out they had received the ſanction of Apollo. A like reaſon induced Numa to pretend to an intimacy with the nymph Egeria, and Mahomet to aſcribe his doctrines and inſtitutions to the revelation of the angel Gabriel.

In contradiction to this account, others of the ancients deſcribe Minos as a prince impotently abandoned to the fury of his paſſions, and a barbarous conqueror. Falling paſſionately in love with the nymph Dictynna, who refuſed to gratify his wiſhes, he purſued her to the brink of the ſhore, and forced her to plunge into the ſea, where ſhe was ſaved by ſome fiſhermen, who received her in their nets. He was the firſt of the Greeks who appeared in the Mediterranean at the head of a naval armament. He conquered the Cyclades, expelled the Carians, eſtabliſhed Cretan colonies in thoſe iſlands, and committed the government of them to his ſon.

Being informed, while he was at Paros, that his ſon Androgeus was ſlain at Athens, he declared war againſt Egeus, and impoſed on him a diſgraceful tribute; from the payment of which Theſeus delivered his country. He took arms againſt Niſus, king of Megara, made him priſoner by the treachery of his daughter Scylla, and put him to death, together with Megarus, the ſon of Hippomanes, who had brought ſome forces to his aſſiſtance. Dædalus, who had by ſome means incurred his diſpleaſure, deſpairing of pardon from ſo ſevere and inflexible a prince, employed the reſources of his inventive genius, in order to eſcape from his power. He fled to Sicily, gained the protection of King Cocalus, and obtained an aſylum in his court. Valerius Flaccus has deſcribed his flight in a very lively and pictureſque manner. "Thus Dædalus, with the wings of a bird, aſcended from mount Ida. Beſide him flew the comrade of his flight, with ſhorter wings. They appeared like a cloud riſing in the air. Minos, ſeeing his vengence thus eluded, glowed with impotent rage. In vain he followed with his eyes the ſecure flight of his enemies through the wide expanſe of heaven. His guards returned to Gortynia with their quivers filled with arrows." The Cretan monarch did not, however, give up his prey. He equipped a fleet, purſued the fugitive to Sicily, and fell before the walls of Camicum.

It is plain, that thoſe actions cannot agree to the character of that juſt monarch, whoſe merits raiſed him to the office of determining, in the regions below, the unalterable fate of the righteous and the wicked. We may, therefore, reaſonably conclude, that Minos the legiſlature is a different perſon from the conqueror; that it was the former who gained a laſting reputation by his wiſdom and juſtice; and the latter who ſubdued moſt of the iſlands of the Archipelago, but being enſlaved by his paſſions, tarniſhed his glory by his cruelty and mercileſs thirſt for vengeance.

The laſt king of Crete was Idomeneus. This prince, accompanied by Merion, conducted 24 ſhips to the aſſiſtance of Agamemnon. Homer informs us of the illuſtrious exploits by which he ſignalized himſelf before the walls of Troy. At his departure, he committed the government of his kingdom to Leucus his adopted ſon, promiſing him the hand of his daughter Cliſithera if he governed wiſely in his abſence. That ambitious young man ſoon forgot the favours which had been ſo laviſhly beſtowed on him. Gaining a number of partiſans, he in a ſhort time aſpired to the immediate poſſeſſion of the crown. His impatience would not wait till he ſhould obtain it lawfully by marriage. Flattering himſelf, from the long abſence of the king, that he was perhaps fallen before Troy, he determined to mount the throne. Mida, wife to Idomeneus, and the princeſs Cliſithera, were an obſtacle to his wiſhes. But ambition knows no reſtraint, and tramples under foot the moſt ſacred obligations. The baſe wretch having ſeduced the people from their allegiance, and captivated the affections of the nobles, ſacrificed thoſe unfortunate victims in the temple. When Idomeneus, crowned with laurels, landed on the coaſt of Crete, Leucus, who had now firmly eſtabliſhed his power, attacked him with an armed force, and obliged him to reimbark. A different account is alſo given of the baniſhment of Idomeneus. Servius ſays, that he had vowed, in a ſtorm, to ſacrifice to the gods the firſt perſon that his eyes ſhould behold on the Cretan ſhore; that his ſon having met him firſt after his arrival, he fulfilled his vow, by ſacrificing him; and that the iſland, being ſoon after depopulated by peſtilence, the inhabitants looked upon that affliction as the effect of divine vengeance, and expelled the parricide; who retiring to Italy, founded Salentum, on the Meſſapian coaſt. But that opinion appears entirely groundleſs. Hiſtory mentions no ſon of Idomeneus. If he had a ſon of his own blood, why did he adopt Leucus? Why did he entruſt to him the government of the iſland, when he promiſed him his daughter in marriage? The more probable opinion is, that the plague was introduced into the iſland by his ſhips, when he returned from the ſiege of Troy, as Herodotus aſſerts; and that Leucus artfully made uſe of that pretext to expel his lawful ſovereign from the iſland. But it appears that the uſurper did not long enjoy the fruit of his crimes. Soon after the departure of Idomeneus, monarchy was aboliſhed, and the government of Crete became republican. The republic of Crete has been celebrated by the panegyric of Plato, ſerved Lycurgus as a model for that which he eſtabliſhed in Lacedemon, and was beheld by all Greece with reſpect and admiration. Strabo has thought it not unworthy of its pencil, and has conſecrated the leading features of its conſtitution to laſting fame in his immortal work. It was indeed a ſyſtem of legiſlature, whoſe direct tendency was to call forth the buds of virtue in the heart of infancy; to open and expand then in youth; to inſpire man, as he reached maturity, with the love of his country, of glory, and of liberty; and to comfort and ſupport the infirmities of age with the reſpect and eſteem due to the experience and wiſdom of that period of life. It laboured to form affectionate friends, patriotic citizens, and worthy magiſtrates. It made no uſe, however, of a multitude of acts and ſtatutes to produce thoſe ineſtimable advantages. They flowed all from one ſource; the public education of youth, judiciouſly directed. The virtuous examples ſet before youth in the courſe of that education, the illuſtrious deeds which were recited to them with high applauſe, the honours conferred on valour and on noble actions, the opprobrium invariably caſt on vice; theſe were the only means which the Cretan lawgiver made uſe of to form a warlike, humane, and virtuous nation.

The Cretan government, ſoon after the expulſion of Idomeneus, became ariſtocratical. The power was divided between the nobles and the people. Yet as the chief employments were occupied by the nobles, they directed the adminiſtration of affairs. Ten magiſtrates were annually elected, by a majority of voices in the national aſſembly. Theſe were named *Coſmoi*, and their public office and character were the ſame with thoſe of the Ephori at Sparta. They were the generals of the republic in time of war, and directed all affairs of any importance. They had the right of chooſing certain old men for counſellors. Thoſe old men, to the number of twenty-eight, compoſed the Cretan ſenate. They were choſen from among ſuch as had diſcharged the office of Coſmoi, or had diſtinguiſhed themſelves by extraordinary merit and blameleſs probity. Thoſe ſenators continued in office during life, poſſeſſed a weighty influence, and were conſulted in every affair of any importance. This body was a barrier oppoſed by the wiſdom of the legiſlator againſt the ambition of the ten chief rulers. He had impoſed another reſtraint on their power, by limiting the period of their adminiſtration to one year. His foreſight went ſtill farther. The ſuffrages of the people might be obtained by bribery or perſonal influence, and of conſequence their choice might ſometimes fall on a man unworthy of ſo honourable an office. When that happened, he who had been undeſervedly advanced to the dignity of Coſmos was degraded, either in a national aſſembly, or ſimply by the voices of his colleagues. This, doubtleſs, is what Plato alludes to, when he ſays. "Neither the commonwealth, which approaches too near to a monarchical conſtitution, nor that which affects a licentious liberty, is founded on the ſolid baſis of a juſt medium between anarchy and deſpotiſm. O Cretans! O Lacedemonians! by eſtabliſhing yours on firmer foundations, you have avoided thoſe fatal extremes."

Such were the diſtribution of power and the adminiſtration of public affairs in the Cretan government. Its ſimplicity was admirable. A people who were bleſſed with the ſacred enjoyment of liberty, but poſſeſſed not ſufficient knowledge and diſcernment to direct themſelves, elected magiſtrates, to whom they delegated their authority. Thoſe magiſtrates, thus arrayed with ſovereign power, choſe ſenators to aſſiſt and direct their deliberations. Theſe counſellors could neither enact or decide of themſelves: but they held their office for life; and that circumſtance contributed to ſtrengthen their influence and to increaſe their experience. The magiſtrates were animated by the moſt powerful motives to diſtinguiſh themſelves when in office, by unwearied activity in the public ſervice. On one ſide, they were reſtrained by the fear of degradation; on the other, actuated by the hope of becoming one day members of the national council.

Yet let us enquire what means the Cretan lawgiver uſed to form virtuous citizens. All the Cretans were ſubjected to the power of their magiſtrates; and divided into two claſſes, the adults and the youth. Men arrived at maturity were admitted into the firſt. The ſecond conſiſted of all the young men who were not below the age of ſeventeen. The ſociety of adults eat together in public halls. Their rulers, magiſtrates, poor and rich, ſeated together, partook, without diſtinction, of the ſame ſimple fare. A large bowl, filled with wine and water, which went round the company from one to another, was the only drink that they were allowed. None but the old men had a right to call for more wine. Doubtleſs, that people, ſo celebrated for wiſdom, were not ſtrangers to the power of beauty; for a woman was appointed to preſide at each table. She openly diſtributed the moſt exquiſite meats to thoſe who had diſtinguiſhed themſelves by their valour or wiſdom. That judicious preference was ſo far from exciting envy or jealouſy, that it only prompted every perſon to deſerve it by brave and prudent conduct. Near where the citizens ſat, two tables were laid, which they named *Hoſpital*; all ſtrangers and travellers were entertained at theſe: and there was alſo a particular houſe ſet apart by the public, in which they might ſpend the night.

To ſupply the public expences, every citizen was obliged to bring a tenth part of this annual income into the treaſury. The chief magiſtrates were to take care that every perſon contributed his proportion. In Crete, ſays Ariſtotle, one part of the fruits of the earth, of the produce of the flocks, of the revenues of the ſtate, and of the taxes and cuſtoms, is ſacred to the gods: the other is diſtributed among the members of the community; ſo that men, women, and children, all ſubſiſt at the public expence.

After dinner, the magiſtrates and ſenators uſually ſpent ſome time in deliberating on the affairs of the ſtate; they next recounted the noble deeds which had been done in war, celebrated the courage of their moſt diſtinguiſhed warriors, and animated the youth to heroic valour. Thoſe aſſemblies were the firſt ſchool of the youth. At the age of ſeven, the boy was permitted to handle the bow;—from that time he was admitted into the ſociety of the adults, where he continued till the age of ſeventeen. There, ſitting on the ground, and clothed in a plain and coarſe dreſs, he ſerved the old men, and liſtened, with reſpectful ſilence, to their advices. His young heart was inflamed with the recital of noble deeds in arms, and glowed with ardour to imitate them. He acquired habits of ſobriety and temperance. And being conſtantly witneſs of illuſtrious examples of moderation, wiſdom, and patriotiſm; the ſeeds of virtue were thus ſown and ſoſtered in his heart before he attained the uſe of reaſon.

He was early accuſtomed to arms and to fatigue, that he might learn to endure exceſſive heat or cold, to clamber and leap among hills and precipices, and to bear manfully the blows and wounds which he might receive amid the gymnaſtic exerciſes or in battle. His education was not confined to the gymnaſtic exerciſes; he was alſo taught to ſing the laws, which were written in verſe, with a certain ſpecies of melody; in order that the charms of muſic might diſpoſe him to learn them with more pleaſure, and might impreſs them more deeply on his heart, and that, if he ſhould ever tranſgreſs them, he might not have the excuſe of ignorance to offer. He next learned hymns in honour of the gods, and poems compoſed in praiſe of heroes. When he reached his ſeventeenth year, he retired from the ſociety of the adults, and became a member of that of the young men.

Here his education was ſtill carried on. He exerciſed himſelf in hunting, wreſtling, and fighting with his companions. The lyre played tunes of martial muſic; and he learned to follow exactly the ſounds and meaſure of the muſician. Thoſe ſports and exerciſes were ſometimes attended with danger; becauſe arms of ſteel were ſometimes uſed in them. One dance, in which the youth aſpired moſt ardently to excel, was the Pyrrhic, originally invented in Crete. The performers in that dance were arrayed in complete armour:—they wore a light ſhort coat, which did not fall below the knee, and was bound with a girdle going twice round the waiſt; on their feet and legs were buſkins; above theſe they bore their arms,—and performed various military evolutions to the ſound of muſical inſtruments. "The Lacedemonians and Cretans," (ſays Libanius), "cultivated dancing with amazing ardour; they conſidered, that their laws had directed them to practiſe it for the moſt important purpoſes; and it was ſcarce leſs diſhonourable for a Lacedemonian or Cretan to neglect the military dances, than to deſert his poſt in battle."

Thoſe Cretans who were opulent and high-born, were permitted to form ſocieties of young men of their own age. They often ſtrove, with emulation, who ſhould form the moſt numerous one. The father of the young man who formed one of thoſe ſocieties, uſually preſided in it. He had a right to educate thoſe warlike youth, to exerciſe them in running and in hunting, to confer rewards and inflict puniſhments.

Friendſhip was in high eſtimation among the Cretans; but, ſays Strabo, the manner in which they conducted the intercourſe of friendſhip was pretty extraordinary. Inſtead of mild perſuaſion, they made uſe of violence, to gain the objects of their affections. He who conceived an affection for a young man of his own age, and wiſhed to attach him to himſelf by indiſſoluble bonds, formed a ſcheme for carrying him off by violence. Three days before putting it into execution, he communicated it to his comrades. They could not then interfere to prevent it; becauſe if they had, they would have appeared to think the young man unworthy of ſuch an exceſſive attachment. At the appointed day they aſſembled to protect their companion. If the raviſher appeared to them not unworthy of the object of his affection, they made, at firſt, a faint reſiſtance in obedience to the law—but, at laſt, joyfully favoured his enterpriſe; if, on the other hand, they thought him unworthy of the object of his choice, they made ſuch reſiſtance as to prevent him from executing his deſign. The feigned reſiſtance continued till the raviſher had conducted his friend into the hall of that ſociety to which he belonged. They did not regard him who poſſeſſed ſuperior beauty and gracefulneſs of perſon as the moſt amiable; but him who had moſt diſtinguiſhed himſelf by his modeſty and valour.

The raviſher loaded his young friend with favours, and conducted him wherever he deſired: they were accompanied by thoſe who had favoured the rape: he carried him from feaſt to feaſt, procured him the pleaſures of the chace and good cheer; and after uſing all poſſible means to gain his heart for the courſe of two months, brought him back to the city, and was obliged to give him up to his parents. But firſt he preſented him with a ſuit of armour, an ox, and a drinking-cup; which were the uſual and legal preſents on ſuch occaſions. Sometimes his generoſity went ſtill farther; and he made more expenſive preſents; to defray the expence of which his comrades contributed. The young man ſacrificed the ox to Jupiter, and gave an entertainment to thoſe who had aſſiſted when he was carried off. He then declared his ſentiments concerning a connection with his raviſher, and told whether or not it was agreeable to him. If he had reaſon to complain of the treatment which he had received, the law allowed him to forſake a friend ſo unworthy of the name, and to demand his puniſhment.

It would have been diſgraceful, adds Strabo, to a young man, who was handſome and well-born, to be rejected by his friends on account of the depravity of his manners. Thoſe who had been carried off received public honours. Theirs were the firſt places in the halls and at the race. They were permitted to wear, during the reſt of life, thoſe ornaments which they owed to the tenderneſs of friendſhip; and that mark of diſtinction teſtified to all who ſaw them, that they had been the objects of ſome fond attachment.

When the youth had finiſhed their exerciſes, and attained the legal age, they became members of the claſs of adults; being then conſidered as men, they were permitted to vote in the national aſſemblies, and were entitled to ſtand candidates for any public office. They were then obliged to marry; but did not take home their wives till ſuch time as they were capable of managing their domeſtic concerns.

"The legiſlator (ſays Strabo) had conſidered liberty as the greateſt bleſſing that citizens can enjoy. Liberty alone can ſecure the property of the citizens of any ſtate. Slavery either robs them of it, or renders it precarious. The firſt care of nations ſhould therefore be to preſerve their liberty. Concord ſtrengthens and ſupports her empire; ſhe flouriſhes wherever the ſeeds of diſſenſion are extinguiſhed. Almoſt all thoſe hoſtilities which prevail among nations or individuals ſpring either from an inordinate deſire of wealth or the love of luxury. Introduce, inſtead of thoſe baneful principles, frugality, moderation, and equality of conditions; you will thus baniſh envy, hatred, injuſtice, and haughty diſdain." This was what the Cretan lawgiver happily effected. And the community, which was regulated by his wiſe inſtitutions roſe to glory, opulence, and power; and was honoured with the panegyrics of the moſt celebrated philoſophers of Greece: but the higheſt honour it ever obtained, was that of ſerving Lycurgus as a model for the admirable form of government which he eſtabliſhed at Sparta.

The republic of Crete continued to flouriſh till the age of Julius Cæſar. No other ſtate has enjoyed ſo long a period of ſtrength and grandeur. The legiſlature, regarding liberty as the only ſure baſis of a nation's happineſs, had inſtituted a ſyſtem of laws, the natural tendency of which was, to inſpire men with an ardent paſſion for liberty, and with ſuch virtue and valour as are neceſſary to ſupport and defend it. All the citizens were ſoldiers; all of them were ſkilled in the art of war. The valiant youth of other nations reſorted to Crete, to learn the exerciſes, manœuvres, and evolutions, of the military art. “Philopœmen (ſays Plutarch) being impatient of indolence, and eager to acquire ſkill in arms, embarked for Crete. After ſpending a conſiderable time in the nobleſt exerciſes among that brave people, who were ſkilled in the art of war, and accuſtomed to an auſtere and temperate life, he returned to the Achæans. The knowledge which he had acquired made him ſo eminent among them, that he was immediately appointed general of their cavalry.”

On the other hand, the legiſlator, being perſuaded that conqueſts are generally unjuſt and criminal, that they often exhauſt the ſtrength of the victorious nation, and almoſt always corrupt its manners, endeavoured to preſerve the Cretans from the ambition of conqueſt. The fertility of the iſland abundantly ſupplied their wants. They needed not that commerce ſhould introduce among them the riches of foreign countries, along with which luxury and her train of attendant vices would alſo be introduced; and he knew how to inſpire them with an indifference for ſuch acquiſitions without expreſsly forbidding them. The gymnaſtic exerciſes, which occupied the leiſure of the gallant youths; the pleaſures of the chace; the ardour of friendſhip; the public ſhows, at which all the different orders of the community, both men and women, uſed to aſſemble; the love of equality, order, and their country, with which he inflamed every breaſt; the wiſe inſtitutions, which united a whole nation ſo cloſely that they compoſed but one family;—all theſe ties attached the Cretans to their native iſland: and finding at home that happineſs which was the object of their wiſhes, they never thought of wandering abroad in ſearch of an imaginary glory, or of extending their empire over other nations. Therefore, from the period at which that ſtate aſſumed a republican form till the time when they were attacked by the arms of Rome, the nation was not once known to ſend an hoſtile force into the territories of any of their neighbours. This inſtance of moderation is unparalleled in hiſtory; no other nation can divide the glory of it with the Cretans. Individuals indeed might leave their country to engage in foreign armies. Thoſe princes and ſtates who knew their valour and ſkill in archery eagerly ſought to take them into their pay; all the neighbouring monarchs were deſirous of having in their armies a body of Cretan archers. Over the whole world none were more celebrated than they for bending the bow. “The arrows of Gortynia (ſays Claudian) aimed from a truſty bow, are ſure to wound, nor ever miſs the deſtined mark.”

Though the multitude of independent cities which flouriſhed in Crete did not unite their arms to ſubjugate the neighbouring iſlands, and drench them with the blood of their inhabitants, yet they were not ſo wiſe as to live in peace among themſelves. Diſcord often ſtalked among them with her flaming torch. The moſt powerful wiſhed to enſlave the reſt. Sometimes Gnoſſus and Gortynia marched with ſocial banners againſt their neighbours, levelled their fortreſſes, and ſubjected them to their power; at other times they attacked each other with hoſtile violence, and ſaw their braveſt youth periſh amid the horrors of civil war. Lyctos and Cydon oppoſed an invincible barrier to their ambition, and preſerved their own liberty. The laſt of theſe cities had acquired ſuch ſtrength and influence, that ſhe held the balance between the rival powers of the iſland. Thoſe wars deſtroyed a number of the cities, and drenched the native country of Jupiter with blood.

To what ſource muſt we attribute theſe inteſtine diſſentions? One part of the iſland was occupied by the Eteocretes, the original inhabitants; the reſt was peopled with colonies from Athens, Sparta, Argos, and Samos. Perhaps the ancient grudges which had ſubſiſted among thoſe ſtrangers, being ſtill unextinguiſhed in their breaſts, were eaſily rekindled by accident or circumſtances, and inflamed with new fury. We may alſo ſuppoſe, that the moſt powerful among them, exulting in their ſuperiority, would endeavour to take advantage of the weakneſs of the reſt, and diſregard all laws but thoſe of force; beſides, the glowing ardour of the youth, trained to military exerciſes, was ever ready to fly to arms. Such, probably, were the cauſes which fomented diſcord and hoſtility among a people living under the ſame religion, cuſtoms, and laws. Whatever theſe might be, the Cretans, being perſuaded that the firm union of their ſoldiers was eſſential to victory, arrayed the braveſt youths of the army in ſplendid robes, and cauſed them to ſacrifice to friendſhip before engaging in battle. In ſome countries it would be very proper to oblige the generals, on ſuch occaſions, to ſacrifice to concord. If ſuch a ſacrifice were performed with ſincerity, it might preſerve their glory unſtained, and prevent ſuch deluges of blood from being waſted without producing any advantages to the ſtate.

Their paſſion for war did not extinguiſh in the breaſts of the Cretans that exquiſite ſenſibility which is the mother and nurſe of the fine arts. “The Cretans (ſays Sozomen) gave an illuſtrious proof of their munificence to genius, by making Homer a preſent of a thouſand pieces of ſilver; and to perpetuate the memory of this act of generoſity, they recorded it by an inſcription on a public column.” In Crete, adds Ptolemy, men are ſtill more deſirous of cultivating their underſtandings than of exerciſing their bodily powers. Often when diſſentions aroſe, the voice of wiſdom and the charms of poeſy recalled them to reaſon and harmony. Thales of Gortynia, the preceptor of Lycurgus, was one of their moſt celebrated philoſophers. Being both a poet and legiſlator, he made an happy uſe of his abilities and knowledge to extinguiſh among his countrymen the kindling ſparks of diſcord. “His poems were moral diſcourſes in verſe, which recalled the people to concord and ſubmiſſion to the laws. Uſing a regular meaſure, he recommended the auſterity of his ſubject by the inſinuating and powerful charm of ſentiment. So powerful were the effects of his verſes, which addreſſed at once the ears, the heart, and the underſtanding of his hearers, that their rage was gradually ſoftened. Next, opening their hearts to the love of peace, the advantages of which he deſcribed in glowing colours, they forgot their inteſtine diſſentions, and ranged themſelves around the ſtandard of concord." That ſage is ſaid to have invented tunes for the military dances and for the Cretan Pyrrhic. Men who felt ſo ſtrongly the influence of poetry and muſic could ſcarcely be enemies to pleaſure. Accordingly they had a cuſtom of diſtinguiſhing their fortunate days with white flint ſtones, their unfortunate days with black. At the end of the year they counted the number of their white ſtones, and reckoned that they had lived only ſo many days as were diſtinguiſhed for having been fortunate. They did not think mere exiſtence, without the enjoyment of pleaſure, worthy of the name of *life*. For this reaſon, they cauſed to be inſcribed on their tombs: "He lived ſo many days; he continued in exiſtence ſo long."

A paſſion for glory is eaſily awaked in a feeling and generous breaſt. The Cretans eagerly repaired to the famous ſolemnities of Greece, and were often crowned at the Olympic, Nemæan, and Pythian games: others of them were favourites of the muſes, and verſified the predictions of prophets, or celebrated the glorious deeds of their heroes. Several of them diſtinguiſhed themſelves by hiſtorical compoſitions. At the moſt ancient games, a prize is ſaid to have been beſtowed on the poet who ſung the nobleſt hymn in honour of Apollo: Chryſothemis of Crete ſung and gained the prize.

The ravages of time have deprived us of almoſt all their works; and if Pindar had not preſerved the memory of ſome of their crowns, we ſhould not know even the names of the conquerors who wore them. The temple of Dianna at Epheſus, built by the Cretan Cteſipon and his ſon Metagenes, was not proof againſt the frantic hand of the incendiary. Thoſe ingenious architects had built it on the principles of the Ionic order: to the coſtlineſs of the materials, the elegance of the architecture, the ſymmetry of the parts, and the majeſty and perfection of the whole, they had added ſolidity and ſtrength, without which the reſt muſt have been of ſmall value. Their names have deſcended to poſterity, but the pillars of that monument which has perpetuated their memory have been diſperſed or deſtroyed. Scarce a veſtige remains of that building which was eſteemed one of the ſeven wonders of the world.

Nations are effaced from the earth like the monuments of their power, and after the revolution of ſeveral ages we can ſcarce trace in their poſterity any remains of their ancient character. Some of them exiſt longer, others ſhorter; but we may almoſt always calculate the period of their duration by the excellence of their laws, and the fidelity with which they ſupport and obey them. The republic of Crete, being eſtabliſhed on a ſolid baſis, knew no foreign maſter for a period of ten centuries. She bravely repelled the attacks of thoſe princes who attempted to enſlave her. At length the time arrived when the warlike and victorious Romans aſpired to the empire of the world, and would ſuffer none but their ſubjects or ſlaves to inhabit within the reach of their arms. Florus does not ſcruple to acknowledge, that the Romans had no other motives for invading Crete but the ambitious deſire of ſubduing the renowned native country of Jupiter. "If any perſons wiſh to know the reaſons which induced us to attack Crete (ſays he), the true reaſon was our deſire to ſubdue ſo celebrated an iſland. The Cretans had appeared to favour Mithridates, and the Romans thought proper to declare war againſt them on that pretext. Mark Antony, father of the triumvir, attacked them with ſtrong hopes of ſucceſs; but was ſeverely puniſhed for his preſumption and imprudence. The Cretans took a great part of his fleet, hung up his ſoldiers and ſailors on the maſts amid the ſails and cordage, and returned in triumph into their harbours."

The Romans never forgot nor forgave a defeat. As ſoon as the Macedonian war was brought to an happy concluſion, they again took arms againſt the Cretans to revenge their ignominy and loſs. Quintus Metellus was ſent to Crete with a powerful armament. He met with an obſtinate and vigorous reſiſtance. Parnarus and Laſthenes, two experienced leaders, collecting a body of 20,000 young warriors, all eager for battle, and of determined courage, employed their arms and arrows ſucceſsfully againſt the Romans, and protracted the fate of Crete for three years. Thoſe conquerors could not make themſelves maſters of the iſland before deſtroying its braveſt warriors. They loſt a great number of troops, and bought a bloody victory at the price of many a danger and much fatigue. However, their uſual good fortune at length prevailed. The firſt care of the conqueror was to aboliſh the laws of Minos, and to eſtabliſh in their room thoſe of Numa. Strabo, that enlightened philoſopher, complains of this act of ſeverity; and informs us, that in his days the original laws of Crete were no longer in force, becauſe the Romans compelled the conquered provinces to adopt their civil code. To ſecure themſelves ſtill more fully in the poſſeſſion of the iſland, they ſent a powerful colony to Gnoſſus.

From that era to the preſent time, that is, for a period of 1900 years, the Cretans have no longer formed a ſeparate nation, nor made any figure among the ſtates and kingdoms of the world: their noble and ingenuous manners, their arts and ſciences, their valour and their virtues, are no more. They have loſt theſe with the loſs of liberty. So true is it that man is born for himſelf; and that, when deprived of that aid which Nature has deſigned to ſtrengthen and ſupport his weakneſs, the flame of genius and the ardent glow of valour are extinguiſhed in his breaſt; he becomes incapable of vigorous reſolution, and ſinks below the natural virtue and dignity of the ſpecies.

The iſland of Crete, joined with the ſmall kingdom of Cyrene, on the Lybian coaſt, formed a Roman province. It was at firſt governed by a proconſul; a queſtor and an aſſiſtant were afterwards ſent there; at laſt, as Suetonius informs us, it was put under the government of a conſul. This iſland was one of the firſt places in the world that were favoured with the light of the goſpel. St Paul introduced the Chriſtian faith into Crete: and his diſciple Titus, whom he left there to cheriſh and cultivate the precious plant, became the firſt biſhop of the iſland. In the reign of the emperor Leo, it had twelve biſhops, who were all ſubject to the patriarch of Conſtantinople. Conſtantine ſeparated Crete from Cyrene in the new diviſion which he made of the provinces of the empire. Leaving three ſons, Conſtantius, Conſtantine, and Conſtans, he aſſigned Thrace and the eaſtern provinces to the firſt; to the ſecond, the empire of the Weſt; the iſland of Crete, Africa, and Illyria, to the third.

When Michael Balbus ſat on the throne of Conſtantinople, the rebellion of Thomas, which laſted three years, cauſed him to neglect the other parts of the empire. The Agarenians (a people of Arabia), who had conquered the fineſt provinces of Spain, ſeized that opportunity. They fitted out a conſiderable fleet, plundered the Cyclades, attacked the iſland of Crete, and made themſelves maſters of it without oppoſition. In order to ſecure their conqueſt, they built a fortreſs which they named *Khandak*, "intrenchment." From that cidatel the barbarians made inroads into the interior parts of the iſland, carrying havock and devaſtation wherever they appeared. By repeated attacks, they ſubdued all the cities in Crete except Cydon. Michael made ſome ineffectual efforts to expel them from Crete. The emperor Baſilius, the Macedonian, was not more ſucceſsful. They defeated him in a bloody battle; but being vanquiſhed by one of his generals, they were ſubjected to the payment of an annual tribute. At the end of ten years, the Arabians refuſed the tribute. It was reſerved for Nicephorus Phocas, who was afterwards emperor, to deliver this fine iſland from the yoke of the infidels. He landed on the iſland with a numerous army, boldly attacked them, and routed them in various engagements. The Saracens, no longer daring to meet ſo formidable a general in the field, fled for protection to their fortreſſes. Phocas being plentifully ſupplied with all the warlike machines neceſſary for a ſiege, levelled their walls, and alarmed their hearts with terror. He took their cities and fortreſſes, and drove them into Khandak their metropolis and laſt reſource. In the courſe of nine months he ſubdued the whole iſland, took their king Curup and his lieutenant Aremas priſoners, and reunited to the empire a province which had been 127 years in the hands of the Infidels. It remained under the dominion of the Romans till the time when Baldwin Count of Flanders, being raiſed to the throne, liberally rewarded the ſervices of Boniface Marquis of Montſerrat, by making him king of Theſſalonica, and adding the iſland of Crete to his kingdom. That lord, being more covetous of gold than glory, ſold it to the Venetians in the year 1194; under whom it aſſumed the name of CANDIA. See the ſequel of its hiſtory under that article.

CRETIO, in antiquity a certain number of days allowed the heir to conſider whether he would act as heir to the deceaſed or not; after which time, if he did not act, he was excluded from the eſtate.

CREUX, a term in ſculpture, much uſed by the French; though not yet, that we know of, naturalized among us: but the want of a word of equal import in Engliſh, as it has frequently put us under a neceſſity of uſing this in the courſe of the preſent work; ſo it pleads ſtrongly for its admiſſion into our language.

Creux originally ſignifies a *hollow*, *cavity*, or *pit*, out of which ſomething has been ſcooped or dug; hence it is uſed to denote that kind of ſculpture and graving where the lines and figures are cut and formed within the face or plane of the plate or matter engraven on. In which ſenſe it ſtands oppoſed to relievo: where the lines and figures are emboſſed, and appear prominent above the face of the matter.

CREW, the company of ſailors belonging to a ſhip, boat, or other veſſel.

The ſailors that are to work and manage a ſhip are regulated by the number of laſts it may carry; each laſt making two ton. The crew of a Dutch ſhip, from 40 to 50 laſts, is ſeven ſailors and a ſwabber; from 50 to 60 laſts, the crew conſiſts of eight men and a ſwabber; and thus increaſes at the rate of one man for every ten laſts; ſo that a ſhip of 100 laſts has 12 men, &c. Engliſh and French crews are uſually ſtronger than Dutch; but always in about the ſame proportion. In a ſhip of war there are ſeveral particular crews, or gangs, as the boatſwains crew, the carpenter's crew, the gunner's crew, &c.

CREVIER (JOHN BAPTIST LEWIS), a Pariſian, was trained under the celebrated Rollin, and afterwards became profeſſor of rhetoric. Upon the death of his maſter, in 1741, he took upon him to finiſh his Roman Hiſtory. He publiſhed other works, and was greatly ſerviceable to the cauſe of virtue and religion as well as letters. His death happened, 1765, in a very advanced age. Beſides the continuation juſt mentioned, he publiſhed, 1. An edition of *Livius, cum Notis*, in 6 vols 4to, 1748; and afterwards another edition, better adapted to the uſe of his pupils, in 6 vols. ſmall 8vo. 2. *La Hiſtoire des Empereurs de Romains Juſqu'a Conſtantin*, 1749, 12 tom. 12mo. 3. *Hiſtoire de l'Univerſité de Paris*, 7 tom. 12mo. 4. *Rhetorique Françoiſe*, a juſt and uſeful work. 5. *Obſervations ſur l'Eſprit des Loix.* Here he ventured out of his depth; he ſhould have kept within the precincts of the belles lettres.

CREUSA, in fabulous hiſtory, daughter of Creon king of Corinth. As ſhe was going to marry Jaſon, who had divorced Medea, ſhe put on a poiſoned garment, which immediately ſet her body on fire, and ſhe expired, in the moſt excruciating torments. She had received this gown as a gift from Medea, who wiſhed to take that revenge upon the infidelity of Jaſon. Some call her *Glauce*. (*Ovid. de Art. Am.* 1. v. 335.) A daughter of Priam, king of Troy by Hecuba. She married Æneas, by whom ſhe had, among other children, Aſcanius. When Troy was taken, ſhe fled in the night with her huſband; but they were ſeparated in the midſt of the confuſion and tumult, and Æneas could not recover her, nor hear where ſhe was. Some ſay that Cybele ſaved her, and carried her to her temple, of which ſhe became prieſteſs. *Pauſ.* 10. c. 26.—*Virg. Æn.* 2. v. 562.

CREX, in ornithology, a ſpecies of RALLUS.

CRIB, the rack or manger of a ſtable, or the ſtall or cabbin of an ox. It is alſo uſed for any ſmall habitation, as a cottage, &c.

CRIB, in the Engliſh ſalt-works, a name given to a ſort of caſe uſed in ſome places inſtead of the *drab*, to put the ſalt into as it is taken out of the boiling pan.

Cribbage, a game at cards, to be learnt only by practice.

CRIBRATION, in pharmacy, the paſſing any ſubſtance through a ſieve or ſearce, in order to ſeparate the finer particles from the groſſer.

Cribrosum os, in anatomy, called alſo *os ethmoides*. See *Anatomy*, nº 17.

CRICELASIA, the driving a ring or hoop. Driving a hoop was one of the ancient gymnaſtics: this hoop was as high as the breaſt of the perſon who uſed it. It was commended for rendering the limbs pliable, and for ſtrengthening the nerves.

CRICETUS, in zoology. See Mus.

CRICHTON (James), a Scots gentleman, who lived in the 16th century, and who, on account of his extraordinary endowments both of body and mind, obtained the appellation of "the admirable Crichton;" by which title he has continued to be diſtinguiſhed down to the preſent day. The time of this celebrated perſon's birth is ſaid, by the generality of writers, to have been in 1551; but, according to Lord Buchan*, it appears, from ſeveral circumſtances, that he was born in the month of Auguſt 1560. There is a difference likewiſe between the Earl of Buchan and other biographers, with regard to the family of Crichton, and the rank and ſituation of his father. The common accounts aſſert, that James Crichton's father was Robert Crichton of Clunie, in the county of Perth; and that this Robert Crichton commanded Queen Mary's army at the battle of Langſide in the year 1568. But from the Earl of Buchan we learn, that this gentleman was of Elliock in the ſame county, and that he was lord advocate of Scotland in queen Mary's reign from 1561 to 1573; part of which time he held that office in conjunction with Spens of Condie. The mother of James Crichton was Elizabeth Stuart, the only daughter of Sir James Stuart of Beath, who was a deſcendant of Robert duke of Albany, the third ſon of king Robert the ſecond, by Elizabeth Muir or More, as ſhe is commonly called. It is hence evident, that when the admirable Crichton boaſted (as he did abroad), that he was ſprung from Scottiſh kings, he ſaid nothing but what was agreeable to truth.

James Crichton is ſaid to have received his grammatical education at Perth, and to have ſtudied philoſophy in the univerſity of St Andrew. His tutor in that univerſity was Mr John Rutherford, a profeſſor at that time famous for his learning, and who diſtinguiſhed himſelf by writing four books on Ariſtotle's logic and a commentary on his poetics. According to Aldus Manutius, who calls Crichton firſt couſin to the king, he was alſo inſtructed, along with his majeſty, by Buchanan, Hepburn, and Robertſon, as well as by Rutherford; and he had ſcarcely arrived to the 20th year of his age, when he had run through the whole circle of the ſciences, and could ſpeak and write to perfection in ten different languages. Nor was this all; for he had likewiſe improved himſelf to the higheſt degree in riding, dancing, and ſinging, and in playing upon all ſorts of inſtruments.

Crichton, being thus accompliſhed, went abroad upon his travels, and is ſaid to have gone to Paris; of his tranſactions at which place the following account is given. He cauſed ſix placards to be fixed on all the gates of the ſchools, halls, and colleges belonging to the univerſity, and on all the pillars and poſts before the houſes of the moſt renowned men for literature in the city, inviting all thoſe who were well verſed in any art or ſcience, to diſpute with him in the college of Navarre, that day ſix weeks, by nine of the clock in the morning, where he would attend them, and be ready to anſwer to whatever ſhould be propoſed to him in any art or ſcience, and in any of theſe 12 languages, Hebrew, Syriac, Arabic, Greek, Latin, Spaniſh, French, Italian, Engliſh, Dutch, Flemiſh, and Sclavonian; and this either in verſe or proſe at the diſcretion of the diſputant. During this whole time, inſtead of cloſely applying to his ſtudies, he regarded nothing but hunting, hawking, tilting, vaulting, riding of a well-managed horſe, toſſing the pike, handling the muſket, and other military feats; or elſe he employed himſelf in domeſtic games, ſuch as balls, concerts of muſic vocal and inſtrumental; cards, dice, tennis, and the like diverſions of youth. This conduct ſo provoked the ſtudents of the univerſity, that, beneath the placard which was fixed on the Navarre gate, they cauſed the following words to be written: "If you would meet with this monſter of perfection, to make ſearch for him either in the tavern or bawdy-houſe, is the readieſt way to find him." Nevertheleſs, when the day appointed arrived, Crichton appeared in the college of Navarre, and acquitted himſelf beyond expreſſion in the diſputation, which laſted from nine o'clock in the morning till ſix at night. At length, the preſident, after extolling him highly for the many rare and excellent endowments which God and nature had beſtowed upon him, roſe from his chair, and, accompanied by four of the moſt eminent profeſſors of the univerſity, gave him a diamond ring, and a purſe full of gold, as a teſtimony of their love and favour. The whole ended with the repeated acclamations and huzzas of the ſpectators: and henceforward our young diſputant was called, "the admirable Crichton." It is added, that he was ſo little fatigued with the diſpute, that he went on the very next day to the Louvre, where he had a match of tilting (an exerciſe then in much requeſt), and in the preſence of ſome of the princes of the court of France, and a great many ladies, carried away the ring 15 times ſucceſſively.

About two years after this we find him at Rome, where he affixed a placard upon all the eminent places of the city, in the following terms: *Nos Jacobus Crichtonus Scotus, cuicunque rei propoſitæ ex improviſo reſpondebimus.* In a city which abounded in wit, this bold challenge, to anſwer to any queſtion that could be propoſed to him without his being previouſly advertiſed of it, could not eſcape the ridicule of a paſquinade. It is ſaid, however, that being nowiſe diſcouraged, he appeared at the time and place appointed; and that, in the preſence of the pope, many cardinals, biſhops, doctors of divinity, and profeſſors in all the ſciences, he diſplayed ſuch wonderful proofs of his univerſal knowledge, that he excited no leſs ſurpriſe than he had done at Paris. Boccalini, who was then at Rome, gives ſomething of a different relation of the matter. According to this author, the paſquinade againſt Crichton, which was to the following effect, "*And he that will ſee* it *let him go to the*

---

* MS. Memoir read to the Society of Antiquaries at Edinburgh.

the ſign of the Falcon and it ſhall be ſhown," made ſuch an impreſſion upon him, that he left a place where he had been ſo groſsly affronted as to be put upon a level with jugglers and mountebanks.

From Rome he went to Venice: where he contracted an intimate friendſhip with Aldus Manutius, Laurentius Maſſa, Speron Speronius, Johannes Donatus, and various other learned perſons, to whom he preſented ſeveral poems in commendation of the city and univerſity. At length he was introduced to the Doge and Senate, in whoſe preſence he made a ſpeech, which was accompanied with ſuch beauty of eloquence, and ſuch grace of perſon and manner, that he received the thanks of that illuſtrious body, and nothing was talked of through the whole city but this *rara in terris avis*, this prodigy of nature. He held, likewiſe, diſputations on the ſubjects of theology, philoſophy, and mathematics, before the moſt eminent profeſſors, and large multitudes of people. His reputation was ſo great, that the deſire of ſeeing and hearing him brought together a vaſt concourſe of perſons from different quarters to Venice. It may be collected from Manutius, that the time in which Crichton exhibited theſe demonſtrations of his abilities was in the year 1580.

During his reſidence at Venice, he fell into a bad ſtate of health, which continued for the ſpace of four months. However, before he was perfectly recovered, he went, by the advice of his friends, to Padua, the univerſity of which city was at that time in great reputation. The next day after his arrival, there was a meeting of all the learned men of the place, at the houſe of Jacobus Aloyſius Cornelius; when Crichton opened the aſſembly with an extemporary poem in praiſe of the city, the univerſity, and the company who had honoured him with their preſence. After this, he diſputed for ſix hours with the moſt celebrated profeſſors on various ſubjects of learning; and he expoſed, in particular, the errors of Ariſtotle and his commentators, with ſo much ſolidity and acuteneſs, and at the ſame time with ſo much modeſty, that he excited univerſal admiration. In concluſion, he delivered extempore an oration in praſe of ignorance, which was conducted with ſuch ingenuity and elegance, that his hearers were aſtoniſhed. The exhibition of Crichton's talents was on the 14th of March 1581. Soon after he appointed a day for another diſputation to be held at the palace of the biſhop of Padua; not for the purpoſe of affording higher proofs of his abilities, for that could not poſſibly be done, but in compliance with the earneſt ſolicitations of ſome perſons who were not preſent at the former aſſembly. However, ſeveral circumſtances occurred which prevented this meeting from taking place. Such is the account of Manutius: but Imperialis relates, that he was informed by his father, who was preſent upon the occaſion, that Crichton was oppoſed by Archangelus Mercenarius, a famous philoſopher; and that he acquitted himſelf ſo well as to obtain the approbation of a very honourable company, and even of his antagoniſt himſelf.

Amidſt the diſcourſes which were occaſioned by our young Scotſman's exploits, and the high applauſes that were beſtowed upon his genius and attainments, ſome perſons there were who endeavoured to detract from his merit. For ever, therefore, to confound theſe invidious impugners of his talents, he cauſed a paper to be fixed on the gates of St John and St Paul's church, wherein he offered to prove before the univerſity, that the errors of Ariſtotle, and of all his followers, were almoſt innumerable; and that the latter had failed both in explaining their maſter's meaning, and in treating on theological ſubjects. He promiſed likewiſe to refute the dreams of certain mathematical profeſſors; to diſpute in all the ſciences; and to anſwer to whatever ſhould be propoſed to him or objected againſt him. All this he engaged to do, either in the common logical way or by numbers and mathematical figures, or in 100 ſorts of verſes, at the pleaſure of his opponents. According to Manutius, Crichton ſuſtained this conteſt, without fatigue, for three days; during which time he ſupported his credit, and maintained his propoſitions, with ſuch ſpirit and energy, that, from an unuſual concourſe of people, he obtained acclamations and praiſes, than which none more magnificent were ever heard by men.

From Padua, Crichton ſet out for Mantua; where there happened to be at the time a gladiator, who had foiled, in his travels, the moſt famous fencers in Europe, and had lately killed three who had entered the liſts with him in this city. The duke of Mantua was much grieved at having granted this man his protection, as he found it to be attended with ſuch fatal conſequences. Crichton, being informed of his Highneſs's concern, offered his ſervice, not only to drive the murderer from Mantua, but from Italy, and to fight him for 1500 piſtoles. Though the duke was unwilling to expoſe ſuch an accompliſhed gentleman to ſo great a hazard; yet, relying upon the report he had heard of his warlike atchievements, he agreed to the propoſal; and the time and place being appointed, the whole court attended to behold the performance. At the beginning of the combat Crichton ſtood only upon his defence; while the Italian made his attack with ſuch eagerneſs and fury, that having overacted himſelf, he began to grow weary. Crichton now ſeized the opportunity of attacking his antagoniſt in return; which he did with ſo much dexterity and vigour, that he ran him through the body in three different places, of which wounds he immediately died. The acclamations of the ſpectators were loud and extraordinary upon this occaſion; and it was acknowledged by all of them, that they had never ſeen Art grace Nature, or Nature ſecond the precepts of Art, in ſo lively a manner as they had beheld theſe two things accompliſhed on that day. To crown the glory of the action, Crichton beſtowed the prize of his victory upon the widows of the three perſons who had loſt their lives in fighting with the gladiator.

It is aſſerted, that inconſequence of this and his other wonderful performances, the duke of Mantua made choice of him for preceptor to his ſon Vincentio di Gonzaga, who is repreſented as being of a riotous temper and a diſſolute life. The appointment was highly pleaſing to the court. Crichton, to teſtify his gratitude to his friends and benefactors, and to contribute to their diverſion framed, we are told, a comedy, wherein he expoſed and ridiculed all the weakneſſes and failures of the ſeveral employments in which men are engaged. This compoſition was regarded as one of the moſt ingenious ſatires that ever was made upon mankind. But the moſt aſtoniſhing part of the ſtory is, that Crichton ſuſtained 15 characters in the repreſentation of his own play. Among the reſt, he acted the divine, the philoſopher, the lawyer, the mathematician, the phyſician, and the ſoldier, with ſuch inimitable grace, that every time he appeared upon the theatre he ſeemed to be a different perſon.

From being the principal actor in a comedy, Crichton ſoon became the ſubject of a dreadful tragedy. One night, during the time of carnival, as he was walking along the ſtreets of Mantua, and playing upon his guitar, he was attacked by half a dozen people in maſks. The aſſailants found that they had no ordinary perſon to deal with, for they were not able to maintain their ground againſt him. In the iſſue, the leader of the company being diſarmed, pulled off his maſk, and begged his life, telling him that he was the prince his pupil. Crichton immediately fell upon his knees, and expreſſed his concern for his miſtake; alleging, that what he had done was only in his own defence, and that if Gonzaga had any deſign upon his life, he might always be maſter of it. Then taking his own ſword by the point, he preſented it to the prince, who immediately received it, and was ſo irritated by the affront which he thought he had ſuſtained in being foiled with all his attendants, that he inſtantly ran Crichton through the heart.

Various have been the conjectures concerning the motives which could induce Vincentio di Gonzaga to be guilty of ſo ungenerous and brutal an action. Some have aſcribed it to jealouſy, aſſerting that he ſuſpected Crichton to be more in favour than himſelf with a lady whom he paſſionately loved; and Sir Thomas Urquhart has told a ſtory upon this head which is extravagant and ridiculous in the higheſt degree. Others, with greater probability, repreſent the whole tranſaction as the reſult of a drunken frolic; and it is uncertain, according to Imperialis, whether the meeting of the prince and Crichton was by accident or deſign. However, it is agreed on all hands that Crichton loſt his life in this rencounter. The time of his deceaſe is ſaid, by the generality of his biographers, to have been in the beginning of July 1583; but Lord Buchan fixes it to the ſame month in the preceding year. There is a difference, likewiſe, with regard to the period of life at which Crichton died. The common accounts declare that he was killed in the 32d year of his age: but Imperialis aſſerts that he was only in his 22d when that calamitous event took place; and this fact is confirmed by Lord Buchan.

Crichton's tragical end excited a very great and general lamentation. If Sir Thomas Urquhart is to be credited, the whole court of Mantua went three quarters of a year into mourning for him; the epitaphs and elegies that were compoſed upon his death and ſtuck upon his hearſe, would exceed, if collected, the bulk of Homer's works; and, for a long time afterwards, his picture was to be ſeen in moſt of the bedchambers and galleries of the Italian nobility, repreſenting him on horſeback, with a lance in the one hand and a book in the other. The ſame author tells us, that Crichton gained the eſteem of kings and princes, by his magnanimity and knowledge; of noblemen and gentlemen, by his courtlineſs and breeding; of knights, by his honourable deportment and pregnancy of wit; of the rich, by his affability and good fellowſhip; of the poor, by his munificence and liberality; of the old, by his conſtancy and wiſdom; of the young, by his mirth and gallantry; of the learned, by his univerſal knowledge; of the ſoldiers, by his undaunted valour and courage; of the merchants and artificers, by his upright dealing and honeſty; and of the fair ſex, by his beauty and handſomeneſs, in which reſpect he was a maſterpiece of nature.

Joannes Imperialis, in his life of Crichton, ſays, That he was the wonder of the laſt age, the prodigious production of nature; the glory and ornament of Parnaſſus, in a ſtupendous and unuſual manner; and that, in the judgment of the learned world, he was the phœnix of literature, and rather a ſhining particle of the Divine Mind and Majeſty than a model of what could be attained by human induſtry. The ſame author, after highly celebrating the beauty of his perſon, aſſerts, that his extraordinary eloquence and his admirable knowledge of things teſtified that he poſſeſſed a ſtrength of genius wholly divine. "What (adds this writer) can more exceed our comprehenſion, than that Crichton, in the 21ſt year of his age, ſhould be maſter of ten different languages, and perfectly well verſed in philoſophy, mathematics, theology, polite literature, and all other ſciences? Beſides, was it ever heard in the whole compaſs of the globe, that to theſe extraordinary endowments of the mind ſhould be added a ſingular ſkill in fencing, dancing, ſinging, riding, and in every exerciſe of the gymnaſtic art?" Nay, Imperialis, in his account of Crichton's death, declares, that the report of ſo ſad a cataſtrophe was ſpread to the remoteſt parts of the earth; that it diſturbed univerſal nature; and that in her grief for the loſs of the wonder ſhe had produced, ſhe threatened never more to confer ſuch honour upon mankind. Compared with theſe extravagancies, the aſſertion of Bayle that Crichton was one of the greateſt prodigies of wit that ever lived, and the teſtimony of Fœlix Aſtolfus concerning his wonderful memory, may be conſidered as modeſt encomiums.

Such are the accounts which, by a ſucceſſion of writers, and particularly ſince the time of Mackenzie, have been given of the admirable Crichton. Theſe accounts are indeed ſo wonderful that many perſons have been diſpoſed to conſider them as in a great meaſure, if not entirely, fabulous. We ſhall therefore ſubjoin from the *Biographia Britannica* the following obſervations of Dr Kippis, with a view to aſcertain what portion of faith is due to the different parts of the preceding narrative, or at leaſt to aſſiſt the reader in forming a proper judgment concerning them.

The Doctor begins with obſerving, "That no credit can be granted to any facts which depend upon the ſole authority of Sir Thomas Urquhart. Mr Pennant indeed ſpeaks of him with approbation; and Dr Samuel Johnſon laid a ſtreſs on his veracity, in the account of Crichton which he dictated to Dr Hawkſworth, and is inſerted in the 81ſt number of the Adventurer; of which account it may be obſerved, that it is only an elegant ſummary of the life written by Mackenzie. But with all deference to theſe reſpectable names, I muſt declare my full perſuaſion that Sir Thomas Urquhart is an author whoſe teſtimony to facts is totally unworthy

thy of regard; and it is ſurpriſing that a peruſal of his works does not ſtrike every mind with this conviction. His productions are ſo inexpreſſibly abſurd and extravagant, that the only rational judgment which can be pronounced concerning him is, that he was little, if at all, better than a madman. To the character of his having been a madman muſt be added that of his being a liar. Severe as this term may be thought, I apprehend that a diligent examination of the treatiſe which contains the memorials concerning Crichton would ſhow that it is ſtrictly true. But of his total diſregard to truth there is inconteſtable evidence in another work of his, intitled, The true Pedigree and Lineal Deſcent of the moſt ancient and honourable Family of the Urquhart's in the Houſe of Cromarty, from the Creation of the World until the year of God 1652. In this work it is almoſt incredible what a number of falſities he has invented both with reſpect to names and facts. Perhaps a more flagrant inſtance of impoſture and fiction was never exhibited; and the abſurdity of the whole pedigree is beyond the power of words to expreſs. It can only be felt by thoſe who have peruſed the tract itſelf. Such a man therefore can juſtly be intitled to no degree of credit, eſpecially when he has a purpoſe to ſerve, as was the caſe with Sir Thomas Urquhart. His deſign was to exalt his own family and his own nation at any rate. With reſpect to his own nation, there was no occaſion for having recourſe to fiction, in order to diſplay the luſtre of Scotland, in the eminent men whom it has produced in arms and literature. The pencil of truth alone would have been amply ſufficient for the purpoſe.

“ So far therefore as Sir Thomas Urquhart's authority is concerned, the wonderful exhibitions of Crichton at Paris, his triumph at Rome, his combat with the gladiator, his writing an Italian comedy, his ſuſtaining fifteen characters in the repreſentation of that comedy, the extraordinary ſtory of the amour which is deſcribed as the cauſe of his death, the nine months mourning for him at Mantua, and the poems hung round his hearſe to the quantity of Homer's works, muſt be regarded as in the higheſt degree doubtful, or rather abſolutely falſe. I cannot forbear mentioning two circumſtances, which ſhow how much Sir Thomas Urquhart was deſtitute of prudence, as well as of ſcrupuloſity, in his violations of truth. He ſays that the duke of Mantua was pleaſed to confer upon the young lady that was Crichton's miſtreſs and future wife, a penſion of five hundred ducats a year; and that the prince alſo beſtowed as much upon her during all the days of his life, “ which was (adds Sir Thomas) but ſhort; for he did not long enjoy himſelf after the croſs fate of ſo miſerable an accident. Now it is well known that Vincenzo di Gonzaga ſucceeded his father in the dukedom of Mantua in 1587, and that he did not die till the year 1612; which was almoſt, if not entirely, thirty years after Crichton's deceaſe. The other inſtance of the imprudence of Sir Thomas Urquhart in the contrivance of his fictions, occurs at the concluſion of his narrative, where he aſſerts that the verity of the ſtory which he hath related concerning the incomparable Crichton, ‘ may be certified by two thouſand men yet living who have known him.’ *Two thouſand men yet living!* that is, in 1652, ſixty-nine or ſeventy years after Crichton's death, for ſuch was the time of Sir Thomas's publication. Our author would have been ſadly puzzled to collect together theſe two thouſand living witneſſes who could certify the verity of his ſtory.

“ With regard, however, to the account which is given of the prodigious exertions of Crichton, both corporal and mental, at Paris, Mackenzie imagines that he has found a full confirmation of them in a paſſage produced by him from the *Diſquiſitions* of Stephen Paſquier, and which he conſiders as the teſtimony of an eye-witneſs. But the whole of what has been built upon it by Mackenzie and ſucceeding biographers, is founded on a miſtake. In the quotation from the *Diſquiſitions*, the name of Crichton is not mentioned, and the author doth not appear to have been perſonally preſent at the exhibitions of the extraordinary youth there deſcribed. The expreſſions which are ſuppoſed to carry that meaning may well be referred not to the writer himſef, but to his countrymen the French, before whom the young man is ſaid to have diſplayed his ſurpriſing talents. But the diſcuſſion of this point is totally needleſs, becauſe the paſſage in queſtion is not an original authority. The book intitled *Stephani Paſchieri Diſquiſitiones*, is only an abridgment in Latin of Paſquier's *Des Recherches de la France*. Now in this laſt work there is indeed an account of a wonderful youth, ſuch as is related in Mackenzie's quotation, and from which that paſſage was formed. But this wonderful youth, whoever he might be, was not the admirable Crichton: for Paſquier, who does not tell his name, expreſsly ſays that he appeared in the year 1445 (A). The evidence, therefore, produced by Mackenzie falls entirely to the ground.

(A) This matter has lately been ſet in a clear light by a learned and judicious writer in the Edinburgh Magazine for May 1787, whoſe letter is as follows.

“ SIR,

“ We are informed by Sir John Hawkins, that Dr Johnſon dictated from memory that account of the perſon vulgarly named *the Admirable Crichton*, which is to be found in one of the papers of the Adventurer.

“ That account is plainly an abridgment of the Life of Crichton by Dr George Mackenzie. Dr Mackenzie ſuppoſes that Paſquier, the French lawyer and antiquary, was an eye witneſs of the feats performed in arts as well as in arms by Crichton. This is one of the groſſeſt errors in biography which has occurred to me in the courſe of my reading: and it is an error which I perceive is gaining ground daily, and bids fair in a ſhort time to be received as an indiſputable truth.

“ The error ſeems to have ariſen from the following circumſtance: Dr Mackenzie had never read the original work of Paſquier intitled *Recherches de la France*; what he quotes concerning *the wonderful young man* is ground. Indeed, if the ſtory of Crichton's exploits at Paris had been true, no man was more likely to be acquainted with them than Stephen Paſquier, who lived at that time, and who would be fond enough of recording tranſactions ſo extraordinary. It may farther be obſerved, that Thuanus, who was likewiſe a contemporary, and who in his own life is very particular in what relates to learned men, makes no mention of Crichton. The only authority for his having ever reſided in France at all (Sir Thomas Urquhart excepted) is that of Dr John Johnſon, who ſays *Gallia pectus excolit*. But this amounts to no proof of the truth of the tranſactions related by Urquhart. The whole which can be deduced from it is, that Crichton, in the courſe of his travels, might make ſome ſtay in France for the purpoſe of improvement. Even this, however, doth not agree with the narration of Imperialis, who informs us, that when troubles aroſe in Scotland on account of religion, and queen Mary fell into ſo many calamities, Crichton was ſent by his father directly from that country to Venice as a place of ſecurity.

“ It is acknowledged by Sir John Hawkins, that Sir Thomas Urquhart has produced no authorities in ſupport of his ſurpriſing narrations. But this defect, Sir John thinks, is ſupplied in the life of Crichton which is given in Mr Pennant's Tour. I am under the neceſſity of ſaying, that this is by no means the caſe. The article in Pennant was not drawn up by that ingenious and learned gentleman, but is the tranſcript of a pamphlet, that was printed ſome years ago at Aberdeen; and which pamphlet is nothing more than a republication, with a few verbal alterations, of the Life of Crichton written by Mackenzie. It doth not, therefore, furniſh a ſingle additional teſtimony in confirmation of Sir Thomas Urquhart's ſtories, excepting in the miſtaken inſtance from Paſquier. In other reſpects it only borrows facts from Sir Thomas Urquhart, without eſtabliſhing them upon freſh proofs. It is obſervable, that the earlier biographers of Crichton had no knowledge of moſt of the tranſactions enlarged upon by this extravagant writer; for if they had known them, they would have been eagerly diſpoſed to relate them, and to do it with every circumſtance of exaggeration. How much this was the character of Thomas Dempſter, with regard to his own countrymen, is ſufficiently underſtood, and hath frequently been remarked; and yet his account of Crichton is uncommonly modeſt, compared with thoſe of ſucceeding authors. The extravagance of Imperialis in reſpect to Crichton has already appeared. There ſeems indeed to have been an univerſal tendency in the writers of this young Scotſman's life to produce wonder and aſtoniſhment. Mackenzie remarks, that Imperialis could not but know the truth of all, or at leaſt of moſt of, the things he has related concerning Crichton, ſince he lived upon the places in which they were tranſacted, and had them from an eye and ear-witneſs, even his own father. It is, however, to be remembered, that Imperialis's *Muſeum Hiſtoricum* was not publiſhed till 1640, nearly ſixty years after the events recorded by him happened; to which may be added, that the information he derived from his father was probably very imperfect. Imperialis the elder was not born till 1568, and conſequently was only thirteen years old when Crichton diſplayed his talents at Padua. What real dependence, therefore, could there be on the accuracy of the account given by a youth of that age? He could only relate, and perhaps from inadequate intelligence, the things which were talked of when he was a boy. Beſides, his authority is appealed to for no more than a ſingle fact, and that a doubtful one, ſince it does not accord with Manutius's narrative: and who ever heard of the famous philoſopher Arcangelus Mercenarius?

“ The truth of the matter is, that, ſome ſlight circumſtances excepted, neither Dempſter nor Imperialis have produced any evidences of Crichton's extraordinary abilities beſides thoſe which are recorded by the younger Aldus Manutius. He therefore is to be regarded as the only living authority upon the ſubject.

---

is taken from a Latin abridgement of that work; he refers to *Steph. Paſch.* Diſquiſ. lib. v. cap. 23. and he gives his quotation in Latin; indeed it does not appear that Dr Mackenzie had ever heard of the original work. Now Paſquier, inſtead of ſaying that he was an eye-witneſs of the wonders exhibited by Crichton, ſays, in the moſt unequivocal terms, that what he relates was taken ‘ from a manuſcript which was occaſionally uſed by him,’ *(d'un livre ecrit á la main dont je m'aide ſelon les occurrences)*. And he adds, ‘ I will repreſent the ſtory in its own ſimple garb, without any artificial colouring, ſo that my readers may be the more inclined to give credit to it.’ *(vous repreſentant cette hiſtoire en ſa ſimplicite ſans y apporter aucun fard pour ce que vous y adjouſteres plus de foy)*. He then tranſcribes the narrative from the MS. which places the appearance of this phenomenon in the year 1445, a full century before the birth of our Crichton. See *Recherches de la France*, lib. vi. c. 38, 39.

“ Dr Mackenzie, although he had not read the original of Paſquier, appears to have read an author who quotes the ſame ſtory: ‘ The learned M. du Launoy (ſays he), in his Hiſtory of the College of Navarre, finding the hiſtory of this diſpute recorded in a MS. Hiſtory of the College of Navarre, and the like account of a Spaniard in Trithemius, confounds the two together, and *robs* our author of the glory of this action, and places it in the year 1445; whereas it ſhould be in the year 1571.’ This charge of *robbery* is ſingular enough.

“ Let me only add, that Paſquier tranſcribes ſome verſes written by George Chaſtelain, a French poet in the reign of Charles VII. king of France, which allude to the ſame ſtory; and that Paſquier himſelf was born at Paris in 1528, paſſed his life in that city, and was an eminent lawyer and pleader in 1571; ſo that it is impoſſible the feats of Crichton, had they been really performed at Paris, could have been unknown to him, and moſt improbable that, knowing them, he would have omitted to mention them; for, in the ſame lib. iv. c. 39. he is at pains to produce examples of great proficiency, diſplayed by men in a much humbler rank of life than that of philoſophers and public diſputants. I am, &c.”

ject. Manutius was contemporary with Crichton; he was cloſely connected with him in friendſhip; and he relates ſeveral things on his own perſonal knowledge. He is a poſitive and undoubted witneſs with reſpect to our young Scotſman's intellectual and literary exertions at Venice and Padua; and from him it is that our account of them is given above. Nevertheleſs, even Aldus Manutius is to be read with ſome degree of caution. Dedications are apt to aſſume the ſtyle of exaggeration, and this is the caſe with Manutius's dedication of the *Paradoxa Ciceronis* to Crichton. In addition to the general language of ſuch addreſſes, he might be carried too far by his affection for his friend, which appears to have been very great: nor was the younger Aldus eminent for ſteadineſs and conſiſtency of character. It is even ſaid that by his imprudencies he fell into contempt and miſery. But independently of any conſiderations of this kind, it may be obſerved, that Manutius's narrative, previouſly to Crichton's arrival at Venice, could not be derived from perſonal knowledge. For that part of it (which is ſufficiently erroneous) he was probably indebted to Crichton himſelf. Neither does he appear to have been an eye-witneſs of the whole of the diſputations which were held at Padua; for ſpeaking of his young friend's praiſe of ignorance, he relates, that thoſe who were preſent told him afterwards how much they were ſtruck with that oration. However, at the other diſputation, which laſted three days, Manutius ſeems certainly to have attended; for he concludes his accounts of it with ſaying, that he was not only the adviſer but the ſpectator of Crichton's wonderful conteſts. It is evident, however, from the dedication, that his extraordinary abilities were not univerſally acknowledged and admired. Some there were who detracted from them, and were diſpleaſed with Manutius for ſo warmly ſupporting his reputation.

" As to the real cauſe and manner of our young Scotſman's death, both of them ſtill remain in ſome degree of obſcurity. That he was killed in a rencounter at the carnival at Mantua, is teſtified by too many authors to be reaſonably doubted. But whether there was that particular malignity on the part of Vincenzo di Gonzago, which is commonly aſcribed to him, may be conſidered as uncertain.

" One important method yet remains by which we may be enabled to form a judgment of Crichton's genius, and that is from a peruſal of the four poems of his which are ſtill preſerved. It is, however, to be feared, that theſe will not exhibit him in a very high point of view. Some fancy, perhaps, may be thought to be diſplayed in the longeſt of his poems, which was written on occaſion of his approach to the city of Venice. He there repreſents a Naiad as riſing up before him; and, by the order of the Muſes and of Minerva, directing him how to proceed. But this is a ſentiment which ſo eaſily preſents itſelf to a claſſical reader, that it can ſcarcely be conſidered as deſerving the name of a poetical invention. The three other poems of Crichton have ſtill leſs to recommend them. Indeed his verſes will not ſtand the teſt of a rigid examination even with regard to quantity.

" What then is the opinion which on the whole we are to form of the admirable Crichton? It is evident that he was a youth of ſuch lively parts as excited great preſent admiration, and high expectations with regard to his future attainments. He appears to have had a fine perſon, to have been adroit in his bodily exerciſes, to have poſſeſſed a peculiar facility in learning languages, to have enjoyed a remarkably quick and retentive memory, and to have excelled in a power of declamation, a fluency of ſpeech, and a readineſs of reply. His knowledge, likewiſe, was probably very uncommon for his years; and this, in conjunction with his other qualities, enabled him to ſhine in public diſputation. But whether his knowledge and learning were accurate or profound, may juſtly be queſtioned; and it may equally be doubted whether he would have ariſen to any extraordinary degree of eminence in the literary world. It will always be reflected upon with regret, that his early and untimely death prevented this matter from being brought to the teſt of experiment."

From the portraits which remain of Crichton, it appears that in his face and form he was beautiful and elegant, and that his body and limbs, though not muſcular or athletic, were well proportioned, and fitted for feats of agility. The following catalogue of Crichton's works is given by Dempſter: 1. *Odæ ad Laurentium Maſſam plures.* 2. *Laudes Patavinæ, Carmen extempore effuſum, cum in Jacobi Moyſii Cornelii domo experimentum ingenii coram tota Academiæ frequentia, non ſine multorum ſtupore, faceret.* 3. *Ignorationis Laudatio, extemporale Thema ibidem redditum, poſt ſex horarum diſputationes, ut præſentes ſomnia potius fovere quam rem ſe veram videre affirmarint, ait Manutius.* 4. *De appulſu ſuo Venetias.* 5. *Odæ ad Aldum Manutium.* 6. *Epiſtolæ ad Diverſos.* 7. *Præfationes ſolemnes in omnes Scientias ſacras et prophanas* 8. *Judicium de Philoſophis.* 9. *Errores Ariſtotelis.* 10. *Arma an Literæ præſtant, Controverſia oratoria.* 11. *Refutatio Mathematicorum.* 12. A Comedy in the Italian language.

CRICK, among farriers, is when a horſe cannot turn his neck any manner of way, but holds it fore right, inſomuch that he cannot take his meat from the ground without great pain.

CRICKET, in zoology. See GRYLLUS.

CRICKET is alſo the name of an exerciſe or game, with bats and a ball.

Mole Cricket. See GRYLLOTALPA.

CRICKLADE, a borough-town of Wiltſhire, ſituated on the river Iſis, about 26 miles ſouth-weſt of Oxford. It ſends two members to parliament. W. Long. 1. 55. N. Lat. 51. 35.

CRICOARYTANOIDÆUS, in anatomy, a name given to two muſcles of the larynx. See ANATOMY, nº 116.

CRICOIDES, in anatomy, a cartilage of the larynx, called alſo the *annular cartilage*. It occupies the loweſt part by way of baſe to the reſt of the cartilages, and to the lower part of it the aſpera arteria adheres. See ANATOMY, *Table of the muſcles.*

CRICOTHYROIDÆUS, in anatomy, one of the five proper muſcles of the larynx. *Ibid.*

CRIM-TARTARS, a people of Aſia, ſo called becauſe they originally came from Crimea. They rove from place to place in ſearch of paſtures, their houſes being drawn on carts. There are a great number of them about Aſtrachan, to which place they flock in the winter-time; but they are not permitted to enter the city: for this reaſon, they erect huts up and down in the open fields; which are made either of bull-ruſhes or reeds, being about 12 feet in diameter, of a round form, and with a hole at the top to let out the ſmoke. Their fuel is turf or cow-dung; and, when the weather is very cold, they cover the hut with a coarſe cloth, and ſometimes paſs ſeveral days without ſtirring out. They are generally of ſmall ſtature, with large faces, little eyes, and of an olive complection. The men are generally ſo wrinkled in their faces, that they look like old women. Their common food is fiſh dried in the ſun, which ſerves them inſtead of bread; and they eat the fleſh of horſes as well as camels. Their drink is water and milk, eſpecially mares milk, which they carry about in naſty leathern-bags. Their garments are of coarſe grey cloth, with a looſe mantle made of a black ſheep's ſkin, and a cap of the ſame. The women are clothed in white linen, with which likewiſe they dreſs their heads, hanging a great many Muſcovian pence about them; and there is likewiſe a hole left to ſtick feathers in. As for their religion, they are a ſort of Mahometans; but do not coop up their women like the Turks.

CRIM-TARTARY, or *Crimea*. See CRIMEA.

CRIME *and* PUNISHMENT. The diſcuſſion and admeaſurement of crimes and puniſhments forms in every country the code of criminal law; or, as it is more uſually denominated in England, the doctrine of the *pleas of the crown:* ſo called, becauſe the king, in whom centres the majeſty of the whole community, is ſuppoſed by the law to be the perſon injured by every infraction of the public rights belonging to that community; and is therefore in all caſes the proper proſecutor for every public offence.

The knowledge of this branch of juriſprudence, which teaches the nature, extent, and degrees of every crime, and adjuſts to it its adequate and neceſſary penalty, is of the utmoſt importance to every individual in the ſtate. For no rank or elevation in life, no uprightneſs of heart, no prudence or circumſpection of conduct, ſhould tempt a man to conclude, that he may not at ſome time or other be deeply intereſted in theſe reſearches. The infirmities of the beſt among us, the vices and ungovernable paſſions of others, the inſtability of all human affairs, and the numberleſs unforeſeen events which the compaſs of a day may bring forth, will teach us (upon a moment's reflection), that to know with preciſion what the laws of our country have forbidden, and the deplorable conſequences to which a wilful diſobedience may expoſe us, is a matter of univerſal concern.

In proportion to the importance of the criminal law, ought alſo to be the care and attention of the legiſlature in properly forming and enforcing it. It ſhould be founded upon principles that are permanent, uniform, and univerſal; and always conformable to the dictates of truth and juſtice, the feelings of humanity, and the indelible rights of mankind: though it ſometimes (provided there be no tranſgreſſion of theſe eternal bounderies) may be modified, narrowed, or enlarged, according to the local or occaſional neceſſities of the ſtate which it is meant to govern. And yet, either from a want of attention to theſe principles in the firſt concoction of the laws, and adopting in their ſtead the impetuous dictates of avarice, ambition, and revenge; from retaining the diſcordant political regulations, which ſucceſſive conquerors or factions have eſtabliſhed, in the various revolutions of goverment; from giving a laſting efficacy to ſanctions that were intended to be temporary, and made (as lord Bacon expreſſes it) merely upon the ſpur of the occaſion; or from, laſtly, too haſtily employing ſuch means as are greatly diſproportionate to their end, in order to check the progreſs of ſome very prevalent offence; from ſome, or from all, of theſe cauſes it hath happened, that the criminal law is in every country of Europe more rude and imperfect than the civil. We ſhall not here enter into any minute enquiries concerning the local conſtitutions of other nations; the inhumanity and miſtaken policy of which have been ſufficiently pointed out by ingenious writers of their own*. But even in Great Britain, where the crown-law is with juſtice ſuppoſed to be more nearly advanced to perfection; where crimes are more accurately defined, and penalties leſs uncertain and arbitrary; where all accuſations are public, and trials in the face of the world; where torture is unknown, and every delinquent is judged by ſuch of his equals, againſt whom he can form no exception, nor even a perſonal diſlike;—even there we ſhall occaſionally find room to remark ſome particulars that ſeem to want reviſion and amendment. Theſe have chiefly ariſen from too ſcrupulous an adherence to ſome rules of the ancient common law, where the reaſons have ceaſed upon which thoſe rules were founded; from not repealing ſuch of the old penal laws as are either obſolete or abſurd; and from too little care and attention in framing and paſſing new ones. The enacting of penalties to which a whole nation ſhall be ſubject, ought not to be left, as a matter of indifference, to the paſſions or intereſts of a few, who upon temporary motives may prefer or ſupport ſuch a bill; but be calmly and maturely conſidered by perſons who know what proviſions the laws have already made to remedy the miſchief complained of, who can from experience foreſee the probable conſequences of thoſe which are now propoſed, and who will judge without paſſion or prejudice how adequate they are to the evil. It is never uſual in the houſe of peers even to read a private bill which may affect the property of an individual, without firſt referring it to ſome of the learned judges, and hearing their report thereon. And ſurely equal precaution is neceſſary, when laws are to be eſtabliſhed, which may affect the property, the liberty, and perhaps even the lives, of thouſands. Had ſuch a reference taken place, it is impoſſible that in the 18th century it could ever have been made a capital crime, to break down (however maliciouſly) the mound of a fiſhpond, whereby any fiſh ſhall eſcape; or to cut down a cherry-tree in an orchard. Were even a committee appointed but once in an hundred years to reviſe the criminal law, it could not have continued to this hour a felony without benefit of clergy, to be ſeen for one month in the company of perſons who call themſelves or are called *Egyptians*.

It is true, that theſe outrageous penalties, being ſeldom or never inflicted, are hardly known to be the law by the public; but that rather aggravates the miſchief, by laying a ſnare for the unwary. Yet they cannot but occur to the obſervation of any one, who

* As Baron Monteſquieu, Marquis of Beccaria, &c.

Crime and Puniſhment.

hath undertaking the taſk of examining the great outlines of our law, and tracing them up to their principles, and it is the duty of ſuch a one to hint them with decency to thoſe whoſe abilities and ſtations enable them to apply the remedy. Proceed we now to conſider (in the firſt place) the general nature of *crimes*.

I. A crime, or miſdemeanour, is an act committed, or omitted, in violation of a public law, either forbidding or commanding it. This general definition comprehends both crimes and miſdemeanours; which, properly ſpeaking, are mere ſynonymous terms: though in common uſage, the word "crimes" is made to denote ſuch offences as are of a deeper and more atrocious dye; while ſmaller faults, and omiſſions of leſs conſequence, are comprized under the gentler name of "miſdemeanours" only.

The diſtinction of public wrongs from private, of crimes and miſdemeanours from civil injuries, ſeems principally to conſiſt in this: that private wrongs, or civil injuries, are an infringement or privation of the civil rights which belong to individuals, conſidered merely as individuals; public wrongs, or crimes and miſdemeanours, are a breach and violation of the public rights and duties, due to the whole community, conſidered as a community, in its ſocial aggregate capacity. As if I detain a field from another man, to which the law has given him a right, this is a civil injury, and not a crime; for here only the right of an individual is concerned, and it is immaterial to the public which of us is in poſſeſſion of the land: but treaſon, murder, and robbery, are properly ranked among crimes; ſince, beſides the injury done to individuals, they ſtrike at the very being of ſociety; which cannot poſſibly ſubſiſt, where actions of this ſort are ſuffered to eſcape with impunity.

In all caſes the crime includes an injury: every public offence is alſo a private wrong, and ſomewhat more; it affects the individual, and it likewiſe affects the community. Thus treaſon in imagining the king's death, involves in it conſpiracy againſt an individual, which is alſo a civil injury: but as this ſpecies of treaſon in its conſequences principally tends to the diſſolution of government, and the deſtruction thereby of the order and peace of ſociety, this denominates it a crime of the higheſt magnitude. Murder is an injury to the life of an individual; but the law of ſociety conſiders principally the loſs which the ſtate ſuſtains by being deprived of a member, and the pernicious example thereby ſet, for others to do the like. Robbery may be conſidered in the ſame view: it is an injury to private property; but, were that all, a civil ſatiſfaction in damages might atone for it: the public miſchief is the thing, for the prevention of which our laws have made it a capital offence. In theſe groſs and atrocious injuries the private wrong is ſwallowed up in the public: we ſeldom hear any mention made of ſatiſfaction to the individual; the ſatiſfaction to the community being ſo very great. And indeed, as the public crime is not otherwiſe avenged than by forfeiture of life and property, it is impoſſible afterwards to make any reparation for the private wrong; which can only be had from the body or goods of the aggreſſor. But there are crimes of an inferior nature, in which the public puniſhment is not ſo ſevere, but it affords room for a private compenſation alſo: and herein the diſtinction of crimes from civil injuries is very apparent. For inſtance; in the caſe of battery, or beating another, the aggreſſor may be indicted for this at the ſuit of the king, for diſturbing the public peace, and be puniſhed criminally by fine and impriſonment: and the party beaten may alſo have his private remedy by action of treſpaſs for the injury, which he in particular ſuſtains, and recover a civil ſatisfaction in damages. So alſo, in caſe of a public nuiſance, as digging a ditch acroſs a highway, this is puniſhable by indictment, as a common offence to the whole kingdom, and all his majeſty's ſubjects: but if any individual ſuſtains any ſpecial damage thereby, as laming his horſe, breaking his carriage, or the like, the offender may be compelled to make ample ſatiſfaction, as well for the private injury as for the public wrong.

II. The nature of crimes and miſdemeanours in general being thus aſcertained and diſtinguiſhed, we proceed in the next place to conſider the general nature of puniſhments: Which are evils or inconveniences conſequent upon crimes and miſdemeanours; being deviſed, denounced, and inflicted by human laws, in conſequence of diſobedience or miſbehaviour in thoſe, to regulate whoſe conduct ſuch laws were reſpectively made. And herein we will briefly conſider the *power*, the *end*, and the *meaſure*, of human puniſhment.

Blackſt. Comment.

1. As to the *power* of human puniſhment, or the right of the temporal legiſlator to inflict diſcretionary penalties for crimes and miſdemeanours. It is clear, that the right of puniſhing crimes againſt the law of nature, as murder and the like, is in a ſtate of mere nature, veſted in every individual. For it muſt be veſted in ſomebody; otherwiſe the laws of nature would be vain and fruitleſs, if none were empowered to put them in execution: and if that power is veſted in any one, it muſt alſo be veſted in all mankind; ſince all are by nature equal. Whereof the firſt murderer Cain was ſo ſenſible, that we find him expreſſing his apprehenſions, that whoever ſhould find him would ſlay him. In a ſtate of ſociety this right is transferred from individuals to the ſovereign power; whereby men are prevented from being judges in their own cauſes, which is one of the evils that civil government was intended to remedy. Whatever power therefore individuals had of puniſhing offences againſt the law of nature, that is now veſted in the magiſtrate alone; who bears the ſword of juſtice by the conſent of the whole community. And to this precedent natural power of individuals muſt be referred that right, which ſome have argued to belong to every ſtate (though, in fact, never exerciſed by any), of puniſhing not only their own ſubjects, but alſo foreign embaſſadors, even with death itſelf; in caſe they have offended, not indeed againſt the municipal laws of the country, but againſt the divine laws of nature, and become liable thereby to forfeit their lives for their guilt.

As to offences merely againſt the laws of ſociety, which are only *mala prohibita*, and not *mala in ſe*; the temporal magiſtrate is alſo empowered to inflict coercive penalties for ſuch tranſgreſſion: and this by the conſent of individuals; who, in forming ſocieties did, Crime and Puniſhment.

did either tacitly or expreſsly inveſt the ſovereign power with a right of making laws, and of enforcing obedience to them when made, by exerciſing, upon their non-obſervance, ſeverities adequate to the evil. The lawfulneſs therefore of puniſhing ſuch criminals is founded upon this principle, that the law by which they ſuffer was made by their own conſent; it is a part of the original contract into which they entered, when firſt they engaged in ſociety; it was calculated for, and has long contributed to, their own ſecurity.

This right therefore, being thus conferred by univerſal conſent, gives to the ſtate exactly the ſame power, and no more, over all its members, as each individual member had naturally over himſelf or others. Which has occaſioned ſome to doubt, how far a human legiſlature ought to inflict capital puniſhments for poſitive offences: offences againſt the municipal law only, and not againſt the law of nature; ſince no individual has, naturally, a power of inflicting death upon himſelf or others for actions in themſelves indifferent. With regard to offences *mala in ſe*, capital puniſhments are in ſome inſtances inflicted by the immediate command of God himſelf to all mankind; as, in the caſe of murder, by the precept delivered to Noah their common anceſtor and repreſentative. "Whoſo ſheddeth man's blood, by man ſhall his blood be ſhed." In other inſtances they are inflicted after the example of the Creator, in his poſitive code of laws for the regulation of the Jewiſh republic; as in the caſe of the crime againſt nature. But they are ſometimes inflicted without ſuch expreſs warrant or example, at the will and diſcretion of the human legiſlature: as for forgery, for theft, and ſometimes for offences of a lighter kind. This practice is thus juſtified by that great and good man Sir Matthew Hale: "When offences grow enormous, frequent, and dangerous to a kingdom or ſtate, deſtructive or highly pernicious to civil ſocieties, and to the great inſecurity and danger of the kingdom or its inhabitants, ſevere puniſhment and even death itſelf is neceſſary to be annexed to laws in many caſes by the prudence of lawgivers." It is therefore the enormity, or dangerous tendency, of the crime, that alone can warrant any earthly legiſlature in putting him to death that commits it. It is not its frequency only, or the difficulty of otherwiſe preventing it, that will excuſe our attempting to prevent it by a wanton effuſion of human blood. For though the end of puniſhment is to deter men from offending, it never can follow from thence, that it is lawful to deter them at any rate and by any means; ſince there may be unlawful methods of enforcing obedience even to the juſteſt laws. Every humane legiſlator will be therefore extremely cautious of eſtabliſhing laws that inflict the penalty of death, eſpecially for ſlight offences, or ſuch as are merely poſitive. He will expect a better reaſon for his ſo doing, than that looſe one which generally is given; that it is found by former experience that no lighter penalty will be effectual. For is it found upon farther experience, that capital puniſhments are more effectual? Was the vaſt territory of all the Ruſſias worſe regulated under the late empreſs Elizabeth, than under her more ſanguinary predeceſſors? Is it now under Catherine II. leſs civilized, leſs ſocial, leſs ſecure? And yet we are aſſured, that neither of theſe illuſtrious princeſſes have, throughout their whole adminiſtration, inflicted the penalty of death: and the latter has, upon full perſuaſion of its being uſeleſs, nay even pernicious, given orders for aboliſhing it entirely throughout her extenſive dominions. But indeed, were capital puniſhments proved by experience to be a ſure and effectual remedy, that would not prove the neceſſity (upon which the juſtice and propriety depend) of inflicting them upon all occaſions when other expedients fail. It is feared this reaſoning would extend a great deal too far. For inſtance, the damage done to our public roads by loaded waggons is univerſally allowed, and many laws have been made to prevent it, none of which have hitherto proved effectual. But it does not therefore follow, that it would be juſt for the legiſlature to inflict death upon every obſtinate carrier, who defeats or eludes the proviſions of former ſtatutes. Where the evil to be prevented is not adequate to the violence of the preventive, a ſovereign that thinks ſeriouſly can never juſtify ſuch a law to the dictates of conſcience and humanity. To ſhed the blood of our fellow-creature is a matter that requires the greateſt deliberation, and the fulleſt conviction of our own authority: for life is the immediate gift of God to man; which neither he can reſign, nor can it be taken from him, unleſs by the command or permiſſion of him who gave it, either expreſsly revealed, or collected from the laws of nature or ſociety by clear and indiſputable demonſtration.

We would not be underſtood to deny the right of the legiſlature in any country to enforce its own laws by the death of the tranſgreſſor, though perſons of ſome abilities have doubted it; but only to ſuggeſt a few hints for the conſideration of ſuch as are, or may hereafter become, legiſlators. When a queſtion ariſes, whether death may be lawfully inflicted for this or that tranſgreſſion, the wiſdom of the laws muſt decide it: and to this public judgment or deciſion all private judgments muſt ſubmit; elſe there is an end of the firſt principle of all ſociety and government. The guilt of blood, if any, muſt lie at their doors, who miſinterpret the extent of their warrant; and not at the doors of the ſubject, who is bound to receive the interpretations that are given by the ſovereign power.

2. As to the end, or final cauſe, of human puniſhments. This is not by way of atonement or expiation for the crime committed; for that muſt be left to the juſt determination of the Supreme Being: but as a precaution againſt future offences of the ſame kind. This is effected three ways: either by the amendment of the offender himſelf; for which purpoſe all corporeal puniſhments, fines, and temporary exile or impriſonment, are inflicted: or, by deterring others by the dread of his example from offending in the like way, "*ut pœna* (as Tully expreſſes it) *ad paucos, metus ad omnes, perveniat*; which gives riſe to all ignominious puniſhments, and to ſuch executions of juſtice as are open and public: or, laſtly, by depriving the party injuring of the power to do future miſchief; which is effected by either putting him to death, or condemning him to perpetual confinement, ſlavery, or exile. The ſame one end, of preventing future crimes, is endeavoured to be anſwered by each of theſe three ſpecies of puniſhment. The public gains

equal ſecurity, whether the offender himſelf be amended by wholeſome correction, or whether he be diſabled from doing any farther harm: and if the penalty fails of both theſe effects, as it may do, ſtill the terror of his example remains as a warning to other citizens. The method, however, of inflicting puniſhment ought always to be proportioned to the particular purpoſe it is meant to ſerve, and by no means to exceed it: therefore the pains of death, and perpetual diſability by exile, ſlavery, or impriſonment, ought never to be inflicted, but when the offender appears incorrigible: which may be collected either from a repetition of minuter offences; or from the perpetration of ſome one crime of deep malignity, which of itſelf demonſtrates a diſpoſition without hope or probability of amendment: and in ſuch caſes it would be cruelty to the public to defer the puniſhment of ſuch a criminal till he had an opportunity of repeating perhaps the worſt of villanies.

3. As to the *meaſure* of human puniſhments. From what has been obſerved in the former articles we may collect, that the quantity of puniſhment can never be abſolutely determined by any ſtanding invariable rule: but it muſt be left to the arbitration of the legiſlature to inflict ſuch penalties as are warranted by the laws of nature and ſociety, and ſuch as appear to be the beſt calculated to anſwer the end of precaution againſt future offences.

Hence it will be evident, that what ſome have ſo highly extolled for its equity, the *lex talionis* or "law of retaliation," can never be in all caſes an adequate or permanent rule of puniſhment. In ſome caſes indeed it ſeems to be dictated by natural reaſon; as in the caſe of conſpiracies to do an injury, or falſe accuſations of the innocent; to which we may add that law of the Jews and Egyptians, mentioned by Joſephus and Diodorus Siculus, that whoever without ſufficient cauſe was found with any mortal poiſon in his cuſtody, ſhould himſelf be obliged to take it. But, in general, the difference of perſons, place, time, provocation, or other circumſtances, may enhance or mitigate the offence; and in ſuch caſes retaliation can never be a proper meaſure of juſtice. If a nobleman ſtrikes a peaſant, all mankind will ſee, that if a court of juſtice awards a return of the blow, it is more than a juſt compenſation. On the other hand, retaliation may ſometimes be too eaſy a ſentence; as, if a man maliciouſly ſhould put out the remaining eye of him who had loſt one before, it is too ſlight a puniſhment for the maimer to loſe only one of his: and therefore the law of the Locrians, which demanded an eye for an eye, was in this inſtance judiciouſly altered; by decreeing, in imitation of Solon's laws, that he who ſtruck out the eye of a one-eyed man, ſhould loſe both his own in return. Beſides, there are very many crimes, that will in no ſhape admit of theſe penalties, without manifeſt abſurdity and wickedneſs. Theft cannot be puniſhed by theft, defamation by defamation, forgery by forgery, adultery by adultery, and the like. And we may add, that thoſe inſtances, wherein retaliation appears to be uſed, even by the divine authority, do not really proceed upon the rule of exact retribution, by doing to the criminal the ſame hurt he has done to his neighbour, and no more; but this correſpondence between the crime and puniſhment is barely a conſequence from ſome other principle. Death is ordered to be puniſhed with death; not becauſe one is equivalent to the other, for that would be expiation, and not puniſhment. Nor is death always an equivalent for death: the execution of a needy decrepid aſſaſſin is a poor ſatisfaction for the death of a nobleman in the bloom of his youth, and full enjoyment of his friends, his honours, and his fortune. But the reaſon upon which this ſentence is grounded ſeems to be, that this is the higheſt penalty that man can inflict, and tends moſt to the ſecurity of the world: by removing one murderer from the earth, and ſetting a dreadful example to deter others: ſo that even this grand inſtance proceeds upon other principles than thoſe of retaliation. And truly, if any meaſures of puniſhment is to be taken from the damage ſuſtained by the ſufferer, the puniſhment ought rather to exceed than equal the injury; ſince it ſeems contrary to reaſon and equity, that the guilty (if convicted) ſhould ſuffer no more than the innocent has done before him: eſpecially as the ſuffering of the innocent is paſt and irrevocable, that of the guilty is future, contingent, and liable to be eſcaped or evaded. With regard indeed to crimes that are incomplete, which conſiſt merely in the intention, and are not yet carried into act, as conſpiracies and the like; the innocent has a chance to fruſtrate or avoid the villany, as the conſpirator has alſo a chance to eſcape his puniſhment; and this may be one reaſon why the *lex talionis* is more proper to be inflicted, if at all, for crimes that conſiſt in intention than for ſuch as are carried into act. It ſeems indeed conſonant to natural reaſon, and has therefore been adopted as a maxim by ſeveral theoretical writers, that the puniſhment due to the crime of which one falſely accuſes another ſhould be inflicted on the perjured informer. Accordingly, when it was once attempted to introduce into England the law of retaliation, it was intended as a puniſhment for ſuch only as preferred malicious accuſations againſt others; it being enacted by ſtatute 37 Edw. III. c. 18. that ſuch as preferred any ſuggeſtions to the king's great council ſhould put in ſureties of taliation; that is, to incur the ſame pain that the other ſhould have had, in caſe the ſuggeſtion were found untrue. But, after one years experience, this puniſhment of taliation was rejected, and impriſonment adopted in its ſtead.

But though from what has been ſaid it appears, that there cannot be any regular determinate method of rating the quantity of puniſhments for crimes, by any one uniform rule; but they muſt be referred to the will and diſcretion of the legiſlative power: yet there are ſome general principles, drawn from the nature and circumſtances of the crime, that may be of ſome aſſiſtance in allotting it an adequate puniſhment.

As, firſt, with regard to the object of it: for the greater and more exalted the object of an injury is, the more care ſhould be taken to prevent that injury, and of courſe under this aggravation the puniſhment ſhould be more ſevere. Therefore treaſon in conſpiring the king's death is (in Britain) puniſhed with greater rigour than even actually killing any private ſubject. And yet, generally, a deſign to tranſgreſs is not ſo flagrant an enormity as the actual completion of that deſign. For evil, the nearer we approach it, is the more diſagreeable and ſhocking;

ſo that it requires more obſtinacy in wickedneſs to perpetrate an unlawful action, than barely to entertain the thought of it: and it is an encouragement to repentance and remorſe, even till the laſt ſtage of any crime, that it never is too late to retract; and that if a man ſtops even here, it is better for him than if he proceeds: for which reaſons an attempt to rob, to raviſh, or to kill, is far leſs penal than the actual robbery, rape, or murder. But in the caſe of a treaſonable conſpiracy, the object whereof is the king's majeſty, the bare intention will deſerve the higheſt degree of ſeverity; not becauſe the intention is equivalent to the act itſelf; but becauſe the greateſt rigour is no more than adequate to a treaſonable purpoſe of the heart, and there is no greater left to inflict upon the actual execution itſelf.

Again: The violence of paſſion, or temptation, may ſometimes alleviate a crime: as theft, in caſe of hunger, is far more worthy of compaſſion, than when committed through avarice, or to ſupply one in luxurious exceſſes. To kill a man upon ſudden and violent reſentment is leſs penal than upon cool deliberate malice. The age, education, and character, of the offender; the repetition (or otherwiſe) of the offence; the time, the place, the company wherein it was committed; all theſe, and a thouſand other incidents, may aggravate or extenuate the crime (A).

Farther: As puniſhments are chiefly intended for the prevention of future crimes, it is but reaſonable that among crimes of different natures thoſe ſhould be moſt ſeverely puniſhed, which are the moſt deſtructive of the public ſafety and happineſs; and, among crimes of an equal malignity, thoſe which a man has the moſt frequent and eaſy opportunities of committing, which cannot be ſo eaſily guarded againſt as others, and which therefore the offender has the ſtrongeſt inducement to commit: according to what Cicero obſerves, *Ea ſunt animadvertenda peccata maxime, quæ difficillime præcaventur*. Hence it is, that for a ſervant to rob his maſter is in more caſes capital than for a ſtranger. If a ſervant kills his maſter, it is a ſpecies of treaſon; in another it is only murder. To ſteal a handkerchief, or other trifle of above the value of twelvepence, privately from one's perſon, is made capital; but to carry off a load of corn from an open field, though of fifty times greater value, is puniſhed with tranſportation only. And in the iſland of Man this rule was formerly carried ſo far, that to take away an horſe or an ox was there no felony, but a treſpaſs, becauſe of the difficulty in that little territory to conceal them or carry them off: but to ſteal a pig or a fowl, which is eaſily done, was a capital miſdemeanour, and the offender was puniſhed with death.

Laſtly, as a concluſion to the whole, we may obſerve, that puniſhments of unreaſonable ſeverity, eſpecially when indiſcriminately inflicted, have leſs effect in preventing crimes, and amending the manners of a people, than ſuch as are more merciful in general, yet properly intermixed with due diſtinctions of ſeverity. It is the ſentiment of an ingenious writer, who ſeems to have well ſtudied the ſprings of human action, that crimes are more effectually prevented by the certainty than by the ſeverity of puniſhment; for the exceſſive ſeverity of laws (ſays Monteſquieu) hinders their execution. When the puniſhment ſurpaſſes all meaſure, the public will frequently prefer impunity to it. Thus alſo the ſtatute 1 Mar. ſt. 1. c. 1. recites in its preamble, "that the ſtate of every king conſiſts more aſſuredly in the love of the ſubject towards their prince, than in the dread of laws made with rigorous pains; and that laws made for the preſervation of the commonwealth without great penalties, are more often obeyed and kept than laws made with extreme puniſhments." Happy had it been for the nation if the ſubſequent practice of that deluded princeſs in matters of religion, had been correſpondent to theſe ſentiments of herſelf and parliament in matters of ſtate and government! We may further obſerve, that ſanguinary laws are a bad ſymptom of the diſtemper of any ſtate, or at leaſt of its weak conſtitution. The laws of the Roman kings, and the twelve tables of the *decemviri*, were full of cruel puniſhments: the Porcian law, which exempted all citizens from ſentence of death, ſilently abrogated them all. In this period the republic flouriſhed: under the emperors ſevere puniſhments were revived, and then the empire fell.

It is, moreover, abſurd and impolitic to apply the ſame puniſhment to crimes of different malignity. A multitude of ſanguinary laws (beſides the doubt that may be entertained concerning the right of making them) do likewiſe prove a manifeſt defect either in the wiſdom of the legiſlative, or the ſtrength of the executive, power. It is a kind of quackery in government, and argues a want of ſolid ſkill, to apply the ſame univerſal remedy, the *ultimum ſupplicium*, to every caſe of difficulty. It is, it muſt be owned, much eaſier to extirpate than to amend mankind; yet that magiſtrate muſt be eſteemed both a weak and a cruel ſurgeon, who cuts off every limb which through ignorance or indolence he will not attempt to cure. It has been therefore ingeniouſly propoſed, that in every ſtate a ſcale of crimes ſhould be formed, with a correſponding ſcale of puniſhments, deſcending from the greateſt to the leaſt. But if that be too romantic an idea, yet at leaſt a wiſe legiſlator will mark the principal diviſions, and not aſſign penalties of the firſt degree to offences of an inferior rank. Where men ſee no diſtinction made in the nature and gradations of puniſhment, the generality will be led to conclude there is no diſtinction in the guilt. Thus in France the puniſhment of robbery, either with or without murder, is the ſame: hence it is, that though perhaps they are therefore ſubject to fewer robberies, yet they never rob but they alſo murder. In China murderers are cut to pieces, and robbers not: hence in that country they never murder on the highway, though they often rob. And in Britain, beſides the additional terrors of a ſpeedy execution, and a ſubſequent expoſure or diſſection, robbers

---

(A) Thus Demoſthenes (in his oration againſt Midias) finely works up the aggravations of the inſults he had received. "I was abuſed (ſays he) by my enemy, in cold blood, out of malice, not by heat of " wine, in the morning, publicly, before ſtrangers as well as citizens; and that in the temple, whither " the duty of my office called me."

Crime and Puniſhment.

robbers have a hope of tranſportation, which ſeldom is extended to murderers. This has the ſame effect here as in China, in preventing frequent aſſaſſination and ſlaughter.

Yet though in this inſtance we may glory in the wiſdom of our law, we ſhall find it more difficult to juſtify the frequency of capital puniſhment to be found therein; inflicted (perhaps inattentively) by a multitude of ſucceſſive independent ſtatutes, upon crimes very different in their natures. It is a melancholy truth, that among the variety of actions which men are daily liable to commit, no leſs than 160 have been declared by act of parliament to be felonies without benefit of clergy; or, in other words, to be worthy of inſtant death. So dreadful a liſt, inſtead of diminiſhing, increaſes the number of offenders. The injured, through compaſſion, will often forbear to proſecute; juries, through compaſſion, will ſometimes forget their oaths, and either acquit the guilty or mitigate the nature of the offence; and judges, through compaſſion, will reſpit one half of the convicts, and recommend them to the royal mercy. Among ſo many chances of eſcaping, the needy and hardened offender overlooks the multitude that ſuffer: he boldly engages in ſome deſperate attempt to relieve his wants or ſupply his vices; and if unexpectedly the hand of juſtice overtakes him, he deems himſelf peculiarly unfortunate in falling at laſt a ſacrifice to thoſe laws which long impunity has taught him to contemn.

As to the trials and mode of puniſhment, See ARRAIGNMENT; TRIAL, and the references therefrom; CONVICTION; JUDGMENT; ATTAINDER; *CORRUPTION of Blood*; FORFEITURE; EXECUTION; the ſeveral *Crimes* under their reſpective names; and LAW, Part II. cxxii. *et ſeq.* and Part III. clxxxvi.

Perſons capable or incapable of committing CRIMES; or (which is all one) of ſuffering the cenſures of the law upon the commiſſion of forbidden acts.

Crimes.

All the ſeveral pleas and excuſes which protect the committer of a forbidden act from the puniſhment which is otherwiſe annexed thereto, may be reduced to this ſingle conſideration, the want or defect of *will*. An involuntary act, as it has no claim to merit, ſo neither can it induce any guilt: the concurrence of the will, when it has its choice either to do or to avoid the fact in queſtion, being the only thing that renders human actions either praiſeworthy or culpable. Indeed, to make a complete crime, cognizable by human laws, there muſt be both a will and an act. For though, *in foro conſcientiæ*, a fixed deſign or will to do an unlawful act is almoſt as heinous as the commiſſion of it; yet as no temporal tribunal can ſearch the heart, or fathom the intentions of the mind, otherwiſe than as they are demonſtrated by outward actions, it therefore cannot puniſh for what it cannot know. For which reaſon, in all temporal juriſdiction, an *overt* act, or ſome open evidence of an intended crime, is neceſſary in order to demonſtrate the depravity of the will, before the man is liable to puniſhment. And as a vitious will without a vitious act is no civil crime; ſo, on the other hand, an unwarrantable act without a vitious will is no crime at all. So that to conſtitute a crime againſt human laws, there muſt be, firſt, a vitious will; and, ſecondly, an unlawful act conſequent upon ſuch vitious will.

Now there are three caſes in which the will does not join with the act: 1. When there is a defect of underſtanding. For where there is no diſcernment, there is no choice; and where there is no choice, there can be no act of the will, which is nothing elſe but a determination of one's choice to do or to abſtain from a particular action: he, therefore, that has no underſtanding, can have no will to guide his conduct. 2. Where there is underſtanding and will ſufficient reſiding in the party, but not called forth and exerted at the time of the action done; which is the caſe of all offences committed by chance or ignorance. Here the will ſits neuter, and neither concurs with the act nor diſagrees to it. 3. Where the action is conſtrained by ſome outward force and violence. Here the will counteracts the deed; and is ſo far from concurring with, that it loaths and diſagrees to what the man is obliged to perform. Infancy, idiocy, lunacy, and intoxication, fall under the firſt claſs; misfortune and ignorance may be referred to the ſecond; and compulſion or neceſſity may properly rank in the third. See INFANCY, IDIOCY, DRUNKENNESS, MISFORTUNE, IGNORANCE, NECESSITY.

CRIMEA, or CRIM TARTARY, anciently the *Cherſoneſus Taurica*, a peninſula ſituated directly to the ſouth of St Peterſburg, between the 51ſt and 55th degrees of latitude, and in 46 of longitude. Its ſouthern and weſtern coaſts lie in the Euxine, its northern and eaſtern in the Rotten Sea and the Palus Mæotis. It is joined, however, to the continent on the north by a ſmall neck of land not more than ſix miles broad. This peninſula has been known more than 3000 years ſince the firſt naval expedition of the Argonauts; a ſtory, though mixed with fable, yet well founded in its principal facts. The mountainous parts were inhabited by the Tauri, probably a colony of Scythians; and its coaſts on the weſt, the eaſt, and the ſouth, by Greeks. The Scythians were driven out by Mithridates; the Greeks by the Sarmatians; and theſe again by the Alani and Goths, a northern hord of Scythians. The Hungarians, the Coſſacks, and Tartars, ſucceeded in their turn; while the Genoeſe, in the 12th century, held a temporary and precarious poſſeſſion of the ſea-ports, which they were obliged to yield to the Turks in 1475. At the peace of 1774, the Tartars of the Crimea were declared independent; and in 1783, this peninſula was united to the Ruſſian empire.

From the abovementioned iſthmus, on which is built the fortreſs of Or-kapi or Perekop, to the firſt riſing of the hill at Karaſubaſar, the country is one continued flat; elevating itſelf, by an eaſy gradation, to the ſummit of the hill, which forms the ſouth ſide of the peninſula and the ſhore of the Euxine Sea. The ſurface of the ſoil is almoſt all of one kind, a reddiſh-grey loam; on digging, you find it more or leſs mixed with a black earth, and the hills abound with marle. The whole flat, from Perekop to the river Salgir, which may be an extent of 80 miles, is full of ſalt marſhes and lakes; from whence the neighbouring Ruſſian governments, as well as the Crim itſelf, Anatolia, and Beſſarabia, are ſupplied with ſalt. The moſt remarkable of theſe lakes are five in number: Koſlof and Keffa; ſo called after the towns near which they lie, are very large; the Tuſla, about 15 verſts from Perekop, on the road from Keffa; the Red Lake, not far from the laſt mentioned; and the Black Lake. Beſides theſe, there are many other ſwamps and lakes, from whence the inhabitants get ſalt for their own conſumption.

The greateſt part of the peninſula is ſo level that a man may travel over the half of it without meeting with a river, or even the ſmalleſt brook. The inhabitants of the villages, therefore, make a pit in the yard of every houſe for receiving the rain or the water that runs from the hills. The whole tract is bare of every kind of tree. Not a buſh or bramble is to be ſeen, and the herbage is extremely ſcanty. This, however, does not proceed ſo much from the unfruitfulneſs of the place, as from the vaſt herds of cattle which rove the whole year long from place to place; by which means all the graſs in ſpring, ſummer, or autumn, no ſooner appears through the long drought which ſucceeds the rainy ſeaſon, but it is immediately devoured or trodden down. The univerſal prevalence of this cuſtom of keeping cattle to wander up and down, joined to the ſlothfulneſs of the Tartars, with their inaptitude and averſion to agriculture, is the reaſon of the total neglect of that ſcience here. Otherwiſe, were the land divided into portions and properly managed, there would be a ſufficiency for the cattle, and the reſt would be fruitful in corn and grain. By this means alone the Crim would become a fertile country, and no natural defect would be found in oppoſition to the welfare of its inhabitants. The truth of this is well known by their neighbours; where, of a hundred Tartars, one perhaps follows huſbandry, who finds it to anſwer to ſo much profit, that he has not only enough for his own uſe, but wherewith to ſell to the ninety-nine.

This peninſula, which is indeed but a little diſtrict, yet, from the many advantages conferred upon it by nature, may be eſteemed peculiarly rich, is divided into the hilly country and the flat. The latter, which extends from Perekop to Koſlof and the river Bulganak, to Karaſubaſar, Keffa, and Yenicali, is ſtrewn here and there with little Tartar villages, maintained by cattle and the produce of the ſalt lakes. The highlands, or hilly country, form the ſouthern part of the Crim, along the ſtraight coaſt of the Black Sea, and ſtretching weſtward, in a right line from Keffa, to the vicinity of Belbek. Theſe hills are compoſed of layers of chalk; which, in the headlands and promontories, is ſoft, but more inland quite hard. The ſtrata of the higheſt hills are like thoſe of the promontories, and take a direction from north to ſouth. Theſe qualities of the ſtrata prevail not throughout the whole hills, but only in the large and lofty ones; ſuch as the two that riſe near Karaſubaſar, and one very high by Achmetſched, which bears the name of Aktau. The other ſmaller hills lie ſcattered and diſperſed, but take the names of the greater ones, to which they ſeem to belong; as the great ridge of Caucaſus does, which extends beyond the Donau, through Bulgaria, and are named *Palkans*.

All accounts agree in this, that nature has favoured theſe highland countries with great advantages, and bleſſed them with abundance of all things. A number of ſprings that flow from the mountains form the two conſiderable rivers Salgir and Karaſu, which run into the Rotten Sea. The former, which takes its riſe from a cavern in a high hill near Achmetſched, falls ſtraight into the plain below, and waters a great part of the Crim; the other, commencing behind Karaſubaſar, falls likewiſe into the plain, and mingles with the Salgir. There are many other little rivers and ſtreams, which run eaſtward, and either join the two forementioned, or fall immediately into the Rotten Sea. All the ſtreams, for the whole length of the hills, which begin at Keffa, and proceed in a chain of the ſame height, flow to the north or the north-eaſt, excepting the one behind Achmetſched, where the great mountain Aktau is, which falls on the other ſide: this river, riſing on the northern ſide of this mountain, flows, as was before obſerved, towards the north-eaſt, to the Salgir and the Rotten Sea; as likewiſe thoſe which ſpring on the weſtern ſide, take their courſe weſtward to the Bulganak, and thence ſtraight to the Black Sea; which alſo receives all the other little rivers that ariſe from theſe hills, as the Amma, the Katſcha, the Belbek, the Kaſulkioi, &c.

The mountains are well covered with woods fit for the purpoſe of ſhip-building, and contain plenty of wild beaſts. The valleys conſiſt of fine arable land; on the ſides of the hills grow corn and vines in great abundance, and the earth is rich in mines. But theſe mountaineers are as careleſs and negligent as the inhabitants of the deſerts; ſlighting all theſe advantages; and, like their brethren of the lowlands, are ſufficiently happy if they are in poſſeſſion of a fat ſheep and as much bread as ſerves them to eat.

About 20 years ago this peninſula was uncommonly full of inhabitants and wealth. They reckoned at that time at leaſt 1200 villages; but, from the late troubles in the Crim, it has loſt more than a third part of its inhabitants; and now, wherever we turn, we meet with the ruins of large villages and dwellings. The people were compoſed of various nations, who lived together under the Tartars in the moſt unbounded freedom; but in the late Turkiſh war they either put themſelves under the Ruſſian government, and were transferred to that empire, or fled to Abcaſia and the Tſchirkaſſian hills.

The houſes in the towns, as well as the villages, are for the moſt part of ſquare timbers, having the interſtices filled with brick work, if the poſſeſſor can afford it, and thoſe of the poorer ſort with turf. The chinks and crannies are made tight with clay, and then plaſtered within and without. The covering is commonly either of brick or of turfs. Only the medſcheds, minarets, and baths, are of ſtone, and a few extremely handſome of marble. They have chimnies in the chambers, at which they likewiſe dreſs their victuals; but ſtoves in the Ruſſian manner none. In extreme froſts a great iron pan of charcoal is brought into the room, for making it comfortable. Their cuſtom is, to ſit upon low ſofas, with Turkiſh coverings and cuſhions, or upon a clay ſeat, ſomewhat raiſed above the earth, and ſpread with a carpet. In theſe rooms are cupboards and cheſts, often covered with cuſhions, to ſerve as ſeats; in which they keep their gold, ſilver, and valuables. Such are the inner apartments or harams, in which the women generally live; the others are not ſo fine. Theſe contain only a ſofa, or a bank of clay covered with a carpet, as in the chimney rooms.

The rich Tartars, and their nobility or murzas (excepting only ſuch as are about the perſon of the khan), commonly dwell all the year round in the country, coming only to town when they have buſineſs there. There are but few towns in the Crim, at leaſt in compariſon of its former population. The Krimſkoi Tartars have no tribunal of juſtice, controverſies and quarrels being ſeldom heard of among them; and if a diſpute ſhould ariſe, it is immediately ſettled by an appeal to the Koran. Little differences in the villages inevitably happening about property, or other matters not taken notice of in that code, are amicably adjuſted by the eldermen or abeſes; but in the towns all weighty concerns, excepting the ſingle caſe of murder or homicide, are brought before the kaimakan or commandant, who ſettles them abſolutely without appeal.

The reſidence of the khans of the Crimea was formerly Bachtſchiſarai, in which city they held their ſeat for upwards of 200 years. They went thither from Eſki-Crim, or Old Crim, the capital city of the Genoeſe, upon Bengli Ghireikhan's plundering the ſea-ports, and driving all the Genoeſe from their ſtations. Before Eſki-Crim, and indeed upon the firſt coming of the Tartars into this peninſula, the ſovereign reſidence was at Koſlof; but here they remained not long. Under the late khan Shagin Ghirei it was held at Keffa, the ancient Theodoſia; which is 10 miles diſtant from Eſki-Crim, ſaid to be the Cimmerium of the ancients.

The principal cities or towns of the Crimea are: 1. *Bachtſchi-Sarai*, an extenſive and wealthy city, lying in a vale between two high mountains, and ſurrounded by a number of gardens. From this circumſtance it has its name; *bachtſchi* ſignifying in the Tartarian language "a garden," and *ſorai* "a palace." It formerly contained 3000 houſes, and many ſumptuous medſcheds. The palace of the khans, with its gardens and ponds, were much improved under the government of Khan Kerim Girei, under whoſe government the laſt Turkiſh war took its riſe. In this palace is the burial place of all the khans of Crimea, wherein all the khans that have reigned here lie interred. The fine Krimſkoi vines, with their large cluſters of grapes, grow in great plenty all about this town, and a profuſion of other delicious fruits, from whence the neighbouring parts of Ruſſia are ſupplied. 2. *Keffa*, the preſent reſidence of the khans, ſtands on the ſhore of a large harbour in the Black Sea. Its ſite is on the declivity of a long ridge of mountains; and is mantled by a ſtone wall, fortified by ſeveral towers, and encompaſſed by a deep ditch. On both ſides of the city formerly ſtood caſtles, and in the middle of them a lofty turret for the purpoſe of giving ſignals by fire. Before the wall were wide extended ſuburbs; containing, among other conſiderable buildings, medſcheds, churches for the Greek and Armenian worſhip; of all which now only the veſtiges remain. The caſtles and towers lie alſo in ruins; and not one third part of the houſes of the city itſelf are now remaining, and thoſe chiefly built of materials taken from the aforeſaid ruins. They formerly reckoned Keffa to contain 4000 houſes, including the ſuburbs, with a number of medſcheds and Chriſtian churches; but this number has been much diminiſhed by the laſt Turkiſh war. The preſent inhabitants conſiſt moſtly of Tartars; who carry on a trade by no means inconſiderable, in commodities brought from Turkey. The late khan, an intelligent and enlightened perſonage, made this city the place of his reſidence, and brought hither the mint from Bachtſchiſarai, built himſelf a palace, and erected a divan, which aſſembled three times a-week, and the fourth time was held in the palace of the khan, in which he always perſonally aſſiſted. Here is alſo a cuſtom houſe, the management of which is farmed out. 3. *Karaſubaſar*, likewiſe a very rich city in former times, ſtands at the beginning of the mountains, about half-way between Keffa and Bachtſchiſarai. It is a large trading town; contains a conſiderable number of dwelling-houſes and medſcheds, but the greateſt part of them in decay, and many fine gardens. This place is the moſt famous in all the Crim for its trade in horſes, and has a market once a-week for that article of traffic; to which are likewiſe brought great numbers of buffaloes, oxen, cows, camels, and ſheep, for ſale. Near this city flows one of the principal rivers of the Crim, called the *Karaſu*, that is, the Black Water. Of this river they have an opinion in Ruſſia, that one part of it flows upwards for ſeveral verſts together. But this is in ſome ſort true, not only of the Karaſu, but of all the rivers of the Crim that have a ſtrong current. The Tartars, who dwell either in the valleys or on the ſides of the mountains (frequently without conſidering whether the place is ſupplied with water or not), dig canals either from the ſource of the next river, or from that part of it which lies neareſt to their particular habitation, about an arſhine in breadth, for their gardens and domeſtic uſe. From theſe they cut ſmaller ones through the villages, to ſupply them with water, and not unfrequently to drive a mill. Theſe canals appear, to the imagination of the common people, to run in a contrary direction to the current of the river; and in fact theſe canals do lie, in many places for a verſt in length, ſome fathoms higher than the level of the ſtream from whence they are ſupplied. 4. *Achmetſhed*, a pretty large city not far from Bachtſchiſarai; now made the capital of all the Crimea by the regulations of Prince Potemkin in the ſummer of 1785. 5. *Koſlof*, formerly a very conſiderable trading town, lies on the weſtern ſide of the peninſula, in a bay of the Black Sea; which, as well as the ſound at Keffa, might rather be called a road than a haven. This was the firſt town the Tartars poſſeſſed themſelves of on their firſt entrance into the Crim, and eſtabliſhed a cuſtomhouſe therein, after the example of the Genoeſe, which is now farmed out.

The other remarkable places are, *Sudak*, which is built on the hills upon the ſhore of the Black Sea, at the ſouth ſide of the peninſula, and is famous for its excellent wine, reſembling Champaigne both in colour and ſtrength; *Aluſchti*, on the ſame ſide, among the hills on the ſea-ſhore; *Baluklava*, where there is a fine harbour, and perhaps the only one on the Black Sea, containing ample room for a very good fleet; *Inkerman* may be noticed for its commodious though not very large haven, called *Achtiar*; and *Mangup*, the old Cherſoneſus: which were all formerly very flouriſhing towns; but are now either in ruins, or dwindled into ſmall villages.

All theſe places, ſo long as the Genoeſe remained maſters of the Crim, were well fortified; but the Tartars, in taking them, demoliſhed all the works. While they were under the Turks, they left the fortreſſes of Keffa, Kertſch, and Koſlof, and built the fort Arabat on the neck of land between the ſea of Azof (or Palus Mæotus) and the Rotten Sea, where Perekop alſo is.

In *Arabat* are but few houſes; but here the warlike ſtores of the khans were kept.—*Perekop*, called by the Turks *Or-kapi*, is a fortreſs of moderate ſtrength; ſtanding about the middle of the neck of land that joins the peninſula with the continent. This iſthmus, which is at leaſt ſix miles broad, is cut through with a wide and deep ditch lined with ſtone, and reaches from the Black to the Rotten Sea. This was formerly kept without water, but now is filled from both ſeas. On the Crimean ſide a high wall of earth runs the whole length of it, ſtraight from one ſea to the other. The people paſs over the ditch by means of a drawbridge, and through the wall by a gateway. The walls of the fortreſs are ſome fathoms from the road-ſide; of which the ruins are only now diſcernible, namely, large brick houſes, with a number of bomb-ſhells and cannon-balls about them, which were formerly kept in the fortreſs. At leaſt two miles from this is the pretty populous but miſerable place, which was probably the town to which this fort belonged. Near the gate is a cuſtom-houſe, where all imports and exports pay duty.

This peninſula was formerly extremely populous; the number of its inhabitants, in Tartars, Turks, Greeks, Armenians, Jews, and others, amounted to above 200,000 men. Since that, however, the greateſt part of the Chriſtians have betaken themſelves to the other parts of the Ruſſian empire, particularly the government of Azof; and many other inhabitants, particularly Tartars, have gone to Taman and Abchaſia; ſo that the preſent population of the Crim cannot now be reckoned at more than 70,000 men at moſt.

The Crim was heretofore divided into 24 kaduliks or diſtricts, namely, Yenikali, Kertſch, Arabat, Eſki-krim, Keffa, Karaſubaſar, Sudak, Achmetſched, Yalof, Bachtſchiſarai, Balaklava, Mangup, Inkerman, Koſlof, Or, Manſur, Tarkan, Sivaſch, Tſchongar, Sarubalat, Barun, Argun, Sidſchugut, and Schirin. Several of theſe diſtricts are named after the town or village wherein the murza, their governor, dwells; and many of them are at preſent in a ſtate of total decay.

CRIMEN FALSI. See *FALSI CRIMEN*.

CRIMSON, one of the ſeven red colours of the dyers. See DYEING.

CRINGLE, a ſmall hole made in the bolt-rope of a ſail, by intertwiſting one of the diviſions of a rope, called a *ſtrand*, alternately round itſelf and through the *ſtrands* of the bolt-rope, till it becomes threefold, and aſſumes the ſhape of a wreath or ring. The uſe of the cringle is generally to contain the end of ſome rope, which is faſtened thereto for the purpoſe of drawing up the ſail to its yard, or of extending the ſkirts by the means of *bridles*, to ſtand upon a ſide wind. The word ſeems to be derived from *krinchelen* (Belg.) "to run into twiſts."

CRINUM, ASPHODEL-LILY: A genus of the monogynia order, belonging to the hexandria claſs of plants; and in the natural method ranking under the 9th order, *Spathaceæ*. The corolla is funnel-ſhaped, monopetalous, and ſexpartite, with three alternate ſegments having hooked appendages; the germen is covered in the bottom of the corolla, the ſtamina ſtanding aſunder. They are very beautiful green-houſe plants, riſing two or three feet high, each of them crowned by a large umbellate cluſter of a ſpathaceous, monopetalous, long funnel-ſhaped flowers, blue, white, or ſtriped, having a very fragrant ſmell. They are propagated by off-ſets.

CRISIS, in medicine, is uſed in different ſenſes, both by the ancient and modern phyſicians. With ſome it means frequently no more than the excretion of any noxious ſubſtance from the body. Others take the word for a ſecretion of the noxious humours made in a fever. Others uſe it for the critical motion itſelf: and Galen defines a criſis in fevers, a ſudden and inſtantaneous change, either for the better or the worſe, productive of recovery or death.

CRISPIN *and* CRISPIANUS, two legendary ſaints, whoſe feſtival, as marked in the kalendar, is on the 25th of October. According to the legend, they were brethren, born at Rome; from whence they travelled to Soiſſons in France, about the year 303, to propagate the Chriſtian religion; and becauſe they would not be chargeable to others for their maintenance, they exerciſed the trade of ſhoemakers: but the governor of the town diſcovering them to be Chriſtians, ordered them to be beheaded. From which time the ſhoemakers made choice of them for their tutelar ſaints.

CRISTÆ, in ſurgery, a term for certain excreſcences about the anus and pudenda. See MEDICINE-*Index*.

CRISTA GALLI, in anatomy, an eminence in the middle of the *os ethmoides*, advancing within the cavity of the cranium; and to which is faſtened that part of the dura mater which divides the brain, called, *falx*. It has its name from its figure, which reſembles that of a cock's comb. In adults, this proceſs appears of a piece with the *ſeptum narium*.

CRITERION, or CRITERIUM, a ſtandard by which propoſitions and opinions are compared, in order to diſcover their truth or falſehood.

CRITHE, in ſurgery, commonly called the *ſtye*, is a ſort of tubercle that grows on the eye-lids. When ſmall, it is ſeated on the edge of the eye-lid; but when large, it ſpreads further. When they do not ſuppurate, they become wens. They are apt to diſappear and return. If there is inflammation, endeavour to ſuppurate it with the white-bread poultice: if it is hard, deſtroy it with a mixture of equal parts of hog's lard and quickſilver. If the lower eye lid is affected, the tumor is more frequently on its inſide; and then it is beſt to diſſect it, or to make way for it outwardly by applying a cauſtic on the ſkin juſt upon it.

CRITHMUM, SAMPHIRE: A genus of the digynia order, belonging to the pentandria claſs of plants; and in the natural method ranking under the 45th order, *Umbellatæ*. The fruit is oval and compreſſed, the florets equal. There are two ſpecies, the principal of which is the maritimum, or common maritime ſamphire. It hath a fibrous penetrating root; thick ſucculent, branchy ſtalks riſing two feet high; winged fleſhy leaves, conſiſting of many ſmall ſpear-ſhaped lobes; with round yellow flowers growing in umbels. It is produced naturally on the ſea-coaſts among the gravel and rocks. Its leaves are an excellent pickle uſed for ſauces, and are by many eaten raw in ſalads. It is of a ſaltiſh reliſh, palatable, and comfortable to the ſtomach. It is not very eaſily preſerved in gardens. It muſt be ſown on gravelly or rocky ground, half an inch deep; in which ſituation the plants will come up, and laſt ſome years. The leaves of this plant are ſaid alſo to be aperient and diuretic.

CRITHOMANCY, a kind of divination, performed by conſidering the dough or matter of the cakes offered in ſacrifice, and the meal ſtrewed over the victims to be killed. Hence, in regard they ordinarily uſed barley-meal in theſe ceremonies, this kind of divination was called *crithomancy*, from κριθη, *barley*, and μαντεια, *divination*.

CRITIAS, one of the 30 tyrants ſet over Athens by the Spartans. He was eloquent and well bred, but of dangerous principles. He cruelly perſecuted his enemies and put them to death. He was killed about 400 years before the Auguſtan age, in a battle againſt thoſe citizens whom his oppreſſion had baniſhed. He had been among the diſciples of Socrates, and had written elegies and other compoſitions, of which ſome fragments remain.

CRITICAL DAYS and SYMPTOMS, among phyſicians, are certain days and ſymptoms in the courſe of acute diſeaſes, which indicate the patient's ſtate, and determine him either to recover or grow worſe. See MEDICINE-*Index*.

CRITICISM, the art of judging with propriety concerning any object or combination of objects. But, in a more limited ſenſe, the ſcience of criticiſm is confined to the fine arts. The principles of the fine arts are beſt unfolded by ſtuding the ſenſitive part of our nature, and by learning what objects are naturally agreeable and what are naturally diſagreeable. The man who aſpires to be a critic in theſe arts, muſt pierce ſtill deeper: he muſt clearly perceive what objects are lofty, what low, what are proper or improper, what are manly, and what are mean or trivial. Hence a foundation for judging of taſte, and for reaſoning upon it: where it is conformable to principles, we can pronounce with certainty that it is correct; otherwiſe, that it is incorrect, and perhaps whimſical. Thus the fine arts, like morals, become a rational ſcience; and, like morals, may be cultivated to a high degree of refinement.

Manifold are the advantages of criticiſm, when thus ſtudied as a rational ſcience. In the firſt place, a thorough acquaintance with the principles of the fine arts redoubles the entertainment theſe arts afford. To the man who reſigns himſelf entirely to ſentiment or feeling, without interpoſing any ſort of judgement, poetry, muſic, painting, are mere paſtime; in the prime of life, indeed, they are delightful, being ſupported by the force of novelty and the heat of imagination: but they loſe their reliſh gradually with their novelty; and are generally neglected in the maturity of life, which diſpoſes to more ſerious and more important occupations. To thoſe who deal in criticiſm as a regular ſcience, governed by juſt principles, and giving ſcope to judgment as well as to fancy, the fine arts are a favourite entertainment; and in old age maintain that reliſh which they produce in the morning of life.

In the next place, a philoſophical inquiry into the principles of the fine arts, inures the reflecting mind to the moſt enticing ſort of logic: the practice of reaſoning upon ſubjects ſo agreeable tends to a habit; and a habit ſtrengthening the reaſoning faculties, prepares the mind for entering into ſubjects more difficult and abſtract. To have, in this reſpect, a juſt conception of the importance of criticiſm, we need but reflect upon the common method of education; which, after ſome years ſpent in acquiring languages, hurries us, without the leaſt preparatory diſcipline, into the moſt profound philoſophy: a more effectual method to alienate the tender mind from abſtract ſcience, is beyond the reach of invention: and accordingly, with reſpect to ſuch ſpeculations, the bulk of our youth contract a ſort of hobgoblin terror, which is ſeldom, if ever, ſubdued. Thoſe who apply to the arts are trained in a very different manner: they are led, ſtep by ſtep, from the eaſier parts of the operation to what are more difficult; and are not permitted to make a new motion till they be perfected in thoſe which regularly precede it. The ſcience of criticiſm appears then to be a middle link, connecting the different parts of education into a regular chain. This ſcience furniſheth an inviting opportunity to exerciſe the judgment: we delight to reaſon upon ſubjects that are equally pleaſant and familiar; we proceed gradually from the ſimpler to the more involved caſes: and in a due courſe of diſcipline, cuſtom, which improves all our faculties, beſtows acuteneſs upon thoſe of reaſon, ſufficient to unravel all the intricacies of philoſophy.

Nor ought it to be overlooked, that the reaſonings employed upon the fine arts are of the ſame kind with thoſe which regulate our conduct. Mathematical and metaphyſical reaſonings have no tendency to improve ſocial intercourſe; nor are they applicable to the common affairs of life: but a juſt taſte in the fine arts, derived from rational principles, furniſhes elegant ſubjects for converſation, and prepares us finely for acting in the ſocial ſtate with dignity and propriety.

The ſcience of rational criticiſm tends to improve the heart not leſs than the underſtanding. It tends, in the firſt place, to moderate the ſelfiſh affections: by ſweetening and harmonizing the temper, it is a ſtrong antidote to the turbulence of paſſion and violence of purſuit; it procures to a man ſo much mental enjoyment, that, in order to be occupied, he is not tempted in youth to precipitate into hunting, gaming, drinking; nor in middle-age, to deliver himſelf over to ambition; nor in old age to avarice. Pride and envy, two diſguſtful paſſions, find in the conſtitution no enemy more formidable than a delicate and diſcerning taſte: the man upon whom nature and culture have beſtowed this bleſſing, feels great delight in the virtuous diſpoſitions and actions of others: he loves to cheriſh them, and to publiſh them to the world: faults and failings, it is true, are to him not leſs obvious; but theſe he avoids, or removes out of ſight, becauſe they give him pain. On the other hand, a man void of taſte, upon whom the moſt ſtriking beauties make but a faint impreſſion, has no joy but in gratifying his pride or envy by the diſcovery of errors and blemiſhes. In a word, there may be other paſſions, which, for a ſeaſon, diſturb the peace of ſociety more than thoſe mentioned; but no other paſſion is ſo unwearied an antagoniſt to the ſweets of ſocial intercourſe: theſe paſſions, tending aſſiduouſly to their gratification, put a man perpetually in oppoſition to others; and diſpoſe him more to reliſh bad than good qualities, even in a companion. How different that diſpoſition of mind, where every virtue in a companion or neighbour, is, by refinement of taſte, ſet in its ſtrongeſt light; and defects or blemiſhes, natural to all, are ſuppreſſed, or kept out of view!

In the next place, delicacy of taſte tends not leſs to invigorate the ſocial affections than to moderate thoſe that are ſelfiſh. To be convinced of this tendency, we need only reflect, that delicacy of taſte neceſſarily heightens our ſenſibility of pain and pleaſure, and of courſe our ſympathy, which is the capital branch of every ſocial paſſion. Sympathy, in particular, invites a communication of joys and ſorrows, hopes and fears: ſuch exerciſe, ſoothing and ſatisfactory in itſelf, is neceſſarily productive of mutual good-will and affection.

One other advantage of rational criticiſm is reſerved to the laſt place, being of all the moſt important; which is, that it is a great ſupport to morality. No occupation attaches a man more to his duty than that of cultivating a taſte in the fine arts: a juſt reliſh of what is beautiful, proper, elegant, and ornamental, in writing or painting, in architecture or gardening, is a fine preparation for the ſame juſt reliſh of theſe qualities in character and behaviour. To the man who has acquired a taſte ſo acute and accompliſhed, every action wrong or improper muſt be highly diſguſtful: if, in any inſtance, the overbearing power of paſſion ſway him from his duty, he returns to it upon the firſt reflection, with redoubled reſolution never to be ſwayed a ſecond time: he has now an additional motive to virtue, a conviction derived from experience, that happineſs depends on regularity and order, and that a diſregard to juſtice or propriety never fails to be puniſhed with ſhame and remorſe.

For the rules of criticiſm applicable to the fine arts, and derived from human nature, ſee ARCHITECTURE, BEAUTY, CONGRUITY, COMPARISON, GRANDEUR, &c.

CRITO, an Athenian philoſopher, flouriſhed 400 years before Chriſt. He was one of the moſt zealous diſciples of Socrates, and ſupplied him with whatever he wanted. He had ſeveral ſcholars who proved great men, and he compoſed ſome dialogues which are loſt.

CRITOLAUS, a citizen of Tegea in Arcadia. He with two brothers fought againſt the three ſons of Demoſtratus of Pheneus, to put an end to a long war between their reſpective nations. The brothers of Critolaus were both killed, and he alone remained to withſtand his three bold antagoniſts. He conquered them; and when at his return his ſiſter deplored the death of one of his antagoniſts, to whom ſhe was betrothed, he killed her in a fit of reſentment. The offence deſerved capital puniſhment; but he was pardoned on account of the ſervices he had rendered his country. He was afterwards general of the Achæans; and it is ſaid that he poiſoned himſelf becauſe he had been conquered at Thermopylæ by the Romans, about 146 years before the Auguſtan age.

CRIZZELLING, in the glaſs trade, a kind of roughneſs ariſing on the ſurface of ſome kinds of glaſs. This was the fault of a peculiar ſort of glaſs made in Oxfordſhire and ſome other places, of black flints, a cryſtallized ſand, and a large quantity of nitre, tartar, and borax. The glaſs thus made is very beautiful, but from the too great quantities of the ſalt in the mixture, is ſubject to crizzel; that is, the ſalts in the mixture, from their too great proportion, are ſubject, either from the adventitious nitre of the air from without, or from warm liquors put in them, to be either increaſed in quantity or diſſolved, and thereby induce a ſcabrities or roughneſs, irrecoverably clouding the tranſparence of the glaſs. This is what was called *crizzelling*; but by uſing an Italian white pebble, and abating the proportions of the ſalts, the manufacture is now carried on with advantage, and the glaſs made with theſe ſalts is whiter than the fineſt Venetian, and is ſubject to no faults.

CROATIA, a part of the ancient Illyricum, is bounded on the eaſt by Sclavonia and Boſnia, on the ſouth and ſouth-weſt by Morlachia, and on the north by the Drave, which ſeparates it from a part of Sclavonia. It is about 80 miles in length and 70 in breadth, and was once divided between the Hungarians and Turks; but now the greateſt part of it is ſubject to the houſe of Auſtria. The Croats derive their origin from the Sclavi; and their language is a dialect of the Sclavonian, approaching very near to that of the Poles. The country is divided into two parts, viz. that under, and that beyond the Save. In the late wars between the empreſs queen and the king of Pruſſia, no leſs than 50,000 men were raiſed out of this ſmall territory. Both horſe and foot are good ſoldiers, eſpecially the former. The ſoil, where cultivated, is fruitful in wine and oil, &c. but being a frontier country, and much expoſed to inroads, it is not ſo well cultivated as otherwiſe it might be.

CROCODILE, in zoology. See LACERTA.

Foſſile CROCODILE, one of the greateſt curioſities in the foſſile world which the late ages have produced. It is the ſkeleton of a large crocodile, almoſt entire, found at a great depth under ground, bedded in ſtone. This was in the poſſeſſion of Linkius, who wrote many pieces of natural hiſtory, and particularly an accurate deſcription of this curious foſſile. It was found in the ſide of a large mountain in the midland part of Germany, and in a ſtratum of black foſſile ſtone, ſomewhat like the common ſlate, but of a coarſer texture, the ſame with that in which the foſſile fiſh in many parts of the world are found. This ſkeleton had the back and ribs very plain, and was of a much deeper black than the reſt of the ſtone; as is alſo the caſe in the foſſile fiſhes which are preſerved in this manner. The part of the ſtone where the head lay was not found; this being broken off juſt at the ſhoulders, but that irregularly; ſo that, in one place, a part of the back of the head was viſible in its natural form. The two ſhoulder-bones were very fair, and three of the feet were well preſerved; the legs were of their natural ſhape and ſize, and the feet preſerved even to the extremities of the five toes of each.

CROCODILE (*crocodilus*), in rhetoric, a captious and ſophiſtical kind of argumentation, contrived to ſeduce the unwary, and draw them ſpeciouſly into a ſnare. It has its name crocodile from the following occaſion, invented by the poets. A poor woman, begging a crocodile

codile that had caught her ſon walking by the river-ſide to ſpare and reſtore him, was anſwered, that he would reſtore him, provided ſhe ſhould give a true anſwer to a queſtion he ſhould propoſe: the queſtion was, Will I reſtore thy ſon or not? To this the poor woman, ſuſpecting a deceit, ſorrowfully anſwered, Thou wilt not: and demanded to have him reſtored, becauſe ſhe had anſwered truly. Thou lyeſt, ſays the crocodile; for if I reſtore him, thou haſt not anſwered truly: I cannot therefore reſtore him without making thy anſwer falſe. Under this head may be reduced the propoſitions called *mentientes* or *inſolubiles*; which deſtroy themſelves. Such is that of the Cretan poet: *Omnes ad unum Cretenſes ſemper mentiuntur*: "All the Cretans, to a man, always lie." Either, then, the poet lies when he aſſerts that the Cretans all lie, or the Cretans do not all lie.

CROCUS, SAFFRON: A genus of the monogynia order, belonging to the triandria claſs of plants; and in the natural method ranking under the 6th order, *Enſatæ*. The corolla is ſexpartite and equal; the ſtigmata convoluted or rolled ſpirally inwards. Modern botaniſts allow only one ſpecies of this genus, which, however, comprehends many beautiful varieties. This hath a ſmall roundiſh, brown, bulbous root, compreſſed at the bottom. Directly from the root iſſue many long narrow leaves, of a deep green colour; and amidſt them the flowers all protruded from a thin univalvular radical ſpatha: the tube of the flower is long, ſtanding on the root, and ſerving as a footſtalk to the limb or upper part, which is erect, ſix-parted, widens gradually upward, and grows from about three to five or ſix inches high. The varieties of this ſpecies may be divided into two claſſes, the autumnal and ſpring flowering.

The varieties of the firſt are the *crocus officinalis*, or ſaffron of the ſhops; for the properties of which, and its cultivation for ſale, ſee the article SAFFRON. This hath a long-tubed bluiſh purple flower, with three ſtigmata of a fine golden colour. Other varieties are the autumnal ſmall blue crocus; deep blue, ſky-blue, whitiſh blue, many flowered whitiſh blue, purple, large ruſh leaved purple, autumnal white crocus, and autumnal yellow crocus. The varieties of the vernal crocus are, the ſmall and large, and golden yellow crocuſes, and the yellow black-ſtriped, the yellow purple-ſtriped and double cloth of gold ones; the white, white purple-ſtriped, white purple bottom, white black-ſtriped, whitiſh cream coloured, whitiſh aſh coloured, little narrow-leafed white, and white blue-ſtriped crocuſes. Beſides theſe there are a great many others of a blue and purple colour finely variegated.

The autumnal crocuſes flower about the beginning of October, but never ripen their ſeeds in Britain. They are very beautiful if ſown in patches in the front of borders, or in beds by themſelves, and very proper ornaments for gardens of every extent, as coming up at a time when moſt other flowers are on the decay. They grow freely in any kind of ſoil, and may be propagated by off-ſets. The vernal kinds flower in February, March, and April. They alſo are very ornamental, and are ſo hardy that they will grow almoſt any where. They are propagated by ſeeds, which the plants produce in plenty.

CROCUS, in chemiſtry, denotes any metal calcined to a red or deep yellow colour.

Crocus Metallorum, an emetic preparation of antimony and nitre. See CHEMISTRY-*Index*.

CRŒSUS, the laſt king of Lydia, remarkable for his riches, his conqueſts, his temporary proſperity, and the ſad reverſe of his fortune. He ſubdued the Phrygians, Myſians, Paphlagonians, Thracians, and Carians; amaſſed together immenſe riches; and became one of the moſt powerful and magnificent princes in the world. He drew the learned to his court, and took a pleaſure in converſing with them. Thales of Miletus, Pittacus of Mitylene, Bias of Priené, Cleobulus of Lindus, and moſt of the other "wiſe men," as they are emphatically ſtyled, who lived in that age, as well as Æſop the fabuliſt, and the elegant Greek poets of the times, were bountifully received at the court of Crœſus. There is ſtill on record a memorable converſation between that prince and Solon, which ſeemed to predict the ſubſequent events of his reign, and which had a late but important influence on the character and fortune of the Lydian king. Crœſus having entertained his Athenian gueſt, according to the ancient faſhion, for ſeveral days, before he aſked him any queſtions, oſtentatiouſly ſhowed him the magnificence of his palace, and particularly the riches of his treaſury. After all had been diſplayed to the beſt advantage, the king complimented Solon upon his curioſity and love of knowledge; and aſked him, as a man who had ſeen many countries, and reflected with much judgment upon what he had ſeen, Whom of all men he eſteemed moſt happy? By the particular occaſion, as well as the triumphant air with which the queſtion was propoſed, the king made it evident that he expected flattery rather than information. But Solon's character had not been enervated by the debilitating air of a court; and he replied with a manly freedom, "Tellus, the Athenian." Crœſus, who had ſcarcely learned to diſtinguiſh, even in imagination, between wealth and happineſs, inquired with a tone of ſurpriſe, why this preference to Tellus? "Tellus," rejoined Solon, "was not conſpicuous for his riches or his grandeur, being only a ſimple citizen of Athens; but he was deſcended from parents who deſerved the firſt honours of the republic. He was equally fortunate in his children, who obtained univerſal eſteem by their probity, patriotiſm, and every uſeful quality of the mind or body: and as to himſelf, he died fighting gallantly in the ſervice of his country, which his valour rendered victorious in a doubtful combat; on which account the Athenians buried him on the ſpot where he fell, and diſtinguiſhed him by every honour which public gratitude can confer on illuſtrious merit."

Crœſus had little encouragement, after this anſwer, to aſk Solon, in the ſecond place, Whom, next to Tellus, he deemed moſt happy? Such, however, is the illuſion of vanity, that he ſtill ventured to make this demand; and ſtill, as we are informed by the moſt circumſtantial of hiſtorians, entertained hopes of being favourably anſwered. But Solon replied with the ſame freedom as before, "The brothers Cleobis and Biton; two youths of Argos, whoſe ſtrength and addreſs were crowned with repeated victory at the Olympic games; who deſerved the affection of their parents, the gratitude of their country, the admiration of Greece; and who, having ended their lives with peculiar ſecility, were commemorated by the moſt ſignal monuments of immortal fame." "And is the happineſs of a king, then," ſaid Crœſus, "ſo little regarded, O Grecian ſtranger! that you prefer to it the mean condition of an Athenian or Argive citizen?" The reply of Solon ſufficiently juſtified his reputation for wiſdom. "The life of man," ſaid he, "conſiſts of 70 years, which make 25,550 days; an immenſe number: yet in the longeſt life, the events of any one day will not be found exactly alike to thoſe of another. The affairs of men are liable to perpetual viciſſitudes: the Divinity who preſides over our fate is envious of too much proſperity; and all human life, if not condemned to calamity, is at leaſt liable to accident. Whoever has uninterruptedly enjoyed a proſperous tide of ſucceſs may juſtly be called *fortunate*: but he cannot before his death be intitled to the epithet of *happy*."

The events which ſoon followed this converſation, prove how little ſatisfaction is derived from the poſſeſſion of a throne. Victorious in war, unrivalled in wealth, ſupreme in power, Crœſus felt and acknowledged his unhappineſs. The warmeſt affections of his ſoul centered in his ſon Atys, a youth of the moſt promiſing hopes, who had often ſought and conquered by his ſide. The ſtrength of his attachment was accompanied with an exceſs of paternal care, and the anxiety of his waking hours diſturbed the tranquillity of his reſt. He dreamed that his beloved ſon was ſlain by a dart; and the ſolicitude with which he watched his ſafety, preventing the youth from his uſual occupations and amuſements, and thereby rendering him too eager to enjoy them, moſt probably expoſed him to the much dreaded misfortune. Reluctantly permitted to engage in a party of hunting, the juvenile ardour of Atys, increaſed by the impatience of long reſtraint, made him neglect the precautions neceſſary in that manly amuſement. He was ſlain by a dart aimed at a wild boar of a monſtrous ſize, which had long ſpread terror over the country of the Myſians. The weapon came from the hand of Adraſtus, a Phrygian prince and fugitive, whom Crœſus had purified from the involuntary guilt of a brother's blood, and long diſtinguiſhed by peculiar marks of bounty. To the grateful protection of the Phrygian, Crœſus recommended, at parting, the ſafety of his beloved ſon. A mournful proceſſion of Lydians brought to Sardis the dead body of Atys. The ill-fated murderer followed behind. When they approached the royal preſence, Adraſtus ſtepped forward, and intreated Crœſus to put him to death; thinking life no longer to be endured after killing, firſt his own brother, and then the ſon of his benefactor. But the Lydian king, notwithſtanding the exceſs of his affliction, acknowledged the innocence of Adraſtus, and the power of fate. "Stranger your action is blameleſs, being committed without deſign. I know that my ſon was deſtined to a premature death." Adraſtus, though pardoned by Crœſus, could not pardon himſelf. When the mourners were removed, he privately returned, and periſhed by his own hand on the tomb of Atys.

Two years Crœſus remained diſconſolate for the loſs of his ſon; and might have continued to indulge his unvailing affliction during the remainder of life, had not the growing greatneſs of Perſia, which threatened the ſafety of his dominions, rouſed him from his dream of miſery. (See Lydia.)—He marched againſt Cyrus with a great army, but was defeated; and retreating to his capital Sardis, was there beſieged. The city was taken by aſſault; and as a Perſian ſoldier was going to kill Crœſus, that prince's only ſurviving ſon, who had hitherto been dumb, terrified at his danger, cried, *Stop, ſoldier, and touch not Crœſus.* But though delivered by this extraordinary accident from the blind rage of the ſoldier, he ſeemed to be reſerved for a harder fate. Dragged into the preſence of his conqueror, he was loaded with irons; and the ſtern, unrelenting Cyrus, of whoſe humane temper of mind we have ſo beautiful, but ſo flattering, a picture in the philoſophical romance of Xenophon, ordered him, with the melancholy train of his Lydian attendants, to be committed to the flames. An immenſe pile of wood and other combuſtibles were erected in the moſt ſpacious part of the city. The miſerable victims, bound hand and foot, were placed on the top of the pyre. Cyrus, ſurrounded by his generals, witneſſed the dreadful ſpectacle, either from an abominable principle of ſuperſtition if he had bound himſelf by a vow to ſacrifice Crœſus, as the firſt fruits of his Lydian victory, or from a motive of curioſity, equally cruel and impious, to try whether Crœſus, who had ſo magnificently adorned the temples and enriched the miniſters of the gods, would be helped in time of need by the miraculous interpoſition of his much honoured protectors. Mean while the unfortunate Lydian, oppreſſed and confounded by the intolerable weight of his preſent calamity compared with the ſecurity and ſplendor of his former ſtate, recollected his memorable converſation with the Athenian ſage, and uttered with a deep groan the name of *Solon*. Cyrus aſked by an interpreter, "Whoſe name he invoked?" "*Him*," replied Crœſus, emboldened by the proſpect of certain death, "whoſe words ought ever to ſpeak to the heart of kings." This reply not being ſatisfactory, he was commanded to explain at full length the ſubject of his thoughts. Accordingly he related the important diſcourſe which had paſſed between himſelf and the Athenian, of which it was the great moral, That no man could be called happy till his death.

The words of a dying man are fitted to make a ſtrong impreſſion on the heart. Thoſe of Crœſus deeply affected the mind of Cyrus. The Perſian conſidered the ſpeech of Solon as addreſſed to himſelf. He repented of his intended cruelty towards an unfortunate prince, who had formerly enjoyed all the pomp of proſperity: and dreading the concealed vengeance that might lurk in the boſom of fate, gave orders that the pyre ſhould be extinguiſhed. But the workmen who had been employed to prepare it, had performed their taſk with ſo much care, that the order could not ſpeedily be obeyed. At that moment, Crœſus calling on Apollo, whoſe favourite ſhrine of Delphi had experienced his generous munificence, and whoſe perfidious oracle had made him ſo ungrateful a return; the god, it is ſaid, ſent a plentiful ſhower to extinguiſh the pyre. This event, which ſaved the life, and which ſufficiently atteſted the piety of Crœſus, ſtrongly recommended him to the credulity of his conqueror. It ſeemed impoſſible to pay too much reſpect to a man who was evidently the favourite of heaven. Cyrus gave orders that he ſhould be ſeated by his ſide, and thenceforth treated as a king; a revolution of fortune equally ſudden and unexpected. But the mind of Crœſus had undergone a ſtill more important revolution; for, tutored in the uſeful ſchool of adverſity, he learned to think with patience and to act with prudence, to govern his own paſſions by the dictates of reaſon, and to repay by wholeſome advice the generous behaviour of his Perſian maſter.

The firſt advantage which he derived from the change in Cyrus's diſpoſition towards him, was the permiſſion of ſending his fetters to the temple of Delphian Appollo, whoſe flattering oracles had encouraged him to wage war with the Perſians. "Behold," were his meſſengers inſtructed to ſay, "the trophies of our promiſed ſucceſs! behold the monuments of the unerring veracity of the god!" The Pythia heard their reproach with a ſmile of contemptuous indignation, and anſwered it with that ſolemn gravity which ſhe was ſo carefully taught to aſſume: "The gods themſelves cannot avoid their *own* deſtiny, much leſs avert, however they may retard, the determined fates of men. Crœſus has ſuffered, and juſtly ſuffered, for the crime of his anceſtor Gyges; who, entruſted as chief of the guards, with the perſon of Candaules, the laſt king of the race of Hercules, was ſeduced by an impious woman to murder his maſter, to defile his bed, and to uſurp his royal dignity. For this complicated guilt of Gyges the misfortunes of Crœſus have atoned; but know that through the favour of Appollo, theſe misfortunes have happened three years later than the fates ordained." The Pythia then proceeded to explain her anſwers concerning the event of the war againſt Cyrus, and proved, to the conviction of the Lydians, that her words, if properly underſtood, portended the deſtruction, not of the Perſian, but of the Lydian empire. Crœſus heard with reſignation the report of his meſſengers, and acknowledged the juſtice of the Delphian oracle, which maintained and increaſed the luſtre of its ancient fame. This fallen monarch ſurvived Cyrus. The manner of his death is not known.

CROFT, a little cloſe adjoining to a dwelling-houſe, and incloſed for paſture or arable land, or any other purpoſe.—in ſome ancient deeds, *cruſta* occurs as the Latin word for a "croft;" but *cum toſtis & croftis* is more frequent. Croft is tranſlated in Abbo Floriacenſis, by *prædium* a "farm."

CROISADE, or CRUSADE, a name given to the expeditions of the Chriſtians againſt the infidels for the conqueſt of Paleſtine

Theſe expeditions commenced in the year 1096. The foundation of them was a ſuperſtitious veneration for thoſe places where our Saviour performed his miracles, and accompliſhed the work of man's redemption. Jeruſalem had been taken, and Paleſtine conquered, by Omar the ſucceſſor of Abu Beer,* who ſucceeded Mahomet himſelf. This proved a conſiderable interruption to the pilgrims, who flocked from all quarters to perform their devotions at the holy ſepulchre. They had, however, ſtill been allowed this liberty, on paying a ſmall tribute to the Saracen caliphs, who were not much inclined to moleſt them. But, in 1065, this city changed its maſters. The Turks took it from the Saracens; and being much more fierce and barbarous than the former, the pilgrims now found they could no longer perform their devotions with the ſame ſafety they did before. An opinion was about this time alſo prevalent in Europe, which made theſe pilgrimages much more frequent than formerly. It was ſomehow or other imagined, that the thouſand years mentioned in the 20th chapter of the Revelations were fulfilled; that Chriſt was ſoon to make his appearance in Paleſtine, to judge the world; and conſequently that journeys to that country were in the higheſt degree meritorious, and even abſolutely neceſſary. The multitudes of pilgrims which now flocked to Paleſtine meeting with a very rough reception from the Turks, filled all Europe with complaints againſt thoſe infidels who profaned the holy city by their preſence, and derided the ſacred myſteries of Chriſtianity even in the place where they were fulfilled. Pope Gregory VII. had formed a deſign of uniting all the princes of Chriſtendom againſt the Mahometans; but his exorbitant encroachments upon the civil power of princes had created him ſo many enemies, and rendered his ſchemes ſo ſuſpicious, that he was not able to make great progreſs in this undertaking. The work was reſerved for a meaner inſtrument.

Peter, commonly called the *hermit*, a native of Amiens in Picardy, had made the pilgrimage to Jeruſalem; and being deeply affected with the dangers to which that act of piety now expoſed the pilgrims, as well as with the oppreſſion under which the eaſtern Chriſtians now laboured, formed the bold, and, in all appearance, impracticable deſign of leading into Aſia, from the fartheſt extremities of the Weſt, armies ſufficient to ſubdue thoſe potent and warlike nations that now held the Holy Land in ſlavery. He propoſed his ſcheme to Martin II. who then filled the papal chair; but he, though ſenſible enough of the advantages which muſt accrue to himſelf from ſuch an undertaking, reſolved not to interpoſe his authority till he ſaw a greater probability of ſucceſs. He ſummoned, at Placentia, a council conſiſting of 4000 eccleſiaſtics and 30,000 ſeculars. As no hall could be found large enough to contain ſuch a multitude, the aſſembly was held in a plain. Here the Pope himſelf, as well as Peter, harangued the people, repreſenting the diſmal ſituation of their brethren in the Eaſt, and the indignity offered to the Chriſtian name in allowing the holy city to remain in the hands of the infidels. Theſe ſpeeches were ſo agreeable to thoſe who heard them, that the whole multitude ſuddenly and violently declared for the war, and ſolemnly devoted themſelves to perform this ſervice, which they believed to be ſo meritorious in the ſight of God.

But though Italy ſeemed to have embraced the deſign with ardour, Martin yet thought it neceſſary, in order to enſure perfect ſucceſs, to engage the greater and more warlike nations in the ſame enterprize. Having therefore exhorted Peter to viſit the chief cities and ſovereigns of Chriſtendom, he ſummoned another council at Clermont in Auvergne. The fame of this great and pious deſign being now univerſally diffuſed, procured the attendance of the greateſt prelates, nobles, and princes; and when the Pope and the hermit renewed their pathetic exhortations, the whole aſſembly, as if impelled by an immediate inſpiration, exclaimed with one voice, "It is the will of God! it is the will of God!" Theſe words were deemed ſo memorable, and ſo much the effect of a divine impulſe, that they were employed as the ſignal of rendezvous and battle in all future exploits of theſe adventurers. Men of all ranks now flew to arms with the utmoſt ardour, and a croſs was affixed to their right ſhoulder by all who inliſted in this holy enterprize.

---

* See *Arabia*, n° 76.

At this time Europe was ſunk in the moſt profound ignorance and ſuperſtition. The eccleſiaſtics had gained the greateſt aſcendant over the human mind; and the people, who committed the moſt horrid crimes and diſorders, knew of no other expiation than the obſervances impoſed on them by their ſpiritual paſtors.

But amidſt the abject ſuperſtition which now prevailed, the military ſpirit had alſo univerſally diffuſed itſelf; and, though not ſupported by art or diſcipline, was become the general paſſion of the nations governed by the feudal law. All the great lords poſſeſſed the right of peace and war. They were engaged in continual hoſtilities with one another: the open country was become a ſcene of outrage and diſorder: the cities, ſtill mean and poor, were neither guarded by walls nor protected by privileges. Every man was obliged to depend for ſafety on his own force, or his private alliances; and valour was the only excellence which was held in eſteem, or gave one man the pre-eminence above another. When all the particular ſuperſtitions, therefore, were here united in one great object, the ardour for private hoſtilities took the ſame direction; "and all Europe (as the princeſs Anna Comnena expreſſes herſelf), torn from its foundations, ſeemed ready to precipitate itſelf in one united body upon Aſia."

All orders of men, now deeming the croiſades the only road to heaven, were impatient to open the way with their ſwords to the holy city. Nobles, artiſans, peaſants, even prieſts, inrolled their names; and to decline this ſervice was branded with the reproach of impiety or cowardice. The nobles who inliſted themſelves were moved, by the romantic ſpirit of the age, to hope for opulent eſtabliſhments in the Eaſt, the chief ſeat of arts and commerce at that time. In purſuit of theſe chimerical projects, they ſold at the loweſt price their ancient caſtles and inheritances, which had now loſt all value in their eyes. The infirm and aged contributed to the expedition by preſents and money; and many of them, not ſatiſfied with this, attended it in perſon, being determined, if poſſible, to breath their laſt in ſight of that city where their Saviour had died for them. Women themſelves, concealing their ſex under the diſguiſe of armour, attended the camp; and commonly forgot their duty ſtill more, by proſtituting themſelves to the army. The greateſt criminals were forward in a ſervice which they conſidered as an expiation for all crimes; and the moſt enormous diſorders were, during the courſe of theſe expeditions, committed by men inured to wickedneſs, encouraged by example, and impelled by neceſſity. The multitude of adventurers ſoon became ſo great, that their more ſagacious leaders became apprehenſive leſt the greatneſs of the armament would be the cauſe of its own diſappointment. For this reaſon they permitted an undiſciplined multitude, computed at 300,000 men, to go before them under the command of Peter the hermit, and Gautier or Walter, ſurnamed the *moneyleſs*, from his being a ſoldier of fortune. Theſe took the road towards Conſtantinople through Hungary and Bulgaria; and, truſting that heaven, by ſupernatural aſſiſtance, would ſupply all their neceſſities, they made no proviſion for ſubſiſtence in their march. They ſoon found themſelves obliged to obtain by plunder what they vainly expected from miracles; and the enraged inhabitants of the countries through which they paſſed, attacked the diſordely multitude, and ſlaughtered them without reſiſtance. The more diſciplined armies followed after; and, paſſing the ſtraits at Conſtantinople, they were muſtered in the plains of Aſia, and amounted in the whole to 700,000 men.

This rage for conquering the Holy Land did not ceaſe with this expedition. It continued for very near two centuries, and eight different croiſades were ſet on foot, one after another. The firſt was in the year 1096, as already obſerved. The princes engaged in it were, Hugo, count of Vermandois, brother to Philip I. king of France; Robert, duke of Normandy; Robert earl of Flanders; Raimond, earl of Toulouſe and St Giles; Godfrey of Bouillon, duke of Lorrain, with his brothers Baldwin and Euſtace; Stephen, earl of Chartres and Blois; Hugo, count of St Paul; with a great number of other lords. The general rendezvous was at Conſtantinople. In this expedition, the famous Godfrey beſieged and took the city of Nice. The city of Jeruſalem was taken by the confederated army, and Godfrey choſen king. The Chriſtians gained the famous battle of Aſcalon againſt the ſoldan of Egypt; which put an end to the firſt croiſade.

The ſecond croiſade, in the year 1144, was headed by the emperor Conrad III. and Louis VII. king of France. The emperor's army was either deſtroyed by the enemy, or periſhed through the treachery of Manuel the Greek emperor; and the ſecond army, through the unfaithfulneſs of the Chriſtians of Syria, was forced to break up the ſiege of Damaſcus.

The third croiſade, in the year 1188, immediately followed the taking of Jeruſalem by Saladin the ſoldan of Egypt. The princes engaged in this expedition were, the emperor Frederic Barbaroſſa; Frederic duke of Suabia, his ſecond ſon; Leopold duke of Auſtria; Berthold duke of Moravia; Herman marquis of Baden; the counts of Naſſau, Thuringia, Miſſen, and Holland; and above 60 other princes of the empire; with the biſhops of Beſançon Cambray, Munſter. Oſnaburg, Miſſen, Paſſau, Viſburg, and ſeveral others. In this expedition, the emperor Frederic defeated the ſoldan of Iconium: his ſon Frederic, joined by Guy Luſignan king of Jeruſalem, in vain endeavoured to take Acre or Ptolemais. During which tranſactions, Philip Auguſtus king of France, and Richard II. king of England, joined the croiſade; by which means the Chriſtian army conſiſted of 200,000 fighting men: but great diſputes happening between the kings of France and England, the former quitted the Holy Land, and Richard concluded a peace with Saladin.

The fourth croiſade was undertaken, in the year 1195, by the emperor Henry VI. after Saladin's death. In this expedition the Chriſtians gained ſeveral battles againſt the infidels, took a great many towns, and were in the way of ſucceſs, when the death of the emperor obliged them to quit the Holy Land, and return into Germany.

The fifth croiſade was publiſhed, by order of pope Innocent III. in 1198. Thoſe engaged in it made fruitleſs efforts for the recovery of the Holy Land: for, though John de Neule, who commanded the fleet equipped in Flanders, arrived at Ptolemais a little after Simon of Montfort, Renard of Dampierre, and others; yet the plague deſtroying many of them, and the reſt either returning or engaging in the petty quarrels of the Chriſtian princes, there was nothing done; ſo that the ſoldan of Aleppo eaſily defeated their troops in 1204.

The ſixth croiſade began in 1228; in which the Chriſtians took the town of Damietta, but were forced to ſurrender it again. The next year the emperor Frederic made peace with the ſoldan for 10 years. About 1240, Richard earl of Cornwal, and brother to Henry III. king of England, arrived in Paleſtine at the head of the Engliſh croiſade; but finding it moſt advantageous to conclude a peace, he reembarked, and ſteered towards Italy. In 1244, the Karaſmians being driven out of Perſia by the Tartars, broke into Paleſtine, and gave the Chriſtians a general defeat near Gaza.

The ſeventh croiſade was headed by St Lewis, in the year 1249, who took the town of Damietta; but a ſickneſs happening in the Chriſtian army, the king endeavoured a retreat; in which being purſued by the infidels, moſt of his army were miſerably butchered, and himſelf and the nobility taken priſoners. Then a truce was agreed upon for 10 years, and the king and lords ſet at liberty.

The eight croiſade, in 1270, was headed by the ſame prince, who made himſelf maſter of the port and caſtle of Carthage in Africa; but dying in a ſhort time, he left his army in a very ill condition. Soon after, the king of Sicily coming up with a good fleet, and joining Philip the Bold, ſon and ſucceſſor of Lewis the king of Tunis, after ſeveral engagements with the Chriſtians, in which he was always worſted, deſired peace, which was granted upon conditions advantageous to the Chriſtians; after which both princes embarked for their own kingdoms. Prince Edward of England, who arrived at Tunis at the time of this treaty, ſailed towards Ptolemais, where he landed with a ſmall body of 300 Engliſh and French, and hindered Bendocdar from laying ſiege to Ptolemais: but being obliged to quit the Holy Land to take poſſeſſion of the crown of England, this croiſade ended without contributing any thing to the recovery of the Holy land. In 1291, the town of Acre, or Ptolemais, was taken and plundered by the ſoldan of Egypt, and the Chriſtians quite driven out of Syria. There has been no croiſade ſince that time, though ſeveral popes have attempted to ſtir up the Chriſtians to ſuch an undertaking; particularly Nicholas IV. in 1292. and Clement V. in 1311.

Though theſe croiſades were effects of the moſt abſurd ſuperſtition, they tended greatly to promote the good of Europe. Multitudes indeed were deſtroyed. M. Voltaire computes the people who periſhed in the different expeditions at upwards of two millions. Many there were, however, who returned; and theſe, having converſed ſo long with people who lived in a much more magnificent way than themſelves, began to entertain ſome taſte for a refined and poliſhed way of life. Thus the barbariſm in which Europe had been ſo long immerſed, began to wear off ſoon after this time. The princes alſo who remained at home, found means to avail themſelves of the frenzy of the people. By the abſence of ſuch numbers of reſtleſs and martial adventurers, peace was eſtabliſhed in their dominions. They alſo took the opportunity of annexing to their crown many conſiderable fiefs, either by purchaſe, or by the extinction of the heirs: and thus the miſchiefs which muſt always attend feudal governments were conſiderably leſſened.

With regard to the bad ſucceſs of the croiſaders, it was ſcarce poſſible that any other thing could happen them. The emperors of Conſtantinople, inſtead of aſſiſting, did all in their power to diſconcert their ſchemes. They were jealous, and not without reaſon, of ſuch an inundation of barbarians. Yet, had they conſidered their true intereſt, they would rather have aſſiſted them, or at leaſt ſtood neuter, than entered into alliances with the Turks. They followed the latter method, however, and were often of very great diſſervice to the weſtern adventurers, which at laſt occaſioned the loſs of their city.* But the worſt enemies the croiſaders had, were their own internal feuds and diſſentions. They neither could agree while marching together in armies with a view to conqueſt, nor could they unite their conqueſts under one government after they had made them. They ſet up three ſmall ſtates, one at Jeruſalem, another at Antioch, and another at Edeſſa. Theſe ſtates, inſtead of aſſiſting, made war upon each other, and on the Greek emperors; and thus became an eaſy prey to the common enemy. The horrid cruelties they committed alſo were ſuch as muſt have inſpired the Turks with the moſt invincible hatred againſt them, and made them reſiſt with the greateſt obſtinacy. They were ſuch as could have been committed only by barbarians inflamed with religious enthuſiaſm. When Jeruſalam was taken, not only the numerous garriſon were put to the ſword, but the inhabitants were maſſacred without mercy and without diſtinction. No age nor ſex was ſpared, not even ſucking children. According to Voltaire, ſome Chriſtians, who had been ſuffered by the Turks to live in that city, led the conquerors into the moſt private caves where women had concealed themſelves with their children, and not one of them was ſuffered to eſcape. What eminently ſhows the enthuſiaſm by which theſe conquerors were animated, is their behaviour after this terrible ſlaughter. They marched over heaps of dead bodies towards the holy ſepulchre; and while their hands were yet polluted with the blood of ſo many innocent perſons, ſung anthems to the common Saviour of mankind. Nay, ſo far did their religious enthuſiaſm overcome their fury, that theſe ferocious conquerors now burſt into tears. If the abſurdity and wickedneſs of this conduct can be exceeded by any thing, it muſt be by what follows. In the year 1204, the frenzy of croiſading ſeized the children, who are ever ready to imitate what they ſee their parents engage themſelves in. Their childiſh folly was encouraged by the monks and ſchoolmaſters; and thouſands of thoſe innocents were conducted from

the houſes of their parents on the faith of theſe words, "Out of the mouth of babes and ſucklings haſt thou perfected praiſe." Their baſe conductors ſold a part of them to the Turks, and the reſt periſhed miſerably.

CROISES, or CROIZES, in Engliſh antiquity, pilgrims bound for the Holy Land, or ſuch as have been there; ſo called from a badge they wore in imitation of a croſs. The knights of St John of Jeruſalem, created for the defence and protection of pilgrims, were particularly called *croiſes*.

CROISIERS, a religious order founded in honour of the invention or diſcovery of the croſs by the empreſs Helena. They are diſperſed in ſeveral parts of Europe, particularly in the Low Countries, France, and Bohemia, thoſe in Italy being at preſent ſuppreſſed. Theſe religious follow the rule of St Auguſtine. They had in England the name of *crouched friars*.

CROIX (FRANCIS PETIS DE LA), ſecretary and interpreter to the king of France in the Turkiſh and Arabic languages, died November 4th 1695, in his 73d year; after having executed this employment for the ſpace of 44 years. And it appears, that he executed it with as much integrity as abilities: for, when the Algerines ſought for peace of Louis XIV. conditions were offered, by which they were required to reimburſe to this monarch 600,000 franks. The terms being thought exorbitant, they had recourſe to ſtratagem: and they offered a large ſum to La Croix, who was the interpreter of all that paſſed, if he would put into the treaty "crowns of Tripoli," inſtead of "French crowns:" which would have made to the Algerines a difference of more than 100,000 livres. But the intregrity of the interpreter triumphed over the temptation; which however was the greater, as it was next to impoſſible he ſhould be diſcovered. Beſides the Turkiſh and the Arabic, the Perſian and the Tartarian, he alſo underſtood the Ethiopian and Armenian languages. He is well known to the learned world by many works. He tranſlated the "Hiſtory of France" into the Turkiſh language. He digeſted the three volumes of "Voyages into the Eaſt Indies" of M. Thevenot. He made an accurate catalogue of all the Turkiſh and Perſian books which are in the king's library. He compoſed two complete Dictionaries for the French and Turkiſh languages; and, when he was dying, he was about to preſent the world with the hiſtory of Genghiſcan. He undertook this hiſtory by the order of M. Colbert: for this miniſter, altogether intent upon aggrandizing his maſter, was accuſtomed every week to call together, either in the king's library or his own, certain of the learned, whom, according as they excelled in their ſeveral departments in literature, he conſtantly ſet to work. This hiſtory, which coſt La Croix more than ten years labour, is uſeful, not only to the learned who are curious to know paſt events, or to geographers who had hitherto been greatly ignorant of Grand Tartary, but likewiſe to all who trade to China, Perſia, or other eaſtern parts of the world. There is a good map of northern Aſia drawn by M. de l'Iſle, accompanying the work; which M. Petis de la Croix, the author's ſon, not only reviſed, but, to render it more curious, added to it an abridgement of the lives of all thoſe authors from whom it was extracted. It was tranſlated into Engliſh, and publiſhed at London, 1722, 8vo.

CROMARTY, the capital of the ſhire of Cromarty, in Scotland, with an excellent and ſafe harbour capable of containing the greateſt fleets. W. Long. 3. 40. N. Lat. 57. 54.

CROMLECH, in Britiſh antiquities, are huge, broad, flat ſtones, raiſed upon other ſtones ſet up on end for that purpoſe. They are common in ANGLESY; under which article a very large one is deſcribed. See Plate CL.

Theſe monuments are ſpoken of largely by Mr Rowland, by Dr Borlaſe, and by Wormius, under the name of *Ara* or altar. Mr Rowland, however, is divided in his opinion: for he partly inclines to the notion of their having been altars, partly to their having been ſepulchres; he ſuppoſes them to have been originally tombs, but that in after times ſacrifices were performed upon them to the heroes depoſited within. Mr Keiller preſerves an account of King Harold having been interred beneath a tomb of this kind in Denmark, and Mr Wright diſcovered in Ireland a ſkeleton depoſited under one of them. The great ſimilarity of the monuments throughout the north, Mr Pennant obſerves, evinces the ſame religion to have been ſpread in every part, perhaps with ſome ſlight deviations. Many of theſe monuments are both Britiſh and Daniſh; for we find them where the Danes never penetrated.

The cromlech, or cromleh, chiefly differs from the KIST-*vaen*, in not being cloſed up at the end and ſides, that is, in not ſo much partaking of the cheſt-like figure; it is alſo generally of larger dimenſions, and ſometimes conſiſts of a greater number of ſtones: the terms *cromleh* and *kiſt-vaen* are however indiſcriminately uſed for the ſame monument. The term *cromlech* is by ſome derived from the Armoric word *crum*, "crooked or bowing," and *leh* "ſtone," alluding to the reverence which perſons paid to them by bowing. Rowland derives it from the Hebrew words *carem-luach*, ſignifying a devoted or conſecrated ſtone." They are called by the vulgar *coetne Arthor*, or *Arthur's quoits*, it being a cuſtom in Wales as well as Cornwal to aſcribe all great or wonderful objects to prince Arthur, the hero of thoſe countries.

CROMWELL (Thomas), earl of Eſſex, was the ſon of a blackſmith at Putney, and born in 1498. Without a liberal education, but endowed with a ſtrong natural genius, he conſidered travelling as a proper means of improving his underſtanding; and to this early token of his ſound judgment he ſtood indebted for the high rank and diſtinguiſhed honours he afterwards enjoyed. He became by degrees the confidential favourite and prime miniſter of Henry VIII.; and from the moment he acquired any authority in the cabinet, he employed it in promoting the reformation, to his zeal for which he became a victim; for, the more firmly to ſecure the Proteſtant cauſe, he contrived to marry the king to Ann of Cleves, whoſe friends were all Lutherans. Unfortunately Henry took a diſguſt to this lady, which brought on Cromwell's ruin: the king, with his uſual cruelty and caprice, taking this opportunity to ſacrifice this miniſter to the Roman Catholic party, to whom he ſeemed deſirous of reconciling himſelf as ſoon as he had Catharine Howard in view. Cromwell was a great politician, and a good man; but, like moſt ſtateſmen, was guilty of great errors. In his zeal for the new religion, he had introduced the unjuſtifiable mode of attainder in caſes of treaſon and hereſy; and his enemies, who were numerous (conſiſting of two claſſes, the ancient nobility and gentry, who were enraged to ſee the higheſt honours beſtowed on a man of his mean extraction, and the Roman Catholics, who deteſted him) having preferred many complaints againſt him, availed themſelves of his own law. He was attainted of treaſon and hereſy, convicted unheard, and beheaded in 1540. He was the chief inſtrument of the ſuppreſſion of the abbeys and monaſteries, and of the deſtruction of images and relics; to him alſo we are indebted for the inſtitution of pariſh regiſters of births, marriages, and burials.

CROMWELL (Oliver), ſtyled *Lord Protector* of the commonwealth of England, one of the moſt extraordinary perſonages mentioned in hiſtory, was the ſon of Mr Robert Cromwell of Hinchinbrooke in the county of Huntingdon. His anceſtors were of very honourable extraction: but no ways related to Thomas Cromwell earl of Eſſex, the prime miniſter and favourite of Henry VIII. He was born in the pariſh of St John, Huntingdon, where his father moſtly lived, on the 24th or 25th of April 1599, and educated at the free-ſchool of that town. Little is known concerning him in his younger years, or indeed concerning his behaviour in private life. It is, however, related by authors of unſuſpected veracity, that when at ſchool he gave many ſigns of a very turbulent and reſtleſs diſpoſition. He is alſo ſaid from his early years to have been ſubject to the hypochondriac diſorder, and to many deceptions of the imagination. He had a very remarkable one while at ſchool. It happened in the day time, when he was lying melancholy upon his back in bed. A ſpectre, as he thought, approached him, and told him that he ſhould be the greateſt man in the kingdom. His father, being informed of this, was very angry, and deſired his maſter to correct him ſeverely. This, however, produced no effect. Oliver perſiſted in the truth of his ſtory and would ſometimes mention it, though his uncle told him that it was too traiterous to be repeated."—From this ſchool Oliver was removed to Sidney-college in Cambridge, where he was admitted in 1616. His progreſs in his ſtudies is uncertain; but he ſpent much time in playing at foot-ball, cricket, and other robuſt exerciſes, at which he was very expert. His father dying after he had been about two years at college, Cromwell returned home; but the irregularity of his life, gave ſuch offence to his mother, that, by the advice of ſome friends, ſhe ſent him to London, and placed him in Lincoln's-inn. This expedient by no means anſwered the purpoſe; her ſon gave himſelf up to gaming, wine, and women, ſo that he quickly diſſipated all that was left him by his father. This diſſipation, however, could be but of very ſhort continuance; for he was married before he was 21 years of age, to Elizabeth daughter of Sir James Bouchier of Eſſex. Soon after his marriage he returned to the country, where he led a very grave and ſober life. This ſudden reformation has been aſcribed to his falling in with the Puritans; but it is certain, that Mr Cromwell continued then, and for ſome time after, a zealous member of the church of England, and formed a cloſe friendſhip with ſeveral eminent divines. He continued at Huntingdon where he ſettled after his marriage, till an eſtate of between L. 400 and L. 500 *per annum* devolved to him by the death of his uncle Sir Thomas Stuart. This induced him to remove to the iſle of Ely where the eſtate lay, and here he embraced the puritanical doctrines. He was elected a member of the third parliament of Charles I. which met on the 20th of January 1628; and was a member of the committee for religion, where he diſtinguiſhed himſelf by his zeal againſt popery. After the diſſolution of that parliament, he returned again into the country, where he continued to expreſs much concern for religion, to keep company with ſilenced miniſters, and to invite them often to lectures and ſermons at his houſe. Thus he brought his affairs again into a very indifferent ſituation; ſo that, by way of repairing the breaches he made in his fortune, he took a farm at St Ives, which he kept five years. But this ſcheme ſucceeded ſo ill, that he was obliged to give it up; and at laſt, chagrined with his diſappointments, and made uneaſy by the treatment his party at that time received, he formed a deſign of going over to New-England. In this, however, he was diſappointed; the king iſſued out a proclamation againſt all ſuch emigrations, and Cromwell was obliged to remain in England againſt his will.

In 1638, Cromwell had firſt an opportunity of getting himſelf publicly taken notice of. The earl of Bedford, and ſome other perſons of high rank, who had eſtates in the fen country, were very deſirous of having it better drained; and though one project of this ſort had failed, they ſet on foot another, got it countenanced by royal authority, and ſettled a part of the profits upon the crown. This, though really intended for a public benefit, was oppoſed as injurious to private property: and at the head of the oppoſers was Mr Oliver Cromwell, who had conſiderable influence in theſe parts. The vigour he ſhowed on this occaſion recommended him to his friend and relation Mr Hampden; who afterwards characterized him in parliament, as a perſon capable of contriving and conducting great deſigns. But for all this he was not very ſucceſsful in his oppoſition; and as his private affairs were ſtill declining, he was in very neceſſitous circumſtances at the approach of the long parliament. In this critical ſituation he got himſelf elected member of parliament, in the following manner. In the puritanical meetings which he conſtantly frequented, Oliver had moſt eminently diſtinguiſhed himſelf by his *gifts* of praying, preaching, and expounding. At one of theſe meetings, he met with one Richard Tims, a tradeſman of Cambridge. This man was ſo much taken with Oliver, that he took it into his head to attempt getting him choſen burgeſs for the approaching parliament. Being himſelf one of the common-council, Tims imagined this deſign might be brought about; and with this view went to Mr Wildbore a relation of Cromwell's, to whom he communicated his intention. Wildbore agreed as to the fitneſs of the perſon; but told him the deſign was impracticable, becauſe Oliver was not a freeman. Tims next addreſſed one Evett on the ſame ſubject, who alſo made the ſame objection. He recollected, however, that the mayor had a freedom to beſtow, and a ſcheme was immediately laid for ſecuring this freedom to Cromwell. On application to the mayor, however, he told them that the freedom was already diſpoſed of to another; but this objection being obviated by promiſing that perſon a freedom from the town, the mayor being informed that Cromwell was a man of great fortune, ſignified his intention of beſtowing the freedom upon him. Our hero, being informed of the good offices of his friends, made his appearance in the court dreſſed in ſcarlet richly laced with gold, and having provided plenty of claret and ſweatmeats, they were ſo freely circulated among the corporation, that Mr Mayor's freeman was unanimouſly declared to be a very civil worthy gentleman. When the election came on, the mayor diſcovered his miſtake, but it was now too late; the party among the burgeſſes was ſtrong enough to chooſe him, and accordingly did ſo at the election next year.

When Cromwell firſt came into parliament, he affected great plainneſs, and even careleſſneſs, in his dreſs. His attention to farming had entirely ruſticated him, ſo that he made a very uncouth appearance. "Who (ſays Dr South) that had beheld ſuch a bankrupt, beggarly fellow, as Cromwell, firſt entering the parliament houſe, with a thread-bare torn coat and greaſy hat, and perhaps neither of them paid for, could have ſuſpected, that, in the ſpace of ſo few years, he ſhould, by the murder of one king, and the baniſhment of another, aſcend the throne, be inveſted with the royal robes, and want nothing of the ſtate of a king but the changing his hat into a crown?" Cromwell was very active in promoting the famous *Remonſtrance**; which in reality laid the foundation of the civil war. He declared afterwards to Lord Falkland, that if the remonſtrance had not been carried, he deſigned to have converted the ſmall remains of his eſtate into ready money the next day, and to have left the kingdom by the firſt opportunity. His firmneſs on this occaſion ſo effectually recommended him to Hampden, Pym, and the other leaders of the popular party, that they took him into all their councils; and here he acquired that clear inſight into things, and that knowledge of men, of which he afterwards made ſuch prodigious uſe. His exploits during the civil war, his murder of the king, and uſurpation of the kingdom, are related under the article BRITAIN, n° 139—188.

With regard to the character of Cromwell, Mr Hume expreſſes himſelf as follows: "The writers attached to this wonderful perſon make his character, with regard to abilities, bear the air of the moſt extravagant panegyric: his enemies form ſuch a repreſentation of his moral qualities as reſembles the moſt virulent invective. Both of them, it muſt be confeſſed, are ſupported by ſuch ſtriking circumſtances in his fortune and conduct, as beſtow on their repreſentation a great air of probability. 'What can be more extraordinary (it is ſaid), than that a perſon of private birth and education, no fortune, no eminent qualities of body, which have ſometimes, nor ſhining qualities of mind, which have often, raiſed men to the higheſt dignities, ſhould have the courage to attempt, and the abilities to execute, ſo great a deſign as the ſubverting one of the moſt ancient as well as beſt eſtabliſhed monarchies in the world? That he ſhould have the power and boldneſs to put his prince and maſter to an open and infamous death? ſhould baniſh that numerous and ſtrongly allied family? Cover all theſe temerities under a ſeeming obedience to a parliament, in whoſe ſervice he pretended to be retained? Trample too upon that parliament in their turn, and ſcornfully expel them as ſoon as they gave him ground of diſſatisfaction? Erect in their place the dominion of the ſaints, and give reality to the moſt viſionary idea which the heated imagination of any fanatic was ever able to entertain? Suppreſs again that monſter in its infancy, and openly ſet himſelf up above all things that ever were called *ſovereign* in England? Overcome firſt all his enemies by arms, and all his friends afterwards by artifice? Serve all parties patiently for a while, and afterwards command them victoriouſly at laſt? Over-run each corner of the three nations, and ſubdue with equal facility both the riches of the ſouth, and the poverty of the north? Be feared and courted by all princes, and adopted a brother to the gods of the earth? Call together parliaments with a word of his pen, and ſcatter them again by the breath of his mouth? Reduce to ſubjection a warlike and diſcontented nation by means of a mutinous army? Command a mutinous army by means of ſeditious and factious officers? Be humbly and daily petitioned, that he would be pleaſed, at the rate of millions a-year, to be hired as maſter of thoſe who had formerly hired him for their ſervant? Have the eſtates and lives of three nations as much at his diſpoſal as was once the little inheritance of his father, and be as noble and liberal in the ſpending of them? And, laſtly, (for there is no end of enumerating every particular of his glory), with one word bequeath all this power and ſplendor to his poſterity? Die poſſeſſed of peace at home, and triumph abroad? Be buried among kings, and with more than regal ſolemnity? And leave a name behind him not to be extinguiſhed but with the whole world; which, as it was too little for his praiſe, ſo it might have been for his conqueſts, if the ſhort line of his mortal life could have ſtretched out to the extent of his immortal deſigns?'

"My intention is not to diſfigure this picture drawn by ſo maſterly a hand: I ſhall only endeavour to remove from it ſomewhat of the marvellous: a circumſtance which, on all occaſions, gives much ground for doubt and ſuſpicion. It ſeems to me that the circumſtance of Cromwell's life in which his abilities are principally diſcovered, is his riſing, from a private ſtation, in oppoſition to ſo many rivals, ſo much advanced before him, to a high command and authority in the army. His great courage, his ſignal military talents, his eminent dexterity and addreſs, were all requiſite for this important acquiſition. Yet will not this promotion appear the effect of ſupernatural abilities, when we conſider that Fairfax himſelf, a private gentleman, who had not the advantage of a ſeat in parliament, had, through the ſame ſteps, attained even to a ſuperior rank; and, if endued with common capacity and penetration, had been able to retain it. To incite ſuch an army to rebellion againſt the parliament, required no uncommon art or induſtry: to have kept them in obedience had been the more difficult enterprize. When the breach was once formed between the military and civil powers, a ſupreme and abſolute authority, from that moment, is devolved on

* See *Britain*, n°107.

the general; and if he is afterwards pleaſed to employ artifice or policy, it may be regarded on moſt occaſions as great condeſcenſion, if not as ſuperfluous caution. That Cromwell was ever able really to blind or over-reach either the king or the republicans, does not appear: as they poſſeſſed no means of reſiſting the force under his command, they were glad to temporize with him; and, by ſeeming to be deceived, to wait for an opportunity of freeing themſelves from his dominion. If he ſeduced the military fanatics, it is to be conſidered, that their intereſt and his evidently concurred, that their ignorance and low education expoſed them to the groſſeſt impoſition; and that he himſelf was at bottom as frantic an enthuſiaſt as the worſt of them; and, in order to obtain their confidence, needed but to diſplay thoſe vulgar and ridiculous habits which he had early acquired, and on which he ſet ſo high a value. An army is ſo forcible, and at the ſame time ſo coarſe a weapon, that any hand which wields it, may, without much dexterity, perform any operation, and attain any aſcendant in human ſociety.

“The domeſtic adminiſtration of Cromwell, though it diſcovers great ability, was conducted without any plan either of liberty or arbitrary power: perhaps his difficult ſituation admitted of neither. His foreign enterpriſes, though full of intrepidity, were pernicious to the national intereſt; and ſeem more the reſult of impetuous fury or narrow prejudices, than of cool foreſight and deliberation. An eminent perſonage, however, he was in many reſpects, and even a ſuperior genius; but unequal and irregular in his operations: and, though not defective in any talent except that of elocution, the abilities which in him were moſt admirable, and which contributed moſt to his marvellous ſucceſs, were the magnanimous reſolution of his enterprizes, and his peculiar dexterity in diſcovering the characters and practiſing on the weakneſſes of mankind.

“If we ſurvey the moral character of Cromwell, with that indulgence which is due to the blindneſs and infirmities of the human ſpecies, we ſhall not be inclined to load his memory with ſuch violent reproaches as thoſe which his enemies uſually throw upon it. Amidſt the paſſions and prejudices of that time, that he ſhould prefer the parliamentary to the royal cauſe, will not appear extraordinary; ſince even at preſent many men of ſenſe and knowledge are diſpoſed to think, that the queſtion, with regard to the juſtice of the quarrel, may be regarded as doubtful and ambiguous. The murder of the king, the moſt atrocious of all his actions, was to him covered under a mighty cloud of republican and fanatical illuſions; and it is not impoſſible but he might believe it, as many others did, the moſt meritorious action which he could perform. His ſubſequent uſurpation was the effect of neceſſity, as well as of ambition; nor is it eaſy to ſee how the various factions could at that time have been reſtrained without a mixture of military and arbitrary authority. The private deportment of Cromwell as a ſon, a huſband, a father, a friend, is expoſed to no conſiderable cenſure, if it does not rather merit praiſe. And, upon the whole, his character does not appear more extraordinary and unuſual by the mixture of ſo much abſurdity with ſo much penetration, than by his tempering ſuch violent ambition and ſuch enraged fanaticiſm with ſo much regard to juſtice and humanity.”

That Cromwell continued a moſt complete and bigotted enthuſiaſt to the very laſt, appears from his behaviour in his laſt ſickneſs. His diſeaſe, which at firſt was a kind of ſlow fever, brought on by the cares and anxiety of his mind, ſoon degenerated into a tertian ague. For about a week the diſorder continued without any dangerous ſymptoms, inſomuch that every other day he walked abroad; but one day after dinner his five phyſicians coming to wait upon him, one of them having felt his pulſe, ſaid that it intermitted. At this Cromwell was ſurpriſed, turned pale, fell into a cold ſweat, and, when he was almoſt fainting, ordered himſelf to be carried to bed; where, by the aſſiſtance of cordials, being brought a little to himſelf, he made his will with reſpect to his private affairs. The next morning when one of his phyſicians came to viſit him, Cromwell aſked him, why he looked ſo ſad? and when anſwer was made, that ſo it became every one who had the weighty charge of his life and health upon him, “Ye phyſicians (ſays Cromwell), think I ſhall die: I tell you I ſhall not die this bout, I am ſure of it. Do not you think (ſaid he to the phyſician, looking more attentively at him), do not think that I am mad: I ſpeak the words of truth upon ſurer grounds than your Hippocrates or Galen can furniſh you with. God Almighty himſelf hath given that anſwer, not to my prayers alone, but alſo to the prayers of thoſe who entertain a ſtricter commerce and greater intereſt with him. Go on chearfully, baniſhing all ſadneſs from your looks; and deal with me as you would do with a ſerving man. Ye may have a ſkill in the nature of things; yet nature can do more than all phyſicians put together, and God is far more above nature.” As this phyſician was coming out of the chamber, he accidentally met with another, to whom he expreſſed his fear that the protector was turning light-headed. But the other informed him that the chaplains, being diſperſed the preceding night into different parts of the houſe, had prayed for the protector's recovery, and unanimouſly received for anſwer that he ſhould recover. Nay, to ſuch a degree of madneſs did they at laſt arrive, that, a public faſt being kept at Hampton-court, they did not ſo much pray to God for the protector's health, as return thanks for the undoubted pledges they had of his recovery. On this account, though the phyſicians perceived his diſtemper increaſing every hour, they took no notice of his danger, till it became neceſſary for him to appoint a ſucceſſor while he had any breath remaining. But being then in a lethargic fit, he anſwered from the purpoſe; upon which he was again aſked whether he did not name his eldeſt ſon Richard? and to this queſtion he anſwered. Yes. Being then aſked where his will was which he had formerly made concerning the heirs of the kingdom; he ſent to look for it in his cloſet and other places, but in vain; for ſomebody had either ſtole it, or he himſelf had burnt it. Soon after, he expired, on the 3d of September 1658, aged ſomewhat more than 59 years and four months. This day of September he had always reckoned to be the moſt fortunate for him in the whole year. A violent tempeſt, which immediately ſucceeded his death, ſerved as a ſubject of diſcourſe to the vulgar. His partizans, as well as his opponents, were fond of remarking this event: and each of them endeavoured, by forced inferences, to interpret it as beſt ſuited their particular prejudices.

It has been imagined by ſome, that Oliver Cromwell was poiſoned; but for this there ſeems to be no reaſonable foundation. His body was opened by Dr Bates. He found the brain ſomewhat overcharged with blood, and the lungs a little inflamed; but what he reckoned to have been the principal cauſe of his diſorder was a total degeneracy of the ſubſtance of the ſpleen into a matter reſembling the lees of oil. This, he thought, alſo accounted for the hypochondriac diſpoſitions to which Cromwell had from his infancy been ſubject. Though the bowels were taken out, and the body filled with ſpices wrapped in a fourfold cere-cloth, put firſt into a coffin of lead, and then into one of wood, yet the corruption was ſo great that the humour wrought itſelf through the whole, and there was a neceſſity of interring the body before the ſolemnity of the funeral. A very pompous funeral was ordered at the public expence, and performed from Somerſet-houſe, with a ſplendor not only equal but ſuperior to that beſtowed upon crowned heads. Some have related that his body was depoſited in Naſeby-field: others, that it was wrapped in lead, and ſunk in the deepeſt part of the Thames, to prevent any inſult that might afterwards be offered to it. But it ſeems beyond doubt that his body was interred at Weſtminſter; as we are informed, that on the order to diſinter him after the reſtoration, his corpſe was found in a vault in the middle aiſle of Henry VII.'s chapel. In the inſide of the coffin, and on the breaſt of the corpſe, was laid a copper plate finely gilt, incloſed in a thin caſe of lead. On one ſide of this plate were engraven the arms of England impaled with thoſe of Oliver, and on the reverſe the following legend: *Oliverius Protector Reipublicæ Angliæ, Scotiæ, et Hiberniæ, natus* 25 *Aprilis* 1599, *inauguratus* 16 *Decembris* 1653, *mortuus* 3 *Septembris ann.* 1658, *hic ſitus eſt.*

Cromwell was of a robuſt frame of body, and of a manly, though not agreeable aſpect. His noſe being remarkably red and ſhining, was often made the ſubject of ridicule. He left only two ſons, Richard and Henry; and three daughters; one married to General Fleetwood, another to Lord Fauconberg, and a third to Lord Rich. His mother lived till after he was protector; and contrary to her orders he buried her with great pomp in Weſtminſter Abbey. She could not be perſuaded that ever his power or his perſon was in ſafety. At every noiſe ſhe heard ſhe would exclaim that her ſon was murdered; and was never ſatisfied that he was alive if ſhe did not receive frequent viſits from him. She was a decent woman; and by her frugality and induſtry had raiſed and educated a numerous family upon a ſmall fortune. She had even been obliged to ſet up a brewery at Huntingdon, which ſhe managed to good advantage. Hence Cromwell, in the invectives of that age, is often ſtigmatized with the name of brewer. Ludlow, by way of inſult, mentions the great acceſſion which he would receive to his royal revenues upon his mother's death, who poſſeſſed a jointure of 60 pounds a-year upon his eſtate. She was of a good family, of the name of Stuart; and is by ſome ſuppoſed to have been remotely allied to the royal family.

CROMWELL (Richard), eldeſt ſon of Oliver Cromwell, was by his father appointed ſucceſſor to the protectorſhip, but very ſoon depoſed by the army *. They diſcharged his debts, took all the houſehold ſtuff, plate, &c. gave him a protection for ſix months, and ſo he retired. He was by no means qualified to ſupport the ſtation gained by the aſpiring talents of his father. He was of a moderate temper, and untainted with that fanatical ſpirit which his father had ſo ſucceſsfully cultivated. On the reſtoration he went abroad; but returned in 1680 under the aſſumed name of Clark, and ſettled at Cheſhunt in Hertfordſhire, where he lived privately, and died in 1712, aged 86.

CRONENBURG, a town of Germany, in the circle of the upper Rhine, and in the landgravate of Heſſe Caſſel, with a ſtrong caſtle. It is ſeated at the foot of a high mountain, on a fertile ſoil, and is ſurrounded with a double wall. E. Long. 8. 15. N. Lat. 50. 15.

CRONENBURG, a ſtrong fortreſs of Denmark, in the iſle of Zealand, at the entrance of the Sound, where the Danes take toll of ſuch ſhips as are bound for the Baltic. It was very richly furniſhed, but pillaged by the Swedes in 1658, who took away the furniture, among which were ſome ſtatues of maſſy ſilver. It is built upon piles. E. Long. 12. 50. N. Lat. 56. 0.

CRONIUS, in chronology, the ancient name of the Athenian month Hecatombæon; which was the firſt of their year, and anſwered to the latter part of our June and beginning of July.—There were feaſts called *Cronienes* celebrated at Athens in this month, in honour of Saturn, anſwering to the Saturnalia of the Romans.

CRONSLOT. See CRONSTADT.

CRONSTADT, a ſea port town of Ruſſia, where the greateſt part of the navy is ſituated. It ſtands upon the iſland of Retuſari, in the Gulf of Finland; and was founded by Peter I. as being provided with the ſafeſt harbour in theſe parts, and as forming a ſtrong bulwark by ſea for the defence of the new metropolis. The only paſſage by which ſhips of burden can approach Peterſburg lies on the ſouth ſide of Retuſari, through a narrow channel; one ſide whereof is commanded by Cronſtadt, and the oppoſite by Cronſlot and the citadel. Cronſlot, which ſtands upon a ſmall iſland of ſand, is a circular wooden building, and ſurrounded with fortifications of wood that jut into the water. It contains a garriſon of 100 men. The citadel is another ſmall wooden fortreſs, conſtructed alſo upon an adjacent ſand-bank, and capable of holding about 30 ſoldiers. All large veſſels muſt ſail between Cronſtadt and theſe two fortreſſes expoſed to the fire of the oppoſite batteries; for the other parts of the gulf are only from one to eleven feet in depth. All theſe fortifications were, at the time of their conſtruction, eſteemed places of conſiderable ſtrength; but now they derive their conſequence more from their paſt importance than from any reſiſtance they could make againſt the attack of a powerful fleet.

Cronſtadt is built upon the ſouth-eaſtern extremity of the iſland, and is defended towards the ſea by wooden piers projecting into the water, and towards the land by ramparts and baſtions. It is a very ſtraggling place; and occupies, like all the Ruſſian towns, a larger ſpace of ground than the number of habitations,

---

* See *Britain*, n° 189, 190.

tions ſeem to require; the houſes are moſtly of wood, excepting a few fronting the harbour, which are of brick ſtuccoed white. Among the latter are the imperial hoſpital for ſailors, the barracks, and the academy for marines and officers of the navy. That ſeminary uſually contains between three and four hundred cadets, who are clothed, maintained, and taught at the expence of the crown. They are admitted at the age of five, and are ſuffered to remain until they reach their ſeventeenth year. They learn accounts, mathematics, drawing, fortification, and navigation; and have maſters in the French, German, Engliſh, and Swediſh languages. They are trained to naval affairs, and make an annual cruiſe in the Baltic as far as Revel.—Cronſtadt has a ſeparate haven appropriated to the men of war, and another to merchant ſhips. Cloſe to the haven for merchant ſhips is a canal and ſeveral dry docks, begun in 1719 by Peter I. for the purpoſe of refitting the men of war. This uſeful work was neglected under his ſucceſſors, and was not completed until the reign of his daughter Elizabeth. It has been ſtill further beautified and improved by the preſent empreſs; and is now applied for building as well as careening ſhips of the line. At the extremity of theſe docks is a great reſervoir, 568 feet in length, which contains water ſufficient, and half the quantity over, to ſupply all the docks; which is pumped into it by means of a fire engine, the diameter of whoſe cylinder is ſix feet. The length of this work, from the beginning of the canal to the end of the laſt dock, is 4221 feet. The ſides of the docks are faced with ſtone, and the bottom is paved with granite. They are 40 feet deep and 150 broad; and are capable of containing nine men of war upon the ſtocks.

CRONSTAT, a town of Tranſylvania, near the frontiers of Moldavia, ſubject to the houſe of Auſtria. E. Long. 25. 0. N. Lat. 47. 0.

CROP, the higheſt part or end of any thing cut off. It is particularly uſed for the corn gathered off a field in harveſt. See AGRICULTURE, Part II.

CROSIER, or CROZIER, a ſhepherd's crook; a ſymbol of paſtoral authority, conſiſting of a gold or ſilver ſtaff, crooked at the top, carried occaſionally before biſhops and abbots, and held in the hand when they give the ſolemn benedictions. The cuſtom of bearing a paſtoral ſtaff before biſhops is very ancient, as appears from the life of St Cæſarea of Arles, who lived about the year 500. Among the Greeks none but the patriarchs had a right to the croſier. The corſiers were at firſt no more than ſimple wooden ſtaves in form of a T, uſed to reſt and lean upon. By degrees they were made longer; and at length arrived to the form we now ſee them of. Regular abbots are allowed to officiate with a mitre and croſier.

CROSIER, in aſtronomy, four ſtars in the ſouthern hemiſphere, in the form of a croſs, ſerving thoſe who ſail in ſouth latitudes to find the antarctic pole.

CROSLET, in heraldry, is when a croſs is croſſed again at a ſmall diſtance from each of the ends. Upton ſays it is not ſo often borne by itſelf in arms as other croſſes are, but often in diminutives, that is, in ſmall croſlets ſcattered about the field. See HERALDRY.

CROSS, a gibbet made with two pieces of wood placed croſswiſe, whether they croſs with right angles at the top like a T, or in the middle of their length like an X. The croſs to which our Saviour was faſtened, and on which he died, was of the former kind; being thus repreſented by old monuments, coins, and croſſes; and St Jerom compares it to a bird flying, a man ſwimming, or praying with his arms extended. The puniſhment of the croſs was common among the Syrians, Egyptians, Perſians, Africans, Greeks, Romans, and Jews.

The death of the croſs was the moſt dreadful of all others, both for the ſhame and pain of it; and ſo ſcandalous, that it was inflicted as the laſt mark of deteſtation upon the vileſt of people. It was the puniſhment of robbers and murderers, provided that they were ſlaves too; but otherwiſe, if they were free, and had the privileges of the city of Rome, this was then thought a proſtitution of that honour, and too infamous a puniſhment for ſuch a one, let his crimes be what they would.

The Moſaic law ordained, that the perſons executed ſhould not be left upon the tree after ſun-ſet, becauſe he that is hanged in this manner is accurſed of God. Deut. xxi. 22. The Jews believe, that the ſouls of thoſe who remain upon the gibbet, and without burial, enjoy no peace, and receive no benefit from the prayers of other people; but wander up and down till their bodies are buried: which agrees with the notions that the Greeks and Romans had of this matter, as may be ſeen in *Hom. Il.* 4. and *Virg. Æneid.* 6.

The form of a croſs being ſuch as has been already deſcribed, the body of the criminal was faſtened to the upright piece by nailing the feet to it, and on the other tranſverſe piece generally by nailing the hands on each ſide. Now, becauſe theſe parts of the body, being the inſtruments of action and motion, are provided by nature with a much greater quantity of nerves than others have occaſion for; and becauſe all ſenſation is performed by the ſpirit contained in theſe nerves; it will follow, as Stanhope obſerves, that wherever they abound, the ſenſe of pain muſt needs in proportion be more quick and tender.

The Jews confeſs, that indeed they crucified people in their nation, but deny that they inflicted this puniſhment upon any one alive. They firſt put them to death, and then faſtened them to the croſs either by the hands or neck. But there are indiſputable proofs of their crucifying men frequently alive. The worſhippers of Baal-peor and the king of Ai were hung up alive; as were alſo the deſcendants of Saul, who were put into the hands of the Gibeonites, 2 Sam. xxi. 9.

Before crucifixion the criminal was generally ſcourged with cords: ſometimes little bones, or pieces of bones, were tied to theſe ſcourges, ſo that the condemned perſon might ſuffer more ſeverely. It was alſo a cuſtom, that he who was to be crucified ſhould bear his own croſs to the place of execution. After this manner we find Chriſt was compelled to bear his own croſs; and as he ſunk under the burden, Simon the Cyrenian was conſtrained to bear it after him and with him. But whereas it is generally ſuppoſed that our Lord bore the whole croſs, *i. e.* the long and tranſverſe part both, this ſeems to be a thing impoſſible; and therefore Lipſius (in his treatiſe *De Supplicio Crucis*) has ſet the matter in a true light, when he tells us that

Jeſus only carried the tranſverſe beam; becauſe the long beam, or the body of the croſs, was either fixed in the ground before, or made ready to be ſet up as ſoon as the priſoner came: and from hence he obſerves, that painters are very much miſtaken in their deſcription of our Saviour carrying the whole croſs.

There were ſeveral ways of crucifying; ſometimes the criminal was faſtened with cords to a tree, ſometimes he was crucified with his head downwards. This way St Peter choſe out of reſpect to his maſter Jeſus Chriſt, not thinking himſelf worthy to be crucified like him; though the common way of crucifying was by faſtening the criminal with nails, one through each hand, and one through both feet, or one through each of them: for this was not always performed in the ſame manner; the ancients ſometimes repreſenting Jeſus Chriſt crucified with four nails, and ſometimes with three. The criminal was fixed to the croſs quite naked; and in all probability the Saviour of the world was not uſed with any greater tenderneſs than others upon whom this puniſhment was inflicted. The ſoldiers divided his cloths among them, and caſt lots for his tunic, which is an under garment worn over the fleſh like a ſhirt.

The text of the Goſpel ſhows clearly, that Jeſus Chriſt was faſtened to the croſs with nails; and the Pſalmiſt (xxxii. 17.) had foretold long before, that they ſhould pierce his hands and his feet; but there are great diſputes concerning the number of theſe nails. The Greeks repreſent our Saviour as faſtened to the croſs with four nails; in which particular Gregory of Tours agrees with them, one at each hand and foot. But ſeveral are of opinion, that our Saviour's hands and feet were pierced with three nails only, *viz.* one at each hand, and one through both his feet: and the cuſtom of the Latins is rather for this laſt opinion; for the generality of the old crucifixes made in the Latin church have only three nails. Nonnus thinks that our Saviour's arms were beſides bound faſt to the croſs with chains; and St Hilary ſpeaks of the cords wherewith he was tied to it.

Sometimes they who were faſtened upon the croſs lived a good while in that condition. St Andrew is believed to have continued three days alive upon it. Euſebius ſpeaks of certain martyrs in Egypt who were kept upon the croſs till they were ſtarved to death. Pilate was amazed at Jeſus Chriſt's dying ſo ſoon; becauſe naturally he muſt have lived longer, if it had not been in his power to have laid down his life and to take it up again. The thighs of the two thieves who were crucified together with our Saviour were broken in order to haſten their death, that their bodies might not remain upon the croſs on the Sabbath day (John xix. 31, 32, 33.), and to comply with the law of Moſes, which forbids the bodies to be left there after ſun-ſet. But among other nations they were ſuffered to remain upon the croſs a long time. Sometimes they were devoured alive by birds and beaſts of prey. Guards were appointed to obſerve that none of their friends or relations ſhould take them down and bury them. The ſtory of the Epheſian matron and the ſoldier who was ſet to guard the croſs, is very well known. The Roman ſoldiers who had crucified Jeſus Chriſt and the two thieves continued near the croſſes till the bodies were taken down and buried.

Croſſes were uſually, in former times, erected on the tops of houſes, by which tenants pretended to claim the privileges of the Templars Hoſpitallers, to defend themſelves againſt their rightful lords. This was condemned by the ſtatute Wil. II. c. 37. It was uſual alſo, in thoſe days, to ſet up croſſes in places where the corpſe of any of the nobility reſted as it was carried to be buried, that *a tranſeuntibus pro ejus animo deprecetur.* Croſſes, &c. are forbidden, to be brought into England by 13 Eliz. c. 2. on pain of a *præmunire*, &c.

Invention of the Cross, an ancient feaſt, ſolemnized on the 3d of May, in memory of St Helena's (the mother of Conſtantine) finding the true croſs of Chriſt deep in the ground on mount Calvary; where ſhe erected a church for the preſervation of part of it: the reſt being brought to Rome and repoſited in the church of the Holy Croſs of Jeruſalem.

Theodoret mentions the finding of three croſſes; that of Jeſus Chriſt and thoſe of the two thieves; and that they diſtinguiſhed between them by means of a ſick woman, who was immediately healed by touching the true croſs. The place is ſaid to have been pointed out to her by St Quiriacus, then a Jew, afterwards converted and canonized.

Exaltation of the Cross, an ancient feaſt, held on the 14th of September, in memory of this, that Heraclitus reſtored to mount Calvary the true croſs in 642, which had been carried off 14 years before by Coſroes king of Perſia, upon his taking Jeruſalem from the emperor Phocas.

The adoration of the croſs appears to have been practiſed in the ancient church; inaſmuch as the Heathens, particularly Julian, reproach the primitive Chriſtians with it. And we do not find that their apologiſts diſclaimed the charge. Mornay, indeed, aſſerted, that this had been done by St Cyril, but could not ſupport his allegation at the conference of Fontainbleau. St Helena is ſaid to have reduced the adoration of the croſs to its juſt principle, ſince ſhe adored in the wood, not the wood itſelf, which had been direct idolatry and Heatheniſm, but him who had been nailed to this wood. With ſuch modifications ſome Proteſtants have been induced to admit the adoration of the croſs. John Huſs allowed of the phraſe, provided it were expreſsly added, that the adoration was relative to the perſon of Chriſt. But however Roman Catholics may ſeem to triumph by virtue of ſuch diſtinction and mitigations, it is well known they have no great place in their own practice. Imbert, the good prior of Gaſcony, was ſeverely proſecuted in 1683 for telling the people, that in the ceremony of adoring the croſs, practiſed in that church on Good Friday, they were not to adore the wood, but Chriſt, who was crucified on it. The curate of the pariſh told them the contrary; it was the wood! the wood! they were to adore. Imbert replied, it was Chriſt, not the wood: for which he was cited before the archbiſhop of Bourdeaux, ſuſpended from his functions, and even threatened with chains and perpetual impriſonment. It little availed him to cite the biſhop of Meaux's diſtinction; it was anſwered, that the church allowed it not.

Cross-Bearer (port-croix, cruciger), in the Romiſh church, the chaplain of an archbiſhop or a primate, who bears a croſs before him on ſolemn occaſions.

The pope has the croſs borne before him every where; a patriarch any where out of Rome; and primates, metroplitans, and thoſe who have a right to the pallium, throughout their reſpective juriſdictions.

Gregory XI. forbad all patriarchs and prelates to have it borne in preſence of cardinals. A prelate bears a ſingle croſs, a patriarch a double croſs, and the pope a triple one on their arms.

Cross-Bearers alſo denote certain officers in the inquiſition, who make a vow before the inquiſitors or their vicars to defend the Catholic faith, though with the loſs of fortune and life. Their buſineſs is to provide the inquiſitors with neceſſaries. They were formerly of great uſe: but in proceſs of time ſome of their conſtitutions were changed, and they were called of the penance of St Dominic.

Pectoral Cross, is a croſs of gold or ſilver, or other precious materials, often enriched with diamonds, which the biſhops, archbiſhops, &c. and regular abbeſſes, wear hanging from the neck.

Order of the Cross, or *Croiſade*, an order of ladies inſtituted in 1668 by the empreſs Eleonora de Gonzagua, wife of the emperor Leopold; on occaſion of the miraculous recovery of a little golden croſs, wherein were incloſed two pieces of the true croſs, out of the aſhes of part of the palace. It ſeems the fire had burnt the caſe wherein it was incloſed, and melted the cryſtal, yet the wood remained untouched.

Maids of the Cross, a community of young women inſtituted in 1265 at Roye in Picardy, and ſince diſperſed to Paris and other towns. They inſtruct young perſons of their own ſex. Some take the three vows of poverty, chaſtity, and obedience, others retain their liberty. They are under the direction of a ſuperior.

Cross, in heraldry, is defined by Guillim, an ordinary compoſed of fourfold lines: whereof two are perpendicular, and the other two tranſverſe; for ſo we muſt conceive of them, though they be not drawn throughout, but meet by couples, in four right angles, near the feſſpoint of the eſcutcheon. See Heraldry.

This bearing was firſt beſtowed on ſuch as had performed, or at leaſt undertaken, ſome ſervice for Chriſt, and the Chriſtian profeſſion; and is held by divers the moſt honourable charge in all heraldry. What brought it into ſuch frequent uſe, was the ancient expeditions into the Holy Land; and the holy war pilgrims, after their pilgrimage, taking the croſs for their cognizance; and the enſign of that war being the croſs. In thoſe wars, ſays Mackenzy, the Scots carried St Andrew's croſs; the French a croſs argent; the Engliſh a croſs or; the Germans, ſable; the Italians, azure; the Spaniards, gules.

St George's Cross, or the red croſs, in a field argent, is now the ſtandard of England, that ſaint being the reputed patron of that nation.

Nor is it only in croſſes that the variety is ſo great; the like is found in many other bearings, and particularly in lions, and the parts of them; whereof Colombier gives us no leſs than 96 varieties. Leigh mentions but 46 ſeveral croſſes; Sylvanus Morgan, 26; Upton, 30; Johannes de Bado Aureo, 12; and ſo others, whom it is needleſs to mention. Upton owns he dares not preſume to aſcertain all the various croſſes uſed in arms, for that they are at preſent almoſt innumerable; and therefore he only takes notice of ſuch as he had ſeen uſed in his own time.

Cross, in mining, two nicks cut in the ſuperficies of the earth, thus +, which the miners make when they take the ground to dig for ore. This croſs gives the miners three days liberty to make and to ſet on ſtones. As many of theſe croſſes as the miner makes, ſo many mears of ground he may have in the vein, provided he ſet on ſtones within three days after making his croſs or croſſes. But if he make but one croſs, and a ſtander-by makes the ſecond, and a ſtranger makes the third, every one is ſerved with the next mear, according as they have firſt or laſt, ſooner or later, made their croſs or croſſes upon the ground.

Cross, in coins, a name given to the right ſide or face, the other being called the *pile* or *reverſe*. It has been a common error, that the reverſe was meant by the croſs; becauſe at this time in Britain, it is marked with figures diſpoſed in that form; but the ſtamping the head of the prince in Britain on the right ſide of the coin, was preceded by a general cuſtom of ſtriking on that part the figure of a croſs; while the other, called the *pile*, contained the arms, or ſome other device.

Cross, inſtead of a ſignature to a deed, &c. is derived from the Saxon practice of affixing the ſign of the croſs, whether they could write or not.

Cross-Bar Shot, a bullet with an iron bar paſſing through it, and ſtanding ſix or eight inches out at both ſides. It is uſed at ſea for deſtroying the enemy's rigging.

Cross-Bill, in ornithology. See Loxia.

Cross-Bill, in chancery, is an original bill, by which the defendant prays relief againſt the plaintiff.

Cross-Bows. See Bows and Archery.

Cross-grained Stuff, in joinery. Wood is ſaid to be croſs-grained, when a bough or branch has ſhot out of it; for the grain of the branch ſhooting forward, runs athwart that of the trunk.

In wood well grown this defect is ſcarce perceivable, except in working; but in deal-boards theſe boughs make knots. If the bough grew up with the young trunk, inſtead of a knot is found a curling in the ſtuff, very ſenſible under the plane.

Cross-Jack, pronounced *cro-jeck*, a ſail extended on the lower yard of the mizen-maſt, which is hence called the *croſs-jack yard*. This ſail, however, has generally been found of little ſervice, and is therefore very ſeldom uſed.

Cross-Piece, a rail of timber extended over the windlaſs of a merchant-ſhip from the knight-heads to the belfry. It is ſtuck full of wooden pins, which are uſed to faſten the running rigging as occaſion requires. See Windlass.

Cross-Tining, in huſbandry, a method of harrowing land, conſiſting in drawing the harrow up the interval it went down before, and down that which it was drawn up.

Cross-Trees, certain pieces of timber, ſupported by the cheeks and treſtle-trees, at the upper ends of the lower maſts, athwart which they are laid to ſuſtain the frame of the top.

Cross-Tree Yard, is a yard ſtanding ſquare, juſt under the mizen-top, and to it the mizen-top is faſtened below. See *Cross-Jack*.

Cross-Wort, in botany. See Valentia.

Ordeal of the Cross, a ſpecies of trial frequently practiſed in the days of ſuperſtition. See Ordeal.

CROSS, an Engliſh artiſt, famous only for copying, in the reigns of Charles I. and Charles II. Of this talent there is a ſtory current, more to the credit of his ſkill than of his probity. He is ſaid to have been employed by Charles I. to copy the celebrated Madona of Raphael in St Mark's church at Venice; and that, having obtained leave of the ſtate for that purpoſe, he executed his piece ſo well as to bring away the original and leave his copy in the place of it. The deception was not detected until it was too late to recover the loſs; and this piece was bought in Oliver's time by the Spaniſh ambaſſador for his maſter, who placed it in the Eſcurial.

CROSSEN, a handſome town of Sileſia in Germany, and capital of a principality of the ſame name. It is ſituated at the confluence of the rivers Bobar and Oder, in a fertile country abounding in wine and fruits. There is a bridge over the Oder which is fortified. E. Long. 15. 20. N. Lat. 52. 5.

CROSSOSTYLUS, in botany: A genus of the polyandria order belonging to the monadelphia claſs of plants. The calyx is a quadrangular, quadrifid, turbinated perianthium: the corolla conſiſts of four elliptical petals; the ſtamina are 20 filiform filaments, almoſt the length of the calyx; the antheræ ſmall and roundiſh; the pericarpium an hemiſpherical, unilocular berry, with many ſtriæ on its upper part; the ſeeds numerous and roundiſh.

CROTALARIA, RATTLE-WORT: A genus of the decandria order, belonging to the diadelphia claſs of plants; and in the natural method ranking under the 32d order, *Papilionaceæ*. The legumen is turgid, inflated, and pedicellated; the filaments are coalited with a fiſſure on the back. There are 11 ſpecies, all of them natives of warm climates. They riſe from 18 inches to 5 feet in height, and are adorned with flowers of a blue or yellow colour. The moſt remarkable ſpecies is the retuſa, with ſimple oblong wedged leaves. It is a native of the iſland of Ceylon and ſome other parts of the Eaſt Indies. The flowers are yellow, the pods ſmooth, cylindrical, inflated, and placed horizontally: they are filled with ſeeds, which, when dried, and ſhaken by the ſlighteſt wind, emit a rattling noiſe: and this, by the rude inhabitants of the countries where the plant is native, is attributed to the devil, who is thought to deliver his oracles in this whimſical manner.

CROTALO, an inſtrument of military muſic, like that deſcribed in the next article. The Turks are the firſt, among the moderns, who introduced the uſe of it for their troops. It is now common in Flanders and Florence, and other territories on the continent. It has only one tone; but its effect in marking time may be diſtinctly heard through the noiſe of forty drums. This is the ſame inſtrument with the ancient cymbalum.

CROTALUM, an ancient kind of caſtagnetta, or muſical inſtrument, found on medals, in the hands of the prieſts of Cybele. The crotalum differed from the ſiſtrum; though authors frequently confound the two. It conſiſted of two little braſs plates or rods, which were ſhaken in the hand, and in ſtriking againſt each other made a noiſe.

It was ſometimes alſo made of a reed ſplit lengthwiſe; one part whereof they ſtruck againſt the other; and as this made a noiſe ſomewhat like that of a crane's bill, they called that bird *crotaliſtria*, a player on the crotala; and Ariſtophanes calls a great talker a *crotalum*.

Clemens Alexandrinus attributes the invention to the Sicilians; and forbids the uſe thereof to the Chriſtains, becauſe of the indecent motions and geſtures that accompany it.

Plate CXLIX.

CROTALUS, or RATTLE-SNAKE, in zoology, a genus belonging to the order of amphibia ſerpentes; the characters of which are theſe: the belly is furniſhed with ſcuta, and the tail has both ſcuta and ſcales; but the principal characteriſtic of this genus is the rattle at the end of the tail. The rattles conſiſt of ſeveral articulated cruſtaceous, or rather horny, bags, which make a conſiderable rattling noiſe when the creature moves, and ſerves to warn people of their approach. There are five ſpecies; and the bite of every one of them is ſo highly poiſonous, that it generally kills in a ſhort time. Of theſe we have no account that can be depended upon, except that given by Mr Cateſby of the horridus, or American rattle-ſnake. This grows ſometimes to the length of 8 feet, and weighs between 8 and 9 pounds. The colour of the head is brown; the eye red; the upper part of the body of a yellowiſh-brown colour, tranſverſely marked with irregular broad black liſts. The rattle is of a brown colour, compoſed of ſeveral horny, membranous, cells, of an undulated pyramidal figure. Theſe are articulated within one another in ſuch a manner that the point of the firſt cell reaches as far as the baſis of the protuberant ring of the third, and ſo on; which articulation, being very looſe, gives liberty to the parts of the cells that are incloſed within the outward rings to ſtrike againſt the ſides of them, and ſo to cauſe the rattling noiſe which is heard when the ſnake ſhakes its tail. This is the moſt inactive and ſlow moving of all the ſnakes, and is never the aggreſſor except in what it preys upon. The above gentleman is of opinion that no remedy is yet diſcovered for the bite of this animal. He had frequently acceſs to ſee Indians bit by it; and always thought that thoſe who recovered were cured more through the force of nature, or by reaſon of the ſlightneſs of the bite, than by the remedies uſed. He tells us that the Indians know their deſtiny the moment they are bit; and if the bite happens to be on any of the large veins, they apply no remedies, as knowing them to be entirely uſeleſs. He believes the reports of the faſcinating power of this ſerpent, though he never had an opportunity of ſeeing it. See the article POISON and SERPENT.

CROTALYSTRIÆ, in antiquity, a kind of morice dancers, admitted to entertainments, in order to divert the company with their dancing and playing on an inſtrument called *crotalum*, whence they had their name.

CROTCHET, in muſic, one of the notes or characters of time, equal to half a minim, and double of a quaver.

CROTCHETS are alſo marks or characters, ſerving to incloſe a word or ſentence which is diſtinguiſhed from the reſt, being generally in this form [ ].

CROTO, or CROTON, (anc. geog.), a noble city of the Bruttii, built by the Acheans; an hundred and fifty ſtadia to the north of Lacinium, and in the neighbourhood of Metapontum. It was twelve miles in compaſs before the arrival of Pyrrhus into Italy; but after the deſolation produced by that war, ſcarce half of it was inhabited. The citadel on one ſide hung over the ſea, on the other towards the land. It was naturally ſtrong from its ſituation, but afterwards walled round; on which ſide it was taken by Dionyſius by ſtratagem, by means of the rocks behind it.

Pythagoras, after his long peregrinations in ſearch of knowledge, fixed his reſidence in this place, which ſome authors think his native one, at leaſt that of his parents, ſuppoſing him to have been born in the iſle of Samos, and not at ſome town of that name in Italy. This incomparable ſage ſpent the latter part of his life in training up diſciples to the rigid exerciſe of ſublime and moral virtue, and inſtructing the Crotonites in the true arts of government, ſuch as alone can inſure happineſs, glory, and independence.

Under the influence of this philoſophy, the Crotonites inured their bodies to frugality and hardſhips, and their minds to ſelf-denial and patriotic diſintereſtedneſs. Their virtues were the admiration of Greece, where it was a current proverb, that the laſt of the Crotonites was the firſt of the Greeks. In one Olympiad, ſeven of the victors in the games were citizens of Croton; and the name of Milo is almoſt as famous as that of Hercules. The vigour of the men and beauty of the women were aſcribed to the climate, which was believed to be endowed with qualities peculiarly favourable to the human ſyſtem. Their phyſicians were in high repute; and among theſe, Alcmeon and Democides rendered themſelves moſt conſpicuous. Alcmeon was the firſt who dared to amputate a limb, in order to ſave the life of a patient; and alſo the firſt writer who thought of inculcating moral precepts under the amuſing cloak of apologues. This invention is more commonly attributed to Æſop, as he was remarkably ingenious in this ſpecies of compoſition. Democides was famous for his attachment to his native ſoil. Though careſſed and inriched by the king of Perſia, whoſe queen he had ſnatched from the jaws of death, he abandoned wealth and honours, and by a ſtratagem eſcaped to the humble comforts of a private life at Croton.—The Pythagoreans are ſaid to have diſcovered that diſpoſition of the ſolar ſyſtem, which, with ſome modifications, has been revived by Copernicus, and is now univerſally received, as being moſt agreeable to nature and experiment. Theano, the wife of Pythagoras, and many other women, emulated the virtues of their huſbands.

In thoſe fortunate days the ſtate of Croton was moſt flouriſhing. Its walls incloſed a circumference of 12 miles. Of all the colonies ſent out from Greece, this alone furniſhed ſuccour to the mother-country when invaded by the Perſians. By its avenging arms the Sybarites were puniſhed for their ſhameful degeneracy; but victory proved fatal to the conquerors, for riches, and all their pernicious attendants, inſinuated themſelves into Croton, and ſoon contaminated the purity of its principles. Indeed, the very conſtitution of human nature militates againſt any long continuance in ſuch rigid practices of virtue; and therefore it is no wonder if the Crotonites fell by degrees into the irregularities they once abhorred. Not long after, the Locrians, who were leſs corrupted, defeated them on the banks of the Sagra, and reduced the republic to diſtreſs and penury. This reſtored the remaining Crotonites to their priſtine vigour of mind, and enabled them to make a brave, though unſucceſsful, reſiſtance, when attacked by Dionyſius of Syracuſe. They ſuffered much in the war with Pyrrhus, and, by repeated miſfortunes, decreaſed in ſtrength and numbers, from age to age, down to that of Hannibal, when they could not muſter 20,000 inhabitants. This ſmall population being incapable of manning the extenſive works erected in the days of proſperity, Croton was taken by the Carthaginians, and its citizens tranſported to Locri. The Romans ſent a colony hither 200 years before Chriſt. In the Gothic war, this city rendered itſelf conſpicuous by its fidelity to Juſtinian, and Totila beſieged it long in vain.

CROTON, WILD RICINUS: A genus of the adelphia order, belonging to the monœcia claſs of plants; and in the natural method ranking under the 38th order, *Tricoccæ*. The male calyx is cylindrical and quinquedentated, the corolla is pentapetalous; the ſtamina from 10 to 15. The female calyx is polyphyllous; no corolla; three bifid ſtyles; the capſule trilocular; one ſeed. There are 21 ſpecies; of which the moſt remarkable are, 1. The tinctorium, or plant from which the French turnſole is made. This grows naturally in the ſouth of France: it is an annual plant, riſing about 9 inches high, with an herbaceous branching ſtalk, garniſhed with irregular or rhomboidal figured leaves, which are near two inches long and an inch and a quarter wide in their wideſt part. Theſe ſtand upon ſlender footſtalks near four inches long. The flowers are produced in ſhort ſpikes from the ſides of the ſtalks, at the end of the branches; the upper part of the ſpike is compoſed of male flowers, having many ſtamina which coaleſce at the bottom; the lower part hath female flowers, which have each a roundiſh, three-cornered, germen; theſe afterwards become a roundiſh capſule with three lobes, having three cells, each including one roundiſh ſeed. This flowers in July; but unleſs the plants are brought forward on a hot-bed, they do not ripen ſeeds in Britain. From this plant is made the turnſole uſed for colouring wines and jellies. It is made of the juice which is lodged between the empalement and the ſeeds; which, if rubbed on cloths, at firſt appears of a lively green, but afterwards changes to a bluiſh purple colour. If theſe cloths are put into water, and afterwards wrung, they will dye the water to a claret colour. The rags thus dyed are exported to Britain, and ſold in the druggiſts ſhops under the name of *turnſole*. 2. The ſebifera, or tallow-tree, with rhomboidal egg-ſhaped leaves, pointed, ſmooth and very entire. It is about the height of a cherry-tree; its leaves in form of a heart, of a deep, ſhining, red colour, and its bark very ſmooth. Its fruit is encloſed in a kind of pod, or cover, like a cheſnut, and conſiſts of three round white grains, of the ſize and form of a ſmall nut, each having its peculiar capſula, and within that a little ſtone. This ſtone is encompaſſed with a white pulp, which has all the properties of true tallow, as to conſiſtence, colour, and even ſmell: and accordingly the

Chineſe make their candles of it; which would doubtleſs be as good as thoſe in Europe, if they knew how to purify their vegetable tallow as well as we do our animal kind, and to make their wicks as well. 4. The aromaticum, with heart-ſhaped ſerrated leaves, and an arboreſcent ſtem. The bark of this tree is the ſame as the caſcarilla and eleutheria; though theſe have been conſidered by ſome as diſtinct barks, and ſold in the ſhops as different productions. It is a hot, acrid, aromatic bitter, reſembling in appearance the Peruvian bark, but it is more bitter and pungent, though not ſo rough and aſtringent. It was firſt introduced into Europe about the end of the laſt century, and ſeems firſt to have been uſed in Germany, where it is ſtill in very high eſteem. There it is frequently employed againſt common intermittent fevers, in preference to the Peruvian bark, as being leſs ſubject to ſome inconveniences, which the latter on account of its great aſtringency is apt to occaſion. It is alſo ſaid to have been employed with great ſucceſs in ſome very dangerous epidemic fevers attended with petechiæ, and it is frequently employed with advantage in flatulent colics, internal hemorrhagies, dyſenteries, diarrhœas, and ſimilar diſorders. In Britain it has been uſed by ſome practitioners, particularly by the late Dr Keir of London, who was of opinion that it was by no means employed ſo generally as it deſerved to be. Its virtues are partially extracted by water, and totally by rectified ſpirit, but it is moſt effectual when given in ſubſtance. 4. The caſcarilla, deſcribed by Linnæus as producing the officinal bark of that name, is, according to Dr Wright †, the wild roſemary ſhrub of Jamaica, the bark of which has none of the ſenſible qualities of the true caſcarilla or eleutheria above deſcribed.

CROTONA, a town of Italy, in the kingdom of Naples, ſeated on the gulph of Taranto, with a biſhop's ſee and a citadel. E. Long. 17. 27. N. Lat. 39. 10.

CROTOPHAGA, in ornithology, a genus of birds belonging to the order of picæ; the characters of which are: The bill is thin, compreſſed, greatly arched, half oval, and cultrated at top; the noſtrils are round; the tongue flat, and pointed at the end; the tail conſiſts of ten feathers; and the toes are placed two and two. The moſt remarkable ſpecies is the ani, which is about the ſize of a blackbird: the colour of the whole bird is black, in ſome parts gloſſed with purple, and about the neck faintly tinged with green on the margins: the baſe of the bill is furniſhed with black briſtles, which turn forwards: the eye-lids have long hairs like eye-laſhes: the tail is ſix inches long, and much cuneated; and the legs are black. This ſpecies is found in Jamaica, St Domingo, and other iſlands in the Weſt Indies; alſo at Cayenne and other parts of South America. Contrary to all other birds, they have the ſingularity of many laying in the ſame neſt; to make which, they all unite in concert, and after laying their eggs, ſit on them cloſe to each other in order to hatch them, each unanimouſly ſtriving to do the beſt for the general good; and when the young are hatched, the parents, without reſerve, do the beſt to feed the whole flock. Still a greater ſingularity occurs, which is, that as ſoon as each female lays her eggs ſhe covers them with leaves, doing the ſame thing whenever ſhe is obliged to leave the neſt for food: this might be neceſſary in a cold climate; but why it ſhould be wanted in a hot one ſeems not clear, eſpecially as it has not been obſerved in other birds. It generally has two broods in a year, except accidents happen; in which caſe it has been known to make three neſts. The eggs are about the ſize of thoſe of a pigeon, of a ſea-green colour, ſpotted at the ends. Their food is various; worms, inſects, fruits, and grain, according to the ſeaſon. There is a variety called the greater ani, which is about the ſize of a jay, differing no otherwiſe from the former but in ſize. They ought, however, to be conſidered as two diſtinct ſpecies: for they never mix together; though each have the ſame manners, with this difference only, that the ſmaller frequent the open ſavannas, the larger only the ſalt-marſhes near the ſea-coaſts. It is ſaid that they are eaſily made tame, and will learn to talk like parrots. The male and female are both alike. Both ſpecies are eaſy to be ſhot, not being ſo wild as many other birds; but are known to chatter much on the ſight of a man, though they do not fly to a great diſtance; hence are not well reliſhed by ſportſmen, as, like the jays in England, they are the occaſion of hindering his ſport in reſpect to other game, without making him amends in their own fleſh, which is never ſought after for food, being rank and unſavoury.

Plate CLI.

CROTOY, a town of France, in Picardy, and in Ponthieu. The fortifications are demoliſhed. It is ſeated at the mouth of the river Somme. E. Long. 1. 45. N. Lat. 50. 15.

CROUCHED FRIARS. See CROISIERS.

CROUP, in medicine. See MEDICINE-*Index*.

Croup of a Horſe, in the manege, the extremity of the reins above the hips.

CROUPADE, in the manege, a leap, in which the horſe pulls up his hind legs, as if he drew them up to his belly.

CROUTE, SOUR CROUTE, or KROUTE. As this preparation of cabbage has been found of ſovereign efficacy as a preſervative in long voyages from the ſea-ſcurvy, it may not be unacceptable to give a conciſe account of the proceſs for making it, according to the information communicated by an ingenious German gentleman.

The ſoundeſt and moſt ſolid cabbages are ſelected for this uſe, and cut very ſmall, commonly with an inſtrument made for this purpoſe, not unlike the plain which is uſed in this country for ſlicing cucumbers. A knife is uſed when the preparation is made with greater nicety. The cabbage thus minced is put into a barrel in layers, hand high, and over each is ſtrewed a handful of ſalt and carraway ſeeds; in this manner it is rammed down with a rammer *ſtratum ſuper ſtratum*, till the barrel be full; when a cover is put over it and preſſed down with a heavy weight. After ſtanding ſome time in this ſtate it begins to ferment; and it is not till the fermentation has entirely ſubſided that the head is fitted to it, and the barrel is finally ſhut up and preſerved for uſe. There is not a drop of vinegar employed in this preparation. The Germans write this preparation in the following manner; *Sauer kraut*, or *ſauer kohl*; that is, in their language. "ſour herb, or ſour cabbage."

CROUSAZ (John Peter de), a learned philoſopher

---

† *Medical Journal*, vol. viii.

and mathematician, was born in 1663; having made great progreſs in the mathematics and the philoſophy of Des Cartes, he travelled to Geneva, Holland, and France; was ſucceſſively profeſſor in ſeveral univerſities; and at length was choſen governor to Prince Frederic of Heſſe-Caſſel, nephew to the king of Sweden. He wrote many works; the moſt eſteemed of which are, 1. His Logic, the beſt edition of which is that of 1741, in 6 vols 8vo. 2. A Treatiſe on Beauty. 3. A Treatiſe on the Education of Children, 2 vols 12mo. 4. Several Treatiſes on Philoſophical and Mathematical Subjects, &c. He died at Lauſanne in 1748.

CROW, in ornithology. See Corvus.

Crow, in mechanics, a kind of iron lever, with a claw at one end and a ſharp point at the other; uſed for heaving or purchaſing great weights.

Crow's Bill, among ſurgeons, a kind of forceps for drawing bullets and other foreign bodies out of wounds.

Crow's Feet, in the military art, machines of iron, having four points, each about three or four inches long, ſo made, that whatever way they fall there is ſtill a point up: they are thrown upon breaches, or in paſſes where the enemy's cavalry are to march, proving very troubleſome, by running into the horſe's feet and laming them.

Crow-Foot, on ſhip-board, a complication of ſmall cords ſpreading out from a long block, like the ſmaller parts which extend from the back bone of a herring (Plate CL.). It is uſed to ſuſpend the *awnings*; or to keep the top-ſails from ſtriking violently, and fretting againſt the tops.

Crow-Net, is an invention for catching wild-fowl in the winter ſeaſon, and may be uſed in the day-time. This net is made of double thread, or fine pack thread; the meſhes ſhould be two inches wide, the length about ten yards, and the depth three; it muſt be verged on the ſide with good ſtrong cord, and ſtretched out very ſtiff on long poles prepared for that purpoſe. When you are come to the place where you would ſpread your net, open it, and lay it out at its full length and breadth; then faſten the lower end of the net all along the ground, ſo as only to move it up and down; the upper end of the net muſt ſtand extended on the long cord; the farther end thereof being ſtaked firſt to the earth by a ſtrong cord about five yards diſtant from the net. Place this cord in an even line with the lower edge of the net. The other end muſt be at leaſt 25 yards diſtant to reach into ſome natural or artificial ſhelter, by the means of which you may lie concealed from the fowl, otherwiſe no good ſucceſs can be expected. The net muſt be placed in ſuch exact order that it may give way to play on the fowl on the leaſt pull of the cord, which muſt be done ſmartly, leſt the fowl ſhould prove too quick for you. This net may be uſed for pigeons, crows, or other birds, on cornfields newly ſown; as alſo in ſtubble-fields, provided the ſtubble conceals the net from the birds.

CROWD, in a general ſenſe, ſignifies a number of people aſſembled in a place ſcarce big enough to hold them all.

To Crowd, in the ſea-language, is to carry an extraordinary force of ſail upon a ſhip, in order to accelerate her courſe on ſome important occaſion; as in purſuit of, or flight from, an enemy; to eſcape any immediate danger, &c.

CROWLAND, a town in Lincolnſhire, ſeated in the fens, in a dirty ſoil, and had formerly an abbey of very great note. There is no coming at it but by narrow cauſeways, which will not admit a cart. It has three ſtreets. ſeparated from each other by water courſes, whoſe banks are ſupported by piles, and ſet with willow trees. Their chief trade is in fiſh and fowl, which are in great plenty in the adjacent pools and marſhes. W. Long. 0. 10. N. Lat. 52. 40.

CROWN, an ornament worn on the head by kings, ſovereign princes, and noblemen, as a mark of their dignity.

In ſcripture there is frequent mention of crowns, and the uſe of them ſeems to have been very common among the Hebrews. The high prieſt, wore a crown, which was a fillet of gold placed upon the forehead, and tied with a ribbon of hyacinth colour, or azure blue. It ſeems alſo as if private prieſts, and even common Iſraelites, wore alſo a ſort of crown, ſince God commands Ezekiel not to take off his crown, nor aſſume the marks of one in mourning. This crown was no more than a ribbon or fillet, with which the Jews and ſeveral people in the eaſt girt their heads. And indeed the firſt crowns were no more than a bandelet drawn round the head, and tied behind, as we ſtill ſee it repreſented on medals round the heads of Jupiter, the Ptolemies, and kings of Syria. Afterwards they conſiſted of two bandelets; by degrees they took branches of trees of divers kinds; at length they added flowers, inſomuch that Claudius Saturninus ſays, there was not any plant whereof crowns had not been made. The woods and groves were ſearched to find different crowns for the ſeveral deities; and they were uſed not only on the ſtatues and images of the gods, by the prieſts in ſacrificing, and by kings and emperors, but alſo on altars, temples, doors of houſes, ſacred veſſels, victims, ſhips, &c.

The Roman emperors had four kinds of crowns, ſtill ſeen on medals, viz. a crown of laurel, a radial or radiating crown, a crown adorned with pearls and precious ſtones, and the fourth a kind of bonnet or cap, ſomething like the mortier.

The Romans had alſo various kinds of crowns, which they diſtributed as rewards of military atchievements; as, 1. The oval crown, made of myrtle, and beſtowed upon generals, who were intitled to the honours of the leſſer triumph, called *ovation*. 2. The naval or roſtral crown, compoſed of a circle of gold, with ornaments repreſenting beaks of ſhips, and given to the captain who firſt grappled, or the ſoldier who firſt boarded, an enemy's ſhip. 3. The crown called in Latin *vallaris*, or *caſtrenſis*, a circle of gold raiſed with jewels or paliſades: the reward of him who firſt forced the enemy's entrenchments. 4. The mural crown, a circle of gold indented and embattled: given to him who firſt mounted the wall of a beſieged place, and there lodged a ſtandard. 5. The civic crown, made of the branch of a green oak, and given him who had ſaved the life of a citizen. 6. The triumphal crown, conſiſting at firſt of wreaths of laurel, but afterwards made of gold; proper to ſuch generals as had the honour of a triumph. 7. The crown called *obſidionalis*, or *graminea*, made of graſs growing on the place; the reward of a general who had delivered a Roman army from a ſiege. 8. The radial crown, given to princes at their tranſlation among the gods. We meet alſo with the corona aurea, often beſtowed on ſoldiers, without any other additional term; athletic crowns, and crowns of laurel, deſtined to crown victims at the public games, poets, orators, &c. All theſe crowns were marks of nobility to the wearers; and upon competitions with rivals for rank and dignities, often determined the preference in their favour. See Plate CL. For an account of modern crowns, ſee HERALDRY.

CROWN is alſo uſed to ſignify the poſſeſſions and dignity of a king. The crown of England, according to Sir William Blackſtone, is, by common law and conſtitutional cuſtom, hereditary; and this in a manner peculiar to itſelf: but the right of inheritance may from time to time be changed or limited by act of parliament, under which limitations the crown ſtill continues hereditary. See SUCCESSION.

Pleas of the CROWN. See PLEAS.

CROWN, in commerce, is a general name for coins, both foreign and domeſtic, of or near the value of five ſhillings Sterling. In its limited ſenſe, crown is only applicable to that popular Engliſh coin which bears the name, and which is equivalent to ſixty Engliſh pence or five ſhillings, or to ſix livres French money. But, in its extenſive ſenſe, it takes in ſeveral others, as the French ecu, which we call the French crown, ſtruck in 1641 for ſixty ſols, or three livres; alſo the patagon, dollar, ducatoon, rixdollar, and piaſtre or piece of eight.

CROWN, in an eccleſiaſtical ſenſe, is uſed for the clerical tonſure; which is the mark or character of the Romiſh eccleſiaſtics. This is a little circle of hair ſhaved off from the crown of the head; more or leſs broad, according to the quality of the orders received: That of a mere clerk is the ſmalleſt; that of prieſts and monks the largeſt. The clerical crown was anciently a round liſt of hair, ſhaved off around the head, repreſenting a real crown: this is eaſily obſervable in ſeveral ancient ſtatues, &c. The religious of St Dominic and St Francis ſtill retain it.

CROWN, among jewellers, the upper work of the roſe diamond, which all centres in the point at the top, and is bounded by the horizontal ribs.

CROWN-Office, in England, an office belonging to the king's bench court, of which the king's coroner or attorney is commonly maſter. In this office, the attorney-general and clerk of the crown ſeverally exhibit informations for crimes and miſdemeanours at common law, as in the caſe of batteries, conſpiracies, libelling, &c. on which the offender is liable to pay a fine to the king.

CROWN-Glaſs, denotes the fineſt ſort of window-glaſs. See GLASS.

CROWN-Scabs, in farriery. See there, § xxxvi. 2.

CROWN-Wheel of a Watch, the upper wheel next the balance, which by its motion drives the balance, and in royal pendulums is called the *ſwing-wheel*.

CROWN Imperial, in botany. See FRITILLARIA.

CROWN-Work, in fortification, is an out-work running into the field; deſigned to keep off the enemy, gain ſome hill or advantageous poſt, and cover the other works of the place. The crown-work conſiſts of two demi-baſtions at the extremes, and an entire baſtion in the middle, with curtains.

CROWNE (John), a celebrated dramatic writer, born in Nova Scotia, where his father was a miniſter. Being impatient of the gloomy reſtraint of that country, he went to England, where he was reduced to enter into the ſervice of an old lady; of which he was ſoon as weary as he had been of America. He then had recourſe to his pen, which quickly procured him favour at court; but this kind of ſubſiſtence proving precarious, he ventured to ſolicit Charles II. for ſome eſtabliſhment. Charles promiſed to provide for him, but inſiſted firſt on having another comedy; and ſuggeſted to him the plan of a Spaniſh play, from which Crowne produced the comedy of *Sir Courtly Nice*: but the ſudden death of the king on the laſt day of the rehearſal, plunged him at once from his pleaſing expectations into diſappointment and diſtreſs, and left him no reſource but his wits. He died ſome time about the year 1703; and left behind him 17 tragedies and comedies, ſome of which are acted with great ſucceſs. His chief excellency lay in comedy; yet his tragedies are far from being contemptible. His plots are for the moſt part his own invention; his characters are in general ſtrongly coloured and highly finiſhed; and his dialogue lively and ſpirited, attentively diverſified, and well adapted to the ſeveral ſpeakers. So that on the whole he may aſſuredly be allowed to ſtand at leaſt in the third rank of our dramatic writers.

CROWNING, in architecture, is underſtood, in the general, of any thing that terminates or finiſhes a member or decoration. Thus, a corniche, a pediment, &c. are called *crownings*. Thus alſo the abacus is ſaid to crown the capital; and thus any member or moulding is ſaid to be crowned when it has a fillet over it; and a niche is crowned when it is covered with a capital.

CROWNING, in ſea language, denotes the finiſhing part of a knot made at the end of a rope. It is performed by interweaving the ends of the different ſtrands artfully amongſt each other, ſo as that they may not become looſened or untwiſted. They are uſeful in all kinds of ſtoppers.

CROWTH, or CRUTH. See CRUTH.

CROXAL (Samuel), an ingenious Engliſh divine, who in his youth wrote the celebrated poem intitled *The Fair Circaſſian*. He had the livings of Hampton in Middleſex; and the united pariſhes of St Mary Somerſet, and St Mary Mounthaw, in London; both which he held till his death in 1751. He publiſhed many other poems and tranſlations, with an entire Engliſh edition of Eſop's Fables. In conſequence of his attachment to Whig principles, he enjoyed ſome other preferments, and was chaplain in ordinary to George II.

CROYDON, a town in Surry in England. Its ſituation is low, near the ſpring-head of the river Wandel, and it is in a manner ſurrounded with hills. It is pretty large, and is chiefly noted for being the ſeat of the archbiſhop of Canterbury. It has a large handſome church, an hoſpital, and a free ſchool. W. Long. 0. 5. N. Lat. 51. 22.

CRUCIAL INCISION, in ſurgery, an inciſion made in the form of a croſs.

CRUCIANELLA, PETTY MADDER: A genus of the monogynia order, belonging to the tetrandria claſs of plants; and in the natural method ranking under the 47th order, *Stellatæ*. The corolla is monopetalous and funnel-ſhaped, with the tube filiform and the limb unguiculated, or having an inflexed ſegment on the top of each ſegment; the calyx is diphyllous, and there are two linear ſeeds. There are five ſpecies, natives of the ſouthern parts of Europe; but none of them poſſeſſed of any remarkable quality.

CRUCIBLE, a chemical veſſel made of earth, and ſo tempered and backed as to endure the greateſt fire. They are uſed to melt metals, and to flux minerals, ores, &c. See CHEMISTRY-*Index*.

CRUCIFIX, a croſs upon which the body of Chriſt is faſtened in effigy, uſed by the Roman Catholics to excite in their minds a ſtrong idea of our Saviour's paſſion.

They eſteem it an eſſential circumſtance of the religious worſhip performed at the altar; and on Good Friday they perform the ceremony of adoring it, which is done in theſe words, *O crux ave, ſpes unica;* "Hail, thou croſs, our only hope." The officiating prieſt uncovers the crucifix, elevates it with both his hands, and ſays, *Ecce lignum crucis*; "Behold the wood of the croſs." The people anſwer, *in quo ſalus mundi pependit*; "on which the Saviour of the world ſuffered death." Then the whole congregation bow with great reverence, and devoutly kiſs the holy wood.

CRUCIFIXION, a capital puniſhment by nailing the criminal to a croſs. See CROSS.

CRUCIFORM, in general, ſomething diſpoſed croſs-ways; but more eſpecially uſed by botaniſts, for flowers conſiſting of four petals diſpoſed in the form of a croſs.

CRUCITA, in botany, a genus of the digynia order, belonging to the tetrandria claſs of plants, and in the natural method ranking with thoſe the order of which is doubtful. The interior calyx is tetraphyllous, the exterior calyx triphyllous; there is no corolla, and only one ſeed.

CRUDE, an epithet given to ſomething that has not paſſed the fire or had a proper degree of coction.

CRUDITY, among phyſicians, is applied to undigeſted ſubſtances in the ſtomach; to humours in the body which are unconcocted, and not prepared for expulſion; and to the excrements.

CRUISE, from the Germen *kruiſs*, "acroſs," ſignifies to croſs to and fro, to ſail up and down within a certain ſpace of the ſea, called the *cruiſing* latitude, in queſt of veſſels, or fleets of an enemy, &c.

CRUISERS, in the Britiſh navy, are ſmall men of war made uſe of to and fro in the channel, and elſewhere, to ſecure the merchant ſhips and veſſels from the enemy's ſmall frigates and privateers. They are generally ſuch as ſail well, and are commonly well manned: and indeed the ſafety of the trade in the channel, and up and down the ſoundings, and other places, abſolutely requires the conſtant keeping out ſuch ſhips at ſea.

CRUMENTATA, among zoologiſts, animals furniſhed with a pouch or bag, wherein to receive their young in time of danger; as the opoſſum. See DIDELPHIS.

CRUOR, ſometimes ſignifies the blood in general; ſometimes only the venous blood; and ſometimes extravaſated or coagulated blood; but is moſt frequently uſed for the red globules of the blood, in contradiſtinction to the limpid or ſerous part.

CRUPPER, in the manege, the buttocks of a horſe, the rump; alſo a thong of leather put under a horſe's tail, and drawn up by thongs to the buckle behind the ſaddle, ſo as to keep him from caſting the ſaddle forwards on his neck.

CRURÆUS, or CRUREUS, *Muſculus*, in anatomy, a fleſhy maſs, covering almoſt all the foreſide of the os femoris, between the two vaſti, which likewiſe cover the edges of this muſcle on each ſide. See ANATOMY, *Table of the Muſcles*.

CRURAL, in anatomy, an epithet given to the artery which conveys the blood to the crura or legs, and to the vein by which this blood returns towards the heart. See ANATOMY, p. 751.

CRUS, in anatomy, all that part of the body contained between the buttocks and the toes.

CRUSADO, in commerce, a Portugueſe coin, ſtruck under Alphonſus V. about the year 1457, at the time when pope Calixtus ſent thither the bull for a croiſade againſt the infidels. This coin has a croſs on one ſide, and the arms of Portugal on the other.

CRUSCA, an Italian term ſignifying *bran*, is in uſe amongſt us to denote that celebrated academy called *della Cruſca*, eſtabliſhed at Florence for purifying and perfecting the Tuſcan language. See ACADEMY, nº 11. The academy took its name from its office, and the end propoſed by it; which is, to refine the language, and as it were to ſeparate the bran from it. Accordingly, its device is a ſieve; and its motto, *Il piu bel fior ne coglie*; that is, "It gathers the fineſt flour thereof." In the hall or apartment where the academy meets, M. Moneonis informs us, that every thing bears an alluſion to the name and device: the ſeats are in form of a baker's baſket; their backs like a ſhovel for moving of corn; the cuſhions of grey ſattin, in form of ſacks or wallets; and the branches where the lights are placed reſembling ſacks. The vocabulary *Della Cruſca* is an excellent Italian dictionary, compoſed by this academy.

CRUSTA LACTEA, in medicine, the ſame with ACHOR.

CRUSTACEOUS FISH, in natural hiſtory, are thoſe covered with ſhells, conſiſting of ſeveral pieces or ſcales; as thoſe of crabs, lobſters, &c.

Theſe are uſually ſofter than the ſhells of the teſtaceous kind, which conſiſt of a ſingle piece, and generally much thicker and ſtronger than the former; ſuch as thoſe of the oyſter, ſcallop, cockle, &c.

Dr Woodward obſerves, in his Natural Hiſtory, that of all the ſhells found in beds of all the different matters dug out of the earth, there are ſcarce any of the cruſtaceous kind: the reaſon he gives for it is, that theſe being much lighter than the reſt, muſt have floated on the ſurface at the time of the deluge, when all the ſtrata were formed; and there have corrupted and periſhed.

CRUTH, or Crowth, a kind of muſical inſtrument formerly in uſe among the common people in Wales. It is of the fidicinal kind, ſomewhat reſembling a violin, 22 inches in length, and an inch and an half in thickneſs. It has ſix ſtrings ſupported by a bridge, and is played on with a bow: the bridge differs from that of a violin, in that it is flat and not convex on the top; a circumſtance from which it is to be inferred, that the ſtrings are to be ſtruck at the ſame time, ſo as to afford a ſucceſſion of concords. The bridge is not placed at right angles with the ſides of the inſtrument, but in an oblique direction; and, which is further to be remarked, one of the feet of the bridge goes through one of the ſound-holes, which are circular, and reſts on the inſide of the back; the other foot, which is proportionably ſhorter, reſting on the belly before the other ſound-hole. Of the ſtrings, the four firſt are conducted from the bridge down the finger-board, as in a common violin; but the fifth and ſixth, which are about an inch longer than the others, leave the ſmall end of the neck about an inch to the right. The whole ſix are wound up either by wooden pegs in the form of the letter T, or by iron pins, which are turned with a wreſt like thoſe of a harp or ſpinnet. Of the tuning, it is to be remarked, that the fifth and ſixth ſtrings are the uniſon and octave of G; the fourth and fiſth, the ſame of C; and the ſecond and firſt, the ſame of D; ſo that the ſecond pair of ſtrings are a fourth, and the third a fifth, to the firſt. See Plate CL.

Concerning the antiquity of this inſtrument, there is but little written evidence to carry it further back than the time of Leland; nevertheleſs the opinion of its high antiquity is ſo ſtrong among the inhabitants of the country where it was uſed, as to afford a probable ground of conjecture, that the cruth might be the prototype of the whole fidicinal ſpecies of muſical inſtruments. Another evidence of its antiquity, but which tends alſo to prove that it was not peculiar to Wales, ariſes from a diſcovery lately made and communicated to the ſociety of antiquarians, reſpecting the abbey-church of Melroſe in Scotland, ſuppoſed to have been built about the time of Edward II. It ſeems that among the outſide ornaments of that church there is the repreſentation of a cruth, very little different from the deſcription above given. The inſtrument is now diſuſed, in ſo much that Sir John Hawkins, from whom we extract, tells us, that there is but one perſon in the whole principality of North Wales that can play upon it; and as he was at that time near 60 years of age, the ſucceſſion of performers is probably near an end.

CRUX, or St Croix, one of the Caribbee iſlands, ſituated about 60 miles ſouth-eaſt of Porto-Rico, and ſubject to Denmark. From being a perfect deſart, it has begun to flouriſh exceedingly, being made a free port, and receiving great encouragement from government. W. Long. 64. 0. N. Lat. 17. 30.

CRYMODES, among phyſicians, a kind of fever attended with a ſhivering cold, and inflammation of the internal parts of the body.

CRYPTA, a ſubterraneous cell or vault, eſpecially under a church, for the interment of particular families or perſons. S. Ciampini, deſcribing the outſide of the Vatican, ſpeaks of the *cryptæ* of St Andrew, St Paul, &c. The word is formed of κρυπτω, *abſcondo*, "I hide;" whence κρυπτη, *crypta*.

Vitruvius uſes the word *crypta* for a part of a building, anſwering nearly to our cellar; Juvenal for a *cloaca*. Hence *crypto-porticus*, a ſubterraneous place arched or vaulted; uſed as an under-work or paſſage in old walls. The ſame is alſo uſed for the decoration at the entry of a grotto.

Crypta is alſo uſed by ſome of our ancient writers for a chapel or oratory under-ground.

Cryptæ, in anatomy, a name given by Ruyſch to glands ſituated on the back of the tongue, and to glands of the inteſtines.

CRYPTOGAMIA, (from κρυπτος, *occultus*, "concealed," and γαμος, *nuptia*, "nuptials"), the 24th claſs in the Linnæan ſyſtem, comprehending thoſe plants whoſe fructification is concealed, either through minuteneſs, or within the fruit. See Botany, the *Scheme* and Explanation, Vol. III. p. 430.

CRYPTOGRAPHY, the art of writing in cipher, or with ſympathetic ink. See Cipher and Ink.

CRYSTAL, a ſpecies of ſtones of the quartz kind, belonging to the ſiliceous claſs. It always appears, when there has been no interruption to its cryſtallization, in hexagonal priſms pointed at both ends. It is found of different kinds and colours. 1. Opaque or ſemitranſparent, and white or of a milk colour. 2. Opaque and red, or of a cornelian colour, from Oran in Barbary. 3. Opaque and black, from the ſame place. 4. Clear. The ſpecific gravity of theſe kinds of cryſtals is from 2650 to 2700. Profeſſor Bergman extracted from them about ſix parts of argilla and one of calcareous earth per hundred weight; but Mr Gerrard found ſome ſo pure as to contain neither. 5. Clear and blackiſh brown, the ſmoky topaz, or *rauch topaz* of the Germans. It is found at Egan in Norway, and at Loviſa in Finland. Theſe cryſtals are ſaid to become clear by boiling them in tallow. 6. Clear and yellow; found in Bohemia, and ſold inſtead of topazes. 7. Clear and violet-coloured; the amethyſt, from Saxony, Bohemia, and Dannemore in Upland. The moſt tranſparent of theſe are called falſe diamonds. Briſtol, Kerry ſtones, Alençon diamonds, &c. 8. Colourleſs rock-cryſtal, properly ſo called, found in Bohemia, the province of Jemtland, and many other places. 9. Pyramidal cryſtal with one or two points. Theſe have no priſmatic ſhape, but either ſtand upon a baſe in cavities of quartz-veins, have only a ſingle pyramid, and are of various colours; or they lie in a clayey earth, and have both pyramids, but no priſm. They are found at Blackenburgh upon the Hartz, and at Morſeroſh in the Silverland in Tranſylvania.

The coloured tranſparent cryſtals derive their tinge from an exceedingly ſmall portion of metallic calces, but loſe them entirely when ſtrongly heated. They are called *falſe gems*; *viz.* the red from Oran in Barbary, falſe rubies; the yellow from Saxony, falſe topazes; the green from Dauphiny, very rare, falſe emeralds or praſes; the violet from Vil in Catalonia, falſe amethyſts; the blue from Puy in Valay in France, falſe ſapphires. There are likewiſe opal or rainbow cryſtals, the various colours of which are thrown out in zones acroſs the ſurface. They make a very fine appearance, though they never ſhine like the oriental opal.

M. Fourcroy makes a remarkable difference between the cryſtals and quartz, by affirming that the former are unalterable in the fire, in which they neither loſe their hardneſs, tranſparency, nor colour, while the quartz loſes the ſame qualities, and is reduced by it to a white and opaque earth. He claſſes the rock-cryſtals,

I. According to their form, *viz.* 1. Inſulated hexagonal cryſtals ending in pyramids of ſix faces, which have a double refraction, or ſhow two images of the ſame object when looked through. 2. Hexagonal cryſtals united, having one or two points. 3. Tetraedral, dodecaedral, flatted cryſtals; and which, though hexagonal, have nevertheleſs their planes irregular. 4. Cryſtals in large maſſes, from the iſland of Madagaſcar, which have a ſimple refraction.

II. With regard to their colour, as being either diaphanous, reddiſh, ſmoky, or blackiſh.

III. With regard to accidental changes, ſome are hollow; ſome contain water within one or more cavities; ſome are caſed one within the other; ſome are of a round form, as the pebbles of the Rhine; ſome have a cruſt of metallic calces or of a pyrites; ſome are found cryſtallized in the inſide of a cavity; while ſome ſeem to contain amianthus or aſbeſtus; and others contain ſhirls. The ſame author reckons among cryſtals the oriental topaz, the hyacinth, the oriental ſapphire, and the amethyſt. Mr Daubenton has always looked upon this laſt as a quartz of a cryſtal.

When the rock-cryſtals are ſemitranſparent or intermixed with opaque veins, they are called by the Swediſh lapidaries *milk-cryſtals*. When they are found in the form of round pebbles, which is occaſioned by their being toſſed about and rubbed againſt one another by floods or by the ſea, they are called by the Engliſh lapidaries *pebble cryſtals*. They come from the Indies, Siberia, and other places.

According to Bomare, the rock-cryſtals are generally formed upon or among quartz, which ſhows their great affinity, and are to be found in all parts of the world. The greateſt quantity of them is brought from Mount Saint Gothard in Switzerland. Large pieces of theſe, weighing from 5 to 800 pounds, were found there at Grimſelberg; another of about 1200 pounds weight was found ſome years ago at Fiſbach in the Wallais; and a piece ſix feet long, four wide, and equally thick, was found in the iſland of Madagaſcar, where theſe natural productions are of the moſt extraordinary ſize and perfection.

In the imperial collection at Vienna, there is a pyramidal cryſtal vaſe two ells in height, cut wholly out of one piece. It is uſual with the largeſt cryſtals of the German mountains to be full of cracks and flaws, and to be ſo conſtructed internally as to ſhow all the priſmatic colours; but the abovementioned ones were quite free from theſe blemiſhes, and reſembled columns of the pureſt glaſs, only much clearer than any glaſs can be made. Cryſtal is alſo found in many parts of Britain and Ireland. About Briſtol it is found of an amethyſtine tinge. In Sileſia and Bohemia in Germany it is found ſtained with the colours of the ruby, ſapphire, emerald, and topaz; in which caſe jewellers take great advantage of it, ſelling it under the name of *accidental ſapphire*.

The orders of pure cryſtal are three: The firſt is perfect columnar cryſtals, with double pyramids, compoſed of 18 planes, in an hexangular column, terminated by an hexangular pyramid at each end: the ſecond order is that of perfect cryſtals, with double pyramids, without a column, compoſed either of 12 or of 16 planes, in two hexangular pyramids, joined cloſely baſe to baſe, without the intervention of any column: the third order is that of imperfect cryſtals, with ſingle pyramids, compoſed either of 12 or 10 planes, in an hexangular or pentangular column, affixed irregularly at one end to ſome ſolid body, and terminated at the other by an hexangular or pentangular pyramid.

Theſe are all the general forms into which cryſtal, when pure, is found concreted: but under theſe there are almoſt infinite varieties in the number of angles, and the length, thickneſs, and other accidents of the columns and pyramids.

When cryſtal is blended with metalline particles at the time of its formation, it aſſumes a variety of figures wholly different from theſe, conſtituting a fourth order under the name of *metalline cryſtals*: when that metal is lead, the cryſtal aſſumes the form of a cube; when it is tin, of a quadrilateral pyramid, with a broad baſe; when iron, the cryſtal is found concreted in rhomboidal figures: theſe cryſtals are very common about mines; but the common ſpars, which are liable to be influenced in the ſame manner by the metals, and to appear in the very ſame form, are to be carefully diſtinguiſhed from them. There is one very eaſy teſt for this purpoſe, which is, that all ſpars are ſubject to be diſſolved by aquafortis, and efferveſce violently only on its touching them: but it has no ſuch effects on cryſtal.

The pebble-cryſtal is common enough in all parts of the world; but that which is formed of hexangular columns, affixed to a ſolid baſe at one end, and terminated by a hexangular column at the other, is infinitely more ſo: this is what we call *ſprig* or *rock cryſtal*, and is the ſpecies deſcribed by moſt authors under the name of *cryſtal of the ſhops*, or that kept for medicinal uſes.

With regard to the formation of cryſtals, it is certain that they muſt have been once in a ſoft ſtate, ſince ſome are found to have water in their cavities. Profeſſor Bergman obtained 13 regular formed cryſtals, by ſuffering the powder of quartz to remain in a veſſel with fluor acid for two years. Theſe were about the ſize of ſmall peas, and were leſs hard than quartz. Mr Magellan informs us, that he received from Mr Achard two cryſtals, one of the ſparry kind, and the other as hard and tranſparent as rock-cryſtal. The firſt he procured by means of calcareous earth, and the latter from the earth of alum, both diſſolved in water impregnated with fixed air, the water filtrating very ſlowly through a porous bottom of baked clay. The apparatus is deſcribed by the author in the *Journal de Phyſique* for January 1778: but though the proceſs was attempted by Mr Magellan, and afterwards a ſecond time by Mr Achard himſelf, neither of them were able to ſucceed. Mr Morveau, however, in the firſt volume of the Dijon Memoirs for 1785, aſſerts that he has produced a very ſmall artificial cryſtal; and gives the proper method for ſucceeding in the proceſs.

In the natural way many of the more compound foſſile bodies are formed chiefly either of cryſtal, or of ſpar, a body in many things reſembling it. The original formation and coaleſcence of thoſe bodies of which ſpar is the baſis, we know, may have been but of yeſterday, ſince we have evident proofs that ſpar is concreting to this day, and that ſparry bodies are forming every moment. This is evident from the ſparry ſtalactiæ in the arches of modern buildings, particularly in one ſo lately built as the new bridge at Weſtminſter; the roofs of the arches of which were filled with theſe ſpars within a year after they were built. It is alſo demonſtrable that the ſpars are not formed of matter exſuding from the ſtone, ſince brick arches abound equally with them; and the brick vault which ſupports part of the grand terrace at London, was ſome time ago ſo full of them that there was not room to walk. Theſe obſervations ſufficiently demonſtrate the growth of ſpar; but the vegetation of cryſtal remained dubious till Dr Hill ſhowed by ſome experiments that *cryſtal*, as well as ſpar, is diſſolved in every kind of water, even ſuch as appears to be moſt pure and clear. This is alſo probable from an obſervation of Neumann's, who tells us, that he has ſeen leaves, ſtalks of plants, hay, ſtraw, hogs briſtles, &c. incloſed in ſprigs of cryſtal. From the regular forms in which theſe natural cryſtals are found, the regular arrangement of ſalts into different figures takes the name of *cryſtallization*, and both are probably owing to the ſame cauſe*. Henckel gives us a remarkable account of the formation of cryſtal out of human urine. He once filled a large round glaſs-veſſel half way up with the recent urine of a young lad, and tying a bladder over the mouth of the veſſel, ſet it in a ſtove for four years together, never ſtirring it during that whole time. At the end of this time he found a number of ſmall white ſtones growing to the inſide of the glaſs; they were of the ſize of an oat-ſeed, of a priſmatic figure, and tolerably pellucid: they ſtuck ſo faſt to the ſides of the glaſs that they could not be waſhed off by the ſhaking about of the urine; and when taken out had no ſaline taſte, and were not ſoluble even in hot water.

* See *Cryſtallization.*

Cryſtal is frequently cut; and luſtres, vaſes, and toys, are made of it as of other beautiful ſtones. For this purpoſe it is to be choſen perfectly clear and tranſparent. It is to be tried by aquafortis, or by drawing it along a pane of glaſs. The genuine cryſtal will not be affected by the acid, and will cut glaſs almoſt like a diamond. When any piece of workmanſhip of natural cryſtal is become foul and dark, the following method is to be uſed for recovering its brightneſs without hurting the poliſh. Mix together ſix parts of common water and one part of brandy; boil theſe over a briſk fire, and let the cryſtal be kept in it in a boiling ſtate, a quarter of an hour; then take it out and rub it carefully over with a bruſh dipped in the ſame liquor; after this it is to be wiped with a napkin, and by that means its ſurface will be perfectly cleaned, and rendered as bright as at firſt, without any injury to the points of the cutting or the poliſh of the planes or faces, which would probably have happened had the cleaning been attempted by mere rubbing with a cloth.

Natural cryſtal may be reduced by calcination into a ſtate proper for making glaſs with alkaline ſalts, and thus becomes a very valuable fritt. The method of doing it is as follows; calcine natural cryſtal in a crucible; when it is red-hot, throw it into cold water. Repeat this eight times, covering the crucible that no duſt or aſhes may get in among the cryſtal. Dry this calcined maſs, and reduce it to an impalpable powder.

Colouring CRYSTAL, for the imitation of gems. See DOUBLET.

CRYSTAL, is alſo uſed for a factitious body, caſt in glaſs-houſes, called *cryſtal-glaſs*; being in fact no more than glaſs carried, in the compoſition and manufacture, to a greater perfection than the common glaſs.

The beſt kind of glaſs-cryſtal is that called *Venice-cryſtal*, made at Moran near Venice. See GLASS.

Iſland or *Iceland* CRYSTAL, a tranſparent fiſſile ſtone, brought from Iceland, ſoft as talc, clear as rock-cryſtal, and without colour: remarkable for its unuſual refractions.

It is there found in great abundance all over the country, but is particularly plentiful in a mountain, not far from the bay of Roezfiord, where the fineſt and moſt pellucid pieces are found on digging. The mountain lies in 65 degrees latitude, and has its whole outſide made up of it; but though this makes a very bright and glittering appearance, it is not ſo fine as that which lies at a little depth, and is met with on opening the ſurface. This is generally taken up out of the earth in maſſes a foot long, and its corners very frequently are terminated in theſe large maſſes, by a ſort of cryſtals, very different in figure and qualities from the reſt of the maſs. The ſtone itſelf is of a parallelopiped figure; but theſe excreſcences are either ſingle pyramids, affixed to columns like common cryſtal, or double pyramids with or without columns between. The ſtone itſelf is ſoft; theſe are hard, and cut glaſs: the ſtone calcines to lime in the fire; theſe run into glaſs: in ſhort, the ſtone itſelf is true ſpar, and theſe are true cryſtal. Beſide theſe, there ſometimes grows out of the ends of the larger maſſes a pure fine aſbeſtos. This likewiſe is the caſe ſometimes in the ſpar found about Barege in France, and ſhows how nearly together the formation of bodies, wholly different from one another, may happen. The general figure of the ſtone is parallelopiped; or, as ſome expreſs it, rhomboide; and it retains this not only while whole, but alſo when broken to pieces. Every fragment it naturally falls into, though ever ſo ſmall, being truly of the ſhape. But it is remarkable, that in ſome places of this mountain, the ſame ſort of matter is found in form of triangular pyramids, all which have the ſame property of the double refraction with the parallelopipeds of the ſame ſubſtance; ſo that the original error of ſuppoſing its qualities owing to its ſhape, is refuted by this, as well as by the trials made with other pellucid bodies of the ſame figure, which do not ſhow this remarkable property.

The Iceland cryſtal is electrical, and when rubbed will draw up ſtraws, feathers, and other light ſubſtances, in the ſame manner that amber does.

The vaſt maſſes of white ſpar which are found in the lead mines of Derbyſhire, though they are not externally of the parallelopiped figure of the Iceland cryſtal, nor have any thing of its brightneſs or tranſparence in the general lump ; yet when they are broken they ſeparate into rhomboidal fragments, and ſome of theſe are found to be tolerably pellucid : all thoſe which are ſo have the property of the Iceland cryſtal ; and being laid upon paper, where a black line is drawn, they all ſhow that line double in the ſame manner as the real Iceland cryſtal does.

Iceland cryſtal bears a red heat without loſing its tranſparency ; and in a very intenſe heat calcines without fuſion : ſteeped a day or two in water, it loſes its natural poliſh. It is very ſoft and eaſily ſcratched with the point of a pin ; it will not give fire on being ſtruck againſt ſteel ; and ferments and is perfectly diſſolved in aquafortis. It is found in Iceland, from whence it has its name ; and in France, Germany, and many other places. In England fragments of other ſpars are very often miſtaken for it, many of them having in ſome degree the ſame property. It has none of the diſtinguiſhing characters of cryſtal ; and is plainly a genus of ſpars, called from their figure *parallelopipedia*, which, as well as ſome other bodies of a different genus, have the ſame properties. Bartholine, Huygens, and Sir Iſaac Newton, have deſcribed the body at large, but have accounted it either a cryſtal or a talc ; errors which could not have happened, had the criterions of foſſils been at that time fixed ; ſince Sir Iſaac Newton has recorded its property of making an ebullition with aquafortis, which alone muſt prove that it is neither talc nor cryſtal, both thoſe bodies being wholly unaffected by that menſtruum. It is always found in form of an oblique parallelopiped, with ſix ſides, and is found of various ſizes, from a quarter of an inch to three inches or more in diameter. It is pellucid, and not much leſs bright than the pureſt cryſtal, and its planes are all tolerably ſmooth, though when nicely viewed they are found to be waved with crooked lines made by the edges of imperfect plates. What appears very ſingular in the ſtructure of this body is, that all the ſurfaces are placed in the ſame manner, and conſequently it will ſplit off into thin plates, either horizontally or perpendicularly ; but this is found, on a microſcopic examination, to be owing to the regularity of figure, ſmoothneſs of ſurface, and nice joining of the ſeveral ſmall parallelopiped concretions, of which the whole is compoſed, and to the ſame cauſe is probably owing its remarkable property in refraction.

The phenomena of this ſtone are very remarkable, were firſt ſuggeſted by Bartholine, and have been examined with great accuracy by M. Huygens and Sir Iſaac Newton.

1. Whereas in other pellucid bodies there is only one refraction, in this there are two ; ſo that objects viewed through it appear double.

2. Whereas in other tranſparent bodies, a ray falling perpendicularly on the ſurface, paſſes ſtraight through, without ſuffering any refraction ; and an oblique ray is always divided ; in Iceland cryſtal, every ray, whether perpendicular or oblique, becomes divided into two, by means of the double refraction. One of theſe refractions is, according to the ordinary rule, the ſine of incidence out of air into cryſtal, being to the ſine of refraction as five to three ; but the other is perfectly new. The like double refraction is alſo obſerved in cryſtal of the rock, though much leſs ſenſibly. When an incident ray is thus divided, and each moiety arrives at the farther ſurface, that refracted in the firſt ſurface after the uſual manner, is refracted entirely after the uſual manner at the ſecond ; and that refracted in the unuſual manner in the firſt is entirely refracted after the like manner in the ſecond ; ſo that each emerges out of the ſecond ſurface parallel to the firſt incident ray. Again, if two pieces of this cryſtal be placed over each other, ſo that the ſurfaces of the one be parallel to the correſponding ones of the other ; the rays refracted in the uſual manner in the firſt ſurface of the firſt, are refracted after the uſual manner in all the other ſurfaces ; and the ſame uniformity appears in the rays refracted after the unuſual manner ; and this in any inclination of the ſurfaces, provided their planes of perpendicular refraction be parallel.

From theſe phenomena Sir Iſaac Newton infers, that there is an original difference in the rays of light ; by means whereof ſome are here conſtantly refracted after the uſual manner ; and others in the unuſual manner. Were not the difference original, and did it ariſe from any new modifications impreſſed on the rays at their firſt refraction, it would be altered by new modifications in the three following ones : whereas, in fact, it ſuffers no alteration at all. Again, he hence takes occaſion to ſuſpect, that the rays of light have ſeveral ſides, endued with ſeveral original properties : for it appears from the circumſtances, that theſe are not two ſorts of rays differing in their nature from each other, one conſtantly, and in all poſitions, refracted in the uſual, and the other in the unuſual manner ; the difference in the experiment mentioned being only in the poſition of the ſides of the rays to the plane of perpendicular refraction. For one and the ſame ray is refracted ſometimes after the uſual, and ſometimes after the unuſual manner, according to the poſition of its ſides to the cryſtal : the refraction being alike in both, when the ſides of the rays are poſited the ſame way to both, but different when different. Every ray therefore may be conſidered as having four ſides or quarters ; two of which, oppoſite to each other, diſpoſe the ray to be refracted after the unuſual manner ; and the other two in the uſual. Theſe diſpoſitions, being in the rays before their incidence on the ſecond, third, and fourth ſurfaces, and ſuffering no alterations ; for what appears in their paſſage through them muſt be original and connate.

Father Beccaria corrects the obſervations of Huygens and Newton concerning the refraction of rock or mountain cryſtal. The double refraction of the latter happens when a ray paſſes through two ſides that are inclined to each other, and conſequently iſſues coloured ; whereas that of the Iceland cryſtal is made by the paſſage of a ray through two parallel ſides, and therefore it iſſues colourleſs. He ſuggeſts, that there may be other ſubſtances in which there is a manifold refraction. Graveſande had a priſm of Braſil pebble, which had a double refraction at each angle, but of a different kind from one another. Mr B. Martin prepared ſeveral priſms of Iceland cryſtal, which exhibited not only a double but a multiple refraction. A ſingle priſm produced a ſix-fold refraction ; and by combining ſeveral priſms, a number of refractions was obtained equal to the product of thoſe of the ſingle priſms ; *i. e.* a priſm which afforded two images applied to one of ſix, produced a priſm of twelve images, &c. He farther obſerves, with reſpect to Iceland cryſtal, that tho' the ſides of its plane of perpendicular refraction be parallel to one another, a beam of light tranſmitted thro' them will not be colourleſs; in which property it differs from all other known ſubſtances.

CRYSTALLINE, in general, ſomething compoſed of, or reſembling, cryſtal. See CRYSTAL.

CRYSTALLINE Heavens, in ancient aſtronomy, two ſpheres, imagined between the primum mobile and the firmament, in the Ptolemaic ſyſtem, which ſuppoſes the heavens ſolid, and only ſuſceptible of a ſingle motion. See ASTRONOMY, n° 247.

CRYSTALLINE Humour. See ANATOMY, p. 767.

CRYSTALLINÆ, or **CRYSTALLINES**, in medicine, are puſtules filled with water, and ſo called on account of their tranſparency. They are one of the worſt ſymptoms attendant on a gonorrhœa. They are lodged on the prepuce, without pain; and though cauſed by coition, have nothing of infection attending them. The cauſe is ſuppoſed to be a contuſion of the lymphatic veſſels in the part affected. Dr Cockburn, who hath deſcribed this caſe, recommends for the cure a mixture of three parts of lime-water and two of rectified ſpirit of wine, to be uſed warm, as a lotion, three times a-day.

CRYSTALLIZATION, in general ſignifies the natural formation of any ſubſtance into a regular figure, reſembling that of a cryſtal. Hence the phraſes of cryſtallized ores, cryſtallized ſalts, &c. and even the baſaltic rocks are now generally reckoned to be effects of this operation: (See BASALTES and VOLCANO). The term, however, is moſt commonly applied to bodies of the ſaline kind, and their ſeparation in regular figures from the water, or fluid in which they are diſſolved, is called their *cryſtallization* *. The word *cryſtallization* is never applied to the freezing of water, or to the conſolidation of metals after they have been melted; though it might certainly be applied with as much juſtice to theſe ſubſtances as to any others; for all of them concrete into a certain regular form, from which they never deviate, unleſs diſturbed. When water freezes ſlowly, it always forms regular cryſtals of ice, which are conſtantly of the ſame form. They are long, needle-like maſſes, flattened on one ſide, and joined together in ſuch a manner that the ſmaller are inſerted into the ſides of the greater: and thus theſe compound cryſtals have the appearance of feathers, or branches of trees with leaves. The moſt remarkable circumſtance attending this cryſtallization is, that the angle formed by the inſertion of the ſmaller pieces into the larger, is either 60 or 120 degrees. The figures aſſumed by metals of different kinds have not been ſo exactly inveſtigated, except in the regulus of antimony, which is obſerved always to take a ſtellated form. Experience alſo ſhows, that all kinds of earths, or other mineral matters, are capable of aſſuming a cryſtalline form, and may eaſily be made to do ſo by taking away part of the water which diſſolves them.

1
Similarity between congelation and cryſtallization.

Different ſalts aſſume different figures in cryſtallization, and are thus moſt eaſily diſtinguiſhed from one another. The methods of reducing them into this form, for ſale, are mentioned under the article CHEMISTRY, n° 573. But beſides the large cryſtals produced in this way, each ſalt is capable of aſſuming a very different appearance of the cryſtalline kind, when only a ſingle drop of the ſaline ſolution is made uſe of, and the cryſtallization viewed through a microſcope. For our knowledge of this ſpecies of cryſtallization we are indebted to Mr Henry Baker, who was preſented with a gold medal for the diſcovery, in the year 1744. Theſe microſcopical cryſtals he diſtinguiſhes from the large ones by the name of *configurations*; but this term ſeems inaccurate, and the diſtinction may well enough be preſerved by calling the large ones the *common*, and the ſmall ones the *microſcopical*, cryſtals of the ſalt. His method of making theſe obſervations he gives in the following words:

2
Microſcopical cryſtals diſcovered by Mr Baker.

3
His method of procuring them.

“ I diſſolve the ſubject, to be examined, in no larger a quantity of rain or river water than I am certain it is ſufficient to ſaturate. If it is a body eaſily diſſolvable I make uſe of cold water; otherwiſe I make the water warm, hot, or even boiling, according as I find it neceſſary. After it is perfectly diſſolved, I let it reſt for ſome hours, till, if overcharged, the redundant ſaline particles may be precipitated and ſettle to the bottom, or ſhoot into cryſtals; by which means I am moſt likely to have a ſolution of the ſame ſtrength at one time as at another; that is, a ſolution fully charged with as much as it can hold up, and no more; and by theſe precautions the configurations appear alike, how often ſoever tried: whereas, if the water be leſs ſaturated, the proportions at different times will be ſubject to more uncertainty; and if it be examined before ſuch ſeparation and precipitation of the redundant ſalts, little more will be ſeen than a confuſed maſs of cryſtals.

“ The ſolution being thus prepared, I take up a drop of it with a gooſe quill cut in faſhion of a ſcoop, and place it on a flat ſlip of glaſs of about three quarters of an inch in width, and between three and four inches long, ſpreading it on the glaſs with the quill, in either a round or an oval figure, till it appears a quarter of an inch, or more, in diameter, and ſo ſhallow as to riſe very little above the ſurface of the glaſs. When it is ſo diſpoſed, I hold it as level as I can over the clear part of a fire that is not too fierce, or over the flame of a candle, at a diſtance proportionable to the heat it requires (which experience only can direct), and watch it very carefully till I diſcover the ſaline particles beginning to gather and look white, or of ſome other colour, at the extremities of the edges. Then (having adjuſted the microſcope before-hand for its reception, armed with the fourth glaſs, which is the fitteſt for moſt of thoſe experiments), I place it under my eye, and bring it exactly to the focus of the magnifier; and, after running over the whole drop, I fix my attention on that ſide where I obſerve any increaſe or puſhing forwards of cryſtalline matter from the circumference towards the centre.

“ This motion is extremely ſlow at the beginning, unleſs the drop has been overheated, but quickens as the water evaporates; and, in many kinds, towards the concluſion, produces configurations with a ſwiftneſs inconceivable, compoſed of an infinity of parts, which are adjuſted to each other with an elegance, regularity, and order, beyond what the exacteſt pencil in the world, guided by the ruler and compaſſes, can ever equal, or the moſt luxuriant imagination fancy.

---

* See Chemiſtry-Index.

“ When this action once begins, the eye cannot be taken off, even for a moment, without loſing ſomething worth obſervation: for the figures alter every inſtant till the whole proceſs is over; and, in many ſorts, after all ſeems at an end, new forms ariſe different entirely from any that appeared before, and which probably are owing to ſome ſmall quantity of ſalt of another kind, which the other ſeparates from, and leaves to act after itſelf has done: and in ſome ſubjects, three or four different ſorts are obſervable, few or none of them being ſimple and homogeneous.

“ When the configurations are fully formed, and all the water evaporated, moſt kinds of them are ſoon deſtroyed again by the moiſture or action of the air upon them; their points and angles loſe their ſharpneſs, become uneven and defaced, and moulder, as it were, away. But ſome few are permanent, and being incloſed between glaſſes, may be preſerved months, or even years, entertaining objects for the microſcope.

“ It happens oftentimes that a drop of ſaline ſolution can hardly be ſpread on the ſlip of glaſs, by reaſon of the glaſs's ſmoothneſs, but breaks into little globules, as it would do if the ſurface were greaſy: this was very troubleſome, till I found a way of preventing it, by rubbing the broken drop with my finger over the glaſs, ſo as to leave the ſurface ſmeared with it; on which ſmeared place, when dry, another drop of the ſolution may be ſpread very eaſily in what form one pleaſes.

“ It likewiſe ſometimes happens, that when a heated drop is placed properly enough for examination, the obſerver finds he can diſtinguiſh nothing: which is owing to ſaline ſteams that, riſing from the drop, cover and obſcure the object-glaſs, and therefore muſt immediately be wiped away with a ſoft cloth or leather.

“ In all examinations by the microſcope of ſaline ſolutions, even though made in the day-time, I always employ the light of a candle, and adviſe every obſerver to do ſo likewiſe: for the configurations being exceedingly tranſparent, are rendered much more diſtinguiſhable by the brown light a candle affords, than by the more white and tranſparent day-light; and beſides, either by moving the candle or turning the microſcope, ſuch light may be varied or directed juſt as the object requires.”

4
Deſcription of the microſcopical cryſtals of various ſalts.

In this manner were produced the beautiful cryſtallizations repreſented Plate CLII. They are vaſtly different from ſuch cryſtals of the ſame ſalts as are obtained by the common proceſſes; but Mr Baker aſſures us they are no leſs conſtant and invariable than they, and that he has repeated the experiments a great number of times with the ſame ſucceſs.

Fig. 1. ſhows the microſcopical cryſtals of *nitre* or *ſalt-petre*. Theſe ſhoot from the edges, with very little heat, into flattiſh figures of various lengths, exceedingly tranſparent, and with ſtraight and parallel ſides. They are ſhown in their different degrees of progreſſion at the letters *a, b, c, d, e*; where *a* repreſents how they firſt begin. After numbers of theſe are formed, they will often diſſolve under the eye, and diſappear entirely; but if one waits a little, new ſhoots will puſh out, and the proceſs go on afreſh. Theſe firſt figures ſometimes enlarge only without altering their ſhapes, and ſometimes form in ſuch ſort as the drop repreſents; but if the heat has been too great, they ſhoot haſtily into ramifications very numerous and beautiful, but very difficult to be drawn; and which Mr Baker therefore did not attempt. There ſeems all the while a violent agitation in the fluid, and moſt commonly, towards the concluſion, a few octaedra (compoſed of eight triangular planes, or two quadrangular pyramids, joined baſe to baſe) make their appearance.

2. *Blue vitriol*, produces cryſtals round the edges, very ſhort at the beginning, but increaſing gradually, as repreſented at the figures 1, 2, 3, which denote their difference of form, and the progreſs of their growth. Theſe cryſtalline ſhoots are ſolid, regular, tranſparent, and reflect the light very beautifully from their poliſhed ſides and angles. As the watery part evaporates, numbers of long ſlender bodies like hairs are ſeen here and there, ſome lying ſide by ſide, or croſſing each other as at 4, others forming ſtar-like figures with many radiations (5, 5). This ſalt ſhoots but ſlowly, and therefore requires patience. At laſt the true cryſtals begin to appear commonly in the middle of the drop, and are very prettily branched, as at 6.

3. *Diſtilled verdigris*, diſſolved as above directed, and immediately applied to the microſcope, ſhows abundance of the regular figures, 1, 2, 3, 4, 5, 6, 7: but if the ſolution is ſuffered to ſtand for a few hours, and a drop of it is then heated over the fire on a ſlip of glaſs, till it begins to concrete about the ſides, and then examined, ſharp-pointed, ſolid, figures, biſected by a line cut through the middle, from which they are cut away toward the edges, begin to appear, and ſhooting forwards (1, 1, 1). Theſe figures are often ſtriated very prettily from the middle line to the edges obliquely (2, 2); and frequently they ariſe in cluſters; and ſhooting from a centre (3, 3). Theſe figures are a long time in growing; and whilſt they are doing ſo, regular cryſtals appear forming in ſeveral parts of the drop, of the moſt lovely emerald colour, and reflecting the light from their ſides and angles, which are moſt exactly diſpoſed, and finely poliſhed. No cryſtals are formed in the middle till the water is nearly evaporated; and then they begin to form haſtily, for which reaſon they muſt be carefully attended. Their common figures reſembles two long *ſſ* croſſing each other in an angle of about 60°, and ſhooting branches every way: each of which again protrudes other branches from one and ſometimes from both, its ſides; making together an appearance like four leaves of fern conjoined by their ſtalks (5, 5). Separate cluſters of the ſame ſharp pointed figures, as thoſe at the edges of the drop, are alſo formed in the middle of it (6). Sometimes alſo they put on another form like the leaves of dandelion (7). Very beautiful figures are likewiſe produced by a kind of combination of ſharp points and branches (8, 8). All theſe cryſtals are of a moſt beautiful green colour, but deeper or lighter according to the time of their production. The deepeſt are conſtantly produced firſt, and the paler ones afterwards. Towards the end of the proceſs ſome circular figures are formed, extremely thin, and ſo ſlightly tinged, with green lines radiating from a centre, as to be almoſt colourleſs (9, 9). When all

ſeems in a manner over, bundles of hair-like bodies appear frequently ſcattered here and there throughout the drop, like thoſe of blue vitriol already deſcribed.

4. *Alum.* The microſcopical cryſtals of this ſalt prove more or leſs perfect according to the ſtrength of the ſolution and the degree of heat employed in making the experiment. The ſolution of alum, however ſaturated with the ſalt, will not be found overſtrong after ſtanding ſome days; for in that time many cryſtals will have formed in it. This ſeparation will often leave the remainder too weak for the purpoſe; but by holding the vial over, or near the fire, the cryſtals will again diſſolve. After it has ſtood about half an hour it may then be uſed. The drop put on the glaſs and properly heated, exhibits commonly at firſt a dark cloud which appears in motion ſomewhere near the edge, and runs pretty ſwiftly both to the right and left, until it is either ſtopped by the intervention of regular cryſtals, or elſe it proceeds both ways at once, till having ſurrounded the whole drop, the two ends ruſh together, and join into one (*a, a*). This cloudy part, which ſeems to be violently agitated while it is running round, appears on a ſtrict examination to conſiſt of ſalts, ſhot into long and very ſlender lines, much finer than the ſmalleſt hair, croſſing each other at right angles. As they go along, rows of ſolid cryſtals are produced from their internal edges. Theſe are compoſed of many oblique plain ſides (*b, b*), and which have all a tendency towards the figures of the regular cryſtals to be deſcribed preſently. But it frequently happens, that, in ſome parts of the drop, many minute and circular figures are ſeen, riſing at ſome little diſtances from the edge, which enlarging themſelves continually, appear at laſt of a ſtar-like form (*c, c*). The cryſtals in the middle ſeldom appear till the fluid ſeems almoſt wholly evaporated; when, on a ſudden, many ſtraight lines appear puſhing forwards, whoſe ſides or edges are jagged, and from which other ſimilar ſtraight and jagged lines ſhoot out at right angles with the firſt. Theſe again have other ſmall ones of the ſame kind ſhooting out likewiſe from themſelves, and compoſe altogether a moſt beautiful and elegant configuration (D). Each of theſe lines increaſing in breadth towards its end, appears ſomewhat club-headed (*e, e, e*). Sometimes, inſtead of ſending branches from their ſides, many of theſe lines riſe parallel to each other, reſembling a kind of palliſadoe, and having numberleſs minute tranſverſe lines running between them (F). But the moſt wonderful part of all, though not producible without an exact degree of heat and right management, is the dark ground work (G). It conſiſts of an infinity of parallel lines, having others croſſing them at right angles, and producing a variety ſcarce conceivable from lines diſpoſed in no other manner: the direction of the lines (which are exquiſitely ſtraight and delicate) being ſo frequently and differently changed, that one would think it the reſult of long ſtudy and contrivance. During the time this ground work is framing, certain lucid points preſent themſelves to view moſt commonly on one ſide. Theſe grow continually larger, with radiations from a centre, and become ſtar-like figures as before mentioned. Some of them ſend out long tails, which give them the appearance of comets: and at the end of all, a dark lineation in various directions darts frequently through, and occupies all or moſt of the ſpaces between them, making thereby no ill repreſentation, when viewed by candle-light, of a dark ſky, illuminated with ſtars and comets. The regular cryſtals are often formed in the ſame drop with the others (*f*).

5. *Borax.* If a drop of ſolution of borax is held too long over the fire, it hardens on the ſlip of glaſs in ſuch a manner that no cryſtals can appear. The beſt method is to give it a briſk heat for about a ſecond, and then applying it to the microſcope, the cryſtals will quickly form themſelves as repreſented in the figure.

6. *Sal ammoniac* begins with ſhooting from the edges great numbers of ſharp, but thick and broad, ſpiculæ; from whoſe ſides are protruded, as they riſe, many others of the ſame ſhape, but very ſhort; parallel to each other, but perpendicular to their main ſtem (1). Theſe ſpiculæ arrange themſelves in all directions; but for the moſt part obliquely to the plane from whence they riſe, and many are frequently ſeen parallel to one another (1, 1). As they continue to puſh forwards, which they do without increaſing much in breadth, ſome ſhoot from them the ſmall ſpiculæ only (2); others divide in a ſingular manner by the ſplitting of the ſtem (3); and others branch out into ſmaller ramifications (4). Before the middle of the drop begins to ſhoot, ſeveral exceedingly minute bodies may be diſcerned at the bottom of the fluid. Theſe in a little while riſe to the top, and ſoon diſtinguiſh their ſhape as at (5). Their growth is very quick, and for ſome time pretty equal; but at laſt ſome branch gets the better of the reſt, and forms the figure (6). The other branches enlarge but little after this, all the attraction ſeeming to be lodged in that one that firſt began to lengthen; and from this, more branches being protruded, and they again protruding others, the whole appears as at (8). It is not uncommon to ſee in the middle of the drop ſome cryſtals, where, inſtead of the ſtraight ſtems above deſcribed, there is formed a kind of zig-zag, with ſpiculæ like thoſe in the other figures (7).

7. *Salt of Lead*, or *ſaccharum ſaturni.* A little of this ſalt diſſolved in hot water, which it immediately renders milky, after ſtanding a quarter of an hour to ſubſide, is in a fit condition for an examination by the microſcope. A drop of it then applied on a ſlip of glaſs, and held over the fire to put the particles in action, will be ſeen forming round the edge a pretty even and regular border of a clear and tranſparent film or glewy ſubſtance (*a a a a*); which if too ſudden and violent a heat be given, runs over the whole area of the drop, and hardens ſo on the glaſs as not to be got off without great difficulty. But if a moderate warmth be made uſe of, which likewiſe muſt not be too long continued, this border proceeds only a little way into the drop, with a kind of radiated figure compoſed of fine lines, or rather bundles of lines, beginning from the centres in the interior edge of the border, and ſpreading out at nearly equal diſtances from each other every way, towards the exterior (*b b b b*). From the ſame centres are produced afterwards a radiation inwards, compoſed of parallelograms of different lengths and breadths; from one, and ſometimes both the angles of theſe, are frequently ſeen ſhootings ſo exceedingly ſlender, that they are pre-

perhaps the beſt poſſible repreſentations of a mathematical line. The extremities of the parallelograms are generally caſt off at right angles; but they are ſometimes alſo ſeen oblique (*c c c c*). Centres with the like radii iſſuing from them, and ſome of the glutinous matter for their root, are ſometimes formed in the drop, entirely detached from the edges; and in theſe it is very frequent to find a kind of ſecondary radii proceeding from ſome of the primary ones; and others from them again to a great number of gradations, forming thereby a very pretty figure (D).

8. *Salt of Tin*, produces at the edges of the drop a number of octaedra, partly tranſparent, ſtanding on long necks, at ſmall diſtances from each other, with angular ſhoots between them (*a a*). At the ſame time, ſolid and regular opaque cubes will be ſeen forming themſelves in other parts of the drop (*b b*). In the middle of the ſame drop, and in ſeveral other parts of it, very different figures will alſo be formed; particularly great numbers of flat, thin, tranſparent, hexangular bodies (*c c c*); ſome among which are thicker (*e*), and a few appear more ſolid, and with ſix ſloping ſides riſing to a point, as if cut and poliſhed (*d*). The figure (*f*) is compoſed of two high pyramids united at their baſe. Some in this kind of form are found truncated at one of their ends, and others at both. Several of the hexagonal bodies may be obſerved with ſloping ſides, forming a ſmooth, triangular, riſing plane, whoſe angles point to three intermediate ſides of the hexagon (*g*).

9. *Epſom Salt*, begins to ſhoot from the edge in jagged figures (*a*). From other parts differently figured cryſtals extend themſelves towards the middle, ſome of which have fine lines proceeding from both ſides of a main ſtem, in an oblique direction; thoſe on one ſide ſhooting upwards in an angle of about 60°, and thoſe on the other downwards in the ſame obliquity (*c f*). Others produce jags from their ſides nearly perpendicular to the main ſtem, thereby forming figures that reſemble ſome ſpecies of the polipody (*e*); but in others the jags are ſhorter (*d*). Now and then one of the main ſtems continues ſhooting to a conſiderable length, without any branchings from the ſides; but at laſt ſends out two branches from its extremity (*g*). Sometimes a figure is produced having many fine and minute lines radiating from a centre (*b*). The laſt ſhootings in the middle of the drop (*h*) are not unlike the frame-work of the flooring or roofing of a houſe, but with the angles oblique: and ſometimes a form of another kind preſents itſelf (*i*).

10. *Scarborough Salt*, begins to ſhoot from the edges: firſt of all in portions of quadrilateral figures, much reſembling thoſe of common ſalt; but two of their angles, inſtead of 90, are about 100°. They ſhoot in great numbers round the borders of the drop, having their ſides as nearly parallel to one another as the figure of the drop will allow: ſome proceed but a little way, others farther, before they renew the ſhoot (*a a*). In ſome places they appear more pointed and longer (*b*); and ſometimes, inſtead of the diagonal, one of the ſides is ſeen towards the edge, and the other ſhooting into the middle (*c*). The middle cryſtals (*d e f*) ſeem to be of the vitriolic kind.

11. *Glauber's Salt*, produces ramifications from the ſide of the drop, like the growth of minute plants, but extremely tranſparent and elegant (*c*). Some of them, however, begin to ſhoot from a centre at ſome diſtance from the edge, and protrude branches from that centre in a contrary direction (*b*). Sometimes they ſhoot from one, and ſometimes from more ſides of the central point in different varieties (*d*). Other figures are produced from different parts of the edge of the drop (*a, f, e*); but the moſt remarkable and beautiful cryſtallization forms laſt of all near the middle of the drop. It is compoſed of a number of lines proceeding from one another at right angles with tranſparent ſpaces and diviſions running between them, appearing altogether like ſtreets, alleys, and ſquares, (*g g*). When this cryſtallization begins, it forms with great rapidity, affording the obſerver a very agreeable entertainment: but its beauty is of very ſhort duration: in a few moments it diſſolves and vaniſhes like melted ice, which renders the drawing of it very difficult

12. *Salt of Jeſuits bark*. The few ſhootings which the ſalt produces at the edge of the drop are of no regular figure (*a*). The whole area becomes quickly filled with great numbers of rhombi, of different ſizes, extremely thin and tranſparent (*b*). Some of theſe enlarge greatly and acquire a conſiderable thickneſs, forming themſelves into ſolids of many ſides, (*c, c*). Near the concluſion ſome cryſtals of ſea-ſalt are formed (*dd*), and likewiſe a few odd triangular figures (*e*).

13. *Salt of Liquorice*, begins ſhooting from the edge with a ſort of rhombic ſpiculæ (*a*). Some four-branched figures like thoſe of vitriol commonly appear, but moulder away before their ramifications are completed, leaving only their ſtamina behind (*b b*). The middle of the drop is uſually overſpread with great numbers of parallelograms, ſome exceedingly tranſparent, being mere planes; having ſometimes one, ſometimes more, of the angles canted in ſuch a manner as to produce pentagonal, hexagonal, and other figures. Others have much thickneſs, and form parallelopipeds or priſms (*e*). Some of the plane figures now and then protrude an irregular kind of ſhooting which appears very pretty (*d*).

14. *Salt of Wormwood*. The firſt ſhootings of this ſalt from the edges of the drop appear of a conſiderable thickneſs in proportion to their length: their ſides are deeply and ſharply jagged or indented, being made up of many ſomewhat obtuſe angles, and their ends pointed with angles of the ſame kind (*a*). But other ſhoots frequently branch out from theſe original ones, and they again ſend forth others, making altogether a very pretty appearance (*bb*). The cryſtals of this ſalt are very different from each other, conſiſting of ſquares, rhombi, parallelograms, &c. (*c*).

15. *Salt of Tobacco*. If a moderate degree of heat is given to a ſolution of this ſalt its firſt ſhootings will be from the edges of the drop, in ſlender tapering figures, ending with very ſharp points, but at conſiderable diſtances from one another. Along with theſe are formed other cryſtals, nearly of the ſame kind, but entirely detached, and farther within the drop, having the thicker ends towards the centre of the drop, and the ſharp points turned towards its edge (*a*). When a little more heat has been given, other ſpiculæ are produced from the edge, whoſe ends ſpread on either ſide, and then terminate in a point;

and which have all along their ſides triangular pointed cryſtals, placed alternately ſo as to repreſent a zigzag, with a line drawn through its middle (*b*). The regular cryſtals are produced in the middle of the drop, and are either hexagons or rhombi (*c*). When the moiſture is nearly exhaled, there are ſometimes ſeen to ſhoot from, or rather under the ſpiculæ, upon the plane of the glaſs, a repreſentation of leaves very ſmall at their firſt appearance, but gradually increaſing (*d*). A violent agitation may be diſcovered in the fluid by the firſt magnifier during the whole proceſs: but eſpecially at the beginning, and extremely minute cryſtals riſing from the bottom.

16. *Salt of Hartſhorn.* On the application of a very ſmall degree of heat, ſalt of hartſhorn ſhoots near the edges of the drop into ſolid figures ſomewhat reſembling razors or lancets, where the blade turns into the handle by a claſp (*d*). The cryſtals of this ſalt are produced with great velocity, and are ſomewhat opaque, ſhooting from the edges of the drop, on both ſides a main ſtem, and with a kind of regularity, rugged branches like thoſe of ſome ſorts of coral (*a a*). But ſometimes, inſtead of theſe branches, ſharp ſpiculæ, ſome plain, and others jagged, are protruded to a conſiderable depth on one ſide only (*b*). As the fluid exhales, ſome one of the branching figures generally extends to a great length, producing on one ſide ſhoots that are rugged and irregular, and on the other curious regular branches reſembling thoſe of ſome plant (*c*).

17. *Salt of Urine*, ſhoots from the edges of the drop in long parallelograms like nitre (*a a*). But in other places, along the ſides of the drop ſolid angles are formed, that ſeem to be the rudiments of common ſalt (*b*). Some of the parallelograms increaſe much in ſize, and ſpread themſelves in the middle, ſo as to change their firſt figure, and become three or four times bigger than the reſt: and theſe have a dividing line that runs through their whole length from end to end, whence iſſue other ſhort lines at ſmall diſtances, oppoſite to one another; all pointing with the ſame degree of obliquity towards the baſe (*c c*). Among theſe enlarged figures, ſome few ſhoot ſtill forward and tapering towards a point, but, before they form one, ſwell again, and begin as it were anew; and thus they proceed ſeveral times before their figure is quite finiſhed (*aa*). The figures 1, 2, 3, 4, 5, 6, are the regular cryſtals of this ſalt when it is allowed to diſſolve in the air, and no heat at all is given.

18. *Rheum*, or the clear liquor which diſtills from the noſtrils when people catch cold, is ſtrongly ſaturated with ſalt. A drop of it on a ſlip of glaſs will ſoon cryſtallize in a beautiful manner, either with or without heat; but if heated to about the warmth of the blood, and when viewed through the miſcrope, many lucid points will be ſeen riſing and increaſing gradually, till their form is ſhown to be quadrangular, with two tranſparent diagonals croſſing each other (*dd*). Theſe diagonals ſhoot ſoon after far beyond the ſquare, protruding other lines at right angles from their ſides; and thus they go on to form the moſt elegant and beautiful cryſtals (*bb, cc*). When a drop of rheum is ſet to cryſtallize without any heat, inſtead of branched cryſtals over the whole area, ſuch are formed only in the middle; but, about the edges, plant-like figures are produced ſhooting ſeveral ſtems from one point, and reſembling a kind of ſea-moſs (E).

19. *Camphire*, though inſoluble in water, diſſolves very readily in ſpirit of wine. A drop of this ſolution ſpread upon a ſlip of glaſs cryſtallizes inſtantly in the beautiful manner repreſented in the figure.

20. *Manna* eaſily diſſolves in water, and a drop of the ſolution is a very pretty object. Its firſt ſhootings are radiations from points at the very edge of the drop: the radiating lines ſeem opaque, but are very ſlender (*a a a*). Amongſt theſe ariſe many minute tranſparent columns, whoſe ends grow wider gradually as they extend in length, and terminate at laſt with ſome degree of obliquity (*b*). Some few figures radiating from a centre every way, and circumſcribed by an outline, are produced within the drop (*d d*). But the moſt ſurpriſing and elegant configuration is compoſed of many cluſters of radiations ſhooting one from another over great part of the drop, and making all together a figure not unlike a certain very beautiful ſea-plant (C).

5 **Exceſſive variety in the forms of cryſtals.**

The phenomena of cryſtallization have much engaged the attention of modern chemiſts, and a vaſt number of experiments has been made with a view to determine exactly the different figures aſſumed by ſalts in paſſing from a fluid to a ſolid form. It does not, however, appear, from all that has yet been done, that any certain rule can be laid down in theſe caſes, as the figure of ſaline cryſtals may be varied by the ſlighteſt circumſtances. Thus, ſal ammoniac, when prepared by a mixture of pure volatile alkali with ſpirit of ſalt, ſhoots into cryſtals reſembling feathers; but if, inſtead of a pure alkali, we make uſe of one juſt diſtilled from bones, and containing a great quantity of animal oil, we ſhall, after ſome cryſtallizations of the feathery kind, obtain the very ſame ſalt in the form of cubes.

Such ſalts as are ſublimeable cryſtallize not only in the aqueous way by ſolution and evaporation, but alſo by ſublimation; and the difference betwixt the figures of theſe cryſtals is often very remarkable. Thus ſal ammoniac by ſublimation never exhibits any appearance of feathery cryſtals, but always forms cubes or parallelopipeds. This method of cryſtallizing ſalts by ſublimation has not as yet been inveſtigated by chemiſts: nor indeed does the ſubject ſeem capable of inveſtigation without much trouble; as the leaſt augmentation of the heat beyond the proper degree would make the cryſtals run into a ſolid cake, while a diminution of it would cauſe them fall into powder. In aqueous ſolutions, too, the circumſtances which determine the ſhapes of the cryſtals are innumerable; and the degrees of heat, the quantity of ſalt contained in the liquor, nay, the quantity of liquor itſelf, and the various conſtitutions of the atmoſphere at the time of cryſtallization, often occaſion ſuch differences as ſeem quite unaccountable and ſurpriſing.

6 **Mr Bergman's account of their formation.**

Mr Bergman has given a diſſertation on the various forms of cryſtals; which, he obſerves, always reſemble geometrical figures more or leſs regular. Their variety at firſt appears infinite; but by a careful examination it will be found, that a great number of cryſtals, ſeemingly very different from each other, may be produced by the combination of a ſmall number of original figures, which therefore he thinks may be called *primitive*. On this principle he explains the formation

Cryſtallization.

of the cryſtalline gems as well as ſalts; and the reſults of his obſervations are as follow.

I. One of the primitive forms is that named by our author *ſpathaceous*; and theſe, he ſays, properly agglutinated, may form the great variety of diſſimilar bodies found among cryſtals.

7
Of the ſchoerlaceous cryſtal.

In the calcareous ſpar we find a combination of rhombi, whoſe obtuſe angles contain $101\frac{1}{2}$ degrees, and the acute $78\frac{1}{2}$. By a combination of theſe is formed the calcareous ſpar, which appears in the form of a teſſera or oblique parallelopiped; but by other combinations of the ſame planes, cryſtals apparently of the moſt oppoſite forms may be generated. Thus, for the formation of an hexaedral priſm, conſiſting of ſix equal and ſimilar parallelograms terminating at both ends in three rhombi which form a ſolid angle, we have only to ſuppoſe a continual addition of rhombi equal, ſimilar, and parallel to the oblique parallelopiped or cryſtal of the calcareous ſpar. Thus, ſuppoſe the figure ABCDE (fig. 1.) to repreſent a nucleus of the kind juſt mentioned, the axis of which paſſes through the two oppoſite angles B E; it is evident, that by a continual application of rhombi, ſuch as F G, H I, &c. to both ſides of the axis, we ſhall at laſt produce the figure A B, fig. 2. and which repreſents the hexaedral priſm required. This kind of cryſtal, our author tells us, belongs chiefly to the ſtones called *ſchoerls*, and is therefore called the *ſchoerlaceous* form. It belongs likewiſe to ſome others of the calcareous tribe.

Plate CLIII.

8
Garnet cryſtal.

From the ſchoerlaceous cryſtal that of the garnet is eaſily produced by a ſtoppage of the accumulation of the planes as ſoon as the ſides of the priſm have acquired a rhomboidal figure. Thus a complete dodecahedron is formed, which is always the figure of the garnet when perfect.

9
Hyacinth.

The figure of the garnet is eaſily changed into another, frequently aſſumed by the hyacinth, by the regular application of equal and ſimilar rhombi to each of the ſolid angles, which angles are formed by four planes. The garnet, when complete, has ſix angles compoſed of four planes, and eight with three. The formation of this kind of cryſtal will be underſtoood from an inſpection of fig. 3. In this operation the four rhombi are changed into an equal number of oblong hexagons; L H A B into L H *h a b* B: and ſo of the other rhombi repreſented by the different letters of the figure.

10
Pyramidal cryſtals.

In ſome caſes the original planes decreaſe according to a certain law; and this, from whatever cauſe it may ariſe, muſt neceſſarily change the appearance of the terminating planes, and occaſionally either augment or diminiſh their number. Thus, inſtead of a priſm, we ſhall have a double pyramid, one tending upwards and other downwards, as will be eaſily underſtood from what has been already ſaid. This is the form aſſumed by the calcareous cryſtals commonly called *pigtooth* by the miners.

If the decreaſing ſeries of rhombi is ſtopped before they vaniſh ultimately in a point, the formation of truncated pyramids, of which many examples are to be met with in the mineral kingdom, muſt neceſſarily take place. In caſes of this kind, it is eaſy to ſee why the pyramids, if ſtruck in one direction, will break over ſmoothly and eaſily, but not in another.

Cryſtallization.

11
Deviations from a perfect cryſtal-line form.

It is not uncommon to find the original cryſtals themſelves imperfect; in which caſe the large cryſtals, formed by combining them together, muſt deviate more or leſs from the perfect form. Thus, let A B C D E F G (fig. 4.) repreſent the three rhombi which conſtitute the apex of a perfect ſchoerlaceous cryſtal; and let us next ſuppoſe the rhombus A G truncated in the direction of the line *a b*, C G along *c d*, and E G along *e f*. Thus, the regular hexagonal figure of the priſm A B C D E F will be changed into an irregular one *a b c d* D *e f* F, conſiſting of nine unequal ſides, whoſe apex is compoſed of three irregular pentagons, *a b* B G F, *c d* D C B, and *e f* F G D. The rough tourmalins of Tyrol and Ceylon particularly aſſume this form, though it ſometimes belongs to bodies both of the calcareous and ſchoerlaceous kind.

12
Triangular cryſtals.

Triangular cryſtals may be ſuppoſed to ariſe from thoſe of the pentagonal kind; it being obvious, that the periphery of a pentagon, as *a b* B G F, approaches more nearly to a triangle in proportion as the diſtance between *a b* and B F grows leſs: and when theſe diſtances vaniſh entirely, a triagonal priſm is formed, terminated by three triangles: if the cutting line *a b* approach ſtill nearer to the centre G, the form ſtill remains the ſame.

13
Varieties of the garnet cryſtal.

Let us now ſuppoſe, that the garnet cryſtal, whoſe ſhape is repreſented fig. 5. inſtead of complete rhombi, has others accumulated about its axis, whoſe three external angles are truncated; or, which is the ſame thing, if the longitudinal margins of the priſm be cut by planes parallel to the axis, cryſtals will be formed, whoſe ſhape is repreſented by the ſmall letters in the figure. Calcareous cryſtals are ſometimes found of this ſhape; but generally ſo low, that *e* nearly coincides with *a*, *c* with *d*, &c. and hence the pentagon *a b c d e* becomes almoſt of a triangular figure, which has been attributed to theſe cryſtals by ſome authors who did not underſtand their true origin. The pyritaceous cryſtals ſometimes afford inſtances of this kind complete. Sometimes the garnet conſiſts of 24 ſides, by having all the margins truncated; a change which may eaſily be underſtood from what has been already mentioned. If the interſection *c d* of the planes *e e* and *c r* fall without the plane B G, a figure of a very different kind will be generated.

14
Cruciform hyacinthine cryſtal.

Sometimes the hyacinthine cryſtal aſſumes the cruciform appearance A B C D E F G H I K L M, fig. 6. Here the apex is at C, the figure A B C *b c a* being all in the ſame inclined plane, which is the caſe with the other three homologous figures. Now, in order to inveſtigate the formation of theſe cryſtals, let us ſuppoſe the rhombi C O, C P, and C Q, to be completed, which to an eye placed in the high axis C, will appear like as many ſquares ſituated in the ſubjacent plane. Thus we may underſtand the formation of the cryſtals of granite as well as of the hyacinth. The former may be ſuppoſed a quadrangular priſm compoſed of four rhombi, touching one another only at their apices, and terminated at each end by four rhombi meeting at the apex. When this form is a little protracted, or augmented by applying to the apices, ſimilar and equal planes, it becomes that of the hyacinth; whence the granite cryſtal may be called the rudiment of the hyacinth alſo. The variety here

Scot Philad^a

BRITISH MUSEUM

mentioned, of hyacinthine cryſtals, is met with in the Hartz mines. Mr Ehrhart ſays, that they are of a ſiliceous, and not of a calcareous, nature.

15 Other varieties of the forms of cryſtals.

If planes ſimilar to one another, but diſſimilar to the fundamental ones, be added, a vaſt variety of ſhapes may be produced, of which it is needleſs to give more examples at preſent. Our author appeals to experience for the truth of it; and aſſerts, that the looſe texture of calcareous cryſtals will clearly ſhow their conſtruction, if carefully and completely broken. The harder cryſtals can ſcarcely be broken in ſuch a manner as to ſhow their ſtructure; but the ſchoerls diſcover it very plainly, and even the garnets ſhow themſelves to be compoſed of laminæ.

“ Finally (ſays Mr Bergman), we may add one particular obſervation concerning priſmatic and hexagonal calcareous cryſtals truncated perpendicularly; ſuch ſometimes occur, and they cannot derive their origin, in the manner above deſcribed, from the ſpathaceous particles, and by no other way can hexagonal priſms be generated. What, then, is the cauſe which deſtroys their apices? I confeſs this to be a queſtion which I am wholly unable to anſwer, unleſs we may aſſume an accumulation of planes more and more deficient around the axis. We may from hence conclude, that ſomething unuſual occurs; as the truncated extremity is opaque, while the reſt of the priſm is tranſparent; but the upper hexagonal ſection is ſmooth and poliſhed.”

On the whole, our author obſerves, that the greateſt varieties may occur in the figures of cryſtals, though all of them may be generated from thoſe of the ſpathaceous form, and the ſubſtance of all may be ultimately the ſame; whence we ſhould be induced to put but little confidence in the figure. “ If, then, (ſays he), this teſt, which undoubtedly is the moſt remarkable ſo far as externals reach, is of ſo little uſe, of what value can the others be? and with what ſucceſs can we hope to form a ſyſtem of mineralogy upon ſuch diſtinctions? External criteria ſhould certainly not be neglected, but he who truſts implicitly to them deceives himſelf.”

16 Of the minute conſtituent parts of cryſtals.

II. From a conſideration of the larger lamellæ of which cryſtals are compoſed, our author naturally proceeds to an inveſtigation of their ſmaller conſtituent parts. Here he is of opinion, that the different external appearance of all cryſtals is owing to varieties in their mechanical elements. A queſtion, however, occurs, Whether thoſe very minute molecules, which may, as it were, be called the *ſtamina* of cryſtals, be naturally poſſeſſed of a determinate angular figure, or whether they acquire it by cryſtallization? In anſwer to this, he mentions the following facts, which he has had an opportunity of obſerving himſelf.

1. “ If the ſmall particles which ſeparate from lime-water, when expoſed to the air, be inſpected with a microſcope, they will be found ſpathaceous.

2. “ The greater ſpathous teſſeræ, when accurately examined, are frequently found with ſtriæ running diagonally, ſuch as often appear in ſaline cryſtals, by which their internal ſtructure is diſcovered.

3. “ The cubes of common ſalt not only exhibit diagonal ſtriæ, but frequently, upon each ſide, ſhow ſquares parallel to the external ſurface, and gradually decreaſing inwards (fig. 7.), by which we diſcover their internal ſtructure: for every cube is compoſed of ſix quadrangular hollow pyramids, joined by their apices and external ſurfaces; each of theſe filled up by others ſimilar, but gradually decreaſing, completes the form. By a due degree of evaporation, it is no difficult matter to obtain theſe pyramids ſeparate and diſtinct, as in fig. 8. or ſix of ſuch, either hollow, or more or leſs ſolid, joined round a centre. This is the whole courſe of the operation from beginning to end. This takes place in the ſalited vegetable alkali, or *ſal digeſtivus Sylvii*; in the cryſtallized luna cornea; the galena or ſulphurated lead; and quadrangular nitre, which is of the ſpathaceous form, produces a ſimilar congeries of pyramids, and theſe almoſt equally diſtinct with the preceding cubic cryſtals. A ſolution of alum, upon evaporation, generally produces ſolid octaedra; but ſometimes alſo it exhibits hollow pyramids, and upon ſuch of them as are complete, the junctures are very diſtinctly marked by conſpicuous lines.

4. “ Sometimes, too, other ſalts indicate the ſame conſtruction by viſible diagonals. Fig. 9. repreſents a ſection of the hexagonal priſm formed by Rochelle ſalt. The arrangement of the internal particles of this ſalt cannot be known when the cryſtal is complete: but when it is formed on the bottom of the veſſel, as repreſented fig. 10. the lower ſide cannot be perfect; and this parallelogram exhibits two diagonals diſtinctly, as repreſented fig. 11. This is likewiſe the caſe with the ſalt extracted from human urine, called *microcoſmic ſalt*. Beſides, we ſhould obſerve of the vertical triangles, that they are alternately tranſparent and opaque in pairs; which plainly points out a difference in the ſituation of their elements. Some cryſtals of nitre are alſo marked with diagonals; a circumſtance which in others is generally concealed by the cloſe connection of the particles.

5. “ If we examine the hollow pyramid of common ſalt farther, we ſhall find it compoſed of four triangles, and each of theſe formed of threads parallel to the baſe; which threads, upon accurate examination, are found to be nothing elſe than a ſeries of ſmall cubes: Therefore, although the above circumſtances ſeem plainly to point out the formation of all cryſtals from the union and coheſion of pyramids, whoſe ſides, being different in form and magnitude, occaſion the differences of forms; it yet remains uncertain whether the ſame internal ſtructure takes place in thoſe whoſe minuteneſs renders them totally inviſible; and whether the primary ſtamina poſſeſs a determinate figure, or are compoſed by the union of many ſhapeleſs particles. We have long known, that the ſmalleſt concretions which are viſible by a microſcope poſſeſs a determined figure: but theſe are compounds. In the mean time, until this veil be removed in ſome meaſure at leaſt, we cannot avoid comparing the proceſs of cryſtallization with the congelation of water.

“ While the watery particles are concreting, they exert a double tendency; by one of which they are formed into ſpiculæ, by the other theſe ſpiculæ are ranged in ſuch a manner with reſpect to one another as to form angles of 60 degrees: from hence the varieties obſerved in the particles of ſnow may be eaſily explained. The moſt ſimple figure is that where ſix equal radii diverge from a centre in the angle abovementioned, as in fig. 12. The ſame angle will be preſerved if the extremities of theſe be joined by right lines; which will alſo be the caſe, if each of the triangles

angles thus formed be filled with right lines parallel to the baſe, as in fig. 13.

“ Let us now ſuppoſe the particles which are employed in cryſtallization endowed with a tendency to form ſpiculæ, and theſe ſpiculæ with a tendency to arrange themſelves at equal angles of inclination, and we ſhall have both the triangles and the pyramids compoſed of them, even although the primary ſtamina had not a determined figure. As the angles of inclination vary, the triangles and pyramids will alſo vary ; and hence the different forms of cryſtals will be produced, which may to a certain degree be inveſtigated geometrically, the angles being given.

17
Different ways in which they may be produced.

III. Mr Bergman now conſiders the various ways in which cryſtals may be produced ; which are, 1. By water ; 2. By a liquefying heat ; 3. By a volatilizing heat.

1. The moſt common method of obtaining cryſtals is by means of water ; as by this medium ſaline ſubſtances are very readily taken up, and appear again in a ſolid form when the liquid is properly diminiſhed by evaporation. It is not only when diſſolved in water that they acquire determinate forms ; this happens alſo when they are ſufficiently attenuated and mixed with it ; for ſubſtances not ſoluble in water will remain ſuſpended in it, when, by ſufficient diviſion, they have acquired as much ſurface as makes them approach the ſpecific gravity of the fluid ; and it ſeems very probable, that many of the earths met with in the mineral kingdom, which have a regular form, have coaleſced in this way. We muſt, however, carefully diſtinguiſh between mechanical mixture and true ſolution, even though both ſhould agree in weight. When ſolid bodies are mechanically mixed with water, they will remain at the bottom of the veſſel if laid there in powder, unleſs diffuſed by agitation ; but ſoluble ſubſtances totally and ſpontaneouſly diſtribute themſelves through the menſtruum even without any agitation, though this certainly accelerates the ſolution.

2. Another method of obtaining cryſtals is by fuſion and ſlow cooling. Thus ſulphur, when melted and cooled, ſhoots into long ſtriæ, acquiring at the ſame time an electrical property : biſmuth, zinc, and regulus of antimony, acquire a teſſelated appearance ; nay, the laſt of theſe, when ſet to cool in a conical mould, becomes ſtellated, not only on the upper ſurface or baſis of the maſs, but along the whole axis. Glaſs alſo, when melted and ſlowly cooled, will ſometimes ſhoot into beautiful cryſtals. Our author mentions his having ſometimes ſeen the ſcoria of furnaces, where iron had been melted with the addition of calcareous earth, of a regular priſmatic figure ; and when crude iron has been melted with lime, he has ſometimes alſo found complete octaedra in the ſcoria. In large metallic maſſes, however, the under parts are generally ſo much preſſed by the weight of thoſe above, that they ſhow no ſigns of cryſtallization, though beautiful cryſtals are often formed on the ſurface of gold, ſilver, iron, &c.

3. The particles of bodies volatilized by heat, if during cooling they are ſufficiently at liberty, often obey the laws of attraction, and form cryſtals. To this claſs we may refer thoſe which are condenſed from the vapours of regulus of antimony, called the *flores argentini*. The galena which is frequently interſperſed among the copper-ore at Fahlun ſends forth a vapour which condenſes on the upper ſtrata, forming hollow pyramids, which are the baſes of the cubes of galena, entirely ſimilar to thoſe which compoſe common ſalt. In the heaps of arſenical ore expoſed to the fire at Loefa, our author has collected very beautiful cryſtals, of white, yellow, and red colours, partly tetraedral and partly octaedral. Some of theſe exhibit hollow pyramids, whoſe ſides conſiſt of threads parallel to the baſe, and exactly ſimilar to thoſe formed in the moiſt way. Theſe cryſtals, when complete, frequently ſhow the junctures of the pyramids very diſtinctly by ſtraight lines ; and by careful examination, we may be able to trace the whole proceſs through its various ſteps, from the very beginning to the end of the operation.

18
Formation of priſms of various kinds.

Priſms of any kind may be formed by the apices of proper pyramids meeting together in a certain number round the ſame point. The apex may alſo be formed by a ſingle pyramid, having its vertical angle turned outward. Thus, by adding to the cube ABCD the quadrangular pyramids ABE DCF, we ſhall have a four-ſided priſm (fig. 16.) ; and thus, though very ſeldom, common ſalt ſometimes acquires an apex. If we apply to one or both of the apices of the octaedron ACBD, fig. 17. a hollow pyramid *a d b*, ſimilar and equal to the fundamental figure, we will have a priſm of the ſame kind : alum, however, has never been obſerved of a priſmatic form by our author, though ſometimes conſiſting of octaedra imperfectly joined together, as in fig. 18. Four-ſided pyramids may be compoſed of four tetraedra, and conſequently 24 of the ſame may make up a cube ; “ and (ſays our author) it has alſo a double apex of 32. Thus we have a new conſtruction, which undoubtedly ſometimes takes place ; for, as I have already ſaid, arſenical cryſtals ſometimes take the tetraedral, ſometimes the octaedral, form, which may therefore eaſily be mutually exchanged.

“ It is with leſs facility that hexagonal priſms are formed of ſuch pyramids as have the ſame number of ſides, unleſs tetraedra be admitted. In fig. 19. four hexagonal and ſix tetragonal pyramids meet ; the former are eaſily reſolved into ſix and the latter into four tetraedra (fig. 20.) ; 48 of which conſequently make up the whole maſs, ſuppoſing this to be the method followed by nature. I have no doubt that this conſtruction is probable on many accounts ; for it requires only the moſt ſimple elements, and ſuch as are conformable to the figures of all cryſtals. That tetraedra adapted to this purpoſe have ſometimes diſſimilar and unequal ſides, makes not againſt the ſuppoſition : but what is moſt to the purpoſe is, that ſometimes ſuch tetraedra are employed without the ſmalleſt doubt. All theſe circumſtances are of no ſmall weight ; but as long as no traces of tetraedra are to be found among the pyramids of common ſalt, the laws of ſound reaſoning forbid us to draw any general concluſion. I am perfectly certain that nature does frequently employ pyramids in this operation ; it remains for future experiments to determine whether this be always the caſe.”

19
Different theories of cryſtallization.

IV. We come now to conſider the ultimate cauſe of cryſtallization, concerning which there have been many different theories. Some have been of opinion that there cannot be any cryſtallization without a ſaline principle in ſome degree exiſting in the cryſtallizing ſubſtance. This opinion, however, is oppoſed by Mr Bergman on the following grounds :

1. He ſuppoſes cryſtallization to be an effect of attraction ;

traction; conſequently, as all other matters as well as ſalts are ſubject to the laws of that attraction, we cannot conſider the regular and ſymmetrical form in which they arrange themſelves as peculiar to ſaline bodies; and hence cryſtals are alſo produced by ſuch methods as will ſufficiently attenuate and diſengage the integrant parts from each other.

2. The more ſimple that any ſaline body is, and the more free from any kind of heterogeneous matter, the more difficult it is to reduce it into a cryſtalline form. Thus the pure acids and cauſtic alkali cannot be made to aſſume the form of cryſtals without the greateſt difficulty.

3. The ſimilarity of forms in cryſtals, Mr Bergman obſerves, "does not depend upon the acid; as the priſmatic and quadrangular nitre are formed from the ſame acid, though joined indeed to different alkalies. Neither is the baſis ſufficient to determine the figure; for the vegetable, as well as the mineral alkali, when ſaturated with marine acid, will produce cubical cryſtals. The external appearance, therefore, depends on the menſtruum and the baſe jointly. We are not, however, to imagine from thence that there is preſent a neutral or middle ſalt whenever the figure of ſuch a one is diſcoverable; for not the ſmalleſt particle of alum is found in nickel or lead when united with nitrous acid, though both theſe compounds yield octaedral cryſtals." Here we may again remark, that the figure of cryſtals depends upon circumſtances altogether unknown, of which Dr Eaſon, in a paper on this ſubject in the Mancheſter Tranſactions, gives a remarkable inſtance in gypſum, which is known to be a combination of the vitriolic acid with a calcareous baſis; yet this compound is found naturally cryſtallized in five ways, ſo very different from each other, that mineralogiſts have diſtinguiſhed them by five diſtinct names, viz. Lapis ſpecularis. 2. Striated gypſum. 3. Gypſeous alabaſter. 4. Selenites properly ſo called. 5. A gypſeous ſpar frequently adhering to the veins of ore in mountains. All of theſe, when chemically examined, exhibit preciſely the ſame phenomena, and are really nothing but different cryſtallizations of the ſame compound ſalt.

4. Mr Bergman likewiſe obſerves, that there is a great variety in the forms of cryſtals, though the matter remains the ſame; of which examples have been given in the calcareous cryſtals, and in the different kinds of gypſum juſt mentioned. Among the pyrites alſo we meet with cubes ſtriated in a very ſingular manner; the lines of one ſide being perpendicular to thoſe which diſtinguiſh the different ſides, as repreſented fig. 14.; but among theſe there are likewiſe tetraedra, octaedra, dodecaedra, and icoſaedra, to be met with.

5. A great number of cryſtals are either totally deſtitute of any ſaline matter, or poſſeſs it in ſuch a ſmall degree that no experiments hitherto tried have been able to diſcover the ſmalleſt ſenſible traces of it. Thus mica ſometimes ſhoots into hexangular priſms compoſed of parallel lamellæ, the elementary ſpiculæ of which are diſpoſed as in fig. 15.; gems, ſchoerls, granites, and other earthy bodies, are frequently found figured, though no ſaline matter can be diſcovered by analyſis; and the ſame holds good of gold, ſilver, lead, tin, biſmuth, and zinc, united with mercury, all of which regular forms, according to the quantity of the mercury.

"If we have recourſe (concludes Mr Bergman) to the ſuppoſition of an hidden ſaline ſubſtance which cannot be diſcovered by art, it muſt ſurely be unreaſonable to attribute to ſuch a principle ſo great a power as that of arranging the particles in the order neceſſary for cryſtallization; a cauſe, beyond queſtion, unequal to the magnitude of the effect: for how is it poſſible that a ſaline matter, the preſence of the ſmalleſt atom of which cannot be diſcovered by the moſt delicate teſts, ſhall in pure water have yet power to effect the icy cryſtallization with ſuch force as to overcome the ſtrongeſt obſtacles? How can a ſaline matter, which by no teſt can be diſcovered, have power, in an amalgam of gold, to arrange the ponderous particles of both metals in a particular manner? What ſalt is able to form the ſtellated regulus of antimony? What the hexagonal lamellæ of mica?"

20 All of them inſufficient.

On this ſubject we may remark, that whether we affirm or deny a ſaline principle to be the cauſe of cryſtallization, the ultimate power by which it is effected muſt be equally unknown. A ſaline principle can make other bodies cryſtallize along with it only by virtue of the diſpoſition it has of itſelf to aſſume a cryſtalline appearance; and we muſt therefore ſeek for the cauſe of this cryſtallization of the ſalt, as well as of the ſubſtance with which it is mixed. Mr Bergman, as well as others, have endeavoured to account for this on the principle of attraction; but with little ſucceſs. Sir Iſaac Newton ſuppoſes the particles of ſalt to be diffuſed through the ſolvent fluid at equal diſtances from each other; on which account he concludes that they muſt come together in regular figures. Mr Bergman conſiders the particles which form ſaline ſubſtances as endowed with a twofold tendency: one to arrange themſelves in ſpiculæ, the other for the ſpiculæ to arrange themſelves at certain angles of inclination; and as theſe angles vary, different forms of cryſtals muſt be produced. Both theſe effects, he thinks, may be owing to the ſame cauſe, viz. a mutual attraction between the particles; which, according to the various ſhapes and particular figures of the atoms, at one time arranges them in the form of ſpiculæ, and again connects the ſpiculæ already formed under different angles of inclination.

This ſeems to be much the ſame with what other chemiſts underſtand by the *polarity* of the ſaline particles, by which they are arranged in certain directions. All this, however, is totally inſufficient to explain the phenomenon. If, according to Sir Iſaac Newton's ſuppoſition, the particles were brought together by a general attraction, after being placed at equal diſtances by the ſolvent for ſome time, we muſt expect to find all kinds of ſalts cryſtallized in the ſame manner, or rather running into one ſolid lump. The arrangement of the particles, or their tendency to arrangement, aſſigned by Mr Bergman as a cauſe, is only explaining the phenomenon by itſelf; for it is the *cauſe* of this tendency which is the point in queſtion. Now, that the attraction of the ſaline particles to each other cannot be the cauſe of cryſtalline arrangements, is evident from the following conſiderations: 1. The cryſtals of every kind of ſalt contain water as an eſſential part of their compoſition; and if deprived of this, they loſe their cryſtalline form entirely, and fall into powder. It is plain, therefore, that the ſaline particles attract not only one another, but ſome part of the water which diſſolves them; whence it ſeems probable that the proceſſes of cryſtallization and vegetation are analogous to each other. This is likewiſe confirmed by the many curious vegetations of ſalts known by the name of *effloreſcences*. Theſe cannot be owing merely to attraction; becauſe they frequently protrude from a large ſaline maſs, in which they ought rather to be detained by the attraction of the reſt. Thus, if a quantity of the reſiduum of Glauber's ſpirit of nitre diſtilled with a large proportion of vitriolic acid, be expoſed to a moiſt air, beautiful ramifications ſomewhat reſembling ſhrubs will ſometimes ſhoot out to the length of more than an inch. This ſurely cannot be the effect of attraction; but rather of ſome repulſive power by which the particles of the large maſs at firſt tend to ſeparate from one another †. 2. Attraction, in ſuch a manner as would diſpoſe the particles into certain determinate forms, cannot take place where they are all homogeneous, which muſt be the caſe with metals; all of which are capable of forming cryſtals when ſlowly cooled; ſuch cryſtallizations, therefore, muſt be produced by ſome other power.

Mr Bergman conſiders the congelation of water as a ſpecies of cryſtallization; and in order to prove the ſimilitude, he takes notice, that it is by means of the matter of heat that this element becomes fluid. He obſerves likewiſe, that ſalts, in the act of cryſtallizing, part with heat as water does in the act of being converted into ice. It would ſeem, therefore, that the particles were arranged in certain forms by the action of the heat when paſſing from a latent to a ſenſible ſtate. From a late experiment, it would ſeem that the electric fluid was principally concerned. This was firſt diſcovered by Lichtenberg, and conſiſts only in ſprinkling powdered roſin upon an electrophorus, which in certain circumſtances arranges itſelf into ſtars with radii ſimilar to thoſe of the cryſtals of ſnow. See ELECTRICITY.

CRYSTALS, in chemiſtry, ſalts or other matters ſhot or congealed in the manner of cryſtal. See CHEMISTRY-*Index*; and CRYSTALLIZATION.

CTESIAS, a native of Cnidos, who accompanied Cyrus the ſon of Darius in his expedition againſt his brother Artaxerxes; by whom he was taken priſoner. But curing Artaxerxes of a wound he received in the battle, he became a great favourite at the court of Perſia, where he continued practiſing phyſic for 17 years, and was employed in ſeveral negociations. He wrote the Hiſtory of Perſia in 23 books, and a Hiſtory of the Indies: but theſe works are now loſt, and all we have remaining of them is an abridgement compiled by Photius. The moſt judicious among the ancients looked upon Cteſias as a fabulous writer; yet ſeveral of the ancient hiſtorians and modern Chriſtian writers have adopted in part his chronology of the Aſſyrian kings.

CTESIBIUS, a mathematician of Alexandria, about 120 years before Chriſt. He was the firſt who invented the pump. He alſo invented a clepſydra, or a water clock. This invention of meaſuring time by water was wonderful and ingenious. Water was let drop upon wheels which it turned: the wheels communicated their regular motion to a ſmall wooden image, which by a gradual riſe pointed with a ſtick to the proper hours and months, which were engraved on a column near the machine. This artful invention gave riſe to many improvements; and the modern manner of meaſuring time with an hour-glaſs is in imitation of the clepſydra of Cteſibius.

CTESIPHON, a celebrated Greek architect, who gave the deſigns for the famous temple of Epheſus, and invented a machine for bringing thither the columns to be uſed in that noble ſtructure. He flouriſhed 544 B. C.

CTESIPHON (anc. geog.), a large village, or rather a fine city, of Chalonitis, the moſt ſouthern province of Aſſyria. It was ſituated on the left or eaſt ſide of the Tigris, oppoſite to Seleucia on this ſide; and built by the Parthians, to rival Seleucia. Here the kings of Parthia paſſed the winter (Strabo); as they did the ſummer at Ecbatana.

CTESIPHON was alſo the name of ſeveral noted perſons of antiquity. 1. An Athenian, who adviſed his fellow citizens to crown publicly Demoſthenes with a golden crown for his probity and virtue. This was oppoſed by the orator Æſchines, the rival of Demoſthenes, who accuſed Cteſiphon of ſeditious views. Demoſthenes undertook the defence of his friend, in a celebrated oration ſtill extant, and Æſchines was baniſhed. 2. A Greek architect, who made the plan of Diana's temple at Epheſus. 3. An elegiac poet, whom king Attalus ſet over his poſſeſſions in Æolia. 4. A Greek hiſtorian, who wrote an hiſtory of Bœotia.

CUB, a bear's whelp. Among hunters, a fox and marteon of the firſt year are alſo called *cubs*. See URSUS.

CUBA, a large and very important iſland in the Weſt Indies, belonging to Spain. On the eaſt ſide it begins at 20. 20. N. Lat. touches the tropic of Cancer on the north, and extends from 74. to 85. 15. W. Long. It lies 60 miles to the weſt of Hiſpaniola, 25 leagues north of Jamaica, 100 miles to the eaſt of Jucatan, and as many to the ſouth of Cape Florida; and commands the entrance of the gulphs both of Mexico and Florida, as alſo the windward paſſages. By this ſituation it may be called the *key* of the Weſt Indies. It was diſcovered by Columbus in 1492, who gave it the name of Ferdinando, in honour of king Ferdinand of Spain; but it quickly after recovered its ancient name of *Cuba*. The natives did not regard Columbus with a very favourable eye at his landing; and the weather proving very tempeſtuous, he ſoon left this iſland, and ſailed to *Hayta*, now called *Hiſpaniola*, where he was better received. The Spaniards, however, ſoon became maſters of it. By the year 1511 it was totally conquered; and in that time they had deſtroyed, according to their own accounts, ſeveral millions of people. But the poſſeſſion of Cuba was far from anſwering the expectations of the Spaniſh adventurers, whoſe avarice could be ſatiated with nothing but gold. Theſe monſters finding that there was gold upon the iſland, concluded that it muſt come from mines; and therefore tortured the few inhabitants they had left, in order to extort from them a diſcovery of the places where theſe mines lay. The miſeries endured by theſe poor creatures were ſuch that they almoſt unanimouſly reſolved to put an end to their own lives; but were prevented by one of the Spaniſh tyrants called *Vaſco Porcellos*. This wretch threatened to hang himſelf along with them, that he might have the pleaſure, as he ſaid, of tormenting them in the next world worſe than he had done in this; and ſo much were they afraid of the Spaniards, that this threat diverted theſe poor ſavages from their deſperate reſolution. In 1511, the town of Havannah was built, now the principal place on the iſland. The houſes were at firſt built only of wood; and the town itſelf was for a long time ſo inconſiderable, that in 1536 it was taken by a French pirate, who obliged the inhabitants to pay 700 ducats to ſave it from being burnt. The very day after the pirate's departure, three Spaniſh ſhips arrived from Mexico, and having unloaded their cargoes, ſailed in purſuit of the pirate ſhip. But ſuch was the cowardice of the officers, that the pirate took all the three ſhips, and returning to the Havannah, obliged the inhabitants to pay 700 ducats more. To prevent misfortunes of this kind, the inhabitants built their houſes of ſtone; and the place has ſince been ſtrongly fortified. See HAVANNAH.

---

† See *Effloreſcence*.

According to the Abbé Raynal, the Spaniſh ſettlement at Cuba is very important, on three accounts: 1. The produce of the country, which is conſiderable. 2. As being the ſtaple of a great trade; and, 3. As being the key to the Weſt Indies. The principal produce of this iſland is cotton. The commodity, however, through neglect, is now become ſo ſcarce, that ſometimes ſeveral years paſs without any of it being brought into Europe. In place of cotton, coffee has been cultivated: but, by a ſimilar negligence, that is produced in no great quantity; the whole produce not exceeding 30 or 35 thouſand weight, one-third of which is exported to Vera Cruz, and the reſt to Madrid. The cultivation of coffee naturally leads to that of ſugar; and this, which is the moſt valuable production of America, would of itſelf be ſufficient to give Cuba that ſtate of proſperity for which it ſeems deſigned by nature. Although the ſurface of the iſland is in general uneven and mountainous, yet it has plains ſufficiently extenſive, and well enough watered, to ſupply the conſumption of the greateſt part of Europe with ſugar. The incredible fertility of its new lands, if properly managed, would enable it to ſurpaſs every other nation, however they may have now got the ſtart of it: yet ſuch is the indolence of the Spaniards, that to this day they have but few plantations, where, with the fineſt canes, they make but a ſmall quantity of coarſe ſugar at a great expence. This ſerves partly for the Mexican market, and partly for the mother-country; while the indolent inhabitants are content to import ſugar for themſelves at the expence of near 220,000 l. annually. It has been expected with probability, that the tobacco imported from Cuba would compenſate this loſs; for after furniſhing Mexico and Peru, there was ſufficient, with the little brought from Caracca and Buenos Ayres, to ſupply all Spain. But this trade too has declined through the negligence of the court of Madrid, in not gratifying the general taſte for tobacco from the Havannah. The Spaniſh colonies have an univerſal trade in ſkins; and Cuba ſupplies annually about 10 or 12 thouſand. The number might eaſily be increaſed in a country abounding with wild cattle where ſome gentlemen poſſeſs large tracts of ground, that for want of population can ſcarce be applied to any other purpoſe than that of breeding cattle. The hundredth part of this iſland is not yet cleard. The true plantations are all confined to the beautiful plains of the Havannah, and even thoſe are not what they might be. All theſe plantations together may employ about 25,000 male and female ſlaves. The number of whites, meſtees, mulattoes, and free negroes, upon the whole iſland, amounts to about 30,000. The food of theſe different ſpecies conſiſts of excellent pork, very bad beef, and caſſava bread. The colony would be more flouriſhing, if its productions had not been made the property of a company, whoſe excluſive privilege operates as a conſtant and invariable principle of diſcouragement. If any thing could ſupply the want of an open trade, and atone for the grievances occaſioned by this monopoly at Cuba, it would be the advanage which this iſland has for ſuch a long time enjoyed, in being the rendezvous of almoſt all the Spaniſh veſſels that ſail to the new world. This practice commenced almoſt with the colony itſelf. Ponce de Leon having made an attempt upon Florida in 1512, became acquainted with the new canal of Bahama. It was immediately diſcovered that this was the beſt route the ſhips bound from Mexico to Europe could poſſibly take; and to this the wealth of the iſland is principally, if not altogether owing.

CUBE, in geometry, a ſolid body conſiſting of ſix equal ſides. See GEOMETRY.

CUBE-Root of any Number or Quantity, is ſuch a number or quantity, which, if multiplied into itſelf, and then again the product thence ariſing by that number or quantity, being the cube-root, this laſt product ſhall be equal to the number or quantity whereof it is the cube-root; as 2 is the cube-root of 8: becauſe two times 2 is 4, and two times 4 is 8; and $a+b$ is the cube-root of $a^3+3aab+3abb+b^3$. See ALGEBRA.

CUBEBS, in the materia medica, a ſmall dried fruit reſembling a grain of pepper, but often ſomewhat longer, brought into Europe from the iſland of Java. In aromatic warmth and pungency, they are far inferior to pepper,

CUBIC EQUATION. See ALGEBRA.

CUBIDIA, a genus of ſpars. The word is derived from κυϐος, "a die;" and is given them from their being of the ſhape of a common die, or of a cubic figure. Theſe bodies owe this ſhape to an admixture of lead, and there are only two known ſpecies of the genus. 1. A colourleſs cryſtalline one, with thin flakes, found in the lead-mines of Yorkſhire, and ſome other parts of Britain; and, 2. A milky white one with thicker cruſts. This is found in the lead mines of Derbyſhire and Yorkſhire, but is uſually ſmall, and is not found plentifully.

CUBIT, in the menſuration of the ancients, a long meaſure, equal to the length of a mans's arm, from the elbow to the tip of the fingers.

Dr Arbuthnot makes the Engliſh cubit equal to 18 inches; the Roman cubit equal to 1 foot 5.406 inches; and the cubit of the ſcripture equal to 1 foot 9.888 inches.

CUBITÆUS MUSCLES, the name of two muſcles of the hand. See ANATOMY, *Table of the Muſcles*.

CUBITUS, in anatomy, a bone of the arm, reaching from the elbow to the wriſt; otherwiſe called *ulna* or the *greater foſſile*. Some uſe the word for all that part of the arm between the elbow and the wriſt; including the *ulna* or *cubitus*, properly ſo called, and the *radius*.

CUBOIDES, or OS CUBIFORME, in anatomy, the ſeventh bone of the foot; ſo called from its being in form of a cube or die.

CUCKING-STOOL, an engine invented for puniſhing ſcolds and unquiet women, by ducking them in water; called in ancient times a *tumbrel*, and ſometimes a *trebuchet*. In Domeſday, it is called *cathedra ſtercoris*: and it was in uſe even in the Saxons time, by whom it was deſcribed to be *cathedra in qua rixoſæ mulieres ſedentes aquis demergebantur*. It was anciently alſo a puniſhment inflicted upon brewers and bakers tranſgreſſing the laws; who were thereupon in ſuch a ſtool immerged over head and ears *in ſtercore*, ſome ſtinking water. Some think it a corruption from *ducking-ſtool*; others from *choaking ſtool, quia hoc modo demerſæ aquis fere ſuffocantur*. See GASTIGATORY.

CUCKOW, in ornithology. See CUCULUS.

Cuckow-Spit, the ſame with froth-Spit. See *FROTH-Spit*, and CICADA.

CUCUBALUS, BERRY-BEARING CHICKWEED: A genus of the trigynia order, belonging to the decandria claſs of plants, and in the natural method ranking under the 22d order, *Caryophillei*. The calyx is inflated; the petals five, unguiculated without a nectariferous corona at the throat; the capſule is trilocular. There are 13 ſpecies, the moſt remarkable of which are,

1. The beken, Swediſh lychnis, or gumſepungar, is a native of ſeveral parts of Europe. The empalement of its flower is curiouſly wrought like a network, and is of a purpliſh colour. The leaves have ſomewhat of the flavour of peaſe, and proved of great uſe to the inhabitants of Minorca in 1685, when a ſwarm of locuſts had deſtroyed the harveſt. The Gothlanders apply the leaves to eryſipelatous eruptions. Horſes, cows, ſheep, and goats, eat this plant.

2. The noctiflora, or night-flowering lychnis, grows naturally in Spain and Italy. It is a perennial plant, riſing with an upright branching ſtalk, a foot and an half high, garniſhed with very narrow leaves, placed oppoſite. The upper part of the ſtalk branches very much; the flowers ſtand upon long naked footſtalks, each ſupporting three or four flowers which have long tubes with ſtriped empalements: the petals are large, deeply divided at top, and of a pale bluiſh colour. The flowers are cloſed all the day; but when the ſun leaves them, they expand, and then emit a very agreeable ſcent. It may be propagated by ſeeds ſown in the ſpring on a bed of light earth; and when the plants are fit to remove, they ſhould be planted in a nurſery bed at about four inches diſtance, where they may remain till autumn. They may then be planted in the borders where they are to remain, and will flower the following year.

3. The otites, or catch fly, is a native of Britain, and other European countries. It hath a thick, fleſhy perennial root, which ſtrikes deep into the ground from whence riſes a jointed ſtalk three or four feet high. At the joints there exſudes a viſcous clammy juice, that ſticks to the fingers when handled; and the ſmall inſects which ſettle upon thoſe parts of the ſtalks are thereby ſo faſtened that they cannot get off. The flowers are ſmall, and of a greeniſh colour. The plant is propagated by ſeeds.

Pate CLI.

CUCULUS, the CUCKOW, in orinthology, a genus belonging to the order of picæ: the characters of which are: The bill is ſmooth, and more or leſs bending; the noſtrils are bounded by a ſmall rim; the tongue is ſhort and pointed; the feet and toes formed for climbing. The moſt remarkable ſpecies are:

1. The canorus, or common cuckow, weighs about five ounces; and is in length 14 inches, in breadth 25. The bill is black, and about two thirds of an inch in length. The head, hind part of the neck, coverts of the wings and rump, are of a dove colour; darker on the head and paler on the rump. The throat and upper part of the neck, are of a pale grey; the breaſt and belly white, croſſed elegantly with undulated lines of black. The tail conſiſts of ten feathers of unequal lengths; the two middle tail-feathers are black tipped with white; the others are marked with white ſpots on each ſide their ſhafts. The legs are ſhort; and the toes diſpoſed two backwards and two forwards, like thoſe of the wood-pecker, though it is never obſerved to run up the ſides of trees. The female differs in ſome reſpects. The neck before and behind is of a browniſh-red; the tail barred with the ſame colour and black, and ſpotted on each ſide the ſhaft with white. The young birds are brown mixed with black, and in that ſtate have been deſcribed by ſome authors as old ones.

“This bird appears in our country early in the ſpring, and makes the ſhorteſt ſtay with us of any bird of paſſage. It is compelled here, as Mr Stilingfleet obſerves, by that conſtitution of the air which cauſes the figtree put forth its fruit; though it has been ſuppoſed that ſome of theſe birds do not quit this iſland during the winter; but that they ſeek ſhelter in hollow trees and lie torpid, unleſs animated by unuſually warm weather.” Mr Pennant gives two inſtances of their being heard in February; one in 1771, in the end of that month; the other in 1769, on the 4th day; but after that they were heard no more, being probably chilled again into torpidity. There is a remarkable coincidence between the ſong of theſe birds and the mackarels continuing in full roe; that is, from about the middle of April to the latter end of June. The cuckow is ſilent for ſome time after his arrival; his note is a call to love, and uſed only by the male, who ſits perched generally on ſome dead tree or bare bough, and repeats his ſong, which he loſes as ſoon as the amorous ſeaſon is over. His note is ſo uniform, that his name in all languages ſeems to have been derived from it; and in all countries it is uſed in the ſame reproachful ſenſe:

> The plain-ſong *cuckow* grey,
> Whoſe note full many a man doth mark,
> And dares not anſwer nay. *Shakeſpeare.*

The reproach ſeems to ariſe from the cuckow's making uſe of the bed or neſt of another to depoſite its eggs in, leaving the care of its young to an improper parent; but Juvenal with more juſtice gives the infamy to the bird in whoſe neſt the ſuppoſititious eggs were laid:

Tu tibi nunc corruca *places.*

On the natural hiſtory of this ſingular bird, we have a very curious paper by Mr Jenner, publiſhed in the Philoſophical Tranſactions for 1738†. The firſt appearance of cuckows in Britain, as already obſerved, is about the middle of April; (the 17th according to Mr Jenner, whoſe obſervations were made in Glouceſterſhire). The ſong of the male, which is well known, ſoon proclaims its arrival. The ſong of the female (if the peculiar notes of which it is compoſed may be ſo called) is widely different, and has been ſo little attended to, that perhaps few are acquainted with it: the cry of the dab-chick bears ſome reſemblance to it.

Unlike the generality of birds, cuckows do not pair. When a female appears on the wing, ſhe is often attended by two or three males, who ſeem to be earneſtly contending for her favours. From the time of her appearance till after the middle of ſummer the neſts of the birds ſelected to receive her eggs are to be found in great abundance; but, like the other migrating birds, ſhe does not begin to lay till ſome weeks after her arrival.

It is on all hands allowed, that the cuckow does not hatch its own eggs; for which different reaſons have been given, as will be afterwards noticed. The hedge-ſparrow, the water-wagtail, the tit-lark, the redbreaſt, the yellow hammer, the green linnet, or the whinchat, is generally the nurſe of the young cuckow: but Buffon enumerates 20 ſorts of neſts at leaſt in which they have depoſited their eggs. It may be ſuppoſed, that the female cuckow lays her egg in the abſence of the bird in whoſe neſt ſhe intends to depoſite; as it has been known, that on ſight of one of theſe a redbreaſt and its mate jointly attacked her on approaching the neſt, putting her to flight; and ſo effectually drove her away, that ſhe did not dare to return. Among the birds abovementioned, it generally, according to Mr Jenner's obſervations, ſelects the three firſt, but ſhows a much greater partiality to the hedge-ſparrow. This laſt commonly takes up four or five days in laying her eggs. During this time (generally after ſhe has laid one or two) the cuckow contrives to depoſite her egg among the reſt, leaving the future care of it entirely to the hedge-ſparrow. This intruſion often occaſions ſome diſcompoſure; for the old hedge-ſparrow at intervals, whilſt ſhe is ſitting, not unfrequently throws out ſome of her own eggs, and ſometimes injures them in ſuch a way that they become addle; ſo that it more frequently happens that only two or three hedge-ſparrows eggs are hatched with the cuckow's than otherwiſe. But whether this be the caſe or not, ſhe ſits the ſame length of time as if no foreign egg had been introduced, the cuckow's egg requiring no longer incubation than her own.

When the hedge-ſparrow has ſat her uſual time, and diſengaged the young cuckow and ſome of her own offspring from the ſhell*, her own young ones, and any of her eggs that remain unhatched, are ſoon turned out, the young cuckow remaining poſſeſſor of the neſt, and ſole object of her future care. The young birds are not previouſly killed, nor are the eggs demoliſhed; but all are left to periſh together, either entangled about the buſh which contains the neſt, or lying on the ground under it.

“The early fate of the young hedge-ſparrows (Mr Jenner obſerves) is a circumſtance that has been noticed by others, but attributed to wrong cauſes. A variety of conjectures have been formed upon it. Some have ſuppoſed the parent cuckow the author of their deſtruction; while others, as erroneouſly, have pronounced them ſmothered by the diſproportionate ſize of their fellow-neſtling. Now the cuckow's egg being not much larger than the hedge-ſparrow's (as I ſhall more fully point out hereafter), it neceſſarily follows, that at firſt there can be no great difference in the ſize of the birds juſt burſt from the ſhell. Of the fallacy of the former aſſertion alſo I was ſome years ago convinced, by having found that many cuckows eggs were hatched in the neſts of other birds after the old cuckow had diſappeared, and by ſeeing the ſame fate than attend the neſtling ſparrows as during the appearance of the old cuckows in the country. But before I proceed to the facts relating to the death of the young ſparrows, it will be proper to lay before you ſome examples of the incubation of the egg, and the rearing of the young cuckow; ſince even the well-known fact, that this buſineſs is intruſted to the care of other birds, has been controverted by an author who has lately written on this ſubject†; and ſince, as it is a fact ſo much out of the ordinary courſe of nature, it may ſtill probably be diſbelieved by others.

“*Example* 1. The titlark is frequently ſelected by the cuckow to take charge of its young one; but as it is a bird leſs familiar than many that I have mentioned, its neſt is not ſo often diſcovered. I have, nevertheleſs, had ſeveral cuckows eggs brought to me that were found in titlarks neſts, and had one opportunity of ſeeing the young cuckow in the neſt of this bird. I ſaw the old bird feed it repeatedly; and, to ſatisfy myſelf that they were realy titlarks, ſhot them both, and found them to be ſo.

“*Example* 2. A cuckow laid her egg in a water-wagtail's neſt in the thatch of an old cottage. The wagtail ſat her uſual time, and then hatched all the eggs but one; which, with all the young ones except the cuckow, was turned out of the neſt. The young birds, conſiſting of five, were found upon the rafter that projected from under the thatch, and with them was the egg not in the leaſt injured. On examining the egg, I found the young wagtail it contained quite perfect, and juſt in ſuch a ſtate as birds are when ready to be diſengaged from the ſhell. The cuckow was reared by the wagtails till it was nearly capable of flying, when it was killed by an accident.

“*Example* 3. A hedge-ſparrow built her neſt in a hawthorn buſh in a timber yard. After ſhe had laid two eggs, a cuckow dropped in a third. The ſparrow continued laying as if nothing had happened, till ſhe had laid five, her uſual number, and then ſat.

“June 20. 1786. On inſpecting the neſt, I found that the bird had hatched this morning, and that every thing but the young cuckow was thrown out. Under the neſt I found one of the young hedge-ſparrows dead, and one egg by the ſide of the neſt entangled with the coarſe woody materials that formed its outſide covering. On examining the egg, I found one end of the ſhell a little cracked, and could ſee that the ſparrow it contained was yet alive. It was then reſtored to the neſt, but in a few minutes was thrown out. The egg being again ſuſpended by the outſide of the neſt, was ſaved a ſecond time from breaking. To ſee what would happen if the cuckow was removed, I took out the cuckow, and placed the egg containing the hedge-ſparrow in the neſt in its ſtead. The old birds, during this time, flew about the ſpot, ſhowing ſigns of great anxiety; but when I withdrew, they quickly came to the neſt again. On looking into it in a quarter of an hour afterwards, I found the young one completely hatched, warm, and lively. The hedge-ſparrows were ſuffered to remain undiſturbed with their new charge for three hours (during which time they paid every attention to it), when the cuckow was again put into the neſt. The old ſparrows had been ſo much diſturbed by theſe intruſions, that for ſome time they ſhowed an unwillingneſs to come to it. However, at length they came; and on examining the neſt again in a few minutes, I found the young ſparrow was tumbled out. It was a ſecond time reſtored, but again experienced the ſame fate.

---

† Part II. art. 14.

* The young cuckow is commonly hatched firſt.

† The Hon. Daines Barrington.

“ From theſe experiments, and ſuppoſing, from the feeble appearance of the young cuckow juſt diſengaged from the ſhell, that it was utterly incapable of diſplacing either the egg or the young ſparrows, I was induced to believe that the old ſparrows were the only agents in this ſeeming unnatural buſineſs. But I afterwards clearly perceived the cauſe of this ſtrange phenomenon, by diſcovering the young cuckow in the act of diſplacing its fellow-neſtlings, as the following relation will fully evince.

“ June 18. 1787, I examined the neſt of a hedge-ſparrow, which then contained a cuckow's and three hedge-ſparrow's eggs. On inſpecting it the day following, I found the bird had hatched, but that the neſt now contained only a young cuckow and one young hedge-ſparrow. The neſt was placed ſo near the extremity of a hedge, that I could diſtinctly ſee what was going forward in it; and, to my aſtoniſhment, ſaw the young cuckow, though ſo newly hatched, in the act of turning out the young hedge-ſparrow.

“ The mode of accompliſhing this was very curious. The little animal, with the aſſiſtance of its rump and wings, contrived to get the bird upon its back; and making a lodgement for the burden by elevating its elbows, clambered backward with it up the ſide of the neſt till it reached the top; where reſting for a moment, it threw off its load with a jerk, and quite diſengaged it from the neſt. It remained in this ſituation a ſhort time, feeling about with the extremities of its wings, as if to be convinced whether the buſineſs was properly executed, and then dropped into the neſt again. With theſe (the extremities of its wings) I have often ſeen it examine, as it were, an egg and neſtling before it began its operations; and the nice ſenſibility which theſe parts appeared to poſſeſs, ſeemed ſufficiently to compenſate the want of ſight, which as yet it was deſtitute of. I afterwards put in an egg; and this, by a ſimilar proceſs, was conveyed to the edge of the neſt and thrown out. Theſe experiments I have ſince repeated ſeveral times in different neſts, and have always found the young cuckow diſpoſed to act in the ſame manner. In climbing up the neſt, it ſometimes drops its burthen, and thus is foiled in its endeavours; but, after a little reſpite, the work is reſumed, and goes on almoſt inceſſantly till it is effected. It is wonderful to ſee the extraordinary exertions of the young cuckow, when it is two or three days old, if a bird be put into the neſt with it that is too weighty for it to lift out. In this ſtate it ſeems ever reſtleſs and uneaſy. But this diſpoſition for turning out its companions begins to decline from the time it is two or three till it is about twelve days old; when, as far as I have hitherto ſeen, it ceaſes. Indeed, the diſpoſition for throwing out the egg appears to ceaſe a few days ſooner; for I have frequently ſeen the young cuckow, after it had been hatched nine or ten days, remove a neſtling that had been placed in the neſt with it, when it ſuffered an egg, put there at the ſame time, to remain unmoleſted. The ſingularity of its ſhape is well adapted to theſe purpoſes; for, different from other newly-hatched birds, its back, from the ſcapulæ downwards, is very broad, with a conſiderable depreſſion in the middle. This depreſſion ſeems formed by nature for the deſign of giving a more ſecure lodgement to the egg of the hedge-ſparrow or its young one when the young cuckow is employed in removing either of them from the neſt. When it is about 12 days old, this cavity is quite filled up, and then the back aſſumes the ſhape of neſtling birds in general.

“ Having found that the old hedge-ſparrow commonly throws out ſome of her own eggs after her neſt has received the cuckow's, and not knowing how ſhe might treat her young ones if the young cuckow was deprived of the power of diſpoſſeſſing them of the neſt, I made the following experiment.

“ July 9. A young cuckow, that had been hatched by a hedge-ſparrow about four hours, was confined in the neſt in ſuch a manner that it could not poſſibly turn out the young hedge-ſparrows which were hatched at the ſame time, though it was almoſt inceſſantly making attempts to effect it. The conſequence was, the old birds fed the whole alike, and appeared in every reſpect to pay the ſame attention to their own young as to the young cuckow, until the 13th, when the neſt was unfortunately plundered.

“ The ſmallneſs of the cuckow's egg, in proportion to the ſize of the bird, is a circumſtance that hitherto, I believe, has eſcaped the notice of the ornithologiſt. So great is the diſproportion, that it is in general ſmaller than that of the houſe-ſparrow; whereas the difference in the ſize of the birds is nearly as five to one. I have uſed the term *in general*, becauſe eggs produced at different times by the ſame bird vary very much in ſize. I have found a cuckow's egg ſo light that it weighed only 43 grains, and one ſo heavy that it weighed 55 grains. The colour of the cuckow's eggs is extremely variable. Some, both in ground and penciling, very much reſemble the houſe-ſparrow's; ſome are indiſtinctly covered with bran-coloured ſpots: and others are marked with lines of black, reſembling, in ſome meaſure, the eggs of the yellow-hammer.

“ The circumſtance of the young cuckow's being deſtined by nature to throw out the young hedge-ſparrows, ſeems to account for the parent cuckow's dropping her egg in the neſts of birds ſo ſmall as thoſe I have particulariſed. If ſhe were to do this in the neſt of a bird which produced a large egg, and conſequently a large neſtling, the young cuckow would probably find an inſurmountable difficulty in ſolely poſſeſſing the neſt, as its exertions would be unequal to the labour of turning out the young birds. Beſides though many of the larger birds might have fed the neſtling cuckow very properly had it been committed to their charge, yet they could not have ſuffered their own young to have been ſacrificed for the accommodation of the cuckow in ſuch great number as the ſmaller ones, which are ſo much more abundant; for though it would be a vain attempt to calculate the numbers of neſtlings deſtroyed by means of the cuckow, yet the ſlighteſt obſervation would be ſufficient to convince us that they muſt be very large."

Here Mr Jenner remarks, that though nature permits the young cuckow to make this great waſte, yet the animals thus deſtroyed are not thrown away or rendered uſeleſs. At the ſeaſon when this happens, great numbers of tender quadrupeds and reptiles are ſeeking proviſion; and if they find the callow neſtlings which have fallen victims to the young cuckow, they are furniſhed with food well adapted to their peculiar ſtate.

It appears a little extraordinary, that two cuckows eggs ſhould ever be depoſited in the ſame neſt, as the young one produced from one of them muſt inevitably periſh; yet two inſtances of this kind fell under our author's obſervation, one of which he thus relates: "June 27. 1787. Two cuckows and a hedge-ſparrow were hatched in the ſame neſt this morning; one hedge-ſparrow's egg remained unhatched. In a few hours after, a conteſt began between the cuckows for the poſſeſſion of the neſt, which continued undetermined till the next afternoon, when one of them, which was ſomewhat ſuperior in ſize, turned out the other, together with the young hedge-ſparrow and the unhatched egg. This conteſt was very remarkable. The combatants alternately appeared to have the advantage, as each carried the other ſeveral times nearly to the top of the neſt, and then ſunk down again, oppreſſed by the weight of its burden; till at length, after various efforts, the ſtrongeſt prevailed, and was afterwards brought up by the hedge-ſparrows."

But the principal circumſtance that has agitated the mind of the naturaliſt reſpecting the cuckow is, Why, like other birds, it ſhould not build a neſt, incubate its eggs, and rear its own young?

There is no apparent reaſon, Mr Jenner thinks, why this bird, in common with others, ſhould not perform all theſe ſeveral offices; for it is in every reſpect perfectly formed for collecting materials and building a neſt. Neither its external ſhape nor internal ſtructure prevent it from incubation; nor is it by any means incapacitated from bringing food to its young. It would be needleſs to enumerate the various opinions of authors on this ſubject from Ariſtotle to the preſent time. Thoſe of the ancients appear to be either viſionary or erroneous; and the attempts of the moderns towards its inveſtigation have been confined within very narrow limits: for they have gone but little further in their reſearches than to examine the conſtitution and ſtructure of the bird; and having found it poſſeſſed of a capacious ſtomach with a thin external covering, concluded that the preſſure upon this part, in a ſitting poſture, prevented incubation. They have not conſidered that many of the birds which incubate have ſtomachs analogous to thoſe of cuckows. The ſtomach of the owl, for example, is proportionably capacious, and is almoſt as thinly covered with external integuments. Nor have they conſidered, that the ſtomachs of the neſtlings are always much diſtended with food; and that this very part, during the whole time of their confinement to the neſt, ſupports in a great degree the weight of the whole body: whereas, in a ſitting-bird, it is not nearly ſo much preſſed upon, for the breaſt in that caſe fills up chiefly the cavity of the neſt; for which purpoſe, from its natural convexity, it is admirably well fitted.

Theſe obſervations may be ſufficient to ſhow, that the cuckow is not rendered incapable of ſitting through any peculiarity either in the ſituation or formation of the ſtomach; yet, as a proof ſtill more deciſive, our obſerver adduces the following fact.

"In the ſummer of the year 1786, I ſaw, in the neſt of a hedge-ſparrow, a cuckow, which, from its ſize and plumage, appeared to be nearly a fortnight old. On lifting it up in the neſt, I obſerved two hedge-ſparrows eggs under it. At firſt I ſuppoſed them part of the number which had been ſat upon by the hedge-ſparrow with the cuckow's egg, and that they had become addle, as birds frequently ſuffer ſuch eggs to remain in their neſts with their young; but on breaking one of them I found it contained a living fœtus: ſo that of courſe theſe eggs muſt have been laid ſeveral days after the cuckow was hatched; as the latter now completely filled up the neſt, and was by this peculiar incident performing the part of a ſitting-bird. At this time I was unacquainted with the fact, that the young cuckow turned out the eggs of the hedge-ſparrow; but it is reaſonable to conclude, that it had loſt the diſpoſition for doing this when theſe eggs were depoſited in the neſt.

"Having under my inſpection, in another hedge-ſparrow's neſt, a young cuckow about the ſame ſize as the former, I procured two wagtails eggs which had been ſat upon a few days, and had them immediately conveyed to the ſpot, and placed under the cuckow. On the ninth day after the eggs had been in this ſituation, the perſon appointed to ſuperintend the neſt (as it was ſome diſtance from the place of my reſidence) came to inform me that the wagtails were hatched. On going to the place, and examining the neſt, I found nothing in it but the cuckow and the ſhells of the wagtail's eggs. The fact, therefore, of the birds being hatched, I do not give you as coming immediately under my own eye, but the teſtimony of the perſon appointed to watch the neſt was corroborated by that of another witneſs."

In conſidering to what cauſes may be attributed the ſingularities of the cuckow, Mr Jenner ſuggeſts the following as the moſt probable: "*The ſhort reſidence this bird is allowed to make in the country where it is deſtined to propagate its ſpecies; and the call that nature has upon it, during that ſhort reſidence, to produce a numerous progeny.* The cuckow's firſt appearance here is about the middle of April, commonly on the 17th. Its egg is not ready for incubation till ſome weeks after its arrival, ſeldom before the middle of May. A fortnight is taken up by the ſitting-bird in hatching the egg. The young bird generally continues three weeks in the neſt before it flies, and the foſter-parents feed it more than five weeks after this period; ſo that if a cuckow ſhould be ready with an egg much ſooner than the time pointed out, not a ſingle neſtling, even one of the earlieſt, would be fit to provide for itſelf before its parent would be inſtinctively directed to ſeek a new reſidence, and be thus compelled to abandon its young one; for old cuckows take their final leave of this country the firſt week in July.

“Had nature allowed the cuckow to have ſtaid here as long as ſome other migrating birds, which produce a ſingle ſet of young ones (as the ſwift or nightingale, for example), and had allowed her to have reared as large a number as any bird is capable of bringing up at one time, theſe might not have been ſufficient to have anſwered her purpoſe; but by ſending the cuckow from one neſt to another, ſhe is reduced to the ſame ſtate as the bird whoſe neſt we daily rob of an egg, in which caſe the ſtimulus for incubation is ſuſpended. Of this we have a familiar example in the common domeſtic fowl. That the cuckow actually lays a great number of eggs, diſſection ſeems to prove very deciſively. Upon a compariſon I had an opportunity of making between the ovarium, or racemus vitellorum, of a female cuckow, killed juſt as ſhe had begun to lay, and of a pullet killed in the ſame ſtate, no eſſential difference appeared. The uterus of each contained an egg perfectly formed and ready for excluſion; and the ovarium exhibited a large cluſter of eggs, gradually advanced from a very diminutive ſize to the greateſt the yolk acquires before it is received into the oviduct. The appearance of one killed on the third of July was very different. In this I could diſtinctly trace a great number of the membranes which had diſcharged yolks into the oviduct; and one of them appeared as if it had parted with a yolk the preceding day. The ovarium ſtill exhibited a cluſter of enlarged eggs, but the moſt forward of them was ſcarcely larger than a muſtard-ſeed.

“I would not be underſtood to advance, that every egg which ſwells in the ovarium at the approach or commencement of the propagating ſeaſon is brought to perfection: but it appears clearly, that a bird, in obedience to the dictates of her own will, or to ſome hidden cauſe in the animal economy, can either retard or bring forward her eggs. Beſides the example of the common fowl above alluded to, many others occur. If we deſtroy the neſt of a blackbird, a robin, or almoſt any ſmall bird, in the ſpring, when ſhe has laid her uſual number of eggs, it is well known to every one who has paid any attention to inquiries of this kind, in how ſhort a ſpace of time ſhe will produce a freſh ſet. Now, had the bird been ſuffered to have proceeded without interruption in her natural courſe, the eggs would have been hatched, and the young ones brought to a ſtate capable of providing for themſelves, before ſhe would have been induced to make another neſt, and excited to produce another ſet of eggs from the ovarium. If the bird had been deſtroyed at the time ſhe was ſitting on her firſt laying of eggs, diſſection would have ſhown the ovarium containing a great number in an enlarged ſtate, and advancing in the uſual progreſſive order. Hence it plainly appears, that birds can keep back or bring forward (under certain limitations) their eggs at any time during the ſeaſon appointed for them to lay; but the cuckow, not being ſubject to the common interruptions, goes on laying, from the time ſhe begins till the eve of her departure from Britain; for although old cuckows in general take their leave the firſt week in July (and I never could ſee one after the 5th day of that month, though I conceive it poſſible that here and there a ſtraggling cuckow may be ſeen after this time); yet I have known an inſtance of an egg's being hatched in the neſt of an hedge-ſparrow ſo late as the 15th. And a farther proof of their continuing to lay till the time of their leaving us may, I think, be fairly deduced from the appearances on diſſection of the female cuckow above mentioned, killed on the 3d of July.”

Among the many peculiarities of the young cuckow, there is one that ſhows itſelf very early. Long before it leaves the neſt, it frequently, when irritated, aſſumes the manner of a bird of prey, looks ferocious, throws itſelf back, and pecks at any thing preſented to it with great vehemence, often at the ſame time making a cuckling noiſe like a young hawk. Hence probably the vulgar opinion, that this bird changes into a hawk and devours its nurſe on quitting its neſt; whence the French proverb, *Ingrat comme un coucou*. Sometimes, when diſturbed in a ſmaller degree, it makes a kind of hiſſing noiſe, accompanied with a heaving motion of the whole body.

The growth of the young cuckow is uncommonly rapid. Its chirp is plaintiff, like that of the hedge-ſparrow; but the ſound is not acquired from the foſter-parent, as it is the ſame whether it be reared by the hedge-ſparrow or any other bird. It never acquires the adult note during its ſtay in Britain.

The ſtomachs of young cuckows contain a great variety of food. On diſſecting one that was brought up by wagtails, and fed by them at the time it was ſhot (though it was nearly of the ſize and fulneſs of plumage of the parent-bird), Mr Jenner found in its ſtomach the following ſubſtances: Flies and beetles of various kinds; ſmall ſnails with their ſhells unbroken; graſhoppers; caterpillars; part of a horſe-bean; a vegetable ſubſtance, reſembling bits of tough graſs rolled into a ball; and the ſeeds of a vegetable that reſembled thoſe of the gooſe-graſs. In the ſtomach of one fed by hedge-ſparrows, the contents were almoſt entirely vegetable; ſuch as wheat, ſmall vetches, &c. “But this (ſays our author) was the only inſtance of the kind I had ever ſeen, as theſe birds in general feed the young cuckow with ſcarcely any thing but animal food. However, it ſerved to clear up a point which before had ſomewhat puzzled me; for having found the cuckow's egg in the neſt of a green linnet, which begins very early to feed its young with vegetable food, I was apprehenſive, till I ſaw this fact, that this bird would have been an unfit foſter-parent for the young cuckow.

“The tit-lark, I obſerve, feeds it principally with graſhoppers.

“But the moſt ſingular ſubſtance, ſo often met with in the ſtomachs of young cuckows, is a ball of hair curiouſly wound up. I have found it of various ſizes, from that of a pea to that of a ſmall nutmeg. It ſeems to be compoſed chiefly of horſe hairs; and from the reſemblance it bears to the inſide covering of the neſt, I conceive the bird ſwallows it while a neſtling. In the ſtomachs of old cuckows are often ſeen maſſes of hair; but theſe had evidently once formed a part of the hairy caterpillar, which the cuckow often takes for its food."

There ſeems to be no preciſe time fixed for the departure of young cuckows. Mr Jenner believes they go off in ſucceſſion, probably as ſoon as they are capable of taking care of themſelves; for although they ſtay in Britain till they become nearly equal in ſize and growth of plumage to the old cuckow, yet in this very ſtate the foſtering care of the hedge-ſparrow is not withdrawn from them. "I have frequently (ſays he) ſeen the young cuckow of ſuch a ſize that the hedge-ſparrow has perched on its back, or half-expanded wing, in order to gain ſufficient elevation to put the food into its mouth. At this advanced ſtage, I believe that young cuckows procure ſome food for themſelves; like the young rook, for inſtance, which in part feeds itſelf, and is partly fed by the old ones, till the approach of the pairing ſeaſon. If they did not go off in ſucceſſion, it is probable we ſhould ſee them in large numbers by the middle of Auguſt; for as they are to be found in great plenty when in a neſtling ſtate, they muſt now appear very numerous, ſince all of them muſt have quitted the neſt before this time. But this is not the caſe; for they are not more numerous at any ſeaſon than the parent-birds are in the months of May and June.

The ſame inſtinctive impulſe which directs the cuckow to depoſite her eggs in the neſts of other birds, directs her young one to throw out the eggs and young of the owner of the neſt. The ſcheme of nature would be incomplete without it; for it would be extremely difficult, if not impoſſible, for the little birds deſtined to find ſuccour for the cuckow, to find alſo for their own young ones after a certain period; nor would there be room for the whole to inhabit the neſt."

It is ſuppoſed, that there are more male cuckows than females; ſince two are often ſeen in diſpute where a third has been in ſight; which, no doubt, was of the oppoſite ſex. Mr Pennant obſerved, that five male birds were caught in a trap in one ſeaſon; and Mr Latham ſays, that "out of at leaſt half a dozen that I have attended to, my chance has never directed me to a female; and it is to be wiſhed, that future obſervers may determine whether our obſervations have riſe only in chance, or are founded on the general circumſtance." He believes that the male birds are more liable to be ſhot, their note directing the gunner where to take aim, while the female is ſecured by her ſilence.

Cuckows may be, and often are, brought up tame, ſo as to become familiar. They will eat in this ſtate bread and milk, fruits, inſects, eggs, and fleſh either cooked or raw; but in a ſtate of nature, I believe, chiefly live on caterpillars; which, in a few I have obſerved were all of the ſmooth kind; others have found vegetable matter, beetles, and ſmall ſtones. When fat, they are ſaid to be as good eating as a land rail. The French and Italians eat them to this day. The ancient Romans admired them greatly as food; Pliny ſays that there is no bird which can be compared to them for delicacy.

In migrating, the major part of theſe birds are ſuppoſed to go into Africa, ſince they are obſerved to viſit the iſland of Malta twice in a year, in their paſſage backwards and forwards, as is ſuppoſed, to that part of the world. They are well known alſo at Aleppo. To the north, it is ſaid to be common in Sweden: but not to appear ſo early by a month as in Britain. Ruſſia is not deſtitute of this bird; and Mr Latham has ſeen a ſpecimen brought from Kamtſchatka, now in the poſſeſſion of Sir Joſeph Banks.

2. The Americanus, or cuckow of Carolina. It is about the ſize of a blackbird, the upper mandible of the bill black, the lower yellow; the large wing-feathers are reddiſh; the reſt of the wing, and all the upper part of the body, head and neck, is of an aſh-colour; all the under part of the body, from the bill to the tail, white; the tail long and narrow, compoſed of ſix long and four ſhorter feathers; their legs ſhort and ſtrong. Their note is very different from the cuckow of Britain, and not ſo remarkable to be taken notice of. It is a ſolitary bird, frequenting the darkeſt receſſes of woods and ſhady thickets. They retire on the approach of winter.

Plate CLIV.

3. The indicator, or honey-guide, is a native of Africa. The following deſcription is given of it by Dr Sparrman in the Philoſophical Tranſactions for 1777. "This curious ſpecies of cuckow is found at a conſiderable diſtance from the Cape of Good Hope, in the interior parts of Africa, being entirely unknown at that ſettlement. The firſt place I heard of it was in a wood called the *Groot-vaader's Boſch*, "the Grand-father's Wood," ſituated in a deſert near the river which the Hottentots call *T'kaut'kai*. The Dutch ſettlers thereabouts have given this bird the name of *honiguyzer*, or "honey-guide," from its quality of diſcovering wild honey to travellers. Its colour has nothing ſtriking or beautiful. Its ſize is conſiderably ſmaller than that of the cuckow in Europe: but in return, the inſtinct which prompts it to ſeek its food in a ſingular manner is truly admirable. Not only the Dutch and Hottentots, but likewiſe a ſpecies of quadruped named *ratel* (probably a new ſpecies of badger), are frequently conducted to wild bee-hives by this bird, which, as it were, pilots them to the very ſpot. The honey being its favourite food, its own intereſt prompts it to be inſtrumental in robbing the hive, as ſome ſcraps are commonly left for its ſupport. The morning and evening are its times of feeding, and it is then heard calling in a ſhrill tone, *cherr, cherr*; which the honey-hunters carefully attend to as the ſummons to the chace. From time to time they anſwer with a ſoft whiſtle; which the bird hearing, always continues its note. As ſoon as they are in ſight of each other, the bird gradually flutters toward the place where the hive is ſituated, continually repeating its former call of *cherr, cherr*: nay, if it ſhould happen to have gained a conſiderable way before the men (who may eaſily be hindered in the purſuit by buſhes, rivers, or the like), it returns to them again, and redoubles its note, as it were to reproach them with their inactivity. At laſt the bird is obſerved to hover for a few moments over a certain ſpot, and then ſilently retiring to a neighbouring buſh or reſting-place, the hunters are ſure of finding the bees neſt in that identical ſpot; whether it be in a tree or in the crevice of a rock, or (as is moſt commonly the caſe) in the earth. Whilſt the hunters are buſy in taking the honey, the bird is

ſeen looking on attentively to what is going forward, and waiting for its ſhare of the ſpoil. The bee-hunters never fail to leave a ſmall portion for their conductor; but commonly take care not to leave ſo much as would ſatisfy its hunger. The bird's appetite being whetted by this parſimony, it is obliged to commit a ſecond treaſon by diſcovering another bee's neſt, in hopes of a better ſalary. It is further obſerved, that the nearer the bird approaches the hidden hive, the more frequently it repeats its call, and ſeems the more impatient. I have had frequent opportunities of ſeeing this bird, and have been witneſs to the deſtruction of ſeveral republics of bees by means of its treachery. I had, however, but two opportunities of ſhooting it, which I did to the great indignation of my Hottentots. It is about ſeven inches in length, and is of a ruſty brown colour on the back, with a white breaſt and belly." A neſt which was ſhown to Dr Sparrman for that of this bird, was compoſed of ſlender filaments of bark, woven together in the form of a bottle; the neck and opening hung downwards, and a ſtring, in an arched ſhape, was ſuſpended acroſs the opening faſtened by the two ends, perhaps for the bird to perch on.

4. The Cape cuckow (*Buff.*), is a trifle ſmaller than ours: the bill a deep brown; the upper part of the body greeniſh brown: throat, cheeks, fore part of the neck, and upper wing coverts, of a deep rufous colour: tail feathers rufous, but paler, tipped with white; the breaſt, and all the under parts of the body white, croſſed with lines of black: the legs reddiſh brown. It inhabits the Cape of Good Hope; and is moſt likely the ſame bird which is called *Edolio*, from its pronouncing that word frequently in a low melancholy tone.—Voyagers alſo mention another cuckow, which is common to Loango in Africa. It is bigger than ours, but of the ſame colour; and repeats the word *cuckow* like that bird, but in different inflexion of voice. It is ſaid that the male and female together go through the whole eight notes of the gamut; the male, beginning by itſelf, ſounds the three firſt, after which he is accompanied by the female through the reſt of the octave.

5. The honoratus, or ſacred cuckow, is ſomewhat leſs than our cuckow: the general colour is blackiſh aſh on the upper parts, marked with two ſpots of white on each feather; beneath white, tranſverſely ſpotted with aſh colour: the quills are cinereous, tranſverſely ſpotted with white: the tail is much cuneated, five inches and a half long, and of the ſame colour as the quills; the outer feather only three inches long: the legs and claws are of a pale aſh colour. This ſpecies inhabits Malabar, here the natives hold it ſacred. It feeds on reptiles, which, perhaps may be ſuch as are the moſt noxious; if ſo, this ſeeming ſuperſtition may have riſe from a more reaſonable foundation than many others of the like ſort.

6. The ſhining cuckow is the ſize of a ſmall thruſh: the bill is bluiſh: the upper part of the body green, with a rich gilded gloſs, the under parts are white, tranſverſely waved with green gold: the under tail coverts almoſt white; the quills and tail duſky-brown; the legs are bluiſh. This inhabits New Zealand, where it is called *Poopo-arowro*. See Plate CLI.

7. The vetula is a trifle bigger than a blackbird: the bill above an inch and a half long: the upper mandible black; the lower whitiſh: crown of the head brown, the feathers of it ſoft and ſilky: the upper parts of the body and the quills cinereous olive: throat and fore part of the neck whitiſh; the reſt of the under parts rufous: the tail is much cuneated; the two middle feathers cinereous olive, the others duſky black tipped with white; the outer feather very ſhort: legs blue-black. This ſpecies inhabits Jamaica, where it is frequent in the woods and hedges all the year round. It feeds on ſeeds, ſmall worms, and caterpillars, and is very tame. This bird has the name *tacco* from its cry, which is like that word; the firſt ſyllable of this is pronounced hardly, the other following in a full octave lower than the firſt. It has alſo another cry like *qua, qua, qua;* but that only when alarmed by an enemy. Beſides inſects, it will alſo eat lizards, ſmall ſnakes, frogs, young rats, and ſometimes even ſmall birds. The ſnakes they ſwallow head formoſt, letting the tail hang out of the mouth till the fore-parts are digeſted. This bird, it is moſt likely, might be eaſily tamed, as it is ſo gentle as to ſuffer the negro children to catch it with their hands. Its gait is that of leaping, like a magpie; being frequently ſeen on the ground; and its flight but ſhort, chiefly from buſh to buſh. At the time when other birds breed, they likewiſe retire into the woods, but their neſts have never yet been found; from which one ſhould be inclined to think, that they were indebted to other birds for the rearing their young in the manner of the common cuckow. It has the name of *rain-bird*, as it is ſaid to make the greateſt noiſe before rain. Common all the year at Jamaica. In another ſpecies or variety, common in Jamaica, the feathers on the throat appear like a downy beard, whence probably the name of *old-man rain-bird*, given it there and by Ray, Sloane, &c.

8. The nævius, ſpotted cuckow, or rail-bird, is about the ſize of a fieldfare: the bill three quarters of an inch; the upper mandible black on the top, and rufous on the ſides; the under wholly rufous: the general colour of the plumage is rufous in two ſhades; the under parts rufous white: the feathers on the crown are of a deep brown, and pretty long, with rufous tips and ſome of them margined with rufous: the hind part of the neck is a rufous grey; down the ſhafts deep brown: back and rump the ſame; each feather tipped with a rufous ſpot: on each feather of the throat and neck is a tranſverſe browniſh line near the end: the under tail coverts are rufous: the quills are grey brown, edged with rufous, and a ſpot of the ſame at the tips: the tail is near ſix inches long, much cuneated; the outer feathers only half the length of the middle ones; colour of it the ſame as the quills; ſome of the upper coverts reach to near two-thirds of the length of the tail: the legs are aſh-colour; the claws greyiſh brown. It inhabits Cayenne.—Buffon mentions a variety of this by the name of *rail-bird*. It is much the ſame in ſize, but has leſs rufous, being grey in the place of that colour: the ſide tail-feathers have white tips: the throat is pale grey; under the body white; the tail a trifle longer than in the other. Whether a variety or different ſex, is not known. This is common at Cayenne and Guiana; and is ſeen often perched upon gates and rails, whence its name; and when in this ſituation continually moves its tail. Theſe

BRITISH MUSEUM

are not very wild birds, yet do not form themſelves into troops, although numbers are often found in the ſame diſtrict: nor do they frequent the thick woods like many of the genus.

9. The cayanus, or Cayenne cuckow, is the ſize of a blackbird: the bill is grey brown, above an inch long, and a little bent at the tip: the plumage on the upper parts of the body is purpliſh cheſnut; beneath, the ſame, but paler: the quills are the ſame as the upper parts, tipped with brown: the tail is the ſame; near the end black, and tipped with white; it is much cuneated, and above ten inches long: the legs and claws are grey brown. This inhabits Cayenne, where it goes by the name of *piaye*, or *devil*. The natives give it that name as a bird of ill omen. The fleſh they will not touch; and indeed not without reaſon, as it is very bad and lean. It is a very tame ſpecies, ſuffering itſelf to be almoſt touched by the hand before it offers to eſcape. Its flight is almoſt like that of a king's fiſher; frequents the borders of rivers, on the low branches; feeds on inſects; often wags its tail on changing place.

There are 37 other ſpecies, which inhabit different parts of the globe, and are principally diſtinguiſhed by the ſhape of the tail and variations in colour.

CUCUMBER, in botany. See Cucumis.

CUCUMIS, the Cucumber: A genus of the ſyngeneſia order, belonging to the monœcia claſs of plants; and in the natural method ranking under the 34th order, *Cucurbitaceæ*. The male calyx is quinquedentated, the corolla quinquepartite; the filaments three. The female calyx is quinquedentated, the corolla quinquepartite, the piſtil trifid; the ſides of the apple ſharp pointed. In this genus Linnæus includes alſo the Melon; (ſee that article). There are 11 ſpecies, of which the following are the moſt remarkable.

1. The ſativa, or common cucumber, hath roots compoſed of numerous, long, ſlender, white fibres; long ſlender ſtalks, very branchy at their joints, trailing on the ground, or climbing by their claſpers, adorned at every joint by large angular leaves on long erect footſtalks, with numerous and monopetalous bell-ſhaped flowers of a yellow colour, ſucceeded by oblong rough fruit. The varieties of this kind are, (1.) The common rough green prickly cucumber; a middle-ſized fruit, about ſix or ſeven inches long, having a dark-green rough rind, cloſely ſet with very ſmall prickles; the plant is of the hardieſt ſort, but does not ſhow its fruit early. (2.) The ſhort green prickly cucumber is about three or four inches long; the rind rather ſmooth, and ſet with ſmall black prickles. It is valuable chiefly for being one of the earlieſt and hardieſt ſorts. (3.) The long green prickly cucumber, grows from ſix to nine inches in length, and is rather thinly ſet with prickles. And as there is an early and late cucumber, it is conſiderably the beſt variety for the main crops, both in the frames and hand-glaſs, as well as in the open ground for pricklers. Of this there is another variety with white fruit. (4.) The early green cluſter cucumber is a ſhortiſh fruit, remarkable for growing in cluſters, and appearing early. (5.) The long ſmooth green Turkey cucumber, is a ſmooth green-rinded fruit, growing from 10 to 15 inches in length, without prickles. The plants are ſtrong growers, with very large leaves. (6.) The long ſmooth white Turkey cucumber, is a ſmooth rinded fruit, from 10 to 15 inches long, without prickles. (7.) The large ſmooth green Roman cucumber is a very large and long ſmooth green fruit produced from a ſtrong growing plant. (8). The long white prickly Dutch cucumber, is a white fruit 8 or 10 inches long, ſet with ſmall black prickles; the plants are but bad bearers in Britain.

2. The chata, or round-leaved Egyptian cucumber. According to Mr Haſſelquiſt, this grows in the fertile earth near Cairo after the inundation of the Nile, and not in any other place in Egypt, nor does it grow in any other ſoil. It ripens with the water-melons. The fruit is a little watery; the fleſh almoſt of the ſame ſubſtance with the melons; it taſtes ſomewhat ſweet and cool; but is far from being as cool as the water-melons. This the grandees and Europeans in Egypt eat as the moſt pleaſant fruit they find, and that from which they have the leaſt to apprehend. It is the moſt excellent fruit of this tribe of any yet known.

The four firſt varieties of the cucumis ſativa are thoſe chiefly cultivated in Britain. They are raiſed at three different ſeaſons of the year: 1. on hot-beds, for early fruit; 2. under bell, or hand-glaſſes, for the middle crop; 3. on the common ground, which is for a late crop, or to pickle. The cucumbers which are ripe before April are unwholeſome; being raiſed wholly by the heat of the dung without the aſſiſtance of the ſun. Thoſe raiſed in April are good, and are raiſed in the following manner.

Towards the latter end of January, a quantity of freſh horſe-dung muſt be procured with the litter among it; and a ſmall proportion of ſea-coal aſhes ſhould be added to it. In four or five days the dung will begin to heat; at which time a little of it may be drawn flat on the outſide, and covered with two inches thickneſs of good earth: this muſt be covered with a bell-glaſs; and after two days, when the earth is warm, the ſeeds muſt be ſown on it, covered with a quarter of an inch of freſh earth, and the glaſs then ſet on again. The glaſs muſt be covered with a mat at night, and in four days the young plants will appear. When theſe are ſeen, the reſt of the dung muſt be made up into a bed for one or more lights. This muſt be three feet thick, beat cloſe together, and covered three inches deep with fine freſh earth; the frame muſt then be put on, and covered at night, or in bad weather, with mats. When the earth is hot enough, the young plants from under the bell muſt be removed into it, and ſet two inches diſtance. The glaſſes muſt be now and then a little raiſed, to give air to the plants, and turned often, to prevent the wet from the ſteam of the dung from dropping down upon them. The plants muſt be watered at proper times; and the water uſed for this purpoſe muſt be ſet on the dung till it becomes as warm as the air in the frame: and as the young plants increaſe in bulk, they muſt be earthed up, which will give them great additional ſtrength. If the bed is not hot enough, ſome freſh litter ſhould be laid round its ſides: and if too hot, ſome holes ſhould be bored into ſeveral parts of it with a ſtake, which will let out the heat; and when the bed is thus brought to a proper coolneſs, the holes are to be ſtopped up again with freſh dung. When theſe plants begin to ſhoot their third or rough leaf, another bed muſt be prepared for them like the firſt; and when it is properly warm through the earth, the plants of the other bed muſt be taken up, and planted in this, in which there muſt be a hole in the middle of each light, about a foot deep, and nine inches over, filled with light and fine freſh earth laid hollow in form of a baſon: in each of theſe holes there muſt be ſet four plants: theſe muſt be, for two or three days, ſhaded from the ſun, that they may take firm root; after which they muſt have all the ſun they can, and now and then a little freſh air, as the weather will permit. When the plants are four or five inches high, they muſt be gently pegged down towards the earth, in directions as different from one another as may be; and the branches afterwards produced ſhould be treated in the ſame manner. In a month after this the flowers will appear, and ſoon after the rudiments of the fruit. The glaſſes ſhould now be carefully covered at night; and in the daytime the whole plants ſhould be gently ſprinkled with water. Theſe will produce fruit till about midſummer; at which time the ſecond crop will come in to ſupply their place: theſe are to be raiſed in the ſame manner as the early crop, only they do not require ſo much care and trouble. This ſecond crop ſhould be ſown in the end of March or beginning of April. The ſeaſon for ſowing the cucumbers of the laſt crop, and for pickling, is towards the latter end of May, when the weather is ſettled: theſe are ſown in holes dug to a little depth, and filled up with fine earth, ſo as to be left in the form of a baſon; eight or nine ſeeds being put into one hole. Theſe will come up in five or ſix days; and till they are a week old, are in great danger from the ſparrows. After this they requre only to be kept clear of weeds, and watered now and then. There ſhould be only five plants left at firſt in each hole; and when they are grown a little farther up, the worſt of theſe is to be pulled up, that there may finally remain only four. The plants of this crop will begin to produce fruit in July.

The cucumber is taken in great cities by the lower people as nouriſhment; but by the better ſort is chiefly uſed as a refrigerant, or condiment, to accompany animal food. They have a bland inſipid juice, without acidity or ſweetneſs, approaching, as appears by their ripening, to a farinaceous matter. When uſed green they have no nouriſhment, ſo they are only to be uſed in the ſummer ſeaſon and by the ſedentary. Although cucumbers are neither ſweet nor acid, yet they are conſiderably aceſcent, and ſo produce flatulency, cholera, diarrhœa, &c. Their coldneſs and flatulency may be likewiſe in part attributed to the firmneſs of their texture. They have been diſcharged with little change from the ſtomach, after being detained there for 48 hours. By this means, therefore, their acidity is greatly increaſed. Hence oil and pepper, the condiments commonly employed, are very uſeful to check their fermentation. We have lately uſed another condiment, *viz.* the ſkin, which is bitter, and may therefore ſupply the place of aromatics; but ſhould only be uſed when young.

Beſides the abovementioned ſpecies which are proper for the table, this genus affords alſo two articles for the materia medica.

1. The elaterium of the ſhops, is the inſpiſſated fæcula of the juice of a kind of wild cucumber, called alſo the aſs's cucumber. It comes to this country from Spain and the ſouthern parts of France, where the plant is very common. It is brought to us in ſmall flat whitiſh lumps or cakes that are dry, and break eaſily between the fingers. It is of an acrid, bitter, and nauſeous taſte, and has a ſtrong offenſive ſmell when newly made: but theſe, as well as its other qualities, it loſes after being kept ſome time. Elaterium is a very violent purge and vomit, and is now very ſeldom uſed. The plant is commonly called ſpirting cucumber, from its caſting out its ſeeds with great violence, together with the viſcid juice in which they are lodged, if touched when ripe; from this circumſtance it has obtained the appellation of *noli me tangere*, or "touch me not."

2. The colocynthis, the colocynth, coloquintida, or bitter apple of the ſhops, is brought to us from Aleppo and the iſland of Crete. The leaves of the plant are large, placed alternate, almoſt round, and ſtand upon footſtalks four inches long. The flowers are white; and are ſucceeded by a fruit of the gourd kind, of the ſize of a large apple, and which is yellow when ripe. The ſhelly or huſky outſide incloſes a bitter pulp interſperſed with flattiſh ſeeds. If a hole is made in one of theſe ripe gourds, and a glaſs of rum poured in, and ſuffered to remain 24 hours, it proves a powerful purgative. The pulp itſelf dried and powdered is commonly uſed as a purgative in this country, but is one of the moſt draſtic and diſagreeable we know. If taken in a large doſe, it not only often brings away blood, but produces colics, convulſions, ulcers in the bowels, and fatal ſuper-purgations. The moſt effectual corrector of theſe virulent qualities is to triturate it finely with ſugar or ſweet almonds.

CUCURBIT, the name of a chemical veſſel employed in diſtillation, when covered with its head. Its name comes from its lengthened ſhape, by which it reſembles a gourd: ſome cucurbits, however, are ſhallow, and wide-mouthed. They are made of copper, tin, glaſs, and ſtone-ware, according to the nature of the ſubſtances to be diſtilled. A cucurbit, provided with its capital, conſtitutes the veſſel for diſtillation called an *alembic*.

CUCURBITA, the GOURD, and POMPION: A genus of the ſyngeneſia order, belonging to the monœcia claſs of plants; and in the natural method ranking under the 34th order, *Cucurbitaceæ*. The calyx of the male is quinquedentated; the corolla quinquefid; the filaments three. The calyx of the female is quinquedentated; the corolla quinquefid; the piſtil quinquefid; the ſeeds of the apple with a tumid margin. There are five ſpecies.

1. The lagenaria, or bottle gourd, riſes with thick trailing downy ſtalks, branching into many ſpreading runners. Theſe extend along the ground ſometimes 15 or 20 feet in length. The leaves are large, roundiſh, heart-ſhaped, indented, and woolly. The flowers are large and white, ſucceeded by long incurvated whitiſh yellow fruit, obtaining from about two to five or ſix feet in length, and from about nine to 24 inches in circumference, having a ligneous and durable ſhell.

2. The papo or pompion, commonly called pumpkin,

kin, hath ſtrong, trailing, rough ſtalks, branching into numerous runners. Theſe are much larger than the former, extending from 10 to 40 or 50 feet each way. Theſe are garniſhed with large, roundiſh, lobated, rough leaves, and yellow flowers. The flowers are ſucceeded by large, round, ſmooth fruit, of different forms and ſizes, ſome as big as a peck, others as big as half a buſhel meaſure; ſome conſiderably leſs, and others not exceeding the bulk of an orange; ripening to a yellow, and ſometimes to a whitiſh colour. This ſpecies is the moſt hardy of any, as well as the moſt extenſive in their growth. A ſingle plant, if properly encouraged, will overſpread 10 or 15 rods of ground, and produce a great number of fruit, which, when young, are generally a mixture between a deep blue and pale white, but change as they increaſe in bulk.

3. The verrucoſa, or warted gourd, hath trailing ſtalks very branchy, and running upon the ground 10 or 15 feet each way; large lobated leaves, and yellow flowers, ſucceeded by roundiſh, knobby, warted white fruit, of moderate ſize.

4. The melopepo, erect gourd, or ſquaſh. This riſes with an erect ſtrong ſtalk ſeveral feet high, rarely ſending forth ſide-runners, but becoming buſhy upward. It is adorned with large lobated leaves; and the flowers are ſucceeded by depreſſed knotty fruit, both white and yellow, commonly of a moderate ſize.

5. The lignoſa, ligneous ſhelled gourd, often called calabaſh. This hath trailing ſtalks, branching into runners, which extend far every way; the leaves are large, lobated, and rough; the flowers yellow, and are ſucceeded by roundiſh ſmooth fruit of a moderate ſize, with hard woody ſhells. Of all theſe ſpecies there are a great many varieties, and the fruit of every ſpecies is obſerved to be ſurpriſingly apt to change its form.

Culture. All the ſpecies of gourds and pompions, with their reſpective varieties are raiſed from ſeed ſown annually in April or the beginning of May, either with or without the help of artificial heat. But the plants forwarded in a hot-bed till about a month old, produce fruit a month or ſix weeks earlier on that account, and ripen proportionably ſooner. The firſt ſpecies particularly will ſcarce ever produce tolerably ſized fruit in Britain without the treatment abovementioned.

Uſes. In Britain theſe plants are cultivated only for curioſity; but in the places where they are natives, they anſwer many important purpoſes. In both the Indies, bottle-gourds are very commonly cultivated and ſold in the markets. They make the principal food of the common people, particularly in the warm months of June, July, and Auguſt. The Arabians call this kind of gourd *charrah*. It grows commonly on the mountains in theſe deſarts. The natives boil and ſeaſon it with vinegar; and ſometimes, filling the ſhell with rice and meat, make a kind of pudding of it. The hard ſhell is uſed for holding water, and ſome of them are capacious enough to contain 22 gallons; theſe, however, are very uncommon. The fruit of the pompion likewiſe conſtitutes a great part of the food of the common people during the hot months, in thoſe places where they grow. If gathered when not much bigger than a hen or gooſe egg, and properly ſeaſoned with butter, vinegar, &c. they make a tolerable good ſauce for butcher's meat, and are alſo uſed in ſoups. In England they are ſeldom uſed till grown to maturity. A hole is then made in one ſide, through which the pulp is ſcooped out: after being diveſted of the ſeeds, it is mixed with ſliced apples, milk, ſugar, and grated nutmeg, and thus a kind of pudding is made. The whole is then baked in the oven, and goes by the name of a *pumkin pye*. For this purpoſe the plants are cultivated in many places of England by the country people, who raiſe them upon old dung hills. The third ſpecies is alſo uſed in North America for culinary purpoſes. The fruit is gathered when about half grown, boiled, and eaten as ſauce to butcher's meat. The ſquaſhes are alſo treated in the ſame manner, and by ſome people eſteemed delicate eating.

CUCURBITACEÆ, the name of the 34th order in Linnæus's fragments of a natural method, conſiſting of plants which reſemble the gourd in external figure, habit, virtues, and ſenſible qualities. This order contains the following genera, viz. gronovia, melothria, paſſiflora, anguria, bryonia, cucumis, cucurbita, fevillea, momordica, ſicyos, trichoſanthes.

CUCURUCU, in zoology, the name of a ſerpent found in America, growing 10 or 12 feet long. It is alſo very thick in proportion to its length, and is of a yellowiſh colour, ſtrongly variegated with black ſpots, which are irregularly mixed among the yellow, and often have ſpots of yellow within them. It is a very poiſonous ſpecies, and greatly dreaded by the natives; but its fleſh is a very rich food, and much eſteemed among them, when properly prepared.

CUD, ſometimes means the inſide of the throat in beaſts; but generally the food that they keep there, and chew over again. See COMPARATIVE *Anatomy*, n° 92—94.

CUDDALORE, a town on the coaſt of Coromandel in India, belonging to the Engliſh, very near the place where Fort St David once ſtood. N. Lat. 11. 30. E. Long. 79. 53. 30. This place was reduced by the French in the year 1781; and in 1783 underwent a ſevere ſiege by the Britiſh forces commanded by General Stuart. At this time it was become the principal place of arms held by the French on that coaſt: they had exerted themſelves to the utmoſt in fortifying it; and it was garriſoned by a numerous body of the beſt forces of France, well provided with artillery, and every thing neceſſary for making a vigorous defence.

Previous to the commencement of the ſiege, they had conſtructed ſtrong lines of defence all along the fort, excepting one place where the town was covered by a wood, ſuppoſed to be inacceſſible. Through this wood, however, General Stuart began to cut his way; on which the beſieged began to draw a line of fortification within that alſo. The Britiſh commander then determined to attack theſe fortifications before they were quite completed; and for this purpoſe a vigorous attack was made by the troops under General Bruce. The grenadiers aſſailed a redoubt which greatly annoyed them, but were obliged to retire; on which the whole army advanced to the attack of the lines. The French defended themſelves with reſolution; and as both parties charged each other with fixed bayonets, a dreadful ſlaughter enſued. At laſt the Britiſh were obliged to retreat; but the French having imprudently come out of their lines to purſue them, were in their turn defeated, and obliged to give up the lines they had conſtructed with ſo much pains and ſo gallantly defended. The loſs on the part of the Britiſh amounted to near 1000 killed and wounded, one half of whom were Europeans; and that of the French was not leſs than 600.

Though the Britiſh proved victorious in this conteſt, yet the victory coſt ſo dear that there was not now a ſufficient number to carry on the ſiege with any effect. The troops alſo became ſickly; and their ſtrength diminiſhed ſo much, that the beſieged formed a deſign of not only obliging them to raiſe the ſiege, but of totally deſtroying them. For this purpoſe 4000 men were landed from the ſquadron commanded by M. Suffrein; and the conduct of the enterpriſe committed to the Chevalier de Damas, an experienced and valiant officer. On the 25th of June 1783, he ſallied out at the head of the regiment of Aquitaine, ſuppoſed to be one of the beſt in the French ſervice, and of which he was colonel; with other troops ſelected from the braveſt of the garriſon. The attack was made by day-break; but though the Britiſh were at firſt put into ſome diſorder, they quickly recovered themſelves, and not only repulſed the enemy, but purſued them ſo warmly, that the Chevalier de Damas himſelf was killed with about 200 of his countrymen, and as many taken priſoners.

This engagement was attended with one of the moſt remarkable circumſtances that happened during the whole war, *viz.* A corps of Sepoy grenadiers encountering the French troops oppoſed to them with fixed bayonets, and overcoming them. This extraordinary bravery was not only noticed with due applauſe, but procured for that corps a proviſion for themſelves and families from the preſidencies to which they belonged. No other operation of any conſequence took place during the ſiege, which was now ſoon ended by the news of peace having taken place between the belligerent powers of Europe.

CUDDY, in a firſt-rate man of war, is a place lying between the captain lieutenant's cabin and the quarter-deck; and divided into partitions for the maſter and other officers. It denotes alſo a kind of cabin near the ſtern of a lighter or barge of burden.

CUDWEED, in botany. See GNAPHALIUM.

CUDWORTH (Ralph), a very learned divine of the church of England in the 17th century. In January 1657 he was one of the perſons nominated by a committee of the parliament to be conſulted about the Engliſh tranſlation of the Bible. In 1678 he publiſhed his *True Intellectual ſyſtem of the Univerſe*; a work which met with great oppoſition. He likewiſe publiſhed a treatiſe, intitled, *Deus juſtificatus*: or, "The divine goodneſs of God vindicated, againſt the aſſertions of abſolute and unconditionate reprobation." He embraced the mechanical or corpuſcular philoſophy: but with regard to the Deity, ſpirits, genii, and ideas, he followed the Platoniſts. He died at Cambridge in 1688. The editor of the new edition of the Biographia Britannica obſerves, that it is not eaſy to meet with a greater ſtore-houſe of ancient literature than the "Intellectual Syſtem;" and various writers, we believe, have been indebted to it for an appearance of learning which they might not otherwiſe have been able to maintain. That Dr Cudworth was fanciful in ſome of his opinions, and that he was too devoted a follower of Plato and the Platoniſts, will ſcarcely be denied even by thoſe who are moſt ſenſible of his general merit. The reflections that have been caſt upon ſuch a man as the author, by bigotted writers, are altogether contemptible. It is the lot of diſtinguiſhed merit to be thus treated. Lord Shafteſbury, ſpeaking on this ſubject, has given an honourable teſtimony to the memory of Dr Cudworth. "You know (ſays his lordſhip) the common fate of thoſe who dare to appear fair authors. What was that pious and learned man's caſe, who wrote the Intellectual Syſtem of the Univerſe? I confeſs it was pleaſant enough to conſider, that though the whole world were no leſs ſatisfied with his capacity and learning, than with his ſincerity in the cauſe of Deity; yet he was accuſed of giving the upper hand to the Atheiſt, for having only ſtated their reaſons, and thoſe of their adverſaries, fairly together."

It is obſerved by Dr Birch, that Dr Cudworth's Intellectual Syſtem of the Univerſe has raiſed him a reputation, to which nothing can add but the publication of his other writings ſtill extant in manuſcript. That theſe writings are very valuable cannot be doubted. We may be aſſured that they diſplay a great compaſs of ſentiment and a great extent of learning. Nevertheleſs, from their voluminous quantity, from the abſtruſeneſs of the ſubjects they treat upon, and from the revolutions of literary taſte and opinion, it is morally certain that the publication of them would not be ſucceſsful in the preſent age. Mr Cudworth's daughter Damaris, who married Sir Francis Maſham of Oates in Eſſex, was a lady of genius and learning: ſhe had a great friendſhip for Mr Locke, who reſided ſeveral years at her houſe at Oates, where he died in 1704.

CUE, an *item* or *inuendo*, given to the actors on the ſtage what or when to ſpeak. See PROMPTER.

CUENZA, a town of Spain, in New Caſtile, and in the territory of the Sierra, with a biſhop's ſee. It was taken by Lord Peterborough in 1706, but retaken by the Duke of Berwick. It is ſeated on the river Xucar, in W. Long. 1. 45. N. Lat. 40. 10.

CUERENHERT (Theodore Van), a very extraordinary perſon, was a native of Amſterdam, where he was born in 1522. It appears, that early in life he travelled into Spain and Portugal; but the motives of his journey are not aſcertained. He was a man of ſcience, and, according to report, a good poet. The ſiſter arts at firſt he conſidered as an amuſement only; but in the end he was, it ſeems, obliged to have recourſe to engraving alone for his ſupport. And though the different ſtudies in which he employed his time prevented his attachment to this profeſſion being ſo cloſe as it ought to have been, yet at laſt the marks of genius are diſcoverable in his works. They are ſlight, and haſtily executed with the graver alone; but in an open careleſs ſtyle, ſo as greatly to reſemble deſigns made with a pen. He was eſtabliſhed at Haerlem; and there purſuing his favourite ſtudies in literature, he learned Latin, and was made ſecretary to that town, from whence he was ſent ſeveral times as ambaſſador to the Prince of Orange to whom he addreſſed a famous manifeſto, which that prince publiſhed in 1566. Had he ſtopped here, it had been well; but directing his thoughts into a different channel, he undertook an argument as dangerous as it was abſurd. He maintained, that all religious communications were corrupted; and that, without a ſupernatural miſſion, accompanied with miracles, no perſon had a right to adminiſter in any religious office: he therefore pronounced that man to be unworthy the name of a Chriſtian who would enter any place of public worſhip. This he not only advanced in words, but ſtrove to ſhow the ſincerity of his belief by practice; and for that reaſon would not communicate with either Proteſtant or Papiſt. His works were publiſhed in three volumes folio in 1630; and though he was ſeveral times impriſoned, and at laſt ſentenced to baniſhment, yet he does not appear to have altered his ſentiments. He died at Dergoude in 1590, aged 68 years. It is no ſmall addition to the honour of this ſingular man, that he was the inſtructor of that juſtly celebrated artiſt Henry Goltzius. Cuerenhert worked conjointly with the Galles and other artiſts, from the deſigns of Martin Hemſkerck. The ſubjects are from the Old and New Teſtament, and conſiſt chiefly of middling ſized plates lengthwiſe. He alſo engraved ſeveral ſubjects from Franc. Floris.

CUERPO. To *walk in cuerpo*, is a Spaniſh phraſe for going without a cloak; or without all the formalities of a full dreſs.

CUFF (Henry), the unfortunate ſecretary of the unfortunate earl of Eſſex, was born at Hinton St George in Somerſetſhire, about the year 1560, of a genteel family, who were poſſeſſed of conſiderable eſtates in that county. In 1576, he was entered of Trinity college Oxford; where he ſoon acquired conſiderable reputation as a Grecian and diſputant. He obtained a fellowſhip in the abovementioned college; but was afterwards expelled for ſpeaking diſreſpectfully of the founder (A). He was, however, ſoon after admitted of Merton college; of which, in 1586, he was elected probationer, and in 1588 fellow. In this year he took the degree of maſter of arts. Some time after he was elected Greek profeſſor, and in 1594 proctor of the univerſity. When he left Oxford is uncertain; nor are we better informed as to the means of his introduction to the earl of Eſſex. When that nobleman was made lord lieutenant of Ireland, Mr Cuff was appointed his ſecretary, and continued intimately connected with his lordſhip until his confinement in the tower; and he is generally ſuppoſed to have adviſed thoſe violent meaſures which ended in their mutual deſtruction. The earl indeed confeſſed as much before his execution, and charged him to his face with being the author of all his miſfortunes. Mr Cuff was tried for high-treaſon, convicted, and executed at Tyburn on the 30th of March 1601. Lord Bacon, Sir Henry Wotton, and Camden, ſpeak of him in very harſh terms. He was certainly a man of learning and abilities. He wrote two books; the one intitled, The Differences of the Ages of Man's Life; the other, *De Rebus Geſtis in Sancto Concilio Nicæno*. The firſt was publiſhed after his death; the ſecond is ſtill in mamuſcript.

CUJAS (James), in Latin *Cujacius*, the beſt civilian of his time, was born at Toulouſe, of obſcure parents, in 1520. He learned polite literature and hiſtory; and acquired great knowledge in the ancient laws, which he taught with extraordinary reputation at Toulouſe, Cahors, Bourges, and Valence, in Dauphiné. Emanuel Philibert, duke of Savoy, invited him to Turin, and gave him ſingular marks of his eſteem. Cujas afterwards refuſed very advantageous offers from Pope Gregory XIII. who was deſirous of having him teach at Bologna: but he choſe rather to fix at Bourges, where he had a prodigious number of ſcholars; whom he not only took great pleaſure in inſtructing, but aſſiſted with his ſubſtance, which occaſioned his being called the *The father of his Scholars*. He died at Bourges in 1590, aged 70. His works are in high eſteem among civilians.

CUJAVA, a territory of Great Poland, having on the north the duchy of Pruſſia, on the weſt the palatinate of Kaliſk, on the ſouth thoſe of Licici and Rava, and on the weſt that of Ploczko. It contains two palatinates, the chief towns of which are Inowloez and Breſt; as alſo Uladiſlaw, the capital of the diſtrict.

CUIRASSE, a piece of defenſive armour, made of iron plate, well hammered, ſerving to cover the body from the neck to the girdle, both before and behind. Some derive the word, by corruption, from the Italian *cuore*, "heart;" becauſe it covers that part: others from the French *cuir*, or the Latin *corium*, "leather;" whence *coriaceous*: becauſe defenſive arms were originally made of leather. The cuiraſſe was not brought into uſe till about the year 1300, though they were known both to the ancient Greeks and Romans in different forms.

CUIRASSIERS, cavalry armed with cuiraſſes, as moſt of the Germans are: The French have a regiment of cuiraſſiers; but there have been none in the Britiſh army ſince the revolution.

CULDEES, in church-hiſtory, a ſort of monkiſh prieſts, formerly inhabiting Scotland and Ireland. Being remarkable for the religious exerciſes of preaching and praying, they were called by way of eminence, *cultores Dei*; from whence is derived the word *culdees*. They made choice of one of their own fraternity to be their ſpiritual head, who was afterwards called the *Scots biſhop*.

CULEMBACH, a diſtrict or marquiſate of the circle of Franconia, in Germany. It is bounded on the weſt by the biſhopric of Bamberg; on the ſouth by the territory of Nuremberg; on the eaſt by the palatinate of Bavaria and Bohemia; and on the north by Voight-

---

(A) The founder of Trinity college was Sir Thomas Pope, who, it ſeems, would often take a piece of plate from a friend's houſe, and carry it home concealed under his gown; out of fun, no doubt. Cuff, being merry with ſome of his acquaintance at another college, happened to ſay, alluding to Sir Thomas Pope's uſual joke abovementioned, "A pox on this beggarly houſe! why, our founder ſtole as much plate as would build ſuch another." This piece of wit was the cauſe of his expulſion. The heads of colleges in thoſe days did not underſtand humour. Anthony Wood was told this ſtory by Dr Bathurſt.

land and part of the circle of Upper Saxony. It is about 50 miles in length from north to ſouth, and 30 in breadth from eaſt to weſt. It is full of foreſts and high mountains; the moſt conſiderable of the latter are thoſe of Frichtelberg, all of them covered with pine-trees. Here are the ſources of four large rivers, the Maine, the Sala, the Eger, and the Nab. This marquiſate is the upper part of the burgraviate of Nuremberg.

CULEMBACH, a town of Germany, in Franconia, the capital of the marquiſate of the ſame name. It has good fortifications, and is ſeated at the confluence of two branches of the river Maine. It was pillaged and burnt by the Huſſites in 1430, and by the inhabitants of Nuremberg in 1573. E. Long. 11. 28. N. Lat. 50. 12.

CULEUS, in Roman antiquity, the largeſt meaſure of capacity for things liquid, containing 20 amphoræ, or 40 urnæ. It contained 143 gallons 3 pints, Engliſh wine-meaſure, and was 110.95 ſolid inches.

Plate. CLI.

Barbut's Genera of Inſects.

CULEX, the GNAT; a genus of inſects belonging to the order of diptera. The mouth is formed by a flexible ſheath, incloſing briſtles pointed like ſtings. The antennæ of the males are filiform; thoſe of the females feathered. There are ſeven ſpecies. Theſe inſects, too well known by the ſevere punctures they inflict, and the itchings thence ariſing, afford a moſt intereſting hiſtory. Before they turn to flying inſects, they have been in ſome manner fiſhes, under two different forms. You may obſerve in ſtagnating waters, from the beginning of May till winter, ſmall grubs with their heads downwards, their hinder-parts on the ſurface of the water; from which part ariſes ſideways a kind of vent-hole, or ſmall hollow tube like a funnel, and this is the organ of reſpiration. The head is armed with hooks, that ſerve to ſeize on inſects and bits of graſs on which it feeds. On the ſides are placed four ſmall fins, by the help of which the inſect ſwims about, and dives to the bottom. Theſe larvæ retain their form during a fortnight or three weeks, after which period they turn to chryſalids. All the parts of the winged inſect are diſtinguiſhable through the outward robe that ſhrouds them. The chryſalids are rolled up into ſpirals. The ſituation and ſhape of the windpipe is then altered; it conſiſts of two tubes near the head, which occupy the place of the ſtigmata, through which the winged inſect is one day to breathe. Theſe chryſalids, conſtantly on the ſurface of the water in order to draw breath, abſtain now from eating: but upon the leaſt motion are ſeen to unroll themſelves, and plunge to the bottom, by means of little paddles ſituated at their hinder-part. After three or four days ſtrict faſting, thay paſs to the ſtate of gnats. A moment before, water was its element; but now, become an aerial inſect, he can no longer exiſt in it. He ſwells his head, and burſts his incloſure. The robe he lately wore turns to a ſhip, of which the inſect is the maſt and ſail. If at the inſtant the gnat diſplays his wings there ariſes a breeze, it proves to him a dreadful hurricane; the water gets into the ſhip, and the inſect, which is not yet looſened from it, ſinks and is loſt. But in calm weather, the gnat forſakes his ſlough, dries himſelf, flies into the air, ſeeks to pump the alimentary juice of leaves, or the blood of man and beaſts. The ſting which our naked eye diſcovers, is but a tube, containing five or ſix ſpicula of exquiſite minuteneſs; ſome dentated at their extremity like the head of an arrow, others ſharp-edged like razors. Theſe ſpicula introduced into the veins, act as pump-ſuckers, into which the blood aſcends by reaſon of the ſmallneſs of the capillary tubes. The inſect injects a ſmall quantity of liquor into the wound, by which the blood becomes more fluid, and is ſeen through the microſcope paſſing through thoſe ſpicula. The animal ſwells, grows red, and does not quit its hold till it has gorged itſelf. The liquor it has injected cauſes by its fermenting that diſagreeable itching which we experience; and which may be removed by volatile alkali, or by ſcratching the part newly ſtung, and waſhing it with cold water; for later, the venom ferments, and you would only increaſe the tumor and the itching. Rubbing one's ſelf at night with fuller's-earth and water, leſſens the pain and inflammation. Gnats perform their copulation in the air. The female depoſites her eggs on the water; by the help of her moveable hinder part and her legs, placing them one by the ſide of another in the form of a little boat. This veſſel, compoſed of two or three hundred eggs, ſwims on the water for two or three days, after which they are hatched. If a ſtorm ariſes, the boats are ſunk. Every month there is a freſh progeny of theſe inſects. Were they not devoured by ſwallows, other birds, and by ſeveral carnivorous inſects, the air would be darkened by them.

Gnats, however troubleſome they may be, do not make us feel them ſo ſeverely as the muſketo-flies (*culex pipiens*) do. In the day-time or at night theſe come into the houſes; and when the people are gone to bed they begin their diſagreeable humming, approach always nearer to the bed, and at laſt ſuck up ſo much blood that they can hardly fly away. Their bite cauſes bliſters in people of a delicate complection. When the weather has been cool for ſome days the muſquetoes diſappear; but when it changes again, and eſpecially after a rain, they gather frequently in ſuch quantities about the houſes, that their numbers are aſtoniſhing. In ſultry evenings they accompany the cattle in great ſwarms, from the woods to the houſes or to town; and when they are driven before the houſes, the gnats fly in whereever they can. In the greateſt heat of ſummer, they are ſo numerous in ſome places, that the air ſeems to be quite full of them, eſpecially near ſwamps and ſtagnate waters, ſuch as the river Morris in New Jerſey. The inhabitants therefore make a fire before their houſes to expel theſe diſagreeable gueſts by the ſmoke.

CULIACAN, a province of North America, in the audience of Guadalajara. It is bounded on the north by new Mexico, on the eaſt by New Biſcay and the Zacatecas, on the ſouth by Chiametlan, and on the weſt by the ſea. It is a fruitful country, and has rich mines.

CULLIAGE, a barbarous and immoral practice, whereby the lords of manors anciently aſſumed a right to the firſt night of their vaſſals brides.

CULLEN, a parliament-town in Scotland, ſituated on the ſea-coaſt of Banff-ſhire. W. Long. 2. 12. and N. Lat. 57. 38.

CULLODEN, a place in Scotland within two miles of Inverneſs, chiefly remarkable for a complete victory gained over the rebels on the 16th of April 1746. That day the royal army, commanded by the late Duke of Cumberland, began their march from Nairn, formed into five lines of three battalions each; headed by Major-general Huſke on the left, Lord Sempill on the right, and Brigadier Mordaunt in the centre; flanked by the horſe under the Generals Hawley and Bland, who at the ſame time covered the cannon on the right and left. In this order they marched about eight miles, when a detachment of Kingſton's horſe, and of the Highlanders, having advanced before the reſt of the army, diſcovered the van of the rebels commanded by the young pretender. Both armies immediately formed in the order and numbers ſhown in the annexed ſcheme.

About two in the afternoon the rebels began to cannonade the king's army: but their artillery being ill ſerved, did little execution; while the fire from their enemies was ſeverely felt, and occaſioned great diſorder. The rebels then made a puſh at the right of the royal army, in order to draw the troops forward; but finding themſelves diſappointed, they turned their whole force on the left; falling chiefly on Barrell's and Monro's regiments, where they attempted to flank the king's front-line. But this deſign alſo was defeated by the advancing of Wolfe's regiment, while in the mean time the cannon kept playing upon them with cartridge-ſhot. General Hawley, with ſome Highlanders, had opened a paſſage through ſome ſtone-walls to the right for the horſe which advanced on that ſide; while the horſe on the king's right wheeled off upon their left, diſperſed their body of reſerve, and met in the centre of their front-line in their rear; when being repulſed in the front, and great numbers of them cut off, the rebels fell into very great confuſion. A dreadful carnage was made by the cavalry on their backs; however, ſome part of the foot ſtill preſerved their order: but the Kingſton's horſe, from the reſerve, galloped up briſkly, and falling on the fugitives, did terrible execution. A total defeat inſtantly took place, with the loſs of 2500 killed, wounded, and priſoners, on the part of the rebels; while the royaliſts loſt not above 200. The young pretender had his horſe ſhot under him during the engagement; and after the battle retired to the houſe of a factor of Lord Lovat, about ten miles from Inverneſs, where he ſtaid that night. Next day he ſet out for Fort-Auguſtus, from whence he purſued his journey through wild deſarts with great difficulty and diſtreſs, till at laſt he ſafely reached France, as related under the article BRITAIN, n° 423.

Colonel Roy Stuart's, and thoſe of the above who have only guns.
The D. of Perth's reg. and Ld. Ogilvie's, not to fire without poſitive order; and to keep cloſe, as a freſh corps de reſerve 800.—In all 8350.

CULM, or **Culmus**, among botaniſts, a ſtraw or haulm; defined by Linnæus to be the proper trunk of the graſſes, which elevates the leaves, flower, and fruit.

This ſort of trunk is tubular or hollow, and has frequently knots or joints diſtributed at proper diſtances through its whole length. The leaves are long, ſleek, and placed either near the roots in great numbers, or proceed ſingly from the different joints of the ſtalk, which they embrace at the baſe, like a ſheath or glove.

The haulm is commonly garniſhed with leaves: ſometimes, however, it is naked; that is, devoid of leaves, as in a few ſpecies of cypreſs-graſs. Moſt graſſes have a round cylindrical ſtalk; in ſome ſpecies of ſchœnus, ſcirpus, cypreſs-graſs, and others, it is triangular.

The ſtalk is ſometimes entire, that is, has no branches; ſometimes branching, as in *ſchœnus aculeatus & capenſis;* and not ſeldom conſiſts of a number of ſcales, which lie over each other like tiles.

Laſtly, in a few graſſes, the ſtalk is not interrupted with joints, as in the greater part. The ſpace contained betwixt every two knots or joints, is termed by botaniſts *internodium* and *articulus culmi*.

This ſpecies of trunk often affords certain marks of diſtinction, in diſcriminating the ſpecies. Thus in the genus eriocaulon, the ſpecies are ſcarce to be diſtinguiſhed but by the angles of the culmus or ſtalks. Theſe in ſome ſpecies are in number 5, in others 6, and in others 10.

CULMIFEROUS plants, (from *culmus*, a ſtraw or haulm): plants ſo called, which have a ſmooth jointed ſtalk, uſually hollow, and wrapped about at each joint with ſingle, narrow, ſharp-pointed leaves, and the ſeeds contained in chaffy huſks; ſuch are oats, wheat, barley, rye, and the other plants of the natural family of the GRASSES.

CULMINATION, in aſtronomy, the paſſage of any heavenly body over the meridian, or its greateſt altitude for that day.

CULPRIT, a term uſed by the clerk of the arraignments, when a perſon is indicted for a criminal matter. See *Plea to Indictment*, par. 11.

CULROSS, a parliament town in Scotland, ſituated on the river Forth, about 23 miles north-weſt of Edinburgh. Here is a magnificent houſe with 13 windows in front, built about the year 1590 by Edward Lord Kinloſs, better known in England by the name of Lord Bruce, ſlain in the noted duel between him and Sir Edward Sackville. Some poor remains of the Ciſtercian abbey are ſtill to be ſeen here, founded by Malcolm earl of Fife in 1217. The church was jointly dedicated to the Virgin and St Serf confeſſor. The revenue at the diſſolution was 768 pounds Scots, beſides the rents paid in kind. The number of monks, excluſive of the abbot, were nine. W. Long. 3. 34. N. Lat. 56. 8.

CULVERIN, a long ſlender piece of ordnance or artillery, ſerving to carry a ball to a great diſtance. Manege derives the word from the Latin *colubrina;* others from *coluber*, "ſnake;" either on account of the length and ſlenderneſs of the piece or of the ravages it makes.

There are three kinds of culverins, *viz.* the extraordinary, the ordinary, and the leaſt ſized. 1. The culverin extraordinary has $5\frac{1}{2}$ inches bore; its length 32 calibers, or 13 feet; weighs 4800 pounds; its load above 12 pounds; carries a ſhot $5\frac{1}{4}$ inches diameter, weighing 20 pounds weight. 2. The ordinary culverin is 12 feet long; carries a ball of 17 pounds 5 ounces; caliber $5\frac{1}{2}$ inches, its weight 4500 pounds. 3. The culverin of the leaſt ſize, has its diameter 5 inches; is 12 feet long; weighing about 4000 pounds; carries a ſhot $3\frac{3}{4}$ inches diameter, weighing 14 pounds 9 ounces.

CULVERTAILED, among ſhipwrights, ſignifies the faſtening or letting of one timber into another, ſo that they cannot ſlip out, at the corlings into the beams of a ſhip.

CUMA, or **Cumæ** (anc. geog.), a town of Æolia in Aſia Minor. The inhabitants have been accuſed of ſtupidity for not laying a tax upon all the goods which entered their harbour during 300 years. They were called *Cumani*.

CUMÆ, or **Cuma** (anc. geog.), a city of Campania near Puteoli founded by a colony from Chalcis and Cumæ of Æolia before the Trojan war. The inhabitants were called *Cumæi*. One of the Sibyls fixed her reſidence in a cave in the neighbourhood, and was called the *Cumean Sibyl*.

CUMBERLAND, **Cumbria**, ſo denominated from the *Cumbri* or Britons who inhabited it; one of the moſt northerly counties in England. It was formerly a kingdom extending from the vallum of Adrian to the city of Dumbritton, now Dumbarton, on the frith of Clyde in Scotland. At preſent it is a county of England, which gives the title of *duke* to one of the royal family, and ſends two members to parliament. It is bounded on the north and north-weſt by Scotland; on the ſouth and ſouth-eaſt by part of Lancaſhire and Weſtmoreland; it borders on the eaſt with Northumberland and Durham; and on the weſt is waſhed by the Iriſh ſea. The length from north to ſouth may amount to 55 miles, but the breadth does not exceed 40. It is well watered with rivers, lakes, and fountains; but none of its ſtreams are navigable. In ſome places there are very high mountains. The air is keen and piercing on theſe mountains towards the north; and the climate is moiſt, as in all hilly countries. The ſoil varies with the face of the country; being barren on the moors and mountains, but fertile in the valleys and level ground bordering on the ſea. In general the eaſtern parts of the ſhire are barren and deſolate; yet even the leaſt fertile parts are rich in metals and minerals. The mountains of Copland abound with copper: veins of the ſame metal, with a mixture of gold and ſilver, were found in the reign of queen Elizabeth among the fells of Derwent; and royal mines were formerly wrought at Keſwick. The county produces great quantities of coal, ſome lead, abundance of the mineral earth called *black-lead*, ſeveral mines of lapis calaminaris; and an inconſiderable pear-fiſhery on the coaſt near Ravenglaſs.

Cumberland (Richard), a very learned Engliſh divine in the latter end of the 17th century, was ſon of a citizen of London, and educated at Cambridge. In 1672, he publiſhed his excellent Treatiſe of the Laws of Nature; and in 1686, An Eſſay toward the

Jewiſh Weights and Meaſures. After the revolution he was nominated by king William to the biſhopric of Peterborough, without the leaſt ſolicitation on his part. He purſued his ſtudies to the laſt; and the world is obliged to him for clearing up ſeveral difficulties in hiſtory, chronology, and philoſophy. After the age 83, he applied himſelf to the ſtudy of the Coptic language, of which he made himſelf maſter. He was as remarkable for humility of mind, benevolence of temper, and innocence of life, as for his extenſive learning. He died in 1718.

CUMINUM, cumin: A genus of the digynia order, belonging to the pentandria claſs of plants; and in the natural method ranking under the 45th order, *Umbellatæ*. The fruit is ovate and ſtriated; there are four partial umbels, and the involucra are quadrifid. There is but one ſpecies, *viz.* the cyminum. It is an annual plant, periſhing ſoon after the ſeed is ripe. It riſes 9 or 10 inches high in the warm countries where it is cultivated; but ſeldom riſes above four in Britain. It has ſometimes flowered very well here but never brings its ſeeds to perfection. The leaves are divided into long narrow ſegments, like thoſe of fennel, but much ſmaller: they are of a deep green, and generally turned backward at their extremity: the flowers grow in ſmall umbels at the top of the ſtalks: they are compoſed of five unequal petals, of a pale bluiſh colour, which are ſucceeded by long, channelled, aromatic ſeeds. The plant is propagated for ſale in the iſland of Malta. In Britain the ſeeds muſt be ſown in ſmall pots, and plunged in a very moderate hot-bed to bring up the plants. Theſe, after, having been gradually inured to the open air, turned out of the pots, and planted in a warm border of good earth, preſerving the balls of earth to their roots, will flower pretty well, and may perhaps even perfect a few ſeeds in warm ſeaſons. Theſe ſeeds have a bitteriſh warm taſte, accompanied with an aromatic flavour, not of the moſt agreeable kind. They are accounted good carminatives; but not very often made uſe of. An eſſential oil of them is kept in the ſhops.
